Polychlorinated biphenyls (PCBs). Bradwood Landing's NPDES permit application showed non-detect levels for arsenic, but the detection limit was probably too high (this can be easily remedied). EPA is in the lead on developing the Columbia River temperature TMDL, but work has been stalled for several years. Bradwood Landing's NPDES application lists the following three outfalls and maximum expected temperatures: 1) LNG vaporization discharge, 68 °F summer and winter, 2) Firewater system testing, 47 °F winter, 74 °F summer, and 3) Hydrostatic testing, 60 °F winter, 75 °F summer. Outfall 1 would be the ongoing LNG operation discharging 0.2 million gallons per day (MGD). The firewater system would be tested for one hour each week with a maximum flow of 4,400 gallons per minute (GPM). Hydrostatic testing of tanks would occur once during the construction period using 30 million gallons for each of two tanks. Hydrostatic testing of piping would occur once during the construction period. A total of 1.5 million gallons would be discharged in several episodes over a 2 year period.

DEQ's understanding of the *Friends of Pinto Creek* ruling suggests that we could not issue a permit without requiring that temperature water quality standards be met at the end of the pipe before a TMDL was issued. Outfall 1 discharges may not need any cooling according to the application. However, for outfalls 2 and 3, it might be possible and necessary to cool the water before discharge.

SA1-74

5. Ballast water - No analysis is offered as to impacts of reduced water flows for withdrawal of up to 6.3 billion gallons annually of ballast water from the Columbia River at the berthing area. The applicant proposes contract incentives to LNG ships outfitted with appropriate screening to reduce impacts to organisms and recirculating capabilities to address ship cooling issues and prevent additional withdrawals as well as discharges of heated water. However, this is not standard equipment on the existing LNG ships worldwide and no assurance is given that these retrofit measures will be required. The 9th Circuit Court recently ruled that NPDES discharges to a stream cannot be permitted prior to analysis and load allocations being finalized under a TMDL when the stream is limited for a parameter in the discharge. As the Columbia River temperature TMDL has not been completed, there are no load allocations and therefore no discharge of heated water can be allowed.

SA1-75

6. Invasive organisms - No measures are provided to prevent transfer of non-native species from ship hulls, anchors, propeller, incidental ballast, etc., other than rinsing of anchors and chains prior to leaving the port of origin. These measures would not be adequate to remove organisms from the vessel hull, its components or incidental ballast that were acquired at the port of origin or other waters encountered on the journey to Oregon.

SA1-76

7. Railroad Realignment - Hunt Creek is proposed as a mitigation area through preservation. However, realignment of the railroad will position it only 30 feet from the creek, which is an insufficient buffer area to protect water quality. Typical riparian buffers for water quality protection are at least 100 feet of densely vegetated, low gradient buffer area (or wider where slopes are steep). Additionally, no information is provided as to protection of Hunt Creek's water quality from loss of riparian vegetation and inputs of runoff from potentially chemically treated wood railroad ties, sediment and gravel, train related hydrocarbons, metals, etc. Details for protection measures during construction, as well as post-construction stormwater management measures are required. Mitigation for impacts to Hunt Creek resulting from inadequate buffers must be provided,

SA1-74

As described in section 4.5.2.1, water withdrawals associated with operation of the project would average less than 80 cfs. More specifically, water withdrawals for ballast and engine cooling water would occur at a rate of about 95 cfs. This is a small fraction of the average annual mean streamflow of the Columbia River as measured at the Beaver Army Terminal, which is 233,575 cfs. Therefore, although reduced downstream flows as a result of the proposed project are expected, the reduction would not be significant. See also our response to comment PM1-31.

SA1-75

Additional information on the potential for the introduction of invasive species to the lower Columbia River through hull fouling has been added to section 4.5.1.1.

SA1-76

As described in section 4.3.2.3, approximately 2,000 feet the rerouted railroad line would parallel Hunt Creek. For most of this length, the creek and the edge of the railroad right-of-way would be between 50 and 400 feet apart. However, for about 50 feet, the edge of the railroad right-of-way and Hunt Creek would be less than 50 feet apart. NorthernStar's terminal ESC Plan describes measures that would be taken to prevent construction materials and eroded soil from entering Hunt Creek during construction. Section 4.3.2.3 has been revised to include additional information on the potential impacts on water quality from the portion of the railroad realignment that is located within 50 feet of Hunt Creek.

There may be potential for impacts from run-off containing train related hydrocarbons and metals, but a 2-foot-high berm of earth covered with native grass would be constructed between the Hunt Creek oxbow and the railroad tracks; this would buffer impacts on Hunt Creek if the railroad is used temporarily during construction for delivery of materials. The berm would extend for 100 feet centered on the apex of the oxbow. There is currently no traffic on the tracks and the PWRR has no plans to operate trains west of Wauna (Wauna is east of Bradwood). Treated railroad ties would not be used within 100 feet of any wetland or waterway. Adequacy of mitigation is addressed in the response to comment FA2-10. Section 4.3.2.3 has been revised to include this information.

SA1-76
cont'd

and no mitigation credit should be considered for preservation of the creek riparian areas which are, in fact, being impacted.

SA1-77

8. Erosion due to ship wake – The analysis of potential for erosion due to 125 visits per year of ships larger than those that currently access the Columbia is not representative of proposed ship size and makes favorable conclusions based on lack of information. More information is needed to determine the level of potential effects. Corps studies related to channel deepening in the proposed reach have found wake from current ship traffic to be largely responsible for erosion at Puget Island. The DEIS incorrectly identifies speed as the most important influencing factor in ship wake erosion. The Corps studies have found vessel hull shape to be the contributing factor for ship wake erosion with severity dependent on tidal stage during travel. No information on vessel hull shape and tidal stage correlation is provided in the DEIS analysis. Additionally, tug boat wake from multiple boats during berthing and unberthing should be analyzed in combination with wake and propeller wash from the vessels. (DEQ)

Section 3.0 ALTERNATIVES

SA1-78

Alternatives analysis is not supported by adequate information that relates reasonable alternatives to a demonstrated purpose and need. This section of the DEIS should be more detailed and include a set of criteria that includes commonly accepted import terminal requirements and environmental/permit requirements that can be uniformly be applied to all reasonable build and no-build alternatives. There should be a rigorous analysis of alternatives and more consideration of conservation and renewable energy. The analysis of alternatives is too general to be helpful. Other sites proceeding through the FERC process should be more carefully analyzed and the DEIS should provide more guidance about all of the relative advantages and disadvantages of each project. (DLCDD)

Section 3.0

Also Section 3.1.6.2, p.3-41, Section 3.1.9, p. 3-52 through 3-58 and Table 3.1.9-1

See applicable comments at DSL Section 2.1.3.1, p.2-13 and Sections 2.4.1.2, 2.4.1.3, p. 2-42. (DSL)

Alternatives Analysis

SA1-79

1. Other potential locations within the region have no impacts from dredging or to wetlands at the terminal site. Despite acknowledging that 58 acres of dredging impacts are the most significant and least well understood environmental impact from the proposal, FERC does not find that options with no dredging or wetland impacts are less environmentally impactful.

SA1-80

2. Tribal nations have expressed concerns with the location of the proposal. Although supportive of LNG in Oregon as a “bridge” energy source to reduce dependence on salmon impacting hydropower, such facilities should not be sited in sensitive estuarine areas such as the Columbia River estuary, though which many declining salmonid species must pass in order to access traditional fishing areas. (DEQ)

Section 3.1.9.2

Dredged Material Placement Alternatives

State Agencies

1

SA1-77

See our response to comment FA4-14.

SA1-78

We disagree. The EIS provides adequate information about alternatives. Our analysis discusses the relative advantages and disadvantages of various alternatives. In the beginning of section 3.1 we explain the project objectives and our criteria for evaluating alternatives. We address the no action alternative in section 3.1.1, and discuss conservation and renewable energy alternatives in section 3.1.1.3. See our response to comment SA1-3. The purpose and need for the project is briefly summarized in section 1.1 of the EIS. The Commission Order for this proposal will present a more detailed analysis and conclusion about project need.

SA1-79

It is not true that other potential locations for LNG import terminals in the region would have no impacts from dredging or no impacts on wetlands (see section 3.1.3.4). The proposed Jordan Cove LNG terminal would need to excavate or dredge about 4.3 million cubic yards of material, and its associated sendout pipeline would potentially impact about 406 acres of wetlands. The proposed Oregon LNG terminal would need to dredge about 1.3 million cubic yards of material, and its associated sendout pipeline would cross 11.5 miles of wetlands. The EIS has been revised to explain that NorthernStar intends to dredge about 46 acres within the 58-acre turning basin, producing 700,000 cubic yards of material, the majority, or all, of which would be disposed of on site. Only one of the alternative LNG terminal locations would not require much dredging (Tansy Point). However, that site has no project sponsor, and an LNG terminal at Tansy Point may impact other resources, associated with a higher population density, and a longer sendout pipeline. We have not characterized dredging as “the most significant impact

SA1-80

Section 4.9.3 discloses that Indian tribes have expressed concerns about potential project impacts on the lower Columbia River estuary, federally-listed threatened and endangered salmon species, and tribal fishing rights, due to the proposed location of the LNG import terminal. As explained elsewhere, the project proponent selected the location for its facilities, and the FERC analyzed the environmental impacts the project may have at that location. Our alternatives analysis did not identify another LNG import terminal location that was vastly superior to NorthernStar's location in terms of potential environmental impacts. In fact, several other locations may have greater impacts; especially those projects with longer pipeline routes. However, the FERC usually does not choose between various project locations. If environmental impacts can be mitigated, the FERC could authorize several projects at different locations within the same region, and let the market decide which projects are viable. The EIS for the Bradwood Landing Project discusses the lower Columbia River estuary in section 4.3.2, threatened and endangered salmon species in section 4.6, and tribal fishing rights in section 4.8.1.7.

- SA1-81** Upland placement of dredged sediments. DEQ's Solid Waste Program's comments are on the upland placement of dredged sediments, page 3-53. DEQ has the authority to issue a disposal permit for the disposal of materials that do not meet the definition of clean fill.
- The DEIS does not recognize the role that the DEQ Solid Waste Program plays in the approving the disposal of waste that is not clean fill. There is reason to believe that the sediments will not be clean fill and thus subject to DEQ Solid Waste Program regulations.
- Missing is a discussion of the process that will be used and the interaction with DEQ's Solid Waste Program if the sediments do not meet the definition of clean fill. Add the following text as a new paragraph to page 3-53, under the first paragraph under the heading "Dredged Material Placement Alternatives."
- The Oregon DEQ Solid Waste Program has the authority to issue a disposal permit for the disposal of materials that do not meet the definition of clean fill. To make this determination, the program looks at analytical results from a totals tests (EPA method 6020, as used for the results shown in table 4.2.2-2) to determine if contaminate levels are above DEQ's screening levels. Table 4.2.2-2 shows levels that appear to be above these screening levels for some constituents. In this case, the project proponents and DEQ will work together to determine options for upland disposal of sediment.
 - Suggested deadline for compliance with condition: The project should work with DEQ as soon as practical to determine how sediments will be disposed of. If the dredged materials meet in-water disposal criteria (Sediment Evaluation Framework, Port of Portland criteria, etc.), it is a "clean fill" for upland disposal, and no permit from DEQ's Solid Waste Program is needed. If the method used to determine that sediment meets in-water disposal is a bioassay and/or bioaccumulation test, the sediment may not be appropriate for upland disposal. If it fails in-water disposal criteria but passes screening criteria, it is considered "clean fill" and no Solid Waste Letter of Authorization (SWLA) is needed from DEQ. If the contaminate levels are close to our screening level, more sampling may be required. If sediment fails the screening criteria, a SWLA will be required to dispose of the material on land, except at an approved and permitted landfill. Processing of a SWLA or other permit can take six months, depending upon the associated work load. (DEQ)

Sec 4.0 Environmental Analysis

- SA1-82** If Palomar is listed as a component of the proposed action, then there are many issues/effects that could be associated with it that are not analyzed/disclosed (ODF)

Section 4.0

- SA1-83** Much of the information in the Environmental Analysis is too general. There are general assertions about project effects, but these conclusions are not tied to environmental data and information. The information on dredging impacts generally discusses alterations in flow, but does not discuss the long term impacts on habitat or species in the vicinity of the project or in the downstream areas of the main navigation channel or Clifton channel. While there is good modeling information, the information needs to be tied to a better analysis of effects on key environmental conditions.

State Agencies

1

- SA1-81** The dredged material would meet the definition of clean fill (see section 4.2.2.2).
- SA1-82** See our response to comment SA1-43.
- SA1-83** Potential long-term impacts of alterations created by dredging on habitat and species will be discussed in more detail in the FERC's revised BA and EFH assessment.

State Agencies

1

Bradwood Landing Natural Gas Importation Terminal
Draft Environmental Impact Statement Comments

State of Oregon
Page 20

SA1-83 cont'd Have previously asked for additional information about resource effects.

SA1-84 Information is too general. Need additional detail about habitat impacts of dredging and long term effects of channel modification. (DLCD/OCMP)

Section 4.10, Air Quality and Noise

SA1-85 • The DEIS summary of Air Quality permitting issues for this facility is adequate. Permitting should be able to proceed when a Land Use Compatibility Statement, the permit application materials, and the appropriate fees are submitted to DEQ.
• In the previous Resource Report for Air Quality, an emissions inventory of temporary and mobile sources was included. There was a change in the sulfur content of the fuel used aboard the LNG tanker ships that was not explained in the DEIS, which significantly decreased the estimated emissions. An explanation of why this change was made would be helpful.

SA1-86 • Although DEQ does not have the authority to regulate ship emissions in the Columbia River, the emission inventory submitted in the DEIS represents the potential for a very significant risk to residents in the Lower Columbia area. The State of Oregon currently lacks the resources to adequately monitor and analyze ambient conditions in this area, and therefore does not have information to answer questions from citizens about whether or not the area meets National Ambient Air Quality Standards. Of greatest potential concern are emissions of sulfur oxides and nitrogen oxides.

SA1-87 • The emissions inventory does not contain information on air toxics or hazardous air pollutants, or specifically, diesel particulate matter. All 36 counties in Oregon exceed health benchmarks for diesel particulate matter, including Clatsop County where the proposed Bradwood Landing project would be located. Even though DEQ's air toxics program would not require mitigation at this time, we would encourage Northern Star to voluntarily mitigate its diesel particulate matter emissions including but not limited to:
o installing electrification at the dock to reduce ship hotelling emissions;
o switching to cleaner fuels on all diesel engines;
o installing retrofit devices on all diesel engines; and
o reducing idling for all diesel engines at the facility during construction or operation.
(DEQ)

Section 4.1 GEOLOGY

Global Concerns

SA1-88 1. High (severe) geologic hazards. A hazardous facility proposed at the site and the site is potentially subject to severe geologic hazards.
No mention of technical peer review of the submitted detailed geotechnical and seismic reports to ensure technical competency.
Reference to or completion of technical peer review of the detailed geotechnical and seismic reports.
An independent (non-government agency) technical peer review should be performed on the detailed geotechnical and seismic reports to ensure technical competency. Review should be done by qualified and licensed geologists and engineers.(DOGAMI)

SA1-84 See our response to comment IND82-5.

SA1-85 The EIS addresses air quality issues in section 4.10.1.

SA1-86 Emissions of SO₂ from the LNG carriers shown in table 4.10.1-4 have been updated to reflect a fuel sulfur content of 4.5 weight percent, the international sulfur limit, for ship main engines and generators in transit. In addition, clarifying information documenting the basis for the emissions estimates has been added to table 4.10.1-4.

SA1-87 As documented in table 4.10.1.4 in the final EIS, the annual particulate matter estimated to be emitted from the hotelling LNG carriers is less than 0.5 tpy. Mitigation measures, such as cold ironing were evaluated and were found to not be technically practicable due to limitations in the electrical distribution grid. In addition, internationally flagged LNG carriers in general are not designed to accept shore power and would have to be specially built or retrofitted to accept it.

The diesel engines used during the construction would comply with all state and federal regulations, including the use of cleaner fuels. Additional measures would be employed such as requesting that idling be limited to short durations.

SA1-88 The preliminary design of the Bradwood Landing LNG facility has accounted for the major geologic hazards at an acceptable level of detail at the current time. See also our response to SA1-4 and LA7-25. The FERC staff intends to ensure that NorthernStar consults with the designated state agencies regarding all aspects of the seismic design and geologic hazard mitigation measures.

K-452

- SA1-89** 2. Erroneous technical statements within the DEIS. Erroneous technical statements raise overall concerns about the qualifications of the applicant with respect to technical issues.
No reference to detailed geotechnical and seismic reports (URS reports) on some very complicated geotechnical issues (specific examples are given below). Also erroneous statements which do not match the URS reports.
Reference to detailed geotechnical and seismic reports (URS reports) on some very complicated geotechnical issues. Adequate integration of technical issues into the DEIS.
A technical review of the DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results. (DOGAMI)
- SA1-90** 3. High risk because of the combination of a proposed hazardous facility and the high (severe) geologic hazards. The site has very poor foundation soils, is in a high seismic hazard area, and potentially subject to other severe geologic hazards.
The role of the geotechnical and geologic hazard information and project members appears to be inadequate.
The geotechnical and geologic hazard information has not been fully considered in the DEIS.
Effectively integrate geotechnical/geologic hazard project members into the design, construction, inspection and operations so that the site's severe geologic hazards are mitigated adequately. (DOGAMI)
- Section 4.1.1, Regional Geologic Setting (p.4-2, para, 7)**
- SA1-91** "In recent time, the coastal regions of..." Discussion of vertical deformation rates appear only to consider long-term rates (hundreds of thousands of years) based on geologic studies. Contemporary vertical deformation rates may be different.
- SA1-92** Evaluation of Contemporary vertical deformation rates. The DEIS should differentiate between long-term and short-term (contemporary) uplift rates at the site and evaluate the potential for earthquake-related subsidence at the site. (DOGAMI)
- Section 4.1.1, (p.4-3, para 9)**
- SA1-93** "Erosional features formed along the northern..." Erosion features do not form deposits. Example of global item #2.
Erroneous technical statement. Such erroneous technical statements raise overall concerns about the qualifications of the applicant with respect to technical and public safety issues
A technical review of the DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results. (DOGAMI)
- Section 4.1.2.3 Geologic Hazards (p.4-3, para. 1)**
- SA1-94** "The only geologic hazard that would affect or be influenced..." Since significant dredging is proposed, shoreline erosion may not be the only geologic hazard affected or influenced along the waterway. Does not consider other hazards such as slope stability. Need scientific data to support the statement. Increase in depth of channel may cause slope instability along with shoreline erosion.

State Agencies

1

- SA1-89** URS reports are cited and complete references are provided in Appendix H. See also our response to comment SA1-4.
- SA1-90** See our response to SA1-4.
- SA1-91** The EIS discusses geological issues in section 4.1.
- SA1-92** Vertical deformation rates are provided as general geologic background information. Because such rates are relatively slow and not significant over the lifetime of an LNG facility, the contemporary uplift rate at the LNG terminal site was not evaluated. Although liquefaction and lateral spreading of soils may cause subsidence during an earthquake, the treatment of soils at the site by vibroflotation would minimize such potential.
- SA1-93** The referenced statement has been corrected. See also our response to comment SA1-4.
- SA1-94** Dredging is proposed only at the LNG terminal site, not at other locations along the LNG marine waterway. There would be no deepening of the navigation channel associated with the project.

- SA1-94 cont'd Need detailed study or evaluation by a qualified and licensed geologist or engineer. Evaluate potential slope stability due to increase channel depth. (DOGAMI)
- SA1-95 **Section 4.1.2.3, (p. 4-3, para. 3)**
 “Most of the natural shoreline is resistant to erosion...”. This statement is unsubstantiated and may be inaccurate. May not consider geologic processes and hazards such as river course migration and slope stability. Need scientific data to support the statement. Analysis is missing. Increase in depth of channel may cause slope instability along with shoreline erosion.
 Need detailed study or evaluation by a qualified and licensed geologist or engineer. Evaluate historic current shoreline stability (including potential slope stability). Evaluate shoreline with proposed facilities and channel modifications. (DOGAMI)
- SA1-96 **Section 4.1.2.3 (p. 4-5, para. 7)**
 “NorthernStar commissioned a study of wave...”. DEIS reports that LNG tanker wave heights would be “slightly larger” than other smaller, but similar sized tankers and does not report on the resulting erosion potential from this generalized wave height.
 Does not report how big the resulting waves will be and the erosion potential from these waves. Need scientific data to support the statement.
 Need detailed study or evaluation by a qualified and licensed geologist or engineer. Study that provides specifics about the boat wakes generated by the vessels, their impact at the shore (which is currently vague as it stands). Also baseline study and monitoring at the site. (DOGAMI)
- SA1-97 **Section 4.1.2.3, (p. 4-5, para. 9)**
 “Therefore, it is difficult to determine what additional impacts on shorelines...”. Since it is difficult to determine before hand, some sort of baseline study and monitoring program should be implemented. (DOGAMI)
- SA1-98 **Figure 4.1.3-1, Known faults in the Bradwood Landing Project Area (p. 4-10)**
 This is not a map of known faults. It is simply a copy of the USGS fault and fold map, which identifies only certain types of faults. Example of global item #2.
 Detailed geotechnical evaluation for pipeline indicates that the pipeline will cross four mapped faults. These four faults are not shown on the map.
 Such erroneous technical statements raise overall concerns about the qualifications of the applicant with respect to technical and public safety issues
 Need a technical review of the DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results. Show ALL faults on the map or indicate map is not complete. (DOGAMI)
- SA1-99 **Section 4.1.3.2, Mineral Resources (p. 4-8, para. 2)**
 “Before operation of the LNG terminal...”. Since there is a hazardous facility proposed at the site, reclamation should be performed to adequate standards for this type of facility.
 DEIS proposes standard reclamation. Reclamation should be performed with the proposed hazardous facility in mind. Reclamation should be performed with the proposed hazardous facility in mind. Propose reclamation not to standard regulations, but to levels so that

State Agencies

a hazardous facility can operate without influence in any way from the reclaimed area.
(DOGAMI)

SA1-100

Section 4.1.3.3, Geologic Hazards (p. 4-9, para. 4)

"Debris flows or landslides initiated within Hunt Creek drainage..." Significant landslide hazards like debris flow impact, should be evaluated in detail by a qualified licensed geologist or engineer. There is no reference to a detailed study or evaluation by a qualified geologist or engineer. Need scientific data to support the statement and modeling to show debris flow won't impact the site. (DOGAMI)

SA1-101

Section 4.1.3.3 (p. 4-9, para. 6)

"The risk of rock fall runout proceeding north..." Significant landslide hazards like rock fall impact should be evaluated in detail by a qualified geologist or engineer. No reference to a detailed study or evaluation by a qualified geologist or engineer. Need scientific data to support the statement. a detailed study or evaluation by a qualified licensed geologist or engineer, and modeling to show rock fall won't impact the site. (DOGAMI)

SA1-102

Section 4.1.3.3 (p. 4-11, para. 10)

"Seismic risk can be quantified by the motions..." Ground motions are not expressed in terms of "acceleration due to gravity" as stated in the DEIS. Example of global item #2.

Ground motions are not expressed in terms of "acceleration due to gravity." Ground motion maps are usually expressed in terms of a "percent of gravity". Such erroneous technical statements raise overall concerns about the qualifications of the applicant with respect to technical and public safety issues

Please add a technical review of the DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results. (DOGAMI)

SA1-103

Section 4.1.3.3 (p. 4-11, para. 14)

"The OBE is controlled by earthquakes that have..." This does not address earthquakes between 8.0 and 8.5 nor does it address earthquakes occurring outside the Cascadian subduction zone (CSZ). DEIS lacks references to magnitudes of earthquakes for operating basis earthquake (OBE) and safe shutdown earthquake (SSE) in the URS reports. FERC's draft seismic design guidelines on OBE (section 5.2) are based on probabilistic ground motions (not maximum earthquakes).

Add evaluation of OBE-SSE between 8.0 and 8.5. Evaluate earthquakes not on CSZ. Substantiate approach. A technical review of DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results. Provide consistent statements based on URS analyses. (DOGAMI)

SA1-104

Section 4.1.3.3, (p. 12, para. 15)

"Lateral spreading generally develops on gentle slopes..." The susceptibility, severity, extent and risk of lateral spreading was not discussed. The global stability of the site was not discussed with respect to lateral spreading, including the extent inland, the potentially impacted area, and the associated risks. The site requires safety and stability from damaging permanent ground deformation from lateral spreading.

SA1-100

NorthernStar reviewed site specific Lidar topography and proposed layout of the site facilities. The potential for debris flows impacting the facility is estimated to be very low due to the shallow Hunt Creek stream profile (average gradient from the mouth to 1 mile upstream is approximately 6 percent), lack of topographic evidence of past debris flows at the mouth of the creek, an approximate 1,000-foot setback of the proposed perimeter berm from the mouth of Hunt Creek, and the height of the proposed berm above the surrounding topography (greater than 10 feet). The creek profile includes a 44-foot-high vertical waterfall at the mouth of the creek that, combined with loss of stream confinement, would effectively dissipate horizontal energy as any debris flow exits the incised portion of the drainage and moves onto the 2,000-by-1,000-foot flat area between the mouth of the creek and the perimeter berm. See also our responses to comments SA1-4 and LA7-25.

SA1-101

As indicated in section 4.1.3.3, we do not believe that there is significant risk to the site due to rockfall runout emanating within the Hunt Creek drainage. A detailed study is not warranted due to the large setback of the facility from the base of the bluff (rockfall source area) combined with the proposed perimeter berm. See also our response to comment SA1-4.

SA1-102

Our discussion regarding seismic design and earthquakes in section 4.1.3.3 has been revised. Additional details regarding the "design earthquake" ground motions have been added to the text. URS is the technical consultant hired by NorthernStar to perform the necessary studies documenting the seismic design requirements for the proposed facility. Any "technical review" of the draft EIS by URS would be largely irrelevant as it is the URS studies and recommendations that form the basis for NorthernStar's proposed design. Any short-comings or errors in describing the proposed mitigation measures and the findings of our reviews of the proposal are those of the FERC staff. Also see our response to comment SA1-88.

SA1-103

See our responses to comments SA1-4 and SA1-102.

SA1-104

Liquefaction and lateral spread analyses were performed for the site and are discussed in the Preliminary Geotechnical Report and the Berthing Facility Geotechnical Data Reports. Lateral spreads of up to 6.5 feet have been conservatively estimated. This information has been added to section 4.1.3.3. As discussed in section 4.1.3.3, mitigation measures would include soil treatment such as vibroflotation to strengthen site soils and deep foundation systems.

- SA1-105 Section 4.1.3.3, (p. 4-12, para. 3)
"The LNG storage tanks would also be supported on deep foundations." Additional parts of the support facility should be considered for ground improvements against liquefaction in addition to the tanks. Support facilities are important and deep foundations should be considered as well. (DOGAMI)
- SA1-106 Section 4.1.3.3, (p. 4-14, para. 4)
"The DOGAMI has prepared tsunami hazard maps for the shoreline of the Columbia River..." The proposed facility should be evaluated on a site-specific basis. Regional maps developed over 10 years ago are cited. Site should be re-evaluated on a site-specific basis and include recent scientific data. (DOGAMI)
- SA1-107 Section 4.1.3.3, (p. 4-14, para. 5)
"However, should one occur, the raised elevation of the site..." Conclusions like impacts to the site from locally derived tsunamis should be from qualified professionals. DEIS contains no reference to a detailed study or evaluation by a qualified geologist or engineer. Need scientific data to support the statement and modeling to assess local tsunami impact to the site. Should include detailed landslide map of the area and dynamic slope stability analysis. (DOGAMI)
- SA1-108 Section 4.1.3.3, (p. 4-14, para. 7)
"Federal Emergency Management Agency (FEMA) (1995) insurance rate maps..." This does not consider that the FEMA maps may be out of date and/or simply incorrect because they are based on old topographic data. Also does not consider a potential dam break and subsequent inundation/flooding levels. Need scientific data to support the use of old FEMA maps and evaluation of a dam break. (DOGAMI)
- SA1-109 Section 4.1.3.3, (p. 4-16, para. 6)
"The project would not likely result in land surface subsidence and settlement..." URS report (Dec 2005) indicates "softer compressible soils" and significant settlement. DEIS does not consider regional seismic induced subsidence. Need a technical review of DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results. Provide consistent statements based on URS analyses. Also, consider settlement monitoring during operation. (DOGAMI)
- SA1-110 Section 4.1.3.3, (p. 4-17, para. 3)
"Significant geological hazards are unlikely to be present in the vicinity of the proposed electric..." Pipeline report indicates significant landslides adjacent to the site. Need scientific data and a detailed study or evaluation by a qualified geologist or engineer to support statement. (DOGAMI)
- Section 4.1.4.3 Geologic Hazards (p. 4-20, para. 3)

- SA1-105 Text has been added to section 4.1.3.3 to indicate that all structures integral to the operation of the facility would be founded on deep foundations or designed to function in the case of large displacements. FERC's Seismic Design Guidelines (Jan. 2007) specifies a comprehensive approach to the seismic design of LNG facilities. The FERC staff is not necessarily in agreement with NorthernStar at this time regarding certain preliminary design concepts and other statements made on the record. Appropriate measures would be worked out later in the detailed design process.
- SA1-106 The previously published tsunami maps indicated insignificant effects downstream of the Bradwood Landing location. Given that the berm surrounding the LNG terminal would be at a minimum elevation of 25 feet NAVD (more than 15 feet above high tide level) and the site is located at CRM 38, we do not believe that a site-specific tsunami analysis is warranted.
- SA1-107 We have included additional text regarding NorthernStar's analysis of local tsunami risk in section 4.1.3.3. See also our response to SA1-4.
- SA1-108 Given that the site elevation would be 12 feet above the 100-year flood level based on the FEMA flood maps used, we do not believe further analysis is warranted. The design is not sensitive to the accuracy of FEMA maps. The 100-year flood level is 13.23 feet NAVD and the 500 year flood level is below 14 feet NAVD. The finished site elevation would be 20 feet NAVD and the 5 ft perimeter berm would give additional protection.
- We have added discussion of a potential dam break to section 4.1.3.3.
- SA1-109 Settlement would be mitigated at the site with ground improvement and deep foundations, as stated in the section 4.1.3.3, and therefore is not expected to occur. Earthquake-induced regional subsidence is not expected to be a factor for the project.
- SA1-110 The landslide described in the Pipeline Geohazards Report (URS, 2007) is the Wauna landslide, between about 1.4 and 4.0 miles from the facility. The proposed powerline towers would not cross the Wauna landslide but would tie into existing BPA powerlines north of the landslide.

Bradwood Landing Natural Gas Importation Terminal
Draft Environmental Impact Statement Comments

State of Oregon
Page 25

- SA1-111 "Northern Star indicated it would install automated vibrating...". The DEIS does not indicate how "lack of recent (landslide) activity" was determined. There is no reference to a detailed study or evaluation by a qualified geologist or engineer or scientific data to support the statement. Developer should plan to install inclinometers or some type of monitoring to determine it is not currently moving. (DOGAMI)
- SA1-112 Section 4.1.4.3, (p. 4-23, para.3)
"The 1980 eruption of Mount St. Helens will likely reduce...". This statement and the sentence after are inaccurate and is inconsistent to the references referred. DEIS states that future Mt. St. Helens eruptions will be reduced because of the explosion in 1980 thereby precluding lahars over the design lifetime of the pipeline. A detailed study or evaluation by a qualified geologist or engineer is needed to support statement. (DOGAMI)
- Sections 4.2.3 Pipeline Facilities (Soils and Sediments),
4.3.2.4 Pipeline Facilities (Water Resources)
4.4.1.3 Pipeline Facilities (Wetlands and Terrestrial Vegetation)
4.4.2.3 Pipeline Facilities (Upland Vegetation)
- SA1-113 Pipeline Facilities. There are 94 stream crossings and 24 wetland area crossings proposed to accommodate 30 miles of new pipeline. Associated with these disturbances to the streams and wetlands themselves, are significant impacts to riparian and wetland vegetation. For instance, a full ½ of the existing riparian trees will be removed. Even with total replacement by replanting (which is not proposed because a vegetation free right-of-way is required for 25-feet on each side of the pipeline), temporal losses of wetland and water quality function will be experienced for 1-3 years for wetland shrubs and up to 20 years for trees in forested wetland areas and riparian areas. This riparian vegetation, and in particular trees, is essential to providing water quality and habitat function. Such services as shade to reduce stream temperature, pollutant uptake, stormwater treatment and infiltration, and bank stabilization through root structure and evapotranspiration will be lost in the impacted areas for years to decades. The sensitivity of these areas is not accurately described in the DEIS. The route of the pipeline parallels the Columbia River through tidal wetlands and tributary mouths, which are important spawning, rearing and predator avoidance areas for listed as well as resident species. Loss of riparian vegetation in these areas is directly contradictory to the applicable Water Quality Management Plan for the North Coast Total Maximum Daily Load (TMDL), which requires preservation and restoration of riparian areas in tributaries to address temperature and other water quality parameters. (ODEQ)
- SA1-114 Section 4.3.1, LNG Terminal (p. 4-52 and 4-54)
Groundwater Uses, and Withdrawals. The LNG Terminal must obtain water rights from OWRD for terminal uses listed in the DEIS. With regard to obtaining water for ballast and cooling for LNG ships, Bradwood Landing has indicated its intent to apply for a water right for a fixed, on-shore or on-dock diversion system. If Bradwood does not apply for a water right, the state urges Bradwood to consult with OWRD in the near future to assure that water appropriation does not cause injury to existing uses or over-appropriation of the water resource. Wells appropriating ground water used for ballast and cooling must comply with OWRD's statutes and rules governing well construction. The state urges FERC to require a funding agreement for consultation with OWRD on water rights issues.

- SA1-111 NorthernStar has indicated that it would conduct further investigation of the activity of the Wauna Landslide prior to final design of the pipeline (Pipeline Geohazards Report; URS, 2007). The need for instrumentation would be evaluated based on the results of this investigation.
- SA1-112 The discussion in section 4.1.4.3 regarding Mount St. Helens and lahars has been revised.
- SA1-113 Potential impacts on wetlands and water quality due to clearing of trees and vegetation are discussed in sections 4.4.1 and 4.3.2, respectively. These sections also describe measures to avoid, minimize, and compensate for tree clearing in riparian and wetland habitats. To reduce impacts on riparian vegetation, a riparian strip at least 25 feet wide would be allowed to permanently revegetate with native woody plant species across the entire right-of-way, except for trees greater than 15 feet tall or deep-rooted shrubs within 15 feet of the pipeline. Upland forested communities would be replanted in-kind with trees, with the exception of the portion of the right-of-way within 15 feet of the pipeline. Forested wetlands would be replanted with in-kind wetland tree specimens, with the exception of the portion of the right-of-way within 5 feet of the pipeline. NorthernStar's proposed tree planting exceeds the revegetation requirements of the FERC staff's Procedures. Permanent impacts on wetlands would be mitigated by restoring sites in the general project area that would be set aside and/or developed as compensatory mitigation. A goal of NorthernStar's proposed compensatory mitigation is to reestablish functioning forested wetland and riparian habitat and improve other wetland functions, including water quality improvement, buffer functions, and wildlife habitat. Impacts on listed species resulting from riparian and wetland clearing will be addressed in additional detail in the revised BA and EFH Assessment. See also the response to comment SA1-16.
- SA1-114 See our response to comment IND106-76

State Agencies

1

Bradwood Landing Natural Gas Importation Terminal
Draft Environmental Impact Statement Comments

State of Oregon
Page 26

SA1-114 cont'd A limited License application for construction water would need to be submitted or wait to see if permits are granted and use industrial manufacturing water under a permit. In any event, authorization to use water will be required before construction may begin. This should take place before any FERC Certification. (OWRD)

Section 4.3.1.4, (P. 4-56)

SA1-115 **Pipeline Facilities.** Pipeline excavation and installation, including horizontal drilling activities may adversely affect shallow wells, springs, and surface water in the vicinity. There may well be old wells and home sites that are using springs that are not on any database due to their age. How would adverse effects be handled?
A plan to identify any of these old wells or spring uses needs to be developed and implemented. In addition, a plan to mitigate any impacts needs to be in place before any FERC Certification. (OWRD)

Section 4.3.2.2 (p. 4-67)

SA1-116 **Waterway for LNG Marine Traffic.** This is not an OWRD permitting issue as the intake system is currently described. The DEIS should mention that a permit is not required as the system is currently designed. However, if they change to a specific diversion and piping system, a permit would be required. This should be done prior to any FERC Certification. (OWRD)

Section 4.3.2.3 (p. 4-73)

SA1-117 **Bridge Replacement, first bullet.** The in-water work period is correct but ODFW further recommends (but does not require) work below the ordinary high water (OHW) mark be scheduled (as feasible) to coincide with the low tide series during the in-water work period as an additional environmental precaution. (ODFW)

Section 4.3.2.3 (p. 4-75)

SA1-118 **Railroad Line Realignment, top of page.** This section discusses the railroad right-of-way and its close proximity in one section (50 feet) to Hunt Creek and ditch/ buffer. ODFW's earlier comments requested that "the long-term protection should be addressed also (permanent berm at toe of slope to collect any stray ballast material, or to collect any storm-water and direct it to a more suitable area, etc.)". This section indicates that a 5-foot wide ditch will be used, but does not indicate depth or slope. Within the section in close proximity to Hunt Creek, a ditch may not be sufficient to keep material from working into the buffered area. The DEIS also appears to assume the railroad company will maintain the ditch in the right-of-way, which may be questionable since the line is in service but not currently in use (page 2-41). ODFW proposes that the 50-foot area in question have a small berm (2 feet or so high) incorporated into the south side of the ditch along the narrow area of encroachment as additional protection. (ODFW)

Section 4.3.2.4 Pipeline Facilities and

Table 4.3.2-4 Waterbodies Crossed by the Bradwood Landing Project), (p. 4-78 – 4-82)

SA1-119 **Pipeline facilities crossing streams.** Methods for crossings described here and in section 2.4.2.2 are not being questioned. However, each crossing listed here will need ODFW approval as to the type of crossing method, timing horizontal directional drilling especially, as the DEIS states that this will be outside the in-water work window), and pipeline depth. In addition, it does not appear that adequate coordination with ODFW has occurred in order to provide designation of

SA1-115 See our responses to comments PM6-85 and PM1-40.

SA1-116 We have revised portions of the EIS. It may not be necessary for NorthernStar to acquire a permit from OWRD before the Commission issues its Order.

SA1-117 It is anticipated that working during low tide would be the preference of the construction contractor as well, in that fewer complications can be expected.

SA1-118 Section 4.3.2.3 has been revised to indicate that a small berm would be incorporated into the south side of the ditch adjacent to the railroad tracks as additional protection.

SA1-119 Because the Waterbody and Wetland Construction and Mitigation Procedures Plan has not been finalized, we have recommended in section 4.3.2.4 that NorthernStar continue to consult with the COE, NMFS, FWS, and appropriate federal and state agencies to finalize its Waterbody and Wetland Construction and Mitigation Procedures Plan.

Designation of fish use at waterbodies impacted by the proposed pipeline in Oregon was determined based on the NMFS's Atlas of Salmon and Steelhead Habitat in the Oregon Lower Columbia and Willamette Basins (2005). NorthernStar has also consulted with the ODFW regarding the occurrence of federally listed species at proposed pipeline crossings described in section 4.6.2.3.

Bradwood Landing Natural Gas Importation Terminal
Draft Environmental Impact Statement Comments

State of Oregon
Page 27

SA1-119
cont'd

fish use at each crossing location. (Note: only crossings at which native migratory fish are or were historically present require ODFW approval).

SA1-120

Timing of Stream Crossings, other than the Columbia River, using horizontal directional drilling. In regard to horizontal directional drilling and timing of the work on streams other than the Columbia River, ODFW will not support horizontal directional drilling activities outside of the in-water work period in waterways containing native fish species. Non-fish bearing stream crossings may be considered for out of in-water period work but ODFW's recommendation on these streams must be determined on a site by site basis.

The rationale for this recommendation is as follows: a frac-out or other drilling-related accident outside of the in-water work period could have serious impacts to native fish which spawn and rear in the vicinity of the stream crossing. ODFW is responsible for more than just salmonids (listed or otherwise), and therefore makes this recommendation for all native fish. Greatest impacts would likely be related to spawning areas and activities, but ODFW must also consider juvenile fish that may be rearing in the area. A frac-out during higher flows may be harder to control/repair and clean up, and may involve a much larger area of impact due to higher flows, either from the material itself or from the clean up process. It would seem reasonable to consider out of period work on non-fish bearing streams but ODFW's recommendation will be dependent on distance from fish-bearing water, size, access to site, etc. There may also be amphibian and other wildlife issues that would remove the possibility of working outside of the in-water work period on non-fish bearing streams.

ODFW understands the project sequencing and delivery delay implications that this and the Columbia River HDD crossing (next section) recommendations have for the applicant, but without assurance that no frac-outs will occur, this is the best stance ODFW can take. ODFW's Northwest Region has dealt with frac-outs in the Tualatin basin on past HDD natural gas pipeline projects and frac-outs can indeed cause substantial aquatic impacts. There is no guarantee as to where frac-outs will actually surface, and what quantities of lubricant or bentonite will burst out in a stream before the contractors can act and stop the flow. Mobilizing heavy mop-up rigs across the landscape to find and clean up the mess during the wetter phases of the year is also an access concern. What the in-water work recommendation will mean for the contractor is redesigning the approach to completing all the various elements of the project. This very well might mean longer work hours and extra equipment to conduct horizontal directional drilling under sensitive stream environments only during ODFW-approved in-water work timing months. ODFW would be open to a meeting with the applicant, FERC and National Marine Fisheries Service (NMFS) to discuss all stream and Columbia River horizontal directional drilling crossings.

SA1-121

Timing of HDD for the Columbia River Crossing. ODFW recommends restricting in-water work associated with the Bradwood Landing HDD in the Columbia River to the month of December due to concerns over chum salmon, smelt, and spring Chinook. Normally the recommended in-water work period for the Columbia River is from November 1 through the month of February. Due to the potential of a frac-out occurring during drilling, ODFW recommends the HDD operation not be conducted during the month of November because of potential negative impacts to Endangered Species Act (ESA)-listed chum salmon. Returning chum salmon are most active in the Columbia River during the months of November and December. The chum salmon populations in Oregon on the Columbia River are in an area between two and ten miles below Bonneville Dam around Ives and Pierce islands, near the mouth of Multnomah Creek and at the mouth of McCord Creek. Returning chum salmon adults

SA1-120

Waterbody crossings using the HDD or conventional bore method may be performed outside of the in-water work windows during suitable construction seasons, typically from April through November, depending on the weather. Construction during the rainy season would increase safety concerns and make compliance with NPDES permits more difficult. Waterbody crossings using the HDD or bore method would not involve construction below the ordinary high water mark or MHHW. Waterbody crossing methods, timing, species and life stage occurrence, and potential impacts will be discussed in detail in the revised BA and EFH Assessment.

SA1-121

The crossing of the Columbia River using the HDD method would take 3 months to complete and is currently scheduled to occur during the summer months. On the Oregon side of the river, laydown areas are located in wetlands and the Washington side of the river is relatively hilly; therefore, the HDD crossing of the Columbia River would occur during the dry season. See also our response to comment SA1-120.

Potential impacts on aquatic resources (including salmonids) due to a frac-out are summarized in section 4.5.3.1 and will be discussed in detail in the revised BA and EFH Assessment.

K-459

State Agencies

State of Oregon
Page 28

SA1-121 cont'd begin returning to spawning grounds beginning the first week of November and continue to be present in the Columbia River through December with peak spawning taking place in the above areas in mid-December. A frac-out at River Mile (RM) 53 could have the effect of delaying adult chum salmon migration to spawning grounds. Since typically the bulk of adult chum salmon migration occurs during the month of November, we recommend that no HDD be done during that month.

Smelt begin returning to spawn in the Columbia River and tributaries in December with the majority of mainstem spawners being caught in commercial fisheries in January and February. Commercial smelt fisheries operate in the mainstem Columbia River below the Clatskanie River (RM 50) around Wallace and Puget islands. Should a frac-out occur during January or February it may not only interfere with an important fishery but also negatively impact mainstem spawning in this reach of the river. In addition, spring Chinook salmon begin migrating through this reach of the Columbia River on their way upriver to spawning grounds. Commercial fisheries in the lower Columbia River catch spring Chinook salmon in January and February. Should a frac-out in the Columbia River occur during January or February, it could not only have detrimental effects on an important winter commercial fishery but also disturb and delay migration of ESA-listed upriver spring Chinook salmon.

Because of the above concerns for returning spawners and fisheries in the lower Columbia River and the unpredictable nature of HDD with the possibility of frac-outs taking place while drilling, ODFW recommends that any HDD below the Columbia River be limited to only the month of December when there is the least amount of migration of salmon and smelt occurring in the Columbia River. (ODFW)

Section 4.4.1.2 LGN Terminal (p. 4-96, p. 4-153 of DEIS) and Compensatory Wetlands Mitigation plan (p. 73)

SA1-122 Terminal site Impacts and Compensatory Wetlands Mitigation/Compensatory Mitigation Proposal. Need to clarify mitigation plans for water impacts on the Hunt Creek/Clifton Channel site. The Compensatory Wetlands Mitigation plan lists the acreage to be preserved at Hunt Creek/Clifton Channel is 57 acres (p. 73), but the DEIS states 61 acres.

Preservation may not be adequate to fit within the CIL per OAR 141-085-0131(4). DSL recommends that additional compensatory mitigation measures need to be considered for impacts to waters, including annual maintenance dredging and aquatic impacts.

A finalized and complete Compensatory Wetlands Mitigation and Compensatory Mitigation plan is required prior to any authorization from DSL. As part of Removal/Fill permit, there will be specific success criteria that will need to be met for the Compensatory Mitigation and Compensatory Wetlands Mitigation monitoring report. (DSL)

SA1-123 Section 4.4.1.2 (p. 4-95) LNG Terminal Compensatory Mitigation. There is no discussion about the methodology that will be used to measure function (baseline functions, changes in function, replacement of function at mitigation sites). ODFW recommends that the DEIS refer to a methodology and address this in detail in the Mitigation Plan. (ODFW)

SA1-124 Section 4.4.1.2 (p. 4-96) LNG Terminal Compensatory Mitigation, 3rd paragraph. The on-site biologist that is described in this section as being present during construction of the mitigation site should also be assigned

SA1-122 See our responses to comments FA2-10 and FA3-3.

SA1-123 See our response to comment FA2-10.

SA1-124 As described in section 2.1.6, NorthernStar is currently revising its Compensatory Mitigation Plan based on input received through agencies and from comments on the draft EIS. Therefore, it is anticipated that this comment will be addressed in the final Compensatory Mitigation Plan. See also our response to comment FA2-10.

K-460

- SA1-124 cont'd to ensure that negative impacts to wildlife are avoided (i.e., not just for fish impact avoidance). ODFW recommends that the responsibilities of the on-site biologist include wildlife minimization and avoidance responsibilities (e.g., assuring that timing of blasting avoid sensitive wildlife sites and nesting times). (ODFW)
- Section 4.4.1.3 Pipeline Facilities (p. 4-98)**
- SA1-125 **Pipeline Facilities Impacts and Mitigation, 4th paragraph.** Horizontal directional drilling is addressed with no mention of potential frac-outs and mitigation that would occur in the event of frac-outs. ODFW recommends that this section address what will be done to avoid the potential for frac-outs and then mitigate for impacts in the event that frac-outs do occur. (ODFW)
- Section 4.4.1.3 (p. 4-107)**
- SA1-126 **Pipeline Facilities Compensatory Mitigation.** Regarding the Delameter Creek wetland mitigation site, information is lacking about whether or not the landowner is amenable to a Conservation Easement. ODFW recommends that the DEIS provide this information and clarify how the property will be protected in the long-term. A third-party should hold this CE to ensure long-term protection. (ODFW)
- Section 4.4.2.2 LNG Terminal (p. 4-110 – 4-111)**
- SA1-127 **LNG Terminal Impacts and Mitigation.** Regarding the tree inventory, although tree species other than cottonwood are “not abundant”, it is unclear if any of these are proposed to be removed. It is also unclear if the replacement trees would replace what would be lost. (ODFW)
- Section 4.4.2.2 (p. 4-112)**
- SA1-128 **LNG Terminal Impacts and Mitigation.** Regarding the management of trees within 25 feet of the security fence, topping of trees may not effectively limit the height of some tree species. ODFW suggests that, in addition to topping, girdling trees will limit tree growth and promote development of snags. Also, ODFW recommends placing cleared vegetation on mitigation sites for habitat enhancement (e.g., brush piles). (ODFW)
- Section 4.4.2.2, page 4-112**
- SA1-129 **LNG Terminal Impacts and Mitigation.** It is unclear what seeding with “conservation grasses” means. Please explain this. ODFW recommends coordination with ODFW’S Tillamook Office regarding a grass seed mix that would be acceptable for revegetating the project’s disturbed areas. (ODFW)
- Section 4.4.2.3 (p. 4-115)**
- SA1-130 **Pipeline Facilities General Impacts and Mitigation, Pipeline Right-of-Way.** Final disposition of woody vegetation/ trees removed from the workspace is discussed in this section. Is there an opportunity to reach a similar agreement with ODFW for use of debris/trees for on-site mitigation? Please explore this option and address in the Final EIS. (ODFW)
- Table 4.5.1-2, (p. 4-130)**
- SA1-131 Bullfrog, nutria, house sparrow, rock dove are non-native, invasive species. ODFW recommends removing these species or acknowledging in a footnote that these are not species of concern because of their non-native status. (ODFW)

State Agencies

1

- SA1-125 Section 4.4.1.3 has been revised to include a discussion of the potential for frac-outs in wetlands crossed using the HDD method as well as NorthernStar’s HDD Contingency Plan, which includes mitigation measures to be implemented in the event of a frac-out. Directions for accessing NorthernStar’s HDD Contingency Plan (Frac-out Plan) via the eLibrary can be found in the response to comment FA3-13.
- SA1-126 See our response to comment FA2-10.
- SA1-127 Section 4.5.2.2 has been revised to include the number of trees other than cottonwoods included in the tree inventory conducted by NorthernStar in June 2007. Although the precise number of non-cottonwood trees that would be cleared as a result of terminal construction was not quantified, it did state that most of the trees to be removed would be located along the Hunt Creek estuary, where about 40 red alder, Oregon ash, Sitka spruce, and bigleaf maple are located. NorthernStar proposes to plant 1,895 replacement trees within the LNG terminal site consisting of cottonwoods and other species based on soil and hydrology suitability (e.g., Sitka spruce, red alder, Pacific willow, and other native tree species).
- SA1-128 Although we agree that girdling trees would be an effective method of limiting the height of trees, we are not aware of any environmental advantages to girdling the trees for security reasons.
- Because the Compensatory Mitigation Plan has not been finalized, we have recommended that NorthernStar continue to consult with the COE, FWS, NMFS, ODSL, WDE, and other appropriate resource agencies to finalize its Compensatory Mitigation Plan. The placement of cleared vegetation on mitigation sites for habitat enhancement purposes could be considered as NorthernStar finalizes its plan. Directions for accessing NorthernStar’s Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.
- SA1-129 The term “conservation grasses” generally refers to a mixture of grasses, legumes, and forbs. Because the first use of the term “conservation grasses” occurs in section 4.3.2.4, that section was revised to include a definition of the term.
- We have recommended in section 4.4.2.3 that NorthernStar continue to consult with the COE, FWS, NMFS, Oregon and Washington Departments of Agriculture, and other appropriate resource agencies to revise its Noxious Weeds and Soil-borne Plant Disease Control Plan. Included within this plan is a description of the species that would be used for revegetation in areas impacted by project activities. Directions for accessing NorthernStar’s Noxious Weeds and Soil-borne Plant Disease Control Plan via the eLibrary can be found in the response to comment PM6-60.
- SA1-130 Specific mitigation measures regarding the use of debris/trees for on-site mitigation are beyond the technical scope of the EIS. See also our response to comment SA1-128.
- SA1-131 A footnote has been added to table 4.5.1-2 indicating the non-native, invasive species that occur along the waterway or at the LNG terminal site.

- Section 4.5.2.1, page 4-139 – 4-140.**
SA1-132 Aquatic Resources Log Pond Filling and page 4-141 Hunt Creek Bridge Replacement. Aquatic wildlife may also be present at these locations. A wildlife salvage plan should be prepared and implemented. ODFW permits are needed to conduct fish and wildlife collection/relocation. (ODFW)
- Section 4.5.2, LNG Terminal (p. 153, para. 3, Hunt Creek; Section 4.5.3.1)**
SA1-133 The project proposal claims that preserving Hunt Creek is mitigation. ODFW does not consider preservation as mitigation but it is a good thing to do. Preservation does not replace lost habitat. There will still be habitat lost even with Hunt Creek preserved. Again, ODFW allows preservation but does not count it as mitigation for lost habitat. (ODFW)
- Section 4.5.2.2 (p. 4-154)**
SA1-134a Essential Fish Habitat. ODFW is aware that this section refers to NMFS' Essential Fish Habitat designations. In regard to Oregon Department of State Lands' (DSL) Essential Fish Habitat designation, the applicant/FERC should keep the following information in mind. This section suggests that only two species of Pacific salmon (Chinook and Coho) may be negatively affected by the Bradwood Landing project. Since the Columbia River estuary is known to be an area where not only Chinook and Coho, but also chum salmon and steelhead rear and migrate through, chum and steelhead should be included in the list of fish species Essential Fish Habitat (according to DSL definition) that will be impacted by an LNG project at Bradwood Landing. (ODFW)
- Section 4.5.2.3 Terrestrial Wildlife (p. 4-156 – 4-159)**
SA1-134b ODFW believes this section provides a thorough description of general impacts on terrestrial wildlife. (ODFW)
- Section 4.5.2.3, page 4-158**
SA1-135 Terrestrial Wildlife General Impacts on Terrestrial Wildlife. Wildlife could become entrapped inside the terminal facility's fence. ODFW recommends development of a contingency plan for wildlife trapped inside the facility's fence. (ODFW)
- Section 4.5.2.3, page 4-161**
SA1-136 Terrestrial Wildlife Active Osprey Nest. Regarding relocation of the old osprey nest onto a new platform, it may not be feasible to keep the old nest intact. ODFW recommends that the Final EIS clarify that this will be attempted, but in the event it is not feasible, portions of the old nest will be used to construct a nest start on the new platform with guidance from ODFW. (ODFW)
- Section 4.5.2.3 (p. 4-161)**
SA1-137 Terrestrial Wildlife. This section includes bullfrog, and nutria and these are non-native, invasive species. Either remove these species or acknowledge in a footnote that no mitigation will occur for these species because of their non-native status. (ODFW)

State Agencies

1

- SA1-132 NorthernStar's Fish Salvage Plan includes a statement that all work would be performed under an ODFW/NMFS scientific collection permit. We believe that wildlife concerns related to salvage activities will be adequately identified and addressed through the scientific collection permit process.
- SA1-133 See our response to comment FA3-3.
- SA1-134a We believe that the impacts of the project on EFH, as it is defined under the MSA, are adequately addressed in the EIS. A detailed description of potential impacts on federally listed salmonids occurring in the vicinity of the Bradwood Landing Project is included in section 4.6.2.
- SA1-134b We agree.
- SA1-135 As described in section 4.5.2.3, the fencing that would surround the proposed LNG terminal site would be 10-foot-high woven wire topped with barbed wire. At this height, the fence would effectively preclude most if not all wildlife from jumping over the fence, thus minimizing or eliminating the risk of wildlife being trapped within the LNG terminal site. Therefore, we feel that the development of a contingency plan for wildlife trapped within the LNG terminal site is not necessary.
- SA1-136 Section 4.5.2.3 has been revised to reflect the osprey nest relocation recommendations included in this comment.
- SA1-137 Within section 4.5.2.3, the discussion of wildlife species occurring at the Peterson Point Mitigation Site has been revised.

Section 4.5.2.3 Terrestrial Wildlife (p. 4-172)

- SA1-138 **General Impacts on Terrestrial Wildlife.** The statement in this section that impacts on wildlife from construction of the pipeline are generally short-term is not entirely accurate. Some of the habitat impacts are long-term. (ODFW)

Table 4.5.3-4 Wild Life Species Occurring . . . Pipeline Area(p. 4-173)

- SA1-139 Bullfrog, nutria, house sparrow and rock dove which are non-native, invasive species are included. Either remove these species or acknowledge in a footnote that these are not species of concern because of their non-native status. (ODFW)

Section 4.5.3.3, (1) pages 4-172 -4-175; (2) page 4-174

- SA1-140 (1) The section on General Impacts on Terrestrial Wildlife is a rather abbreviated description of impacts. ODFW recommends expanding the narrative in this section to a similar depth as done on p 4-156 (see comment above).
(2) This section contains a good description of the anticipated re-vegetation and monitoring plan. (ODFW)

Section 4.6.1.1 Federally Listed Threatened and Endangered Species (p. 4-182, last paragraph on Chinook Salmon)

- SA1-141 The statement "Because of their large body size (over 100 pounds and up to 58 inches in length), Chinook tend..." is incorrect and misleading. The statement infers this is a common size for Chinook which was probably not true even in the period before Columbia River dams. Although there were fish of this size, they were still the exception rather than the norm. A better assessment would be "(average size of 20 pounds and average lengths of 34 – 38 inches, and a few over 40 pounds)..." This wording would be more reflective of current physical attributes for Columbia River Chinook. (ODFW)

Section 4.6.1.2 State Listed T&E Species (p. 4-197)

- SA1-142 **Western Pond Turtle.** The status of western pond turtle in Oregon as State sensitive-critical is not mentioned in Section 4.6. Please include this species, its status and information. (ODFW)

Section 4.6.1.2 State Listed T&E Species. (p. 4-198)

- SA1-143 **Columbia Torrent (seep) Salamander.** The status of the Columbia torrent salamander in Oregon as State sensitive-critical is not mentioned in Section 4.6. Please include this species, its status and information. (ODFW)

Section 4.6.1.2 State Listed T&E Species (p. 4-199)

- SA1-144 **American Peregrine Falcon.** The status of American peregrine falcon needs to be corrected. The American peregrine falcon was de-listed in April 2007. (ODFW)

Section 4.6.1.3 Other Special Status Species (p. 4-199)

- SA1-145 **Townsend's Big-eared Bat.** The status of the Townsend's big-eared bat in Oregon as State sensitive-critical is not mentioned in Section 4.6. Please include this species, its status and information. (ODFW)

State Agencies

1

- SA1-138 Section 4.5.2.3 has been revised to provide additional information on potential long-term impacts on wildlife due to construction of the pipeline.
- SA1-139 A footnote has been added to table 4.5.3-4 indicating the non-native, invasive species that occur along the proposed pipeline route.
- SA1-140 Section 4.5.3.3 has been revised to include additional discussion of the potential impacts on terrestrial wildlife due to construction and operation of the pipeline facilities.
- SA1-141 Section 4.6.1.1 has been revised to reflect the typical body size of Chinook.
- SA1-142 The western pond turtle is discussed in section 4.6.1.2. The section has been revised to reflect the State of Oregon's classification of the western pond turtle as sensitive-critical.
- SA1-143 The Columbia torrent (seep) salamander is discussed in section 4.6.1.3. The section has been revised to reflect the State of Oregon's classification of the Columbia torrent salamander as sensitive-critical.
- SA1-144 The American peregrine falcon was removed from the Oregon Threatened and Endangered Species List on April 13, 2007. Therefore, the species has been removed from section 4.6.1.2 of the EIS and is now included in section 4.6.1.3 (Other Special Status Species).
- SA1-145 Townsend's big-eared bat is discussed in section 4.6.1.3. The section has been revised to reflect the State of Oregon's classification of Townsend's big-eared bat as sensitive-critical.

- Section 4.6.1.3 Other Special Status Species (p. 4-201)**
SA1-146 Olive-sided Flycatcher. The status of the olive-sided flycatcher in Oregon is not clear if that listing comes from Oregon's State Sensitive Species List. Please clarify. (ODFW)
- Section 4.6.1.3 Other Special Status Species (p. 4-201)**
SA1-147 Lewis' Woodpecker. This is more of an eastside species. Please double check to see if the project is within this species' range. (ODFW)
- Section 4.6.1.3 Other Special Status Species (p. 4-201)**
SA1-148 Northern Goshawk. The status of the northern goshawk in Oregon as State sensitive-critical is not mentioned in Section 4.6. Please include this species, its status and information. (ODFW)
- Section 4.6.1.3 Other Special Status Species (p. 4-201)**
SA1-149 Purple Martin. The status of the purple martin in Oregon as State sensitive-critical is not mentioned in Section 4.6. Please include this species, its status and information. (ODFW)
- Section 4.6.1.3 Other Special Status Species (p. 4-202)**
SA1-150 Northern Red-legged Frog. The status of the northern red-legged frog in Oregon is State sensitive-undetermined within the Coast Range Ecoregion. The information in the DEIS needs to be corrected. (ODFW)
- Section 4.6.1.3 Other Special Status Species (p. 4-203)**
SA1-151 Tailed Frog. It is not clear in this section that the listing comes from Oregon's State Sensitive Species List. Please clarify. (ODFW)
- Section 4.6.1.3 Other Special Status Species (p. 4-202)**
SA1-152 Western Painted Turtle. It is not clear in this section that the listing comes from Oregon's State Sensitive Species List. Please clarify. (ODFW)
- Section 4.6.1.3 Other Special Status Species (p. 4-204)**
SA1-153 Migratory Bird Treaty Act. Regarding the authority of the Migratory Bird Treaty Act (MBTA), please clarify that the MBTA applies to active nests, eggs, and young. (ODFW)
- Table 4.6.2-1 Summary of Potential Impacts and Mitigation Measures (p. 4-210)**
SA1-154 Action: accidental spill or leak of hazardous materials. There is no "if" scenario included. Please add and include what compensation would occur. The spill response plan should be mentioned. (ODFW)
- Table 4.6.2-1 (p. 4-210)**
SA1-155 Action: Filling log pond. The fish salvage plan needs to include obtaining necessary ODFW fish salvage permits. (ODFW)
- Section 4.6.2**
SA1-156 Impacts and Mitigation. For many federally listed species, there seems to be a lack of mitigation discussion. This section needs to include more information of mitigation measures that would be implemented. (ODFW)

State Agencies

1

- SA1-146 The status of the olive-sided flycatcher as vulnerable on Oregon's State Sensitive Species List has been clarified in section 4.6.1.3.
- SA1-147 As the comment noted, Lewis' woodpecker generally occurs in the eastern portions of both Oregon and Washington. However, due to scoping comments received, the Lewis woodpecker was included in the sensitive species analysis conducted for the Bradwood Landing Project. The text in sections 4.6.1.3 has been revised to clarify that the species is not known to occur within the proposed project area.
- SA1-148 The status of the northern goshawk as critical on Oregon's State Sensitive Species List has been clarified in section 4.6.1.3.
- SA1-149 The status of the purple martin as critical on Oregon's State Sensitive Species List has been clarified in section 4.6.1.3.
- SA1-150 The status of the northern red-legged frog designated by the State of Oregon has been revised in section 4.6.1.3.
- SA1-151 The status of the tailed frog as vulnerable on Oregon's State Sensitive Species List has been clarified in section 4.6.1.3.
- SA1-152 The status of the western painted turtle as critical on Oregon's State Sensitive Species List has been clarified in section 4.6.1.3.
- SA1-153 The text within section 4.6.1.3 relating to the Migratory Bird Treaty Act has been revised to clarify that the Act extends protection to any part, nest, or egg of any such bird (16 USC. 703).
- SA1-154 The spill response plan has been added to table 4.6.2-1 as a minimization measure. We could not speculate what compensation would be appropriate in the event of a spill at this time.
- SA1-155 Section 4.5.2.1 has been revised to clarify that NorthernStar's Fish Salvage Plan includes a statement that all work would be performed under an ODFW/NMFS scientific collection permit.
- SA1-156 As described in section 2.1.5, NorthernStar is currently revising its Compensatory Mitigation Plan. The revised plan will be submitted to the NMFS and FWS as part of the FERC's BA and EFH Assessment. The FERC would not allow construction to begin until after we have completed formal consultation with the FWS and NMFS.

Section 4.6.2.2, LNG Terminal (pp. 4-242 – 4-246)

- SA1-157 **Salmon Enhancement Initiative.** The applicant has proposed to implement a Salmon Enhancement Initiative that would be entirely voluntary, amounting to \$50 million over the life of the project (40 – 50 years). In and of itself, this plan could be a big plus if there were guarantees that it will be completely and successfully implemented, over and above successfully implemented compensatory mitigation. The DEIS does not address specifics of the plan or environmental impacts from its implementation. Because the plan is voluntary and not regulatory and because little detail is given on its specifics, ODFW continues to have many questions about it. ODFW suggests that the applicant first assure successful avoidance, minimization and compensatory mitigation for the project before undertaking the SEL. (ODFW)

Section 4.6.2.2 LNG Terminal (p. 4-258)

- SA1-158 **MBTA.** This section addresses vegetation clearing period to avoid impacts to nests. The proposed start is in mid-July. This section needs to acknowledge that active nests might still be found and address avoidance of impacts to any active nest. ODFW also recommends that the DEIS amend the vegetation clearing start date to August 1 (see comment below). (ODFW)

Section 4.6.2.3 Pipeline Facilities (p. 4-270)

- SA1-159 **MBTA.** This section proposes a vegetation clearing period to avoid impacts to nests as starting August 1. This date is inconsistent with the start date given in Section 4.6.2.2 (i.e., mid-July) and again, needs to address avoidance actions that will be taken if an active nest site is found during vegetation clearing. (ODFW)

Sec 4.7.1.4 (p. 4-277)

- SA1-160 **Publicly owned forest.** Add language on the project's proximity to and potential impacts on the Tillamook State Forest, another publicly owned forest in northwest Oregon. (ODF)

Sec 4.7.1.4 (p. 4-277 & 293)

- SA1-161 **Recreation.** ODF has a Recreation Management Plan for the Astoria District (dated 2000), and recreation on the Clatsop SF is recognized and actively managed in coordination with local user groups and citizen advisory committees. Please consider this in your analysis. (ODF)

Section 4.7.1.4 (pp. 4-279 – 4-280) and**Section 4.8.1.7 Transportation and River Traffic (p. 4-328 – 4-330)**

- SA1-162 **Commercial and Recreational Fishing Use of Columbia River.** The moving 500-yard safety and security zone around 125 LNG ships per year (2 – 3 per week) as they move up the Columbia River will be very disruptive to commercial and recreational fishing boats. The applicant has stipulated in meetings with ODFW and other agencies that ships would ingress/egress the Columbia at night during key fishing seasons such as the Buoy 10 fishery (August – September). This commitment appears to be missing in the DEIS. ODFW recommends that the applicant/FERC include the commitment that ships will ingress/egress the Columbia River at night during key fishing seasons (see attached table for fishing boat numbers on the Columbia River below the proposed Bradwood Landing LNG Terminal site). (ODFW)

State Agencies

1

- SA1-157 We agree. The FERC staff will continue to work with the resource and other regulatory agencies to ensure that the project includes appropriate measures to avoid, minimize, and compensate for environmental impacts.
- SA1-158 Section 4.6.2.2 has been revised to address vegetation clearing timeframes and impacts on active nests.
- SA1-159 Section 4.6.2.3 has been revised to address vegetation clearing timeframes and impacts on active nests.
- SA1-160 Based on a review of State Forest maps, it appears that the Tillamook State Forest is over 60 miles south from Astoria, and well outside the project area.
- SA1-161 Section 4.7.1.4 has been revised to include a reference to the Clatsop State Forest's Astoria District Recreation Management Plan.
- SA1-162 The moving safety and security zone is expected to have a minor impact recreational and commercial fishing. Because of this, restrictive scheduling of LNG ship transits to nighttime hours does not appear justified. Furthermore, the Coast Guard has restricted the LNG ships to daytime transits for the first 6 months of operation to allow the Columbia River Pilots to become accustomed to the vessels.

State Agencies

1

Bradwood Landing Natural Gas Importation Terminal
Draft Environmental Impact Statement Comments

State of Oregon
Page 34

Section 4.7.2.7 (p. 4-294-5)

SA1-163 **Visuals.** ODF's Forest Management Plan for NW OR has Land Management Classification (OAR) designations which include areas where of visual concerns are designated. There is a visual designation along the Columbia River on the Clatsop State Forest directly west of the Bradwood site. Visual impacts from the designated areas on the Clatsop State Forest should be considered in this section. (ODF)

Section 4.8.3.6 Local Infrastructure and Public Services

Table 4.8.1-4 Existing Economic Conditions (p. 4-324)

SA1-164 **Emergency Services.** ODF is an oversight agency to Rural Fire Protection Districts and is a responder to forest and brush fires on private, rural, and state owned lands
Emergency and evacuation plans should be coordinated with ODF, particularly any emergency route across State Forest lands. (ODF)

Section 4.8.2.7 Transportation and Traffic (p. 343-345)

SA1-165 **Transportation and Traffic.** The DEIS understates the importance of US Route 30. "Highway 30 is a two-lane east-west highway that connects Astoria to Portland."

US Route 30 is the only highway serving the Lower Columbia corridor between Portland and Astoria. US Route 30 serves as the "Main Street" for most communities in the corridor and it is the primary facility for freight traffic serving industry in the corridor. The importance of US Route 30 for passenger and freight traffic is reflected by its designation as part of the National Highway System, a State Freight Route, and a Federally Designated Truck Route. ODOT has informed Northern Star's Engineering Firm CTS Engineering and Clatsop County that a Road Approach Permit will be required for Clifton Road at U.S. 30 and OAR 734 Division 51 requirements shall be met; mitigation will be identified during the road approach permitting process. Cost for all highway mitigation as determined by OAR 734 Division 51 due to the development impacts will be the sole responsibility of the developer.

ODOT will need to re-evaluate all traffic impacts at the Clifton Road intersection, once a road approach application has been submitted. Based on a preliminary review of the information supplied to ODOT as of this date, the required mitigation at the U.S. Highway 30/Clifton Road intersection will be:

1. Construction of a left turn refuge on Highway 30 at Clifton Road. This mitigation is based on safety and operational concerns, and is supported by turn-lane warrants being met during the 3-5 year construction period;
2. Widening of the highway shoulder in the southeast quadrant to accommodate right turning vehicles; and
3. Radii improvements.

CTS Engineering was informed that any other mitigation will be identified during the application process.

Currently, a Park & Ride is being proposed at a location approximately 2 miles east of the original location. A right turn lane may be required in lieu of the previously mentioned shoulder widening, due to the location of the Park & Ride, and its potential to increase the number of right turning vehicles.

SA1-163 Section 4.7.1.5 has been revised to include the Clatsop State Forest's Land Management Classification of "Visual" along the Columbia River just west of the proposed LNG terminal.

SA1-164 See our response to comment PM1-1.

SA1-165 The FERC acknowledges the ODOT's concerns regarding Highway 30 and its road approach application process. We will require that NorthernStar's proposed improvements to Clifton Road be reviewed and approved by ODOT prior to construction.

K-466

State Agencies

Bradwood Landing Natural Gas Importation Terminal
Draft Environmental Impact Statement Comments

State of Oregon
Page 35

SA1-165
cont'd

- The new Park & Ride location proposal does not alter ODOT's decision on requiring a left turn lane on US30 at Clifton Road or the Radii improvements..

SA1-166

Due to public safety and operational concerns, ODOT recommends inclusion of the following as a condition of approval: All improvements on U.S. Highway 30 and on Clifton Road shall be completed before any permits will be issued allowing construction at the terminal site which would result in increase traffic at the intersection of Clifton Road. (ODOT, Region 2)

Sec 4.9 Cultural Resources (p. 4-357 – 4-457)

SA1-167

Geologic hazards. The Wauna slide feature and associated Clatsop crest is a very large deep seated feature (portions of which exhibit active slopes) that maybe should be mentioned here (it is mentioned in other sections) (ODF)

Section 4.11.2 Cryogenic Design and Technical Review and Staff Recommended Mitigation # 93 (p. 5-33-5-340)

SA1-168

Reporting Events. All incidents (minor or otherwise) at LNG facilities in Oregon require the Oregon Department of Energy (ODOE) to respond by providing initial notifications to the Governor's office and other response organizations as appropriate. FERC Staff Recommended Mitigation #93 does not require the state be notified immediately of all non-scheduled events at Bradwood Landing.

FERC should revise the DEIS to include language about including the notification of the Oregon Department of Energy immediately of all non-scheduled events at Bradwood Landing in Staff Recommendation Mitigation #93.

Recommended Condition Language - As a condition of the permit, Northern Star will immediately notify the Oregon Department of Energy of all non-scheduled events at Bradwood Landing (Staff Recommendation Mitigation #93). (ODOE)
ODOE

Section 4.11.5.5, Requirements for LNG Carrier Operation and FERC Staff Recommended Mitigation #87 (p. 5-32)

SA1-169

Implement Measures as Outlined in the WSR. A major flaw in the U.S. Coast Guard's (USCG) Waterway Suitability Assessment (WSA) process was that the WSA Validation Committee failed to include members from the cities of Knappa, Astoria, Warrenton, and Clatsop County. Without representation from the host county and local fire and law enforcement officials from the affected communities, it is difficult to adequately assess safety and security issues in this region. Missing is critical safety and security input from local fire and law enforcement experts giving credibility to the USCG WSA process and the final recommendations to FERC in the Waterway Suitability Report.

SA1-170

FERC should require USCG to reconvene a new WSA Validation Committee for the proposed Bradwood Landing Import Terminal with the appropriate local, county, and state emergency response officials to review and discuss appropriate safety and security measures as a result of the new modeling completed for the larger (260,000 cm) LNG vessels. We expect the three zones of concern would likely be expanded for the larger vessels. This could have significant impacts for the city of Astoria. Reconvening the USCG WSA in light of this new information is both timely and protects the integrity of the WSA process.

Recommended Condition Language - As a condition of the permit, USCG will reconvene a new WSA Validation Committee for the proposed Bradwood Landing Import Terminal with

SA1-166

See our response to comment SA1-165. We have included a recommendation that NorthernStar file a final transportation plan, formulated in consultation with Clatsop County and ODOT, that pertains to proposed modifications to Highway 30 and Clifton Road.

SA1-167

We have not added a discussion of the Wauna slide feature and the associated Clatsop Crest to section 4.9. At this time, no cultural resources related to those geological features have been identified within the APE. If, during the course of future investigations for this project, cultural resources are found at those geological features, the FERC would assess their eligibility for nomination to the NRHP, and, if any of the sites are eligible, would consult with the appropriate parties about the resolution of adverse effects. As discussed in section 4.9.2, NorthernStar would implement the measures in its Discovery Plan if any previously unidentified cultural resources are encountered during construction.

SA1-168

If authorized, NorthernStar would have to comply with 49 CFR 193. Section 193.2509(b)(2) requires NorthernStar to have procedures for dealing with an emergency which includes notification of local officials.

SA1-169

The WSA Validation Committee members included appropriate stakeholders that were selected based on their technical expertise. There is no requirement for local government representatives and in fact, including local government units might constitute a conflict of interest. Input from local fire and law enforcement experts was obtained during the WSA process through other measures.

SA1-170

The WSA for the Bradwood Landing Project took into account larger LNG vessels. We recommend in section 4.11.5.5 that NorthernStar annually review and update their WSA to reflect changing conditions at which time the Coast Guard would review and validate.

K-467

State Agencies

1

Bradwood Landing Natural Gas Importation Terminal
Draft Environmental Impact Statement Comments

State of Oregon
Page 36

SA1-170 cont'd the appropriate local, county, and state emergency response officials to review and discuss appropriate safety and security measures as a result of the new modeling completed for the larger (260,000 cm) LNG vessels.

Northern Star will revise the 38 miles transit maps for the three zones of concern to include an increase based on modeling results. Northern Star will provide an updated list of safety and security resource commitments for review and discussion by the WSA Validation Committee.

Northern Star will implement measures as outlined in the revised WSR. (ODOE)

Section 4.11.6 Emergency Response and Evacuation Planning and FERC Staff Recommended Mitigation #62 (p. 5-29 to 5-30)

SA1-171 Bradwood Emergency Response Plan. A major flaw in the draft emergency response plan (ERP) for the proposed Bradwood Landing LNG terminal is that it assumes critical emergency response assets are already committed, in place, and approved by state and local emergency response organizations. Without Northern Star's commitment to provide this region the necessary resources, the state and the Federal Energy Regulatory Commission (FERC) are unable to conduct a thorough evaluation of Bradwood's draft ERP to ensure the plan is adequate and can be effectively implemented to protect the health and safety of Oregonians in the event of an LNG mishap at Bradwood. Specific problems include:

➤ 1 - Local emergency responders currently lack the resources to launch a timely and effective response to a Bradwood Landing emergency. Significant portions of the draft Bradwood ERP cannot currently be implemented, due to lack of resources and insufficient commitments from Northern Star. This includes the incident command structure and the fire response portions of the draft Bradwood ERP.

FERC should require Northern Star to provide fire resources to first responders that meet state and National Fire Protection Association (NFPA) standards for a four-minute response to a 1st Alarm Fire at an industrial facility. In addition, FERC should acknowledge Northern Star's commitment to provide an onsite fire brigade, which will supplement, but not replace or offset, the offsite response. Oregon expects that the fire brigade would operate consistent with NFPA standards.

Recommended Condition Language - As a condition of the permit, Northern Star will meet state and NFPA standards for response to an industrial facility fire. This includes providing adequate fire resources to ensure a four-minute response to a 1st Alarm Fire for an industrial facility as shown in Table 7.2.1.

Table 7.2.1 - Required Resources for a "Medium-Hazard Occupancies" Response. This includes apartments, offices, mercantile and industrial occupancies not normally requiring extensive rescue or fire-fighting forces.

- At least 3 pumpers
- 1 ladder truck (or combination apparatus with equivalent capabilities)
- Other specialized apparatus as may be needed or available
- No fewer than 16 fire fighters, 1 chief officer, 1 safety officer, and a Rapid Intervention Team (4 - 5 fire fighters on standby at event scene).

SA1-171 Development and finalization of an ERP and Cost Sharing Plan are not required prior to completion of the final EIS. However, NorthernStar has developed these plans and they are currently undergoing review. See response to SA1-21

K-468

State Agencies

1

SA1-171
cont'd

Note: Refer to Volume 1 - NFPA Handbook, 19th Edition, Chapter 2, Section 7, Organizing for Fire and Rescue Services

Northern Star will work with state and local emergency response organizations to determine the appropriate location and facility design for the fire station and placement of personnel and equipment resources. Upon commencement of this work, Northern Star will provide a comprehensive resource list of fire resources and placement with state and local signature approval with the draft Bradwood ERP to be submitted to FERC for final review.

2 - While the U.S. Coast Guard has broad authority over the waterways, it lacks resources to respond to LNG vessel fires traveling the 38 mile channel to the Bradwood Landing Import Terminal. The Coast Guard issued its Waterway Suitability Report approving LNG vessel transit for Bradwood Landing without resolving this critical issue leaving Oregon citizens along the 38 miles channel vulnerable to potential vessel mishaps. See "Concern 3" for details concerning the Coast Guard's Waterway Suitability Assessment process.

In addition, Northern Star's draft Bradwood ERP fails to address the issue adequately. In the draft ERP, Northern Star proposes a three tiered response to in-transit fire fighting.

Tier 1: Local Fire Agencies - Local fire agencies are to protect citizens and waterfront property from vessel fire only.

Concern - Stretched resources to protect citizens and waterfront property along the 38 mile channel and no ability to support shipboard fires.

Tier 2: Maritime Fire & Safety Association (MFSA) - The MFSA has 24 members made up of public and private companies including fire agencies, ports, and private companies along the Lower Columbia and Willamette Rivers. The purpose is to set forth a comprehensive system which ensures fast, well-coordinated and effective response to ship fire incidents in the Lower Columbia region.

Concern - MFSA is not a viable option for Bradwood Landing's proposed Tier 2 response to shipboard fires. In this region, any available MFSA resources would be exhausted in the Tier 1 response because fire resources are so limited. Many local fire agencies also choose not to be a MFSA member. Only members can benefit from MFSA resources both in personnel and equipment when available. MFSA member agencies can only respond to shipboard fires that are docked at a port. It is generally agreed that in this region that it would be unlikely for any port to allow a burning vessel to approach their docks.

It is also important to recognize that MFSA resources belong to the respective member fire agencies. This means any resources Northern Star provides to the MFSA cannot be dedicated to Bradwood Landing emergencies alone. Also, response and support from MFSA members is optional. Both fire fighters and equipment may be busy elsewhere and unavailable when needed. As a result, the MFSA is not a reliable system to support Bradwood Landing's Tier 2 response.

K-469

State Agencies

1

SA1-171
cont'd

Tier 3: Contractors Companies - Northern Star proposes contacting with private agencies out of Portland to provide the Tier 3 response to shipboard fires in the channel.

Concern - Significant delay in response.

FERC should require Northern Star to develop a shipboard fire response plan that can actually be implemented in the region for review and approval by the Coast Guard, state, and local agencies. This includes requiring Northern Star to provide the necessary resources to implement the plan.

Recommended Condition Language - As a condition of the permit, Northern Star will work with the U.S. Coast Guard, state, and local emergency response agencies to develop a detailed response plan to effectively address ship board fires along the 38 mile channel. This includes re-considering Tiers 1, 2, and 3 to ensure adequate resources are committed and dedicated for response to Bradwood Landing emergencies only. Upon commencement of this work, Northern Star will provide a comprehensive resource list for response to shipboard fires with Coast Guard, state and local signature approval with the draft Bradwood ERP to be submitted to FERC for final review.

- 3 - The draft Bradwood ERP fails to address response actions for fighting forest and brush fires as a result of a facility emergency. The proposed site is surrounded by forest timber. Without a detailed plan to identify possible scenarios and proposed response actions and coordination to fight such a blaze, the state and FERC are not able to determine whether the region has adequate resources to contain a forest or brush fire as a result of a Bradwood mishap. Additional fire resources may be needed in addition to the resources required for response to an industrial facility fire discussed in problem 1.

FERC should require Northern Star to work with state and local emergency response organizations to develop a detailed draft plan in response forest and brush fires as a result of a Bradwood Landing emergency. This will allow state and local emergency responders to assess whether additional fire resources are needed in response to forest and brush fires.

Recommended Condition Language - As a condition of the permit, Northern Star will provide a detailed draft plan for response to forest and brush fires as a result of a Bradwood Landing emergency for state and local review and approval. This includes information on likely scenarios, response actions, and resources needed to implement response actions. Upon commencement of this work, Northern Star will provide a comprehensive resource list for response to forest and brush fires with state and local signature approval with the draft Bradwood ERP to be submitted to FERC for final review.

See also Oregon Department of Forestry (ODF) comments Section 4.8.3.6, Emergency Services and Section 2.8.2.2, Emergency Response Plan. ODF has oversight for rural fire protection districts and responds to forest and brush fires on private, rural, and state owned lands.

- 4 - While Northern Star has provided verbal commitment to provide a public warning system, no detailed description or proposal has been submitted to the state and local emergency response organizations for review and approval. Without a proposed plan for a

K-470

State Agencies

1

SA1-171
cont'd

public warning system in the region, it is impossible for the state and FERC to determine whether the draft Bradwood Landing ERP can be implemented effectively to provide timely notifications to Oregonians living, recreating, and working near Bradwood Landing or along the 38 mile transit route in the event of an LNG incident.

FERC should require Northern Star to provide a draft detailed plan for a public warning system for the region. This will ensure that FERC and the state have adequate information to evaluate the effectiveness of the procedures for alerting and notifying the public of an LNG incident in the draft Bradwood Landing ERP.

Recommended Condition Language - As a condition of the permit, Northern Star will provide a public warning system for the region that includes the following alert and notifications systems, but is not limited to:

- Reverse 911 (24-Port) System for Clatsop County - The system will include the following capabilities: high volume calling; compatible with major mapping systems; E911 data ready; multiple devices (recorded voice messages, text messages to wireless receivers, and digital pagers); geo-dimensional calling; full networking capabilities; off-site back-up notification; remote launching capability; and other capabilities as appropriate.
- Sirens - Outdoor siren system throughout the entire 38 miles transit route covering all three zones of concern up to the Bradwood Landing Terminal. The system will include the following capabilities: multiple high intensity warning signals; live and digital voice messaging with flat frequency response from 200 - 2000 Hz for clear voice reproduction; 360-degree coverage with no sound variation in the horizontal plane (106 to 125 dBc at 100ft/30m); continued emergency operation regardless of primary power outages, and other capabilities as appropriate. Northern Star will include a map of the proposed number and locations of sirens showing the coverage area of each proposed siren for state and local review and approval.
- Reader Boards - Reader boards located along Highway 101 and Highway 30 in Clatsop County to provide event information, direct traffic, and facilitate evacuations. Northern Star will include a map of the proposed number and locations of reader boards for state and county approval. Reader board specifications must be consistent with the Oregon Department of Transportation reader boards located throughout the state.

Upon commencement of this work, Northern Star will provide a comprehensive resource list for a public warning system with state and local signature approval with the draft Bradwood ERP to be submitted to FERC for final review.

5 - While Northern Star has provided a verbal commitment to provide a remote gas detection system for the region, no plans have been submitted for state and local review and approval. Without a proposed plan for offsite gas detection, the state and FERC are unable to determine whether the draft Bradwood Landing ERP can effectively warn emergency responders of an LNG release in high risk and populated areas along the 38 mile transit route.

FERC should require Northern Star to provide a draft detailed plan for a remote gas detection system for the region. This will ensure that FERC and the state have adequate information to

K-471

State Agencies

1

SA1-171
cont'd

evaluate the effectiveness of the remote gas detection system to detect LNG concentrations threatening high risk or populated areas in the draft Bradwood Landing ERP.

Recommended Condition Language - As a condition of the permit, Northern Star will provide a draft detailed plan for a remote gas detection system for the region. The proposed remote gas detection system plan will include information about the following systems, but is not limited to:

- Fixed Gas Detectors - Fixed gas detectors will be provided in all high risk and high population areas along the entire 38 mile transit route in Clatsop County. Fixed gas detector capabilities will include remote wireless operations and the ability to provide readouts in multiple locations. Northern Star will include a map of the proposed fixed gas detector locations along the 38 mile transit route for state and local review and approval. Fixed gas detector locations include, but are not limited to:

Oregon:

Hammond, Tansy Point, Warrenton, Astoria (3 detectors), Tongue Point, Settler Point, Long Island, Knappa, and Puget Island (3 detectors).

Washington:

Ruby Island, Ilwaco, (2 detectors total - 1 at airport), Chinook, Elliot Point, Middle Valley, and Cathlamet.

- Portable Gas Detectors - Northern Star will provide three layers of portable gas detectors.
1) All emergency responder vehicles in the region will be provided a methane gas detector. 2) Methane gas and oxygen meters will be assigned to all fire trucks, and 3) Multi-meters will be provided to hazardous materials responders.

Northern Star will include a list with a breakdown of all proposed fixed and portable gas detectors and designated locations for the equipment for state and local review. Upon commencement of this work, Northern Star will provide a comprehensive resource list for a remote gas detection system with state and local signature approval with the draft Bradwood ERP to be submitted to FERC for final review.

- 6 - While Northern Star has provided a verbal commitment to develop an interoperable communications system, no plans have been submitted for state and local review and approval. Without a proposed plan for emergency response communications, the state and FERC are unable to determine whether the draft Bradwood ERP is adequate and can be effectively implemented to ensure interoperable communications across jurisdictions and between all responding agencies throughout the duration of an LNG emergency at the facility or along the 38 mile transit route.

FERC should require Northern Star to provide a draft detailed plan for an interoperable communications system for the region. This will ensure that FERC and the state have adequate information to evaluate the effectiveness of the communications plan in the draft Bradwood Landing ERP.

Recommended Condition Language - As a condition of the permit, Northern Star will provide a draft detailed plan for an interoperable communications system for the region. The

K-472

State Agencies

1

SA1-171
cont'd

proposed interoperable communications system plan will include information about the following systems, but is not limited to:

- Repeaters and Cell Towers - Specify the number of repeaters and cell towers needed to ensure uninterrupted cell and radio coverage along the 38 miles transit route to the Bradwood Landing facility, covering all three zones of concern. Include a map of the proposed repeater and cell tower locations showing the coverage area of each proposed repeater and cell tower location for state and local review and approval.
- Incident Command - Specify the number and locations of intrinsically safe handheld radios to be provided to fire, law enforcement, and other responders to a Bradwood Landing mishap. Include information on FCC licensing requirements and proposed frequencies, antenna system, base station console, and other pertinent information.
- Emergency Operations Centers - Multiple federal, state, and local emergency operations centers (EOCs) may be activated in response to a Bradwood Landing mishap. Emergency Operations Centers support the incident command. Specify the primary and redundant backup communications systems to be used to ensure uninterrupted communications between Bradwood Landing and the federal, state, and local EOCs. This includes, but is not limited to a dedicated phone system, video teleconference system, satellite phones, Internet, e-mail, and other technology as appropriate.

Upon commencement of this work, Northern Star will provide a comprehensive resource list for an interoperable communications system with state and local signature approval with the draft Bradwood ERP to be submitted to FERC for final review.

- 7 - The Clatsop County EOC is currently located at 355 Seventh Street in Astoria at the Clatsop County Sheriff's Office. The Clatsop County EOC is within zone 1, the highest impact zone. The potential exists that an LNG vessel mishap while passing through the Astoria waterfront could directly impact county response operations from the EOC. In addition, the current Clatsop County EOC is neither large enough nor equipped to support affected federal, state, and local emergency organizations reporting to Clatsop County to respond collectively to an LNG emergency at Bradwood. Northern Star has made no commitment to relocate or expand, modify and equip the existing Clatsop County EOC to support an LNG response to Bradwood Landing.

FERC should require Northern Star to work with the Clatsop County Sheriff's Office to identify an alternate EOC outside of the three zones of concern. This includes requiring Northern Star to equip the pre-designated alternate EOC with the same capabilities as the primary Clatsop County EOC. This will ensure a seamless transition to the alternate EOC if a LNG mishap prevents the use of the primary Clatsop County EOC. FERC should also require Northern Star to expand the existing primary Clatsop County EOC to ensure sufficient work space for affected federal, state, and local emergency responders as well as Bradwood Landing personnel reporting to Clatsop County to respond collectively to an LNG emergency at Bradwood Landing.

Recommended Condition Language - Alternate Clatsop County EOC - As a condition of the permit, Northern Star will work with the Clatsop County Sheriff's Office to identify a

K-473

State Agencies

1

SA1-171
cont'd

location for an alternate EOC outside of the three zones of concern. Northern Star will ensure the pre-designated alternate EOC has sufficient work space to accommodate affected federal, state, and local emergency responders reporting to Clatsop County to respond collectively to an LNG emergency at Bradwood Landing. This includes equipping the pre-designated alternate EOC with the same capabilities as the primary Clatsop County EOC to ensure a seamless transition to the alternate EOC if a LNG mishap prevents the use of the primary Clatsop County EOC. Pre-designating and equipping an alternate EOC ensures Clatsop County can maintain direction and control of county protective actions and decisions, providing a sustained response throughout the duration of a Bradwood event.

Primary Clatsop County EOC - Also as a condition of the permit, Northern Star will expand, modify, and equip the existing Clatsop County EOC located at 355 Seventh Street in Astoria at the Clatsop County Sheriff's Office to ensure sufficient work space to accommodate affected federal, state, and local emergency responders reporting to Clatsop County to respond collectively to an LNG emergency at Bradwood Landing.

Northern Star will work with the Clatsop County Sheriff's Office to determine the appropriate location, design and layout, and equipping of the primary and alternate Clatsop County EOCs for response to a Bradwood emergency. Upon commencement of this work, Northern Star will provide a comprehensive resource list for both facilities with state and local signature approval with the draft Bradwood ERP to be submitted to FERC for final review.

➤ 8 - Clatsop County does not have a pre-designated Joint Information Center (JIC) to coordinate and release event information to the news media and the public in the event of a Bradwood Landing emergency. The purpose of the JIC is to ensure Bradwood and all federal, state, and local agencies responding to the event provide a consistent message to news media and the public. The JIC will be the location for news conferences; coordinating news releases from responding federal, state, and local jurisdictions; addressing public and media inquiries; and other public information activities as appropriate. Failure to have a central clearing house to manage the receipt and dissemination of emergency information may result in misinformation, inconsistent information, and unconfirmed information getting out to the public and news media creating public panic, confusion, and mistrust.

FERC should require Northern Star to provide a Joint Information Center in Clatsop County outside the three zones of concern. Providing a JIC ensures terminal operators and all federal, state, and local response agencies impacted by a Bradwood Landing emergency can provide a consistent message to the news media and public.

Recommended Condition Language - As a condition of the permit, Northern Star will designate and equip a JIC in Clatsop County outside of the three zones of concern. The JIC will provide adequate work space and access to communications and information systems to support public information officers from Bradwood as well as federal, state, and local public information officers responding to the event. The JIC will also be designed to accommodate news conferences and phone teams addressing public concerns.

Northern Star will work with state and local emergency response organizations to determine the appropriate location, design and layout, and equipping the facility for response to a

K-474

State Agencies

1

SA1-171
cont'd

Bradwood emergency. Upon commencement of this work, Northern Star will provide a comprehensive resource list for the Clatsop County JIC with state and local signature approval with the draft Bradwood ERP to be submitted to FERC for final review.

- 9 - While Northern Star has provided a verbal commitment to provide LNG training to first responders, county officials, and state officials in the region, no plans have been submitted for state and local review and approval. Without a proposed training plan, the state and locals are unable to determine whether Northern Star's training program is adequate for preparing this region's emergency responders and decision-makers for an LNG emergency at Bradwood.

FERC should require Northern Star to provide a draft detailed training plan for state and local review and approval. This will help state and local emergency response organizations determine whether Northern Star's training program is adequate for preparing this region for an LNG emergency at Bradwood.

Recommended Condition Language - As a condition of the permit, Northern Star will provide a draft detailed training plan designed to meet the specific needs of this region's first responders and decision-makers. This includes, but is not limited to:

- Construction of an LNG Fire Training Center in Clatsop County - It is likely more cost effective to build an LNG training facility locally and bring in instructors from Texas A & M or other accredited training institutions than to send fire fighters to training in Texas or elsewhere in the country. Northern Star will work with state and local emergency responders to determine location and facility design and layout.
- Type of training to include, but is not limited to: 1) Incident Command System; 2) facility security; 3) oil & hazmat spill response; 4) LNG for fire fighters, emergency responders, and law enforcement; 5) marine fire fighting; 6) general LNG training; 7) advanced LNG fire fighting; 8) hospital training; 9) tabletops, drill, and exercises and other training as appropriate.
- Schedule of training detailing the type of training, required training hours, and number of anticipated trainees from Bradwood Landing, state, and local agencies.

Northern Star will provide the detailed draft training plan for state and local review and approval. Northern Star will also provide this plan with state and local signature approval with the draft Bradwood ERP to be submitted to FERC for final review.

- 10 - Clatsop County does not have adequate personnel nor funding to develop and maintain the Clatsop County Emergency Response Plan or Annex for the Bradwood Landing Import Terminal. Northern Star has made no commitment to provide funding for a Clatsop County LNG Planner.

FERC should require Northern Star to provide the Clatsop County Sheriff's Office with funding for a County LNG Planner/Fire Response Coordinator. This will ensure Clatsop County can develop and maintain the county's emergency plan for Bradwood Landing.

Recommended Condition Language - As a condition of the permit, Northern Star will provide funding to the Clatsop County Sheriff's Office to hire a full-time County LNG

K-475

State Agencies

1

SA1-171
cont'd

Planner & Fire Response Coordinator. The County LNG Planner & Fire Response Coordinator will work with first responders to prepare for LNG vessel arrivals and departures, work with first responders, the state, and Northern Star to conduct plan review, coordinate training, exercises, public outreach, and perform other LNG emergency preparedness activities as appropriate.

- 11 - While Northern Star has discussed with hospital officials and local emergency responders regarding the region's capabilities to transport burn victims to Columbia Memorial Hospital, triage burn multiple victims, and airlift burn patients to the Oregon Burn Center at Legacy Memorial Hospital in Portland, no written commitment has been made and submitted to state and local officials for review and approval. Without a draft detailed plan to address burn victims, the state and FERC are unable to determine whether the region's medical services sector are sufficiently equipped, have the necessary resources, and are prepared to receive and treat burn victims from a Bradwood Landing mishap.

FERC should require Northern Star to provide a draft detailed plan for state and local review and approval. This will help state and local emergency response organizations determine whether the region has sufficient capabilities at Columbia Memorial Hospital to triage, provide treatment, and transport burn victims to a nearby burn center if needed.

Recommended Condition Language - As a condition of the permit, Northern Star will work with Columbia Memorial Hospital to draft a detailed draft plan to address burn victims as a result of a Bradwood emergency for state and local review and approval. The plan will be consistent with the capabilities outlined in the Burn Mass Casualty Plan for the Oregon Burn Center at Legacy Emanuel Hospital. Specifically, Northern Star will provide Columbia Memorial Hospital with the personnel and resources necessary to implement the Burn Mass Casualty Plan's 72 Hour Burn Plan - Care of Burn Patients in a Non-Burn Hospital. This includes, but is not limited to:

- Identifying resources and procedures necessary for treating burn victims if immediate transfer to a regional burn center is not feasible. This includes ongoing resuscitation and care.
- Identify medical supplies, pharmaceuticals, and equipment needed to support a triage station capable of treating 5 victims with severe burns. This includes pre-packed medical resources.
- Communications capabilities including 800 mhz trunked radio and web-based client/server applications to coordinate communications between the event scene and the Columbia Memorial Hospital and serve as the patient information tracking mechanism in events involving multiple burn victims.
- Staffing requirements for care of burn patients in a non-burn hospital.

Upon commencement of this work, Northern Star will provide a comprehensive resource list for Columbia Memorial Hospital with state and local signature approval with the draft Bradwood ERP to be submitted to FERC for final review. (ODOE)

Draft Environmental Impact Statement Comments

State of Oregon
Page 45

Section 4.11.6, and FERC Staff Recommended Mitigation #63 (p. 5-30)

SA1-172 **Bradwood Emergency Response Plan Cost Sharing Plan** While the site meets the national security requirements as a viable location for an LNG import terminal, like all rural communities, it lacks the basic safety and security infrastructure required to protect public health and safety in the event of an LNG emergency.

FERC should require Northern Star to pay all project specific safety, security, and emergency preparedness and management costs imposed on the state and local agencies as a result of the proposed Bradwood Landing Import Terminal. This will ensure the state and local emergency response organizations have the ability to develop and maintain a level of readiness to ensure the protection of public health and safety in the event of a Bradwood emergency.

Recommended Condition Language - As a condition of the permit, Northern Star will cover all project specific safety, security, and emergency preparedness and management costs imposed on the state and local emergency response organizations as a result of the proposed Bradwood Landing Import Terminal. (ODOE)

Section 4.12 Cumulative Impacts

SA1-173 1. The section is exceedingly short and dismissive of impacts to water quality. The Columbia River is classified as "water quality limited" under Section 303(d) of the Clean Water Act, for the parameters of Temperature, DDE (DDT metabolite), Polychlorinated biphenyls (PCBs), and Arsenic. An EPA approved TMDL has been developed for Dioxin and Total Dissolved Gas parameters. Other parameters listed for potential concern include Cadmium, Copper, Iron, Lead, Mercury, Nickel, Silver, Tributyltin, Zinc, Aldrin, Alpha-BNC, Benzo(a)anthracene, Benzo(g, h, i)perylene, Bhc, Chlordane, Chrysene, Cyanide, DDD, DDT, Dieldrin; Endrin, Hexavalent Chromium, pH, Phenol, Polynuclear Aromatic Hydrocarbons (PAHs), Pyrene, and Radionuclides. This status requires particular attention so as not to allow exacerbation of listed parameters and further impairment of water quality. FERC and the applicant take the converse opinion in stating that because the water is already impaired, further cumulative impacts are not important. This is completely contrary to DEQ's mission (and TMDL development) and EPA's National Priority strategies, which limit actions that impair water quality and implement actions to reverse the impairments.

SA1-174 2. Cumulative effects to water quality are not adequately identified or analyzed. Although additional dredging is identified as a potentially significant cumulative effect, it is dismissed as not occurring. The timelines and duration of dredging that are identified are incorrect. For instance, channel deepening by the Corps will not be completed in the subject reach by 2007. Renewal of 5 year authorizations to continue the deepening are currently being considered by DEQ and the Washington Department of Ecology and total project duration or completion is not currently known. Multiple other dredging projects are permitted and considered for permit in the Columbia River estuary (from the Mouth to Bonneville Dam). These include Corps actions, sand/gravel mining operations, and port and marina maintenance dredging. Although some of these actions are considered minor, in total they are of significant amounts and the impacts are not well understood. The cumulative impacts of these actions need to be thoroughly evaluated and addressed in the EIS. (ODEQ)

SA1-172 See our response to comment SA1-21

SA1-173 We believe the analysis of cumulative impacts on water quality have been addressed adequately in section 4.12. Potential cumulative impacts on water quality are recognized, but not considered significant due to implementation of BMPs. In addition, NorthernStar has committed to providing an overall significant net benefit to the environment of the lower Columbia River ecosystem by implementation of its Compensatory Mitigation Plan and SEI. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.

SA1-174 Phase 3 of the COE's Columbia River Improvement Project is expected to be completed April 2008. Section 4.12 has been updated to reflect the updated COE schedule. The revised section also includes data about the proposed dredging for the Oregon LNG Project, which has not yet been authorized, and smaller maintenance dredging projects at the Port of Astoria, Port of Ilwaco, and at the mouth of the Skipanon River.

K-477

Section 5.0 Conclusions and Recommendations

Section 5.1.8 Socioeconomics (p. 5-11)

- SA1-175 This project will bring in a new supply of natural gas to the region and country. This fact is not addressed in the EIS. The project will have connections to PGE production facilities at Port Westward and to Georgia Pacific Wauna Mill. These connections could prove valuable to those facilities over time as energy cost escalate. This is not mentioned in the EIS but may have significant long term positive impacts for GP Wauna Mill and Ratepayers served by PGE. This of course depends on the details of the contracts that will be executed by the companies involved.
- SA1-176 There is no needs assessment associated with this project. Knowing the impact of this new natural gas source on the regional energy situation would be helpful in determining if the project will benefit industries in the Pacific Northwest and specifically Oregon. Such an analysis would assist us greatly in developing a policy towards LNG terminals locating in the state.
- SA1-177 This project will increase the capacity of ship piloting and tug capacity on the river to the benefit of all shipping operations. New bar and river pilots and tugboats will be added as a result of this project.
- Based on current tax rates, property tax revenue for Clatsop County and special districts would increase by 92.4 percent upon completion of the LNG terminal. This is a very positive affect locally.
- The project will generate increased rail traffic during construction and improve a portion of the rail through a required realignment at the project site. Currently, there are few customers using rail services west of Clatskanie.
- The project will generate 50 FTEs and will operate 24/7. Average salary at the terminal is estimated at \$60,000/yr. based on prevailing wages. The project will also require an additional 15 FTEs for security.
- Construction Jobs will average 331 per year over three years with an expected peak of 506. The company has committed to hiring at prevailing wages for all construction jobs.
- The Company has already aligned itself with the community college(s) to provide training for certain construction and permanent jobs at the site. They are currently subsidizing a welding class at Clatsop Community College directed at non traditional workforce participants.
- The method used to measure economic impacts using IMPLAN appears to be reasonable and the conclusions also seem realistic.
- The area has been able to absorb the impact of having large construction projects being built in the rural region. Projects such as PGE Port Westward and Cascade Grain along with Lines 6 and

State Agencies

1

SA1-175 Please read sections 1.1 and 2.1.4 of the EIS.

SA1-176 We discuss the need for additional sources of natural gas in section 1.0.

SA1-177 Currently there are no customers and no rail traffic on the PWRR west of Clatskanie.

State Agencies

1

Bradwood Landing Natural Gas Importation Terminal
Draft Environmental Impact Statement Comments

State of Oregon
Page 47

SA1-177
cont'd 7 TAD paper towel machines at Georgia Pacific will be completed before the construction starts at Bradwood Landing. The workforce will be available for construction. (ODECD)

Section 5.1.3 Water Resources (p. 5-4, para. 2)

SA1-178 "NMFS" should be changed to "NMFS".(ODFW)

Section 5.1.3, Water Resources (p. 5-3)

SA1-179 The water uses mentioned are not wholly authorized at this time. References to the status of applications with OWRD are not accurate. Limited Licenses for the temporary use of water have been issued for hydrostatic testing of the tanks and pipeline, and the dredging of the turning basin. These limited licenses do not allow use of water for other construction purposes. Applications for permits for permanent use of water have been submitted. These applications propose to use water for fire protection and industrial manufacturing. These permit applications have yet to be authorized. Limited license short term authorizations have been issued, while permanent permits have been applied for but not granted at this time. Construction water authorization has not been obtained at this time.

A limited License application for construction water would need to be submitted or wait to see if permits are granted and use industrial manufacturing water under a permit. In any event, authorization to use water will be required before construction may begin. This should take place before any FERC Certification. (OWRD)

Section 5.0, 5.1.12 Alternatives

SA1-180 Conclusions related to alternatives are not supported by adequate criteria, relevant data and information, a rigorous analysis and a clear explanation about why the evidence and information supports the conclusion. Alternatives are dismissed or not considered based on conclusions that do not adequately address basic need and effects issues. All of the proposed projects should be carefully analyzed against a common set of criteria to determine the best project. This analysis should consider the need for the terminal and pipeline infrastructure based on demonstrated long term planning and an analysis of which project can most economically and efficiently meet regional/national needs with the least long term environmental and social consequences. (DLCD/OCMP)

COMMENTS ON APPENDICES

Appendix B

SA1-181 Wetland Delineation for Pipeline Route. Sheet 1 of 11, Appendix B: Is "minor route variation included in delineation for the pipeline?"

Prior to any construction activity, an on-site wetland delineation, and delineation concurrence by DSL, of entire approved pipeline route is needed. (DSL)

Appendix G and DEIS p. 4-151, last paragraphs:

SA1-182 1. Compensatory Wetlands Mitigation on Svensen Island. Lower Svensen Island Wetland Delineation and use within the Compensatory Wetlands Mitigation plan. It is not clear if this area is proposed for enhancement credit.

SA1-178 Section 5.1.3 has been revised to correct this typographic error.

SA1-179 Issuance of the EIS does not imply that pending permit applications are approved. See also our responses to comments PM6-94, SA1-31, and LA12-3.

SA1-180 The intent of the alternatives analysis is not to compare the proposed LNG projects in the region and pick the "best" project. The FERC's evaluation criteria for the alternatives analysis is described in the introduction to section 3.1.

SA1-181 The final proposed route has been completely delineated for wetlands, including minor route variations.

SA1-182 See our response to comment FA3-3.

K-479

SA1-182 cont'd If Lower Svensen Island is proposed as part of Compensatory Wetlands Mitigation site, a wetland delineation may be needed. The wetland delineation for Middle Svensen Island is currently being reviewed by DSL. (DSL)

SA1-183 2. The Compensatory Wetlands Mitigation ratios listed are not in accordance with the Estuarine Mitigation rules. See OAR 141-085-0256.
Additional detail on the placement of fill material for berm construction around existing home site. If this fill material is within wetlands, the total acreage needs to be accounted for and included as part of Compensatory Wetlands Mitigation. (DEIS, p. 4-152)
It is not clear whether the culverts, tidegate and other removal/fill activity being placed within the Compensatory Wetlands Mitigation site are accounted for as fill and removal activity on the JPA.
At the end of monitoring period for the Compensatory Wetlands Mitigation site, a wetland delineation will be required. This will be at least a 10-year monitoring period with annual reports through year 5. Temporary impact monitoring reports for 5 years.
The permittee will be responsible for submitting yearly monitoring reports on the Compensatory Mitigation and Compensatory Wetlands Mitigation plans.
Conservation easement (or other protection instrument) for the Compensatory Mitigation / Compensatory Wetlands Mitigation sites will need to be in place prior to any construction activity within wetlands or waters. Also, long-term responsible party needs to be identified and a financial security instrument is needed prior to authorization (p.72) (DSL)

SA1-184 3. Compensatory Wetlands Mitigation Plan, p. 13, also page 18-20 and 67 of Compensatory Wetlands Mitigation plan:
Terminal and Pipeline Temporary Impacts. The DEIS states that there are 15 acres of temporary impact at terminal and 98 acres with the pipeline, and p. 13 of the Compensatory Wetlands Mitigation plan states that terminal has up to 1.5 acres and pipeline has up to 75.64 acre of temporary impact. Also, the permanent impacts are not consistent within the DEIS (12.9) and Compensatory Wetlands Mitigation plan (13.7).
Prior to construction activity, the wetland mitigation site will need to be constructed either prior to or concurrent with the wetland/waters impacts authorized within the Removal-Fill Permit. (DSL)

Appendix G, Revised Preliminary Design Draft Mitigation Plan Feb 07¹

SA1-185 General Comments
The terms "weeds" and "noxious weeds" are sometimes used throughout the mitigation plan. Suggest changing the wording to "non-native invasive vegetation" or, at least be consistent with terminology throughout the plan.

The vegetation descriptions include several non-native invasive plant species (e.g., reed canary grass, yellow flag iris, Himalayan blackberry). Some of these species are acknowledged as non-native invasive species, but others are not. ODFW suggests providing clarification identifying all non-native invasive species.

¹ These comments on Appendix G of the mitigation plan were provided by the Oregon Department of Fish and Wildlife.

Bradwood Landing Natural Gas Importation Terminal
Draft Environmental Impact Statement Comments

State of Oregon
Page 49

SA1-185
cont'd

Page 13, Section 2.1 - Oregon Wetland Mitigation

General Comment – The focus of the mitigation discussion is on aquatic resource values for fish. Discussion on wildlife issues is generally weak. Wetland/waterway habitats also provide habitat values for wildlife, but these are not well recognized. Later in Section 3.0 (Wildlife Mitigation) there is a statement about how mitigation for wildlife habitat losses caused by impacts to wetland/waterway habitats are addressed in Section 2.1, but ODFW's Fish and Wildlife Habitat Mitigation Policy does not appear to be specifically addressed in Section 2.1; the focus is on the Army Corps of Engineers/Oregon Department of State Lands mitigation requirements.

Page 14, Section 2.1.2

Mitigation goals and objectives should apply not only to "endangered species", and it is unclear how this term is defined in this context. Mitigation should apply to state and federal threatened and endangered species as well as to State Sensitive Species and other species of concern.

Page 24, first paragraph after bullets

This paragraph provides an example of how wildlife habitat values are not thoroughly addressed in this Section 2.1. In the sentence about presence of large wood debris around the perimeter of the log pond, there is no mention that the logs also provide wildlife value/benefits.

Page 26, Section G

This section provides an example where one species (Scott's broom) is recognized as a non-native invasive species and where others (yellow flag iris, purple loosestrife, and reed canarygrass) are not.

Page 28, Section I Existing Fish and Wildlife

This section needs to clarify that nutria is a non-native, invasive species. The impacted wetland also likely provides habitat for riparian songbirds and various small mammals (e.g., mink).

Page 40, Section 2.1.4 Site Selection

There is no mention of restoration of wildlife habitat or ODFW's Fish and Wildlife Habitat Mitigation Policy as being even minor driving factors in mitigation site selection.

Page 49, Section G, first paragraph, last sentence

What about provision of wildlife habitat? Wildlife habitat is a function in the Hydrogeomorphic Assessment (HGM) and Section 3.0 states that mitigation for wildlife-related wetland impacts is addressed in Section 2.0.

Page 53, third bullet

What will be done with the roots and stumps that would be removed in areas of the pipe trench? ODFW suggests using this material on-site or on mitigation sites for wildlife habitat enhancement (e.g., brush piles for wildlife cover).

Page 59, Herbivore Control

ODFW suggests trapping/removal of nutria to help control herbivory.

K-481

State Agencies

1

Bradwood Landing Natural Gas Importation Terminal
Draft Environmental Impact Statement Comments

State of Oregon
Page 50

SA1-185
cont'd

Page 59, Section 2.1.7

General Comment: Planned restoration activities will also benefit wildlife, but this is not thoroughly addressed. For example, this section could discuss how restored off-channel habitat, large wood, and restored tidal influence will benefit wildlife (e.g., waterfowl, shore birds, secretive marsh birds, etc.).

Pages 60, 105 Large wood features

- (1) The large woody debris (LWD) discussion lacks information/detail associated with the six proposed structures. Figures are referenced but not provided as part of the document. The document should at least contain a "typical" structure detail listing numbers of key large wood pieces, species of wood (conifer), size of key pieces, and general complex design. There needs to be at least some minimum key size and composition criteria for evaluation.
- (2) The mitigation plan calls for structures to be placed in tidal channels. Consideration should be given to placing some additional structure(s) on the flats that would be used by fish during high tide inundation periods. Productivity of the flats would likely be increased with addition of LWD in these areas also. Some of the large wood slated for removal from the terminal site may be suitable for these additional structures, if not being otherwise used.

Page 61, Wildlife Habitat Feature Creation

This section does not adequately describe how lost wildlife habitat functions will be restored.

Page 68, Section L Construction Specifications

This section should include considerations of adjacent wildlife habitat values e.g., amend this section to read "...construction of the mitigation site to ensure that the site is built without impacting adjacent fish *and* wildlife habitat..."

Page 68, Section 2.1.8

Goals 1 and 2 state that native seed would be applied to bare soil, yet Page 58 states that Re-Green would be used for short-term erosion control. Please clarify and make this consistent.

Page 83, Table 3.1

Agriculture/pasture/poplar farm habitat is lumped together and value categorized as ODFW Habitat Category 6 (lowest value designating facilities/structures that are non-restorable). ODFW disagrees with this habitat categorization and recommends that the agriculture/pasture lands be categorized as category 5 and the poplar farms be categorized as category 4.

Page 84, Table 3.1

This section includes a stream as a habitat category 6. Even if this is an intermittent stream or a ditch, it would not be categorized as a category 6. ODFW would be open to discussing this with the applicant as to the stream's appropriate habitat categorization.

Page 85, Second paragraph

This paragraph says: "Mitigation for wetland impacts is addressed in Section 2.0, and mitigation for fish habitat impacts is addressed in Section 4.0 of this mitigation plan." Comment: It is not clear where wetland mitigation, in terms of ODFW's Fish and Wildlife Habitat Mitigation Policy is addressed in Section 2.0. If it assumed that other mitigation methods (e.g., Oregon

K-482

SA1-185
cont'd

Department of State Lands (DSL) wetland mitigation requirement) fulfills ODFW's Fish and Wildlife Habitat Mitigation Policy then clarify this.

Page 87, second paragraph

This paragraph acknowledges that even-aged stands of poplar do indeed provide some wildlife value, including cover habitat for Columbian white-tailed deer (CWTD). This statement supports the change of this habitat to a habitat category 4 as mentioned in the comment above for Page 83.

Page 95, Section 3.9.2 Maintenance, Weed Control

ODFW recommends addressing the timing of when weed control would occur. This should be conducted outside of bird nesting periods.

Page 99 – Avoidance and Minimization Measures for CWTD

Maintenance vegetation control between mid-July to October may be okay for the deer, but not for nesting birds. See comment for page 95 above.

CERTIFICATE OF SERVICE AND MAILING

I hereby certify that I have this day served by electronic mail, and for those parties for which service is not specified at an electronic mail address, by U.S. mail, first class postage prepaid, the foregoing document on all parties listed on the official service list compiled on this proceeding.

Date: December 18, 2007.

Janet L. Prewitt, #85307
Assistant Attorney General

January 3, 2007

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 1st NE Rm 1A
Washington, DC 20426-0001

RE: Corrected Version of submittal Docket No. CP06-365-000

Dear Ms. Bose:

Thank you for the opportunity to provide input on the Draft Environmental Impact Statement (EIS) for the Bradwood Landing, LLC liquefied natural gas (LNG) import terminal and storage facility, and an associated natural gas send out pipeline.

Background

The facility would be located at the former mill town of Bradwood, Clatsop County, Oregon, located at River Mile (RM) 38 on the Columbia River.

Specific components of the facility include a one-berth marine facility capable of handling 125 LNG carrier ships per year; interconnecting facilities including piping, electrical, and control systems; two LNG storage tanks with a capacity of 160,000 cubic meters; vapor handling, re-gasification and send out systems; utilities and other support systems, and associated buildings and enclosures.

A 36-mile underground, high-pressure welded steel send out pipeline would extend from the storage facility. This pipeline is split evenly between Oregon and Washington – with approximately 18.9 miles of 36-inch-diameter pipeline in Clatsop and Columbia Counties, Oregon, and 17.4 miles of 30-inch-diameter pipeline in Cowlitz County, Washington. Northern Natural Gas would construct, manage and own the send out pipeline.

The LNG would arrive by large vessel, from overseas sources. The facility would receive and decompress the LNG, routing it through the pipeline to private recipients and to the Williams Pipeline, near Kelso, Washington. The facility would include a natural gas send out capacity of up to 1.3 billion cubic feet per day ("BCFD").

Page 2 of 11

Authority

This project involves different Divisions within the Department of Natural Resources (DNR). This letter reflects comments from the Aquatic Resources Division.

As the FERC may already be aware, DNR manages over 2.6 million acres of state-owned aquatic lands and attached resources, including bedlands, shorelands, tidelands, and harbor areas.

Resources located upon aquatic lands that DNR manages include aquatic plants, aquatic animals; and valuable materials and minerals.

DNR management authority derives from the state's constitution, law, and regulations.¹ As proprietary manager of state-owned aquatic lands, DNR has been directed to manage these lands "...for the benefit of the public..." in a manner that provides "...a balance of public benefits² for all citizens of the state..." that includes: "(1) Encouraging direct public use and access; (2) Fostering water-dependent uses³; (3) Ensuring environmental protection; and (4) Utilizing renewable resources" (Revised Code of Washington, 79.105.030).

As part of the obligation under RCW 79.105.030 to manage state-owned aquatic lands for the benefit of the public, aquatic resources are viewed as part of a larger complex system. Evaluations typically include assessments of potentially affected aquatic areas, adjacent uplands and the human impacts within those environments. Therefore, individual projects and requests are typically reviewed in this ecosystem context, rather than as isolated cases. The Aquatic Resources Division anticipates taking this approach with hydrokinetic project evaluations on state-owned aquatic land.

State-Managed Aquatic Lands Located Within the Project Area

Of the 17.4 miles of pipeline in Washington, a number of waterbodies will be crossed, and two are considered navigable and under state management by DNR: the Columbia River and the Cowlitz River. NorthernStar Energy, LLC would use horizontal directional drilling methods to cross both the Columbia River and the Cowlitz River.

SA2-1

DNR manages the bedlands and tidelands of the Columbia River where the proposed pipeline is to cross. In order to directional drill through the bedlands and lay pipeline in the Columbia River, the company will need to survey the location and sign a Use Authorization with DNR.

The section of the Cowlitz River where the pipeline would cross is also under DNR management. The crossing is just south of an actively meandering portion of the riverbed. DNR has requested that the company move the original pipeline crossing south, away from this portion of the river.

¹ Articles of the Constitution (XV, XVII, XXVII), Revised Code of Washington (RCW) 79.02, 79.10, 79.14 and 79.105 to 79.145, Washington Administrative Code (WAC) 332-30.

² WAC 332-30-106 defines public benefit as "...that all of the citizens of the state may derive a direct benefit from departmental actions..."

³ Water dependent uses are those uses that "...cannot logically exist in any location but on the water" (RCW 79.90.465).

Page 3 of 11

SA2-1 | The company has complied, but has not provided a survey or exact location of the corrected crossing. Thus far, DNR has only received the images provided in the environmental documents.
cont'd

General Comments⁴

SA2-2 | DNR Encourages Submitting Applications for Use Authorizations Early for Large Complex Projects

DNR met with the applicant in June of 2007 to discuss forest practice and aquatic land use requirements. The applicant stated they would be submitting use authorization packages after obtaining all permits. The applicant was highly encouraged to submit a package early, even if incomplete, due to the nature and complexity of this project.

Applicant Concerned by Agency Delays: The applicant has stated concern in the Draft EIS about being "unreasonably" delayed by state or local agencies. DNR would be able to issue a use authorization in a timely manner, if an application were received early – even if the application package were incomplete. DNR has not received such a package.

Aquatic Lands Excluded from Draft EIS

SA2-3 | At the June 2007 meeting, the applicant was informed that Columbia and Cowlitz River crossings would require the applicant to obtain a bedlands easement. The current Draft EIS excludes specific mention of tidelands and bedlands under management of DNR for which an easement from DNR will be needed. An applicant is not relieved of its obligation to obtain authorization from DNR to use the state-owned bedlands because the applicant is drilling beneath the surface of the bedlands. The state's fee ownership of river beds includes all subsurface rights to such lands. The failure to include bedlands in the calculation of state-owned land necessary for easements is in error and further substantiates a need for a formal survey meeting DNR's requirements.

Clarify any use of State-Owned Aquatic Lands for Dredge Material Deposition and Beneficial Use of Materials

SA2-4 | DNR also manages state-owned aquatic lands on Puget Island, where the applicant states they will be disposing of dredge spoils for purposes of beneficial use. The applicant states the county (Wahkiakum County) will be responsible for obtaining all permits associated with this part of the project. However, DNR has not been contacted about this action or approved a Site Use Authorization for the deposition of dredge material from Oregon for beneficial use on state-owned aquatic lands at Puget Island.

Disposal of Dredge Spoils

If the Wahkiakum County Sand Pit Site is located on or adjacent to state-owned aquatic land, DNR needs to be consulted. The applicant or Wahkiakum County will need to obtain or amend a Use Authorization to use state-owned aquatic lands to dispose of dredge spoils. DNR needs to evaluate the amount and quality of any material placed from the Oregon side of the Columbia River onto the Wahkiakum County Sand Pit site. DNR

⁴ See attached comment matrix

State Agencies

2

SA2-2 The FERC staff, not the applicant, produced the EIS. We list in table 1.3-1 permits NorthernStar should obtain prior to construction, and it is up to NorthernStar to file applications with appropriate regulatory agencies to obtain those permits.

SA2-3 We have revised section 4.7.3.6 to discuss that Washington state-owned lands include riverbeds crossed by the pipeline. It is the responsibility of NorthernStar to apply for and obtain required permits or authorizations from regulatory agencies, such as use authorization application from the WDNR for waterbody crossings in Washington, prior to construction.

SA2-4 NorthernStar is pursuing the appropriate state permits.

K-488

Kimberly D. Bose
1/3/2008
Page 4 of 11

SA2-4
cont'd

will need assurances that all material placed on state-owned aquatic lands is under the ownership of DNR.

Beneficial Use of Sediments

DNR considers the use of material for beneficial, public use a separate action from the disposal of dredge material. According to the locations described in the Draft EIS, placement of dredge material for beneficial use may involve state-owned aquatic lands along Puget Sound Island or Coffee Pot Island beaches. This would require coordination with and a Use Authorization from DNR. Once placed on state-owned aquatic lands, DNR considers the material under state ownership.

DNR is currently developing internal policy and guidance pertaining to beneficial use of dredged materials on state-owned aquatic lands (both marine and freshwater). Until completed, the applicability of this tactic will be evaluated on a case by case basis, both by the Sediment Quality Unit of DNR and the DNR District staff employees.

SA2-5

No Plans for Abandonment and Decommissioning

The applicant has made no plans regarding the abandonment or decommissioning of the pipeline. DNR's easement form has standard language for the removal of structures on state-owned aquatic lands. These provisions require that improvements owned by the easement holder be removed by the Termination Date unless DNR notifies the easement holder the improvements may remain. It is DNR's policy that if the improvements remain on state-owned aquatic lands after the expiration of an easement, DNR may choose to remove the improvements, at the easement holder's expense.

SA2-6

Assumptions Regarding Payment for Easements

The Draft EIS stated one-time payments would be negotiated with public agencies for easements crossing public lands. Such easements would grant temporary construction and permanent rights of way for operation. DNR has not agreed to, or excluded, a one-time payment in the absence of an application for a Use Authorization. DNR's statutory easement authority requires DNR to charge full market value for any easement it grants for the pipeline. DNR may require payment on either a one-time or annual basis.

SA2-7

Impacts to Shorelines of the Columbia River caused by Vessel Wake

The document makes conflicting statements about the impact of vessel wake and shorelines. The Draft EIS justifies the placement of dredged material at Puget Island, as a beneficial use to offset the impacts of vessel wakes (pages 3-53).

"The shoreline located between the Wahkiakum County Sand Pit and the federal navigation channel is subject to a combination of ship wakes, wind, and tidal effects that are currently eroding sand from the river beach at a rapid rate. Dredged material was most recently applied to the beach area in 2001 to mitigate the erosion."

State Agencies

2

- SA2-5 Potential future plans and abandonment are discussed in section 2.9. Any future abandonment would be subject to the appropriate environmental and non-environmental review based on federal, state, and local regulations in effect at that time.
- SA2-6 Section 4.7.3.1 has been revised to state that one-time easement payments are typically negotiated. We acknowledge the DNR's comment that it may require either a one-time payment or payment on an annual basis.
- SA2-7 See our response to comment FA4-14.

K-489

Kimberly D. Bose
1/3/2008
Page 5 of 11

SA2-7
cont'd

The section addressing potential impacts of vessel wake to Columbia River shorelines is simply not clear. No cumulative impact analysis was completed. The Draft EIS concludes that "...staff continue to study this issue and additional analysis regarding shoreline erosion will be included...in the final EIS (pages 4-5)." If the analysis is incomplete, it is difficult to comment on the potential impact.

If there is an increased potential for erosion on state-owned aquatic lands in the Columbia River, DNR needs to be informed of this possibility. Thank you for this opportunity to comment. Should you have any additional questions or comments please do not hesitate to contact me.

Sincerely,

Rich Doenges
Division Manager
Aquatic Resources

		locations ... in the first year after placement of dredged material and concluded that 4 to 24 percent of the erosion was attributable to ship wakes (COE, 1999)?	review on what the potential impacts to Washington's shoreline could be from the 25% increase in deep draft vessel traffic. How will this potential impact be estimated if not under the CEMA?	1) Baseline (now) 2) 25% increase 3) Cumulative impacts 4) Any additional known or predicted future erosion in deep draft traffic in the Columbia	
WENR AQ	4.1.2.3 Geologic Hazards, p. 186	"Northemiller commissioned a study of wave generation by LNG ships, which compared wave generation by an Adriatic tanker, representative of a large ship that works the Columbia River, with an LNG tanker. The study indicated that waves generated by LNG ships would be only slightly larger than those generated by an Adriatic tanker operating at the same speed."	Why not provide complete results of this study? The results will be posted in the Clifton Channel, a narrow area between small islands, which when Bradwood began depositing dredge spoils at the western terminus of Puget Island, may become even more congested. Wouldn't it be in the best interest to fully disclose how the wakes would impact these islands?	Provide a complete description of the study results to support conclusion.	Prior to FEIS
WENR AQ	4.1.2.3 Geologic Hazards, p. 186	"In summary, the degree to which current ship traffic affects shorelines along the waterway is difficult to quantify due to the various other factors which contribute to shoreline erosion and accretion processes. Therefore, it is difficult to determine what additional impacts on shorelines the proposed LNG marine traffic would contribute."	This statement appears to use cumulative impact analysis as a way to avoid addressing potential impacts of wakes on a shoreline. This section is not on cumulative impacts. Pearson (2006) provides information on deep draft vessel impacts on the shoreline, including type of wake, length wake lasts, magnitude of wake, height of wake, backing of ship speed reduction, draw-down, and the surge height. Pearson (2006) found that "Small changes in speed can be expected to generate large changes in surge elevation."	Address potential impacts of LNG vessels on shoreline erosion. Cite Pearson (2006) or similar reference. For example - The authors found that "Redwood characteristics, ground water stage, beach vegetation cover and type, and local beach morphology features may also be important in governing local shoreline and surge."	Prior to FEIS
WENR AQ	4.1.2.5 Geologic Hazards, p. 186	"The PERC staff continues to study this issue and additional analysis regarding shoreline erosion will be included in the revised EA and the final EIS."	If information on potential impacts will not be available until the final EIS, how can agencies comment or consider this document in their decision-making?	Improve analysis and provide it during the public (and agency) comment period, not after.	Prior to FEIS and final Biological Opinion/ITP
WENR AQ	4-1.3 Volcanism and Lahars	"... direct impacts are not expected from the eruption of any of these volcanoes, should one occur. Because it would be underground, the pipeline would not be affected by a lahar."	Was not able to substantiate reference material citing White and Pearson, 1995, used to justify conclusion that within the lifetime of this project, potential for an eruption, lahar or other volcano, even that may affect Bradwood or its pipeline, or records, would occur.	Substantiate explanation.	Prior to FEIS

WDNR AQ	4.2.2.3 Sediments	In accordance with the Dredge Material Evaluation Framework (DMEF) developed by the Regional Management Team (RMT), an inter-agency task force that studies dredging on the Columbia River, Northemstar conducted a Tier I evaluation of the project area. Because the Tier I evaluation indicated the presence of generally low levels of some chemicals of concern, a DMEF Tier II analysis (physical and chemical analysis) was selected as the most appropriate level of evaluation for the proposed dredged materials.	OSR According to the Sediment Evaluation Framework For the Pacific Northwest, which is the framework for assessing and characterizing freshwater and marine sediments in WA, OR, and ID, the Washington Department of Natural Resources is listed as a participant on the Regional Dredging Team, along with the USACE, EPA, Washington Department of Ecology, Washington Department of Natural Resources, Oregon Department of Environmental Quality (ODEQ), Idaho Department of Environmental Quality (IDEQ), and the U.S. Forest Service Water Resources Division (WFRD). The DMEF constitutes and focuses the existing DMEF. The DMEF is a framework for assessing and characterizing freshwater and marine sediments in WA, OR and ID. The DMEF compiles information from many documents in use in the PNW, updating many. The DMEF is consistent with state and federal regulations and provides a toolbox of methods available for sediment characterization, etc... In this DMEF, is the "Regional Management Team" the same as the Regional Dredge Team? If so, DNR is a part of the team. DNR is also a member of the Lower Columbia Solutions Group - DNR is now taking on a leadership role in this group, both from a technical and policy perspective - how sediments are characterized, possible beneficial use locations, STUA's, etc.	Ensure that DNR is contacted and provided with the results of all sediment analyses, since the dredge spoils may be placed on BUAL. Suggest checking terminology (Regional Interagency Team vs Regional Dredging Team, Sediment Evaluation Framework versus Dredge Material Evaluation Framework). Suggest correctly characterizing DNR's role in evaluation of sediment.	Prior to deposition of spoils at Sand Pit
WDNR AQ	4.7.3.1 Land Use	"Northemstar would need to acquire new easements or property to construct and operate the proposed facilities. The easement would convey both temporary (for construction) and permanent rights-of-way to Northemstar and would give Northemstar the right to construct, operate, and maintain the pipeline facilities. Northemstar would negotiate a one-time payment for each easement."	While a one-time payment has been excluded, DNR has been involved in negotiations for payment, and this option has not been agreed upon.	Clearly statement about one-time payment until negotiations complete.	Prior to PER

SA2-21

State Agencies

Re: Draft Environmental Impact Statement (DEIS) for the Bradwood Landing
LNG Project (Docket Nos. CP06-365-000, et al.)

Dear Secretary Bose:

The Washington State Citizen Committee on Pipeline Safety would like to submit the following comments on the Draft Environmental Impact Statement (DEIS) for the pipeline associated with the Bradwood Landing LNG Facility.

The Washington State Citizen Committee on Pipeline Safety was established by the Washington State Legislature in 2000 to "advise the state agencies and other appropriate federal and local government agencies and officials on matters relating to hazardous liquid and gas pipeline safety, routing, construction, operation, and maintenance." The committee is Governor appointed and meets regularly to discuss, identify, review and highlight pipeline safety issues on a local and national level. The committee consists of nine voting members representing the public, including local government, and elected officials. Four non-voting members represent owners and operators of hazardous liquid and gas pipelines.

Over the past couple months committee members have reviewed the DEIS for the Bradwood facility, and voted unanimously at our November 29th committee meeting to submit the following comments.

K-497

State Agencies

3

Construction Related Issues

- K-498
- SA3-1 • We are concerned about possible jurisdiction, coordination, and expertise issues between the Federal Energy Regulatory Commission (FERC), the Pipeline and Hazardous Materials Safety Administration (PHMSA), and the Washington Utilities and Transportation Commission (WUTC). For these reasons we ask that FERC allow the WUTC full access to the pipeline and related construction documents for the purpose of inspection during the construction phase. We also ask that PHMSA grant the WUTC permission to carry out these construction inspections as part of their delegated interstate authority. We ask that this be incorporated in the final EIS.
 - SA3-2 • We are concerned that the DEIS does not clearly call for the non-destructive (e.g., radiographic or ultrasonic methods) inspection of every girth weld on the pipeline. Given the difficult terrain, the pipeline is highly susceptible to abnormal loading, we ask that the final EIS makes clear that every girth weld will be 100% inspected by non destructive testing, and that these girth weld nondestructive test records be retained and made available to governmental inspectors for the life of the pipeline.
 - SA3-3 • We concur with FERC that the current amount of information available regarding seismic and landslide hazards is insufficient, and ask that pipeline construction not begin until FERC, PHMSA, and the WUTC are satisfied with the analysis and any proposed routing changes and mitigation that come from it.
 - SA3-4 • We are concerned with the level of confidence that FERC seems to put in the use of strain gauges for providing warning against landslides. While strain gauges can be valuable for predicting problems on slow moving slide areas, they provide little or no protection for landslides in geologic formations that make them prone to catastrophic failures (e.g. slopes susceptible to high hydrology gradients such as that in Western Washington). This again points to the need for better analysis of landslide areas and rerouting if necessary.
 - SA3-5 • The use of HDD to get under streams and landslide areas is extensive in the construction plans. While we do support the use of HDD in such situations, we also know that even with the best geologic analysis HDD can fail. For this reason we ask that the final EIS clearly state what methods will be used in each situation if the HDD methods turns out not to work in an area. For streams this would include which method would be used in place of HDD, and for slide areas this would include whether the pipeline will be rerouted to avoid the slide or what other mitigation may be employed.

- SA3-1 State agencies with statutory authority to regulate pipelines may conduct inspections independent of the FERC or accompany FERC inspection staff.
- SA3-2 As stated previously the pipeline will conform to DOT regulations including Title 49, Part 192 Subpart E §192.241 and §192.243.
- SA3-3 The FERC would not approve construction until it has determined that all applicable safety standards would be met.
- SA3-4 We have recommended that NorthernStar conduct additional field mapping and subsurface investigations of landslide area as needed to develop a Final Pipeline Design Geotechnical Report. If this project is approved, our recommendation would be made a condition of the authorization. Also see the response to comment LA7-25.
- SA3-5 If an HDD borehole is unsuccessful, the method would be attempted at different locations within the existing construction right-of-way. If it is determined that HDD methods cannot be used at a given location, the FERC's Procedures require a contingency plan for an alternative crossing method at each HDD waterbody crossing location in the event that the HDD method is unsuccessful (see section 4.3.2.4). Furthermore, NorthernStar has indicated in its HDD Contingency Plan that it would have approved alternative crossing methods for implementation in the event of HDD borehole failure. Directions for accessing NorthernStar's HDD Contingency Plan (Frac-out Plan) via the eLibrary can be found in the response to comment FA3-13.

- SA3-6 • Sometimes, during the HDD process under streams frac-outs occur that can dump harmful quantities of fine silt materials into fish bearing streams. In the DEIS it states that response to such frac-outs would occur within 30 minutes. We believe that the detection and response to frac-outs should occur much quicker than 30 minutes and we would like to see this reflected in the final EIS.

Right-of-way Issues

- SA3-7 • It is our understanding that FERC has a policy to encourage the use of existing right-of-ways when possible. It is unclear from the DEIS exactly why this proposed pipeline from the Bradwood facility is not following the existing KB Pipeline for more of its route through Washington. Please either explain this more explicitly in the final EIS, or require this pipeline to follow that existing KB Pipeline right-of-way since they are both going to the same place.

- SA3-8 • The DEIS states that this proposed pipeline would be serving the Beaver power plants. This would appear to make the KB pipeline obsolete, and its existing right-of-way more available for this proposed pipeline. Please discuss the future need for the KB pipeline, and why the replacement of that pipeline with a larger pipeline was not considered as an alternative to the Washington part of this proposal.

- SA3-9 • The DEIS states that after construction trees will be planted on the right-of-way in forest areas and wetlands within 5-15 feet of the pipeline to reduce the visual impact and protect habitat. The DEIS also states that property owners will not be allowed to plant trees anywhere on the permanent fifty foot right-of-way. We support the planting of trees as suggested for forest and wetland areas, and ask that similar planting also be approved for property owners in consultation with the pipeline operator.

- SA3-10 • The DEIS states that after construction trees will be planted on the right-of-way in forest areas and wetlands within 5-15 feet of the pipeline, and that such plantings will create a nearly full canopy cover. While we support this planting of trees, and ask that it remains a part of this plan, it does bring up the question of how the company plans to meet its inspection obligations under CFR 49 Part 192.705. Please describe in the final EIS what inspection methods the company plans to use if a nearly complete canopy precludes aerial inspections.

Proximity to Residences

- SA3-11 • The DEIS states that there are six residences within Washington State, which are within 100 feet of the pipeline. We appreciate the care taken to try to avoid residential areas as much as possible, but according to the C-FER

State Agencies

3

- SA3-6 The EIS has been revised to indicate that the detection and response to frac-outs would occur as soon as possible.

- SA3-7 The proposed pipeline route is collocated with the KB pipeline right-of-way between MPs 22.0 and 30.0 where practical and where conditions are conducive to construction and maintenance of the pipeline. Realignment away from the KB pipeline route have been necessary where the KB pipeline was constructed in areas containing geological hazards such as poor slope stability, or to reduce stream crossing impacts.

- SA3-8 The proposed Bradwood Landing pipeline would provide an alternative source of natural gas to the PGE Beaver Power Plant. There is no indication that the KB pipeline would discontinue its supply of natural gas to the power plant. The potential end users of the KB pipeline and any expansion of the KB pipeline are beyond the scope of this EIS.

- SA3-9 As part of the easement agreement, property owners could negotiate revegetation methods, including tree planting. See also our response to comment CO9-15.

- SA3-10 Among other pipeline DOT safety requirements, the land surface over the pipeline must be inspected at least 26 times each year. FERC would require that NorthernStar adopt the Wetland and Waterbody Construction and Mitigation Procedures, wherein a 10-foot-wide corridor would be kept clear of trees to facilitate the required inspections in wetlands. Furthermore, the trees planted between 5 and 15 feet from the pipeline would be limited to a maximum height of 15 feet. In non-wetland areas, this herbaceous corridor would be extended to a 30-foot-wide maintained corridor within the permanent right-of-way. Maintenance clearing within these corridor widths would prevent the formation of a full-canopy, thereby allowing the inspections to be completed.

- SA3-11 Based on new information provided by NorthernStar, we have identified only three residences within 50 feet of pipeline construction work areas. Pipeline safety is addressed in section 4.11.9.

State Agencies

3

SA3-11
cont'd

Technologies report (A Model For Sizing High Consequence Areas Associated With Natural Gas Pipelines - 2000) that is used to help determine high consequence areas, these residents, and probably others, are well within the hazard area. We ask that the final EIS include a list of all residences within the hazard area as defined by the C-FER Report, and that either the route be adjusted to remove these residences from the hazard area, or that an explanation of why that is not possible be given.

Thank you for considering our comments on this proposed facility. If you have questions feel free to contact me.

Sincerely,

Carl Weimer, Chairman

RE: Bradwood Landing LNG Project, Docket # CP06-365-00, et al.
Comments on Draft Environmental Impact Statement

Dear Ms. Bose:

Thank you for the opportunity to comment on the Draft Environmental Impact Statement (draft EIS) for the Bradwood Landing LNG Project. This project proposes to construct a new pipeline to convey natural gas from a new terminal at Bradwood, Oregon that would cross into Cowlitz County, Washington and terminate at a junction with the Williams natural gas pipeline near Kelso, Washington. The Washington Department of Ecology (Ecology) has experience with the environmental review for natural gas pipelines. The following comments highlight regulations and guidelines that apply to the environmental review of this project during the National Environmental Policy Act (NEPA) and the State Environmental Policy Act (SEPA) processes. They are intended to assist the Federal Energy Regulatory Commission (FERC) in the revision of the draft EIS and completion of the Record of Decision (ROD).

Please note that the State of Washington strongly opposed the FERC's preemption of state jurisdiction over regulation of LNG facilities in 2005 because it undermined our ability to protect our citizens and resources. Regardless of the possibility of federal preemption, we expect Northern Star to reach full compliance with state regulatory requirements by securing and complying with state permits and approvals. Ecology also asserts its authority and expects full compliance with water quality certification requirements under the Clean Water Act.

These comments are separated into three sections. The first includes an excerpt from Ecology's comments on the Notice of Intent (NOI) for this draft EIS. The second section addresses some general comments on the draft EIS and the third is an attachment that includes specific comments and recommendations on the technical details of the proposal and draft environmental analysis.

State Agencies

December 21, 2007
Page 2

Ecology's NOI Comments Not Addressed in draft EIS

The following comments were included in Ecology's comment letter of October 17, 2005 regarding the EIS Notice of Intent issued for this project. We include them here again because they were not adequately addressed in the draft EIS.

- SA4-1 1. **Safety:** The EIS discussion on "reliability and safety" will be critical for revealing the safety impacts, planning, preparedness and contingencies that would affect Washington communities along the Columbia River. As noted in the Notice of Intent, the EIS shall analyze safety issues related to LNG ship traffic and terminal. The EIS should adequately define the boundaries, intensity, duration and extent of potential safety impacts to workers, communities, and property owners. When providing quantitative estimates of impacts, the EIS should use recognized and accepted risk assessment and modeling. The EIS should identify the spectrum of potential accident scenarios that could occur over the life of the proposed action, including failure scenarios from earthquakes, floods, other natural disasters, and human error.
- SA4-2 2. **FERC Guidance vs. Washington State Guidance/Standards:** Typically, the FERC's EIS would require the applicant to implement the FERC's Wetland and Waterbody Construction and Mitigation Procedures, Upland Erosion Control, Revegetation and Maintenance Plan, and Stormwater Pollution Prevention Plan. However, Washington requests that applicants follow state or local guidance when it is more stringent, which includes the Wetlands in Washington Volume 1 and 2 (which can be found on the Ecology website at http://www.ecy.wa.gov/programs/sea/bas_wetlands/index.html) and the Stormwater Management Manual for Western Washington (which can be found on the Ecology website at <http://www.ecy.wa.gov/programs/wq/stormwater/manual.html>). The environmental review would be strengthened if the EIS reflects that the project will follow the most stringent requirements and/or guidance. Further, Ecology recommends that FERC require that contractor training cover both the FERC guidance as well as any other local, state or federal agency guidance that is more stringent and conditioned in the state or local permits.
- SA4-3 3. **Washington State Water Quality Standards:** The EIS should adequately disclose the extent to which the project will be able to meet state water quality standards. This will include compliance with State of Washington Surface Water Quality Standards (Chapter 173-201A WAC), Sediment Management Standards (Chapter 173-204 WAC), and Groundwater Quality Standards (Chapter 173-200 WAC). If the project is likely to exceed water quality standards during construction in water bodies and wetlands, then the EIS should: (1) identify how much, when and how long the project would be out of compliance; (2) how the impact will be minimized; (3) when the project would be back into compliance; and (4) what mitigation is offered for any temporal losses to fish or wetlands. For upland construction, the EIS should address the development of separate Stormwater Pollution Prevention Plans (SWPPPs) for land disturbing activities in Oregon and Washington, as will be required by the state National Pollution Discharge
- SA4-4

State Agencies

4

- SA4-1 Section 4.11.5.3 of the final EIS discusses the hazards associated with a spill from an LNG carrier which includes defining the zones of concern associated with a spill from an LNG carrier, the distance to these zones, the thermal flux levels of these zones, and what communities or areas are included in each zone. Section 4.11.4 discusses the hazards associated with a spill at the LNG terminal which includes modeling for different spill scenarios, thermal flux levels and distances that these thermal flux levels travel. The final EIS presents a consequence analysis of these hazards. The facility must comply with the siting requirements in 49 CFR 193.
- SA4-2 It is anticipated that state-specified measures for project-related activities will be addressed as part of the various permitting processes (see table 1.3-1).
- SA4-3 Table 1.3-1 lists the major federal, state, and local codes, ordinances, statutes, rules, regulations, and permits that would apply to the project. NorthernStar would adhere to conditions of these permits. We have revised section 4.3.2.1 of the EIS to mention Washington state water quality standards. It would be the obligation of NorthernStar to apply for and obtain necessary water quality permits from appropriate Washington state agencies prior to construction. See response to comment SA1-79.
- SA4-4 As described in section 2.4.1, NorthernStar has developed terminal and pipeline ESC Plans for construction activities within Oregon and a SWPPP for Washington. These plans incorporate elements of the FERC's Plan and Procedures, state and county requirements and provisions, stormwater pollution prevention plans, and spill prevention and response procedures. These plans were filed with the FERC as part of the JPA on November 22, 2006. Revisions to the JPA were filed on April 5, 2007. This document is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e. CP06-365), and putting in the proper date range. Potential impacts on critical areas, endangered species and water quality are included in sections 4.7, 4.6, and 4.3, respectively.

K-502

December 21, 2007

Page 3

SA4-4
cont'd | Elimination System (NPDES) permits for construction activities. The EIS should include information on critical areas, endangered species, and how potential impacts to water, such as turbidity, will be evaluated.

SA4-5 | Pursuant to the requirements of the Washington State Water Quality Standards (Chapter 173-201A WAC) the EIS should identify beneficial uses of surface and ground water, impacts on those beneficial uses, and measures to comply with the standards or reduce exceedances of the standards.

SA4-6 | 4. **BMPs:** The project design and the EIS should recognize that BMPs for in-water work may be different from BMPs for upland work. Making this distinction in the EIS will reduce confusion or concerns that inappropriate BMPs will be used. Similarly, it would be useful for reviewers of the EIS to understand that two different water quality monitoring strategies will be needed for the project: one that addresses in-water construction and one that addresses upland construction, as required by the respective water quality permits.

SA4-7 | The EIS should include information on clearing limits. It should discuss the construction access and wheel wash -- how the project will minimize dirt, mud, and debris from being tracked onto private and public roads. If wash stations are proposed the EIS should describe how they will be constructed and maintained to prevent runoff from impacting waterbodies and wetlands. The EIS should also discuss how flow rates will be controlled, and if retention/detention facilities will be constructed. The EIS should discuss BMPs to control sediment and stormwater runoff; preserve vegetation, stabilize soils, and protect slopes; protect drain inlets; stabilize channels and outlets; control all pollutants, including water materials and debris; control de-watering; minimize turbidity from equipment working in waterbodies; or trap sediment in a manner to avoid interference with the movement of salmonids. For example, a checklist of sources and perimeter control BMPs, and BMPs that will apply to equipment that will enter waterbodies could be included in the EIS.

The EIS should describe construction sequencing, work and specific erosion and sediment control plans for work planned during the rainy season, and timing for installation of erosion control BMPs. For example, appropriate BMPs should be set up prior to grading or other activities that disturb soils and have the potential to cause erosion.

The EIS should describe spill prevention protocol and the placement and contents of spill kits, and how construction crews will avoid littering the construction right of way. For example, clearly marked garbage cans could be carried on all construction vehicles for cigarette butts, food wrappers, and drink containers.

SA4-8 | 5. **Cumulative Impacts:** The discussion of cumulative impacts should be element-specific, not discussed separately. The discussion should define what the project is

State Agencies

4

SA4-5 | Potential impacts and mitigation for beneficial uses of ground and surface water have been addressed in section 4.3.1, 4.3.2, and in NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan. Directions for accessing NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan via the eLibrary can be found in the response to comment FA2-17.

SA4-6 | Section 2.4.2.1 discusses general pipeline construction techniques, and section 2.4.2.2, discusses special construction techniques, including in-water work. NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan provides details on different BMPs in wetlands and waterbodies. This document is available for viewing by the public on the FERC's Internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e. CP06-365), and putting in the proper date range.

SA4-7 | Vehicle wheel washing would occur on a paved wash pad near the point where the access road crosses the realigned railroad. No soaps or surfactants would be used for vehicle wheel washing and the temperature of water used for washing would be equal to that of water being stored in the on-site storage tank (no hot water would be used). Excess water from the pad would be discharged to a two-cell sedimentation/infiltration pond. Construction sequencing is discussed in section 2.4. NorthernStar would implement the FERC Staff's Procedures, as well as its Terminal and Pipeline ESC plans in Oregon as well as its SWPPP in Washington. Furthermore, we are recommending that NorthernStar revise its pipeline ESC Plan and SWPPP to include the measures from the FERC's Plan that provide greater protection. We believe that the implementation of these plans will adequately address the issues in this comment.

SA4-8 | We discuss our strategy for analyzing cumulative impacts from projects located in the same geographic region that may occur within similar time frames at the beginning of section 4.12, and list those projects on table 4.12-1. We were unable to find detailed environmental information about each of those other projects, except for the Oregon LNG Project, so we are unable to produce a comparative table. However, we have revised section 4.12 to add data about the Oregon LNG Project. Section 4.12.3 does address cumulative impacts on vegetation and wildlife.

K-503

December 21, 2007

Page 4

SA4-8
cont'd

considering the cumulative impact area. The discussion should be linked to how cumulative impacts relate to project impacts. Providing a table of cumulative impacts to supplement a narrative description would be useful to reviewers. Cumulative effects should be identified for vegetation, wildlife, aquatic species and their habitat. Cumulative impacts should also be described for future maintenance of the right-of-way and pipeline. The EIS would be strengthened by having a summary table for each vegetation, upland habitat, and aquatic habitat that shows acreage of estimated permanent impacts (habitat loss) and temporary impacts. Similarly, the EIS could include a parallel table that summarizes how permanent and temporary impacts will be mitigated. Additionally, the EIS should include the methodologies that were used for the impact analysis.

SA4-9

6. **Unavoidable Impacts:** The EIS should identify the unavoidable direct and indirect impacts and the proposed mitigation. The EIS should also identify those unavoidable direct and indirect impacts that cannot be mitigated. Adding separate subsections that explain unavoidable impacts within each technical element of the EIS would be helpful for reviewers and may reduce comments and requests for additional information. For example, unavoidable adverse impacts could be added as a subsection to each of the section of the chapter on Environmental Analysis. These new subsections would logically follow subsections on mitigation. The EIS would be strengthened if unavoidable adverse impacts were summarized in the Executive Summary and in the chapter on conclusions.

SA4-10

7. **Horizontal Directional Drilling:** The EIS should discuss the possible affects of incidental releases of bentonite drilling mud during the proposed horizontal directional drill crossing at the Columbia River and any other waterbodies where HDD is the preferred crossing method.

SA4-11

8. **Air:** The EIS should adequately describe the boundaries or extent of impact areas, the intensity and duration of the impact, and existing air quality. The EIS should discuss potential effects of the proposed action on ambient air quality during construction, during normal operating conditions, and during upset conditions. The EIS should describe impacts that would distinctly occur only in Oregon or Washington and what permits would be necessary.

SA4-12

9. **Floodplain Issues:** Floodplain permits are necessary for projects that traverse a mapped floodplain (referred to as a Special Flood Hazard Area on FEMA maps). Permits are required for any development in flood hazard areas in all communities that participate in the National Flood Insurance Program. There are general standards that apply to placement of all utilities in floodplains, per local ordinances. The EIS should discuss potential temporary and long-term project impacts to floodplains and measures to be implemented to avoid or minimize these impacts. Where spoils are proposed to be stored within the channel, the EIS should explain how this will impact the floodway.

State Agencies

4

SA4-9 As appropriate, subsections within each portion of the environmental analysis (section 4) specifically address impacts and mitigation.

SA4-10 Potential impacts from a frac-out are discussed in section 4.5.3.1.

SA4-11 Section 4.10.1 of the EIS includes a discussion of the permitting requirements and air quality impacts of the proposed project. Further details of the modeling analysis described in the EIS are contained in the publicly available Bradwood Landing Modeling Report dated March 22, 2007, submitted to the ODEQ and filed with the FERC. As documented in table 12 of the modeling report, impacts from the proposed project were predicted to exceed the CO and NOx significant impact levels (SIL) for the 8-hour and annual averaging periods, respectively. The predicted impacts greater than the CO 8-hour SIL and NOx annual SIL were predicted to extend 0.38 and 4.4 kilometers, respectively, from the proposed project site.

SA4-12 All construction within floodplains would be temporary, lasting only a few months during clearing, grading, trenching, pipe stringing, welding, lowering in, backfilling, and restoration operations. All trench spoil would be returned to the trench, and all disturbed areas would be restored to preconstruction contours. Because the project would not add permanent fill in the floodplains, potential flood flows would not be displaced and long-term impacts are not anticipated.

K-504

December 21, 2007
Page 5

- SA4-13 10. **Channel Migration:** The EIS should discuss stream channel migration issues. The project must not fill, block or otherwise alter channel migration features where such alternations would cause the migration area to impact up or downstream of the area. The EIS should indicate that during project surveying, features of channel migration should also be staked and surveyed (e.g., channel migration areas, relic and overflow channels, spring brooks and other fluvial features related to channel migration).
- SA4-14 11. **Environmental Inspector:** The EIS should describe the responsibilities of the Environmental Inspector. These responsibilities should include notifying agencies of permit violations or when permit requirements need to be altered because of field or weather conditions.
- SA4-15 12. **Vessel Prevention and Contingency Plans:** The vessels delivering LNG to the proposed site will transit Washington State waters inbound and outbound. The EIS should describe the vessels' oil pollution prevention equipment, the vessels' and vessel operators' spill contingency plans and Safety Management Systems. The EIS should describe the vessel bunkering and oil transfer procedures. (Please consult Chapter 317-40 of the Washington Administrative Code - Bunkering Operations for specific requirements that may apply.)
- SA4-16 Ecology's Spill Prevention Program manages a unique non-regulatory environmental protection program for tank vessels. Tank vessels operators are invited to participate in Washington's Voluntary Best Achievable Protection (VBAP) and Exceptional Compliance (ECOPRO) Program for Tank Vessels to protect Washington's irreplaceable natural resources from the damage caused by a spill. For more information about this program please visit the website at: <http://www.ecy.wa.gov/programs/spills/prevention/bap/bapbase.htm>. The EIS should discuss the vessel operators' intent to participate in these and other pollution prevention programs.

Additional Comments specific to the Draft EIS

Section 1, Introduction

The objective or purpose of the project is stated on page 1-3 as follows:

To provide a new source of natural gas to the Pacific Northwest through importation of LNG.

- SA4-17 The stated "need" for this objective is vague and does not sufficiently address the alleged regional shortage or market value problem with natural gas. The draft should be specific about how much more natural gas should be provided to the region. The draft should quantify a reasonably foreseeable future need of natural gas in order to legitimately compare alternatives using the criteria on page 3-1. The boundary of the Pacific Northwest region is not defined, nor is there an estimate of how much this proposal will contribute to the estimated future need of

State Agencies

4

- SA4-13 NorthernStar would comply with the permit requirements under section 404 of the CWA and the FERC's Procedures relative to restoration of the stream beds during waterbody crossings.
- SA4-14 Section 2.6 outlines the duties of an Environmental Inspector.
- SA4-15 Contracts with LNG shippers have not been established yet. All vessels are required to carry approved vessel response plans and comply with state spill prevention and contingency plans, including the applicable requirements in Chapter 317-40 of the Washington Administrative Code – Bunkering Operations. Such language has been added to section 2.7.1.
- SA4-16 Contracts with LNG shippers have not been established yet. Therefore, the EIS cannot discuss the vessel operators intent to participate in Washington's Voluntary Best Achievable Protection and Exceptional Compliance Program for Tank Vessels.
- SA4-17 We have expanded our discussion of purpose and need in section 1.0 and have included the results of a study by Wood Mackenzie Limited (2007) of markets served by the proposed Bradwood Landing Project (see our response to comment PM1-23).

K-505

December 21, 2007

Page 6

SA4-17 new sources of natural gas. The quantified estimates of future demand for natural gas are based on national averages and do not address the stated purpose of the proposal.

cont'd

This information about purpose and need is particularly important given the number of other LNG terminals and pipelines in the region that are engaged in the FERC licensing process.

Section 2, Proposed Action

SA4-18 This section should specifically (i.e. quantitatively) address the current capacity of proposed connector pipelines (e.g. Williams pipeline) and the feasibility of using this system to distribute Bradwood's natural gas. Without this information, it is unclear how this proposal meets the stated purpose and need and consequently it could fall short as a potentially reasonable and environmentally preferable alternative when the evaluation criteria on page 3-1 are applied.

Section 3, Alternatives

SA4-19 The draft EIS should not include the analysis of alternatives that do not address the stated purpose and need. This is an incomplete and potentially misleading exercise – and particularly so when the selection criteria automatically excludes alternatives such as renewable, nuclear power, conservation and efficiency, etc. because they do not fit the stated purpose and need. (page 3-1) More attention should be paid to identifying and refining the purpose and need, and comparing it only to applicable alternatives.

SA4-20 The draft does not adequately address the alternatives of other proposed LNG terminals in Oregon. Although the details of the environmental impacts of these other projects are currently being addressed in concurrent NEPA processes, this draft EIS concludes that the Bradwood Landing terminal is less environmentally harmful (due to a shorter sendout pipeline) than the other proposed projects. This conclusion is made without the necessary cumulative impact analysis of this project and other proposed pipelines. In particular, the analysis should address the Palomar pipeline – which would essentially serve as another sendout pipeline for Bradwood towards the south.

Section 4, Environmental Analysis and Cumulative Impacts

SA4-21 The key missing piece throughout this document is a description of methods that were used to conduct the environmental analysis and provide the basis of comparison between the proposal and the alternatives. This information would document the legitimacy of the conclusions and recommendations for this large complex project of great public interest.

SA4-22 Additionally, FERC received comments on the NOI (as reported on page 1-25) requesting an analysis of the cumulative impacts on global warming and climate change. This draft EIS does not address climate change impacts from this proposal, nor does it include an analysis on how the “existing” environment for the project will be altered in the future due to sea level rise, river hydrology and other changes.

Washington's SEPA specifically requires state and local agencies to consider the impacts of a proposal on climate – as an element of the environment. This draft is deficient in this area.

State Agencies

4

SA4-18 See our response to comment FA2-32.

SA4-19 In the beginning of section 3.1 we explain the project objectives, and our criteria for evaluating alternatives. It is standard practice for the FERC to discuss a range of alternatives, including the no action alternative, other sources of energy, system alternatives, and site alternatives. Furthermore, other parties have commented that the EIS should examine conservation and renewable energy resources as alternatives to the importation of LNG.

SA4-20 We disagree. The EIS adequately addresses other LNG terminal locations in Oregon as alternatives to the Bradwood Landing Project. Where we have data about environmental impacts associated with those other projects, they were provided. See our response to comment FA2-3. It is logical that a longer pipeline would have more environmental impacts. The alternatives analysis has been revised to include the Palomar pipeline (see section 3.1.2.2). We also discuss the Palomar Project in our cumulative impacts section 4.12.

SA4-21 We disagree. The EIS summarizes the studies conducted that led to our conclusions, and provides references to those studies.

SA4-22 Section 4.10.1 has been updated to include the estimated CO2 emissions resulting from the construction and operation of the project. In addition, Section 4.10.1.2 of the final EIS has been updated to indicate that NorthernStar has agreed to voluntarily comply with the ODE's siting requirements for non-generating energy facilities, including the CO2 emission standards, for the proposed LNG import terminal.

K-506

December 21, 2007

Page 7

SA4-22
cont'd

Furthermore, SEPA provides agencies with *supplemental authority*¹ to require mitigation for – or deny under certain circumstances – a proposal when they identify adverse environmental impacts that cannot or will not be mitigated through existing laws or administrative rules. Although SEPA does not require decision makers to mitigate the impacts before making their decision, it does give them the ability to address impacts that would normally be outside their regulatory authorities.

We recognize the potential role of additional natural gas supply for meeting our future energy needs, but nevertheless, we recommend that FERC address climate change impacts from this energy development project. Washington has committed to reducing fossil fuel emissions through both an executive order and recent state legislation. FERC should address specific mitigation needed to avoid, minimize and compensate for any climate change effects. State approvals for this project must consider these impacts and possible mitigation in order to be consistent with our climate change policy and new law.

Again, thank you for the opportunity to comment. We hope our comments help you to complete a full environmental review of this project.

Respectfully,

Richard K. Wallace

¹ Supplemental authority is described in Chapter 43.21C.060 RCW and WAC 197-11-660. All state and local agencies are given the authority to condition for impacts identified in an environmental document when they have identified policies about how they will use the supplemental authority. They can deny a proposal when an EIS has been prepared and mitigation is insufficient to mitigate the impact to a nonsignificant level. This is intended to address gaps in existing regulations due to new science, new issues, new environmental conditions, site specific conditions, and unanticipated consequences. Although many new regulations have been added since 1971 when SEPA was adopted, the legislature reaffirmed the need for SEPA in 1995.

- SA4-23 See our response to comment SA4-3.
- SA4-24 We discuss the engine operations of LNG carriers in sections 2.1.1, 4.10.1.1, and 4.11.5.
- SA4-25 See our response to comment PM1-31.
- SA4-26 In the event that the LNG carrier uses all of its cooling water for ballasting to avoid discharging it to the Columbia River, heat radiating from the LNG carrier's ballast tanks to the surrounding water would not result in adverse impacts for several reasons. The amount of ballasting water needed by an LNG carrier is proportional to its cargo capacity, the larger the cargo capacity, the more water required for ballasting to maintain stability when the cargo is offloaded. For example, a 145,000 m³ LNG carrier would require about 57,000 metric tons (MT) of water for ballasting, while a 210,000 m³ LNG carrier may need upwards of 70,000 MT. Meanwhile, the amount of heat generated (by machinery and power generation) by an LNG carrier while at the terminal depends mainly on the type and size of the LNG carrier's propulsion system, the "hotel loads" and the "transfer loads." Hotel loads are electrical power requirements to operate the ship, excluding the cargo transfer pump loads. Transfer loads are the electrical power requirements to operate the cargo transfer pumps and other ancillary equipment required only to transfer cargo. Transfer loads are proportional to the rate at which the LNG is being unloaded. The unloading rates for LNG carriers at Bradwood Landing would be about 12,000 m³/hr. Unloading at about 12,000 m³/hr requires about 4 MW of power. In all, a steam-powered LNG carrier may require about 6 MW of power considering hotelling and offloading loads, which with an efficiency a bit below 30 percent means that about 15 MW of excess heat is being generated. Conversely, some of the newer (and also larger) LNG carriers being built today require upwards of 9 MW of power during the unloading process but because they employ more efficient generators (more than 40 percent efficient) less overall excess heat is generated. Thus the worst case at the Bradwood Landing terminal would be a steam-powered LNG carrier, generating 15 MW of excess heat during the unloading process. Over the course of the entire unloading process, which lasts about 18 hours, this equates to about 9.2 x 10⁸ Btu. Assuming that all of this excess heat is absorbed by the water used for ballasting (about 57,000 MT), the temperature of the water would only rise about 3 °F. As a side note, the assumption that all of the excess heat is being absorbed by the water only is very conservative considering that much of the excess heat generated in the process would be released to the atmosphere internally (into the engine room) through heat radiation and convection and externally into the outside atmosphere through the power plant's exhaust.

So while the ballast tanks would radiate some heat to the surrounding water, it would be very minimal simply due to the fact that the driving force, a

Attachment Washington Department of Ecology Comments on Bradwood Landing LNG Draft EIS

#	Section and Page	Comment	Recommendation
1	1.3.1 Washington Page 1-12 and Table 1.3-1 Page 1-18	Washington Department of Ecology's authority to protect water quality and regulate "waters of the state" under state statute RCW 90.48 is not addressed. Authority/Regulation/Permit lacks reference to Section 402 of Clean Water Act whereby NPDES Construction Stormwater Permit is required.	1. In section 1.3.1, add a paragraph on Ecology's regulatory role under RCW 90.48 and section 402 of the CWA. 2. Add "Section 402 of the CWA" and "RCW 90.48" to Table 1.3.1 next to "WDE"
2	2.1.1.4 Pressure/ Temperature Control Page 2-6	The internalized combustion energy system of LNG ships is not uniform. Most of the LNG vessels under construction are diesel powered and will meet the requirements of this BOG emission control.	Add details on how diesel powered ships will remove BOG to maintain the tank pressure.
3	2.1.1.5 Ballast and Cooling Water - Delivering filtered river water to the LNG ships	Northern Star proposes to construct a system capable of delivering filtered water to the LNG ships and providing incentives for the delivering vessels to make modifications needed to use this system. The vessels would require regulatory approvals and costly shipyard modifications to accomplish this. This is not practical using spot charter vessels which are not under contract with the terminal as indicated in 2.1.1.9 Ship Selection. The proposal to reduce heat	Northern Star should provide details of how the terminal will enforce this modification on LNG vessels contracted by other parties. Ecology recommends that a heat balance analysis showing the reduction of heat transferred to the Columbia River using this concept versus the normal direct overboard discharge of engine cooling water be included as an appendix to the FEIS.

State Agencies

4

SA4-26 cont'd) temperature difference of 3 °F, is so small. Moreover, much of the area adjacent to the ballast tank is above water, meaning some of the excess heat would be dissipated to the surrounding air. Essentially, given the small difference in temperature between the ballast water and the surrounding Columbia River water, the effects of heat radiating from the ballast tanks would be minimal.

In the event an LNG carrier unloads at the wharf without the necessary modifications to discharge cooling water into the ballast tanks, cooling water discharge would occur via standard overboard methods. We have recommended that NorthernStar continue to consult with the NMFS, ODFW, and other appropriate agencies to develop a temperature performance standard for all cooling water discharges from LNG carriers at the wharf. Further analysis of the potential thermal impacts of cooling water discharge on aquatic resources will be included in the revised BA and EFH Assessment. See also our response to comment PM1-31.

20071222-5003 PERC PLP (UNOFFICIAL) 12/22/2007 05:40:26 AM

		exchange into the river is questionable. Existing LNG vessels discharge warmed engine cooling water directly overboard. This plan would pump the warmed water into the vessel's ballast tanks until they filled, then recirculate ballast water to provide engine cooling. The ballast tanks are adjacent to the steel hull of the vessel. Engine heat transferred to the ballast water would then pass through the steel hull into the surrounding river water.	
		The net effect of this concept is that the engine operational heat would be indirectly transferred to the Columbia River through the ballast tanks rather than directly overboard as warmed cooling water.

SA4-34

			prevent scouring and turbid water from entering any surface waters should also be included.
10	2.4.2.2 Page 2-49 Water body crossings. Water crossings continued.	Trench spoils and top soil stockpiles need to be stabilized during construction to protect water bodies. When working in areas of high ground water, trench de-watering may be necessary. De-watering has the potential to create an immediate need to dispose of large volumes of sediment-laden water during construction. Alternative BMPs and preparation for de-watering needs to be discussed in more detail.	Add requirements for control of dewatering Trench dewatering activities should not result in the deposition of sand, silt or sediment. Trench dewatering water should be discharged away from waters of the state and should be discharged in a manner that allows it to infiltrate into the ground. Turbid water must not be discharged into waters of the state. De-watering was only touched on, and the SWPPP does not have alternative BMPs listed.
SA4-35	Water crossings continued.	The procedures and environmental precautions lack sufficient detail.	Include the identification and the location of all waterbodies requiring "drivable berms".
SA4-36	11 Page 2-51	Water quality protection using straw Bale Barriers is not addressed sufficiently.	Require Northern Star to secure approval from Ecology and/or the WDFW for "additional" imported material that is used to backfill waterbodies at open-cut crossings. Require Northern Star to prepare a site specific deep well dewatering plan for Ecology's review and approval. The plans must identify the location of the well points and the discharge location. Require Northern Star to prepare site specific contingency plans for all waterbodies where the HDD and bore crossing methods are proposed. This should include an incidental release response plan. Clarify that Straw Bale Barriers
SA4-37			
SA4-38			

Attachment - 4 -

SA4-34 NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan addresses the issues raised in this comment. This document is available for viewing by the public on the FERC's Internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e. CP06-365), and putting in the proper date range.

SA4-35 Additional details regarding procedures and environmental precautions are contained in NorthernStar's Pipeline Waterbody and Wetland Construction and Mitigation Procedures Plan. Directions for accessing NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan via the eLibrary can be found in the response to comment FA2-17.

Drivable berms are just one of the potential BMPs that would be used during construction of the pipeline. The number and locations of drivable berms would be determined based on site-specific conditions in the field at the time of construction activities. Other BMPs, such as silt fence and/or straw bale structures may also be used in place of drivable berms at some locations.

SA4-36 NorthernStar would obtain approval from the WDFW for use of any additional imported material used to backfill waterbodies at open-cut crossings.

SA4-37 Dewatering plans would be prepared by the boring contractor prior to conducting borings for waterbody crossings. All applicable permits and approvals would be obtained at that time.

SA4-38 NorthernStar would prepare site specific plans for all HDD waterbody crossings.

December 11, 2007

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
Public Reference Room
888 First Street N.E., Room 2A
Washington, DC 20426

Dear Ms. Bose:

Reference: **Bradwood Landing, LLC Docket No. CP06-365-000**
NorthernStar Energy, LLC Docket No. CP06-366-000

The Washington Utilities and Transportation Commission (UTC) welcomes this opportunity to comment on the draft environmental impact statement (EIS) for the Bradwood Landing liquefied natural gas (LNG) terminal and related pipeline proposed by NorthernStar Energy LLC (NorthernStar).

The UTC is an agent of the U.S. Department of Transportation's Pipeline and Hazardous Material Safety Administration (PHMSA) and authorized to inspect interstate pipelines in that capacity. The UTC is also an intervenor in these Federal Energy Regulatory Commission (FERC) dockets.

Our comments focus on the portions of the draft EIS related to the proposed pipeline (the send-out pipeline) that will transport natural gas from the Bradwood Landing LNG terminal to the Williams interstate gas transmission pipeline near Kelso, Washington.¹

Our comments will apprise FERC of environmental and public health and safety issues raised by NorthernStar's proposal to build this pipeline. Our review also addresses issues related to the construction, operation and maintenance of the proposed pipeline pursuant of the Code of Federal Regulation (CFR) Title 49, Part 192 for Transportation of Natural Gas.

Description of the Proposed Pipeline and its Route through Washington State

The draft EIS proposes a 36 mile-long pipeline extending from the LNG terminal at Bradwood, Oregon, to the Williams Northwest pipeline system near Kelso, Washington. Approximately 17 miles of 30-inch diameter pipe would be within Washington State.

¹ Our comments relate to the route of the pipeline referenced as the "proposed pipeline" in Figure 3.1.8-1 on page 3-7 of the draft environmental impact statement.

FERC Dockets CP06-365-000 and CP06-366-000
December 11, 2007
Page 2 of 4

The pipeline, as proposed, would cross the Columbia River at Port Westward, Oregon, and extend east through the southern portion of Washington's Willapa Hills to Williams Northwest pipeline approximately three-quarters of a mile east of Interstate 5 and north of Kelso. In addition, eight miles of the proposed route is in close proximity to the exiting Kelso-Beaver (KB) pipeline right-of-way. As proposed, the pipeline would be made of carbon steel, with a maximum operating pressure of 1,280 pounds per square inch.

The proposed route is currently lightly populated (e.g., mostly Class 1). The soil type is mostly silt loam and the terrain is typically a 20 to 30 percent slope. The proposed pipeline is located north of the metropolitan areas of Longview and Kelso.

Comments and Recommendations

The UTC has the following comments and recommendations about the proposed NorthernStar pipeline:

SA5-1

1. The principal shortcoming of the draft EIS is that the pipeline route has not been selected to avoid areas of soil instability, a common geological feature in Southwest Washington. Soil instability was the cause of a catastrophic failure of the Williams pipeline near Kalama during 1997. The existing KB pipeline right-of-way, which is adjacent to the proposed pipeline route, includes areas of soil instability and KB has a history of monitoring and mitigating soil induced stresses on its pipeline. For example, a section of the KB Pipeline was relocated above ground and supported by piling across a landslide feature.

The geo-hazards report prepared by United Research Services (URS) for NorthernStar identified 30 landslide features to be crossed by the proposed pipeline alignment. The report states the majority of the landslide features are on private property and have not been field-verified due to access issues. This is an area where additional analysis is needed.

UTC Recommendation: In the final EIS, NorthernStar should identify a route that, to the maximum extent possible, avoids areas of soil instability. To the extent that areas of instability cannot be avoided, specific measures should be identified to address this instability.

SA5-2

2. The URS report also estimates that 41,000 feet of horizontal directional drilling (HDD) will be required for crossing rivers, streams, sloughs and roadways. However, we do not believe that sufficient soil analysis throughout the route has been completed. Without this, an accurate assessment of where HDD may be used will not be achieved. This is important because HDD cannot be used in some soil conditions. If those soil conditions are present, then other means of crossing water features on the route will be needed. These other means are typically more environmentally disruptive during construction.

SA5-1 NorthernStar has routed the Bradwood Landing pipeline to avoid areas of soil instability. Although the pipeline would be largely collocated with the KB pipeline, the route deviates from the KB pipeline route in areas instability. Section 4.1.4.3 discusses measures that would be used to mitigate for soil instability. See also our responses to comments SA3-4 and LA7-25.

SA5-2 See our response to comment SA3-4.

UTC Recommendations:

- | | | |
|--------------------------|--|--|
| SA5-2
cont'd
SA5-3 | | <ul style="list-style-type: none"> • NorthernStar should test soils thoroughly to determine where HDD can be used. The results of this testing should be included in the final EIS. • The criteria that NorthernStar will use to determine both where HDD will be deployed and where the pipeline will be placed above ground should be defined and included in the final EIS. |
| SA5-4 | | <p>3. Federal safety rules require operators to protect gas transmission pipelines from external corrosion by installing a cathodic protection system. The rule allows that this system may be placed in operation as late as one year after completing construction (CFR-49-192-455). In this case, however, we believe that re-excavating the pipeline to attach test stations, galvanic anodes, and other components after the pipeline construction will increase soil erosion and effect surface runoff quality. We therefore recommend that NorthernStar install the cathodic protection system on the pipeline at the time of construction.</p> <p>In addition, cathodic protection systems are susceptible to interference from other systems located nearby or from nearby sources of electrical current. NorthernStar should evaluate possible sources of this interference along its route in the final EIS.</p> <p>UTC Recommendations:</p> <ul style="list-style-type: none"> • To minimize soil erosion and other environmental impacts caused by re-excavation, NorthernStar should be required to install its cathodic protection system at the time of construction. • The final EIS should address explicitly the potential for interference with its planned cathodic protection systems from sources of current in proximity and describe how it will address this issue in design and operation of the pipeline. |
| SA5-5 | | <p>4. Over the past 15 years, Western Washington has experienced dramatic population growth. Previously semi-rural areas now contain housing developments close to pipeline rights-of-way. We encourage the NorthernStar to anticipate increased population density (e.g., class 3 locations) likely to occur in the area north of Longview and Kelso and design its pipeline accordingly.</p> <p>UTC Recommendations:</p> <ul style="list-style-type: none"> • The final EIS should identify the steps NorthernStar will take to mitigate the threat to people and property such as posed by the pipeline in high consequence areas. |
| SA5-6 | | <ul style="list-style-type: none"> • NorthernStar should take the following additional safety measures in potentially high consequence areas through which the proposed pipeline will run: |

State Agencies

5

- | | | |
|-------|--|---|
| SA5-3 | | A final determination on HDD locations will not be made until the final geotechnical analyses have been completed. There are no areas where the pipeline is proposed to be placed aboveground. See also our response to comment FA3-13. |
| SA5-4 | | The FERC does not typically impose additional safety conditions other than DOT standards. |
| SA5-5 | | As addressed in section 4.11.9.1, if a subsequent increase on population density adjacent to the right-of-way indicates a change in class location, NorthernStar would be requested to reduce the MAOP or replace the segment with pipe of sufficient grade and wall thickness to comply with DOT regulations for the new class location. |
| SA5-6 | | The FERC does not typically impose additional safety conditions other than DOT standards. |

UTC Comments
FERC Dockets CP06-365-000 and CP06-366-000
December 11, 2007
Page 4 of 4

SA5-6
cont'd

- o Install cathodic protection test stations at approximately 2,000 linear foot intervals and reference cells where the pipeline crosses other cathodically protected facilities,
- o Conduct a close interval survey approximately two years after the pipeline is installed. Utilize the data obtained from the close interval survey and compare them with the data collected from annual monitoring and reference cells to determine the frequency of close interval surveys.

SA5-7

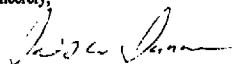

- Conduct an internal inspection survey prior to commissioning the pipeline to identify construction anomalies and establish a baseline for future evaluations.
- Schedule future internal inspections at approximately five-year intervals to identify wall loss from corrosion and third-party excavation damage.

SA5-8

5. In addition to the comments above relating to the EIS, the UTC believes that public health and safety will be protected more fully if NorthernStar includes the following actions in its pipeline construction plan:
- Specify that bedding and shading material around the pipe should be select fill material free of sharp rocks with maximum particle size of ½" and containing a large percentage of fines. If the trench bottom is not free from sharp or unusually rough surfaces, the trench should be over-excavated six inches and refilled with select fill material.
 - Inspect pipe coating integrity before lowering the pipe in the trench by "jeeping" and repairing coating with manufacture's recommended material.
 - Radiographically examine 100 percent of the girth welds. For welds that cannot be radiographed, the radiographer should certify that radiographs are impractical and provide written evidence in support of his or her conclusion.

The UTC Staff appreciates the opportunity to review the EIS for the proposed NorthernStar transmission pipeline to further enhance environmental protection and public safety. If you have questions about our response, please contact David Lykken, Acting Pipeline Safety Director at (360) 664-1219 or Al Jones, Pipeline Safety Engineer at (360) 664-1321.

Sincerely,

David W. Danner
Executive Director

State Agencies

5

SA5-7 The FERC does not typically impose additional safety conditions other than DOT standards.

SA5-8 Section 2.4.2.1 includes the General Pipeline Construction Techniques that NorthernStar would use during installation of its pipeline, including requirements for padding the pipeline in stony soils, pipeline coating, and visual and radiographic inspection of pipeline welds.

Re: Draft Environmental Impact Statement for the Bradwood Landing Liquefied Natural Gas
Terminal and Pipeline Project (Docket No. CP06-365-000, et al.)

Dear Mrs. Boser:

Upon review of the Bradwood Landing Draft Environmental Impact Statement (DEIS), the Washington Department of Fish and Wildlife (WDFW) has many concerns with regard to the proposed project. WDFW believes fish and fisheries-related impacts will occur during construction/implementation, daily operations, and maintenance.

SA6-1 The DEIS addresses many items of concern, but in many cases, WDFW feels the discussion is inadequate. Most prominent of these is that restrictions to sport and commercial fisheries, through river closures, and lost harvest opportunities are only briefly addressed. The closure around the vessel in transit will negatively impact intensive sport salmon, sport sturgeon, and commercial fisheries. Additionally, establishment of the docking site will likely close a significant portion of one of the most popular spring chinook sport fishery locations in the lower Columbia River. Further, discussion regarding associated impacts to Select Area Fisheries (SAFE) harvest and general interception of hatchery fish, preventing them from entering tributaries, is poorly addressed. Restricted harvest of hatchery fish is potentially counter to the goals of the Lower Columbia River Fish Recovery Board (LCFRB) Salmon Recovery Plan (www.lcfrb.org/wa/2002) and the initial recommendations of the Hatchery Scientific Review Group (HSRG).

SA6-2 WDFW categorized its concerns into three main areas: 1) Construction-related; 2) Operations-related; and 3) Mitigation. These are included. WDFW assumes that the Construction impacts will be ephemeral and limited to the proposed site only. While WDFW prefers HDD as the preferred method of pipeline installation, there is assumed "frac-out" risk that would have deleterious effects to spawning grounds. WDFW assumes that the Operations impacts will be on going, including maintenance dredging at the terminal, but remain within in the proposed "footprint". Shipping and related river closures fall in this category. WDFW assumes that mitigation is on going and will be commensurate with the potential impacts of the project.

SA6-3 WDFW views the proposed mitigation for the overall project, specifically on the Washington side, as being grossly inadequate. First of all, it is unclear if the \$50,000,000 SEI is guaranteed or is voluntary.
SA6-4 Additionally, WDFW has concerns that the mitigation site at the mouth of Delamater Creek is adequate in magnitude or benefits to all affected species (including smelt and sturgeon) and affected habitat.

Regards,

Tim Rymer
Regional Habitat Biologist
Washington Department of Fish and Wildlife

OFFICE OF THE
SECRETARY
JAN - 2 P 4: 16
2008
FEDERAL ENERGY REGULATORY COMMISSION

State Agencies

6

SA6-1 The project should not have significant impacts on commercial or recreational fishing. The project would not result in restrictions on fishing activities outside of the moving safety and security zone around LNG carriers in transit in the waterway to the proposed Bradwood Landing terminal, and there would be no river closures. Nor would the safety and security zone around an LNG carrier at dock at the terminal cause the closure of any popular nearby spring Chinook sport fishing areas. See section 4.7.1.4. Significant impacts on fish movements are not expected as a result of operation of the proposed project. Potential impacts on salmon due to construction and operation of the proposed project are discussed in section 4.5.2.1.

SA6-2 Section 4.5.3.1 has been revised to include a discussion of potential impacts on spawning habitat due to a frac-out. Implementation of NorthernStar's HDD Contingency Plan would minimize potential impacts on salmonids if a frac-out were to occur. Directions for accessing NorthernStar's HDD Contingency Plan (Frac-out Plan) via the eLibrary can be found in the response to comment FA3-13.

All operational activities authorized by the FERC would occur within the proposed project footprint. During operation of the project, if circumstances were to result in changes to the area impacted by the proposed project, NorthernStar would be required to file a revision with the COE requesting authorization of the proposed project changes. In addition, changes to the area or volume of sediment being dredged would require reinitiating formal consultation with the NMFS.

Adequacy of mitigation is addressed in the response to comment FA2-10.

SA6-3 The general adequacy of NorthernStar's proposed compensatory mitigation for the project is addressed in the response to comment FA2-10. NorthernStar's SEI is not a part of the compensatory mitigation for unavoidable impacts associated with the project. Although it was proposed by NorthernStar as a voluntary measure to provide a net benefit to the lower Columbia River, the SEI is part of the proposed action. To this end, NorthernStar has indicated that multiple agencies would make the SEI a required component of the project through their permits. See also our response to comment FA4-12.

SA6-4 See our response to comment FA2-10.

Re: Supplemental Draft Environmental Impact Statement
Bradwood Landing LLC Docket No. CP06-366
Northern Star Energy LLC Docket Nos. CP06-366, CP06-376
and CP06-377

Dear Secretary Bose:

SA7-1

On behalf of the State of Oregon, I request that the Federal Regulatory Energy Commission (FERC) issue a supplemental Draft Environmental Impact Statement (DEIS) for the Liquefied Natural Gas (LNG) import terminal facility at Bradwood Landing and its associated pipelines.¹ I believe that a supplemental DEIS (SDEIS) is required under the regulations of the Council on Environmental Quality (CEQ) on the National Environmental Policy Act (NEPA). 40 CFR § 1502.9(c).

As you know, the State of Oregon previously submitted comments on the Draft Environmental Impact Statement for this project, to help ensure that state standards and concerns are addressed by the developer and by the Federal Energy Regulatory Commission. As we explained in those comments, the Bradwood Landing DEIS is incomplete and flawed in a number of respects. We particularly noted in our cover letter to our comments that "any mitigation plan or other document that will be relied on by FERC to determine that the facility meets licensing criteria must be included in the DEIS and circulated for meaningful review before adoption of the final EIS." We also stated:

As an example of the inadequacy of the DEIS, large portions of the mitigation for habitat, wetlands, archeological impact, landslide protection and emergency planning are still unknown. Indeed, many supporting documents for the licensing decision will be produced after the opportunity for comment on the DEIS has closed. This is a fundamental process flaw.

¹ The State of Oregon supports the same request made by Columbia Riverkeeper et al. in the letter to FERC dated April 24, 2008.

SA7-1
cont'd

1. The CEQ regulation requires a Supplemental DEIS in this context.

40 CFR § 1502.9(c) provides:

(c) Agencies:

(1) Shall prepare supplements to either draft or final environmental impact statements if:

(i) The agency makes substantial changes in the proposed action that are relevant to environmental concerns; or

(ii) There are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts.

For purposes of NEPA, the concept of "significance" is defined by the regulations of the Council on Environmental Quality.²

² In 40 CFR § 1508.27, CEQ defines the term "significantly" as follows:

"Significantly" as used in NEPA requires considerations of both context and intensity:

(a) Context. This means that the significance of an action must be analyzed in several contexts such as society as a whole (human, national), the affected region, the affected interests, and the locality. Significance varies with the setting of the proposed action. For instance, in the case of a site-specific action, significance would usually depend upon the effects in the locale rather than in the world as a whole. Both short- and long-term effects are relevant.

(b) Intensity. This refers to the severity of impact. Responsible officials must bear in mind that more than one agency may make decisions about partial aspects of a major action. The following should be considered in evaluating intensity:

(1) Impacts that may be both beneficial and adverse. A significant effect may exist even if the Federal agency believes that on balance the effect will be beneficial.

(2) The degree to which the proposed action affects public health or safety.

(3) Unique characteristics of the geographic area such as proximity to historic or cultural resources, park lands, prime farmlands, wetlands, wild and scenic rivers, or ecologically critical areas.

(4) The degree to which the effects on the quality of the human environment are likely to be highly controversial.

(5) The degree to which the possible effects on the human environment are highly uncertain or involve unique or unknown risks.

State Agencies

7

SA7-1
cont'd

FERC has its own set of NEPA regulations, *see* 18 CFR §§ 380.1 through 380.16. FERC's NEPA regulations, however, do not appear to explicitly address or implicitly bear on the standard for a supplemental EIS established in the CEQ regulation quoted above.

The policy underpinning of the supplemental EIS requirement was well articulated in *Sierra Club v. Marsh*, 714 F Supp 539, 571 (DC Maine 1989), *appeal dismissed*, 907 F2d 210 (1st Cir 1990):

NEPA is an environmental "full disclosure" law. The supplemental EIS process is designed to ensure that agencies act with "complete awareness . . . of the environmental consequences of [their] action[s]."
Essex County Preservation Ass'n v. Campbell, 536 F.2d 956, 961 (1st Cir. 1976) (citation omitted), *aff'g*, 399 F. Supp. 208 (D. Mass. 1975) (ordering supplemental EIS despite inability to determine, as a matter of law, that new information would have significant environmental effect; but public should have opportunity to analyze and assess it).

a. The LNG import terminal facility project has changed substantially since the DEIS was issued.

(6) The degree to which the action may establish a precedent for future actions with significant effects or represents a decision in principle about a future consideration.

(7) Whether the action is related to other actions with individually insignificant but cumulatively significant impacts. Significance exists if it is reasonable to anticipate a cumulatively significant impact on the environment. Significance cannot be avoided by terming an action temporary or by breaking it down into small component parts.

(8) The degree to which the action may adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places or may cause loss or destruction of significant scientific, cultural, or historical resources.

(9) The degree to which the action may adversely affect an endangered or threatened species or its habitat that has been determined to be critical under the Endangered Species Act of 1973.

(10) Whether the action threatens a violation of Federal, State, or local law or requirements imposed for the protection of the environment.

As noted in the April 24, 2008 letter from Columbia Riverkeeper, the Bradwood Landing LNG import terminal facility and associated pipeline project has changed in four key respects:

SA7-2

1. **Unscreened water intakes:** The DEIS contained a recommended condition that "only LNG ships that are retrofitted to use the screened water supply system at the berth are allowed to unload cargo at the Bradwood Landing LNG terminal." DEIS at 4-145. The assessment in the DEIS of environmental effects of the project was presumably based on the assumption that all LNG ships would use screened water intakes. The applicants have recently taken the position that not all incoming LNG tankers will use screened ballast and cooling water intakes. As stated in the applicants' April 8, 2008 letter to FERC,

The goal of Applicants' on-site water system program is to ensure that as many LNG carriers as practicable have the ability to use the on-site water system. * * *

Applicants have proposed, as part of the Project, to provide reasonable contract incentives to encourage equipping or retrofitting LNG carriers for compatibility, but it is not in Applicants' control to require *all* LNG carriers to retrofit. Despite these reasonable contract incentives proposed by Applicants, it is not likely that all LNG carriers making deliveries to the Bradwood Landing terminal under spot market contracts, short term contracts, or as replacement carriers to long term contracts will be equipped for the on-site water system.³

The impacts of unscreened water withdrawals on threatened and endangered salmon were not addressed in the DEIS, and the public has never had a chance to comment on that substantial project change. Hence, the environmental effects of that change must be evaluated in a supplemental DEIS.

SA7-3

2. **Changed pipeline route:** The pipeline route is expected to change. NorthernStar has apparently acknowledged that many alterations of the route are underway. Those changes could significantly alter the nature of the environmental, public-safety-related and economic impacts of the project, which must be evaluated in a supplemental DEIS.

³ Response of NorthernStar Energy LLC and Bradwood Landing LLC to the FERC Staff's Recommended Mitigation Measure 24 in the DEIS. Letter dated April 8, 2008, pp 2-3.

State Agencies

7

SA7-2

After our issuance of the draft EIS, NorthernStar indicated that not all LNG carriers may be retrofitted to connect to the proposed ballast and cooling water supply system. Therefore, our analysis and discussion of potential impacts on water quality and aquatic resources (which includes salmonids) in sections 4.3.2.2 and 4.5.2.1 has been revised. We conducted additional analysis of entrainment and water quality impacts at the wharf without the use of the filtered water supply system and NMFS-approved screens. Due to the potential impacts on sensitive aquatic resources at the terminal, we are recommending that the Commission Order include a condition to require that NorthernStar develop a plan to deliver screened water to LNG carriers at the terminal. We are also recommending that NorthernStar conduct post-installation tests of all intake screens at the terminal, and develop a monitoring and reporting program to assess the efficacy of the screened water supply system at minimizing entrainment and impingement. In addition, we are recommending that NorthernStar develop performance standards for water quality impacts associated with LNG carrier discharges of cooling water at the wharf. We will conduct additional detailed analyses of the screened water supply system and the performance standards in our revised BA and EFH Assessment.

SA7-3

The proposed pipeline route has not changed since the draft EIS was issued. The pipeline alignment in the final EIS is the same alignment that was in the draft EIS. Changes to the pipeline route that may occur after the final EIS is issued would likely be relatively minor and fall within the corridor that has been assessed for wetland and wildlife impacts (where access has been granted). All route realignments, with certain exceptions described in recommended condition no. 6 in section 5.2, would require written approval from the Director of OEP before construction in or near that area.

K-524

SA7-4 3. **Deposit of dredge spoils:** Dredge spoils will now be placed entirely on the Bradwood site; it appears that deposition elsewhere in Wahkiakum County will not occur. The environmental effects of that substantial change must be evaluated in a supplemental DEIS.

SA7-5 4. **Open regasification:** The regasification system may be altered to allow open regasification. That substantial change will result in greatly increased amounts of effluent discharged into the Columbia River. The environmental effects of that increased effluent on fish species and other values are unknown and must be evaluated in a supplemental DEIS.

SA7-6 The standard for requiring a supplemental EIS when a project has substantially changed was explained by the United States Supreme Court in *Marsh v. Oregon Natural Resources Council*, 490 US 360 (1989). The decision to prepare a supplemental EIS is similar to the decision whether to prepare an EIS in the first instance: "If there remains 'major Federal action[n] to occur, and if the new information is sufficient to show that the remaining action will 'affect[t] the quality of the human environment' in a significant manner or to a significant extent not already considered, a supplemental EIS must be prepared." *Id.* at 374.

An agency violates NEPA when it fails to give adequate and timely consideration to the significance of new circumstances. *NRDC v. United States Army Corps of Engineers*, 399 F Supp 2d 386, 405 (SDNY 2005) (dredging action alleged to have changed due to EPA consent order requiring a remedial investigation/feasibility study). A party challenging an agency's failure to prepare a supplemental environmental impact statement need demonstrate only that there is a substantial possibility that the changed agency action may have significant new impacts. *Id.* at 411.

An alternative that entails "a different configuration of activities and locations" from that contained in a previous EIS must be presented in a supplemental EIS. In *Dubois v. United States Department of Agriculture*, 102 F3d 1273 (1st Cir 1996), *cert den* 521 US 1119 (1997), the First Circuit explained that in contrast to "a reduced version of a previously-considered alternative," a new alternative reflected a different proposed configuration must be publicly aired, because "public commenters might have pointed out, if given the opportunity – and the Forest Service might have seriously considered – wholly new problems posed by the new configuration (even if some of the environmental problems present in the prior alternatives have been eliminated)." 102 F3d at 1292-93.

The four changes listed *ante* (unscreened intake water, changed pipeline route, different location for putting dredge spoils, and open gasification system)

State Agencies

7

SA7-4 We considered the alternative of placing all of the dredged material from the ship berth and maneuvering basin at the LNG terminal site in the draft EIS. Up to 205,000 cubic meters of dredged material may still be placed at the Wahkiakum County Sand Pit site. However, even if all of the dredged material is placed at the LNG terminal, aside from the raising the grade an additional 5 feet, there would not be any significant changes in impacts at the LNG terminal site resulting from the additional dredged material.

SA7-5 NorthernStar has not filed any proposed changes to their regasification process with the FERC. NorthernStar proposed SCVs to regasify the LNG and that is the technology that we have analyzed in our EIS.

SA7-6 The submittal by NorthernStar on April 16, 2008 did not contain "substantial" amounts of new information or information that reflected substantial changes in the project.

State Agencies

7

SA7-6
cont'd

represent substantial changes in the project that are relevant to environmental concerns. The CEQ regulation provides that "[a]gencies [s]hall prepare supplements to either draft or final environmental impact statements if [t]he agency makes substantial changes in the proposed action that are relevant to environmental concerns." 40 CFR § 1502.9(c). Hence, FERC is *required* by the CEQ regulation to issue a Supplemental Draft Environmental Impact Statement.

As noted by the First Circuit Court of Appeals with respect to that CEQ regulation, "[t]he use of the word 'shall' is mandatory, not precatory. It creates a duty on the part of the agency to prepare a supplemental EIS if substantial changes from any of the proposed alternatives are made and the changes are relevant to environmental concerns." *Dubois v. United States Department of Agriculture*, 102 F3d at 1292.

b. Significant new information is relevant to environmental concerns and bears on the proposed action and its impacts.

Significant new information has been generated both by the applicants themselves and by the Oregon Department of Energy concerning the proposed LNG import terminal facility and its environmental effects.

On April 16, 2008, NorthernStar and Bradwood Landing submitted to FERC its Motion for Leave to Respond and Response of NorthernStar Energy LLC and Bradwood Landing LLC to Comments Filed with the Commission Regarding the Draft Environmental Impact Statement. The motion to file a response to comments included four large appendices containing voluminous information, which NorthernStar and Bradwood Landing have characterized as "additional information" or information that has been "revised."

A sense of the scope of the "additional" and "revised" information contained in the motion submitted by NorthernStar and Bradwood Landing is conveyed in the Index of Attachments:

Index of Attachments

- Attachment A: Applicants' Responses to Comments on the DEIS re General Matters**
- Attachment A-1: Revised DEIS Table 1.3-1

- Attachment D-2: Columbia River Navigation Channel – Analysis of Navigation Protocols & Priorities

NorthernStar and Bradwood Landing is seeking leave to file its response to comments, given that such response comments are outside the normal NEPA process. By definition, the additional and revised information that NorthernStar and Bradwood Landing has submitted in its reply comments was not considered in the Draft Environmental Impact Statement. Hence, the public has not had a chance in the NEPA process to evaluate the additional and revised information and comment on it. Such additional and revised information is "significant" within the meaning of the CEQ regulation and must be evaluated in a supplemental DEIS.

The current scenario, in which NorthernStar and Bradwood Landing have submitted additional and revised information that the public has had no opportunity to review within the NEPA process, despite the bearing of that

State Agencies

State Agencies

7

SA7-6
cont'd

information to the environmental effects of the proposed project, clearly demonstrates a need for issuance of a Supplemental DEIS.

In *Kettle Range Conservation Group v. United State Forest Service*, 148 F Supp 2d 1107 (ED Wa 2001), the court granted an injunction prohibiting the United States Forest Service from implementing a "Douglas-fir Bark Beetle Project" until the Forest Service had prepared a supplemental EIS. 48 F Supp 2d at 1139-40. And in *Portland Audubon Society v. Babbitt*, 998 F2d 705, 708 (9th Cir 1993), the Ninth Circuit held that a supplemental EIS should have been prepared regarding the effect of timber harvest on the spotted owl, "because the scientific evidence available to the Secretary in 1987 raised significant new information relevant to environmental concerns, information bearing on the impacts arising from the ongoing implementation of the land use decisions driven by the original TMPs [timber management plans]."

SA7-7

In addition to the significant additional and revised information submitted by the applicants, the Oregon Department of Energy has developed the attached report, entitled "Response to Governor Kulongoski's Request for LNG and Natural Gas Review, ODOE, May 7, 2008." That report concerns the need for and costs, both fiscal and environmental, of an LNG import terminal facility in Oregon. The report contains significant new information bearing on the impact of the proposed LNG import terminal facility on the human environment. The report discusses the alternative of new pipelines to bring natural gas from domestic Rocky Mountain sources to Oregon at less cost and with fewer adverse effects on the environment. The report addresses the carbon footprint of LNG generally and the carbon dioxide emissions in Oregon caused by the proposed LNG import terminal facility. That new information is significant, as defined by the CEQ regulation, and hence it must be evaluated in a supplemental DEIS.

More specifically, the ODOE report concludes that natural gas will continue to be needed in Oregon for the foreseeable future, but that the three LNG import terminal facilities proposed in Oregon are not the only viable option to assure needed natural gas supplies are available. There is an over-capacity of existing LNG facilities in the United States, and hence Oregon LNG facilities would likely be underutilized. Furthermore, high oil prices and competition from Asian countries competing for natural gas supply mean that the price of Pacific Basin LNG would greatly exceed the price of North American natural gas. Domestic natural gas from North American could provide adequate natural gas to meet Oregon needs for the foreseeable future. Three new proposed pipelines from the Rocky Mountain gas fields, for example, could provide natural gas more

SA7-7

We have incorporated information from the report titled, *Response to Governor Kulongoski's Request for LNG and Natural Gas Review* (ODE, May 7, 2008) into sections 3 and 4.10.1 of the final EIS.

K-528

economically for the Oregon and California markets than the three LNG terminals.

SA7-8 In addition, the report indicates that LNG has significantly higher life cycle CO2 costs than domestic natural gas, due to the processes used to liquefy and regasify the natural gas and the large transportation distances involved in shipping LNG to Oregon. It is likely that CO2 emissions from regasification at an LNG terminal in Oregon would be included in a regional cap and trade system and thus could adversely affect Oregon's ability to meet its CO2 reduction targets under a state law passed in 2007 (House Bill 3543) and under the Western Climate Initiative. In general, the Rocky Mountain pipelines appear likely to have less environmental impact on Oregon and lower levels of life cycle greenhouse gas emissions than the three LNG facilities proposed for Oregon to serve the same markets. The information contained in the ODOE report is significant new information that must be evaluated in a supplemental DEIS.

SA7-9 In *Blanco v. Burton*, 2006 US Dist Lexis 56533 (ED La 2006) (impacts of Hurricanes Katrina and Rita resulted in new information supporting a call for a supplemental EIS), the court agreed that the plaintiffs were likely to prevail on their NEPA claim that a supplemental EIS was required:

The Court of Appeals has stated, "The principal factor an agency should consider in exercising its discretion whether to supplement an existing EIS because of new information presents a picture of the likely environmental consequences associated with the proposed action not envisioned by the original EIS." *Louisiana Wildlife Fed'n, Inc. v. York*, 761 F.2d 1044, 1051 (5th Cir. 1985) (quoting *Wisconsin v. Weinberger*, 745 F.2d 412, 418 (7th Cir. 1984).

In determining whether to issue a supplemental EIS, FERC is required under NEPA to take a "hard look" at the environmental impacts of substantially changed actions and significant new information. See *Hughes River Watershed Conservancy v. Glickman*, 81 F.3d 437, 446 (4th Cir 1996) (Army Corps of Engineers failed to take a "hard look" at problem of zebra mussel infestation resulting from dam project; case remanded for determination regarding supplemental EIS).

CONCLUSION

SA7-10 As Governor of the State of Oregon, I request that FERC issue a Supplemental Draft Environmental Impact Statement to address the substantial

Request to FERC for Issuance of a Supplemental DEIS

State Agencies

7

SA7-8 We have added a discussion of lifecycle GHG emissions for LNG facilities to sections 3.1.3.3 and 4.10.1 of the final EIS.

SA7-9 We do not believe that substantial new information exists to support the need for a supplemental draft EIS.

SA7-10 See our responses to comments SA7-1 through SA7-9.

SA7-10
cont'd

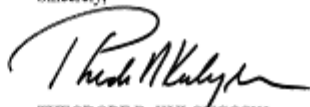

changes in the proposed action and the significant new information relevant to environmental concerns bearing on the proposed action. Such new information includes not only the voluminous material that NorthernStar and Bradwood Landing have themselves identified and submitted to FERC in the form of additional and revised information not previously included in the DEIS, but also the attached report from the Oregon Department of Energy addressing considerations of need, cost and the carbon footprint consequences if the proposed LNG import terminal facility is built in Oregon.

In closing, I reiterate the comment I made in my previous letter accompanying the DEIS comments of Oregon agencies:

Ultimately, the decision to site terminals requires the full engagement of the federal government, the state and the communities where facilities are proposed. Only by working together through the siting, environmental assessment and permitting processes can we make sound decisions about the appropriateness of any proposed LNG terminal.

In that spirit of cooperation and coordination, I look forward to an affirmative resolution of Oregon's request that a Supplemental Draft Environmental Impact Statement be prepared for the Bradwood Landing LNG import terminal facility and associated pipelines.

Sincerely,

THEODORE R. KULENGOSKI

FEDERAL ENERGY
REGULATORY COMMISSION
(file:///C:/Users/Bradwood/FI/2007/CP06-365-000/letter.doc)

To Whom It May Concern:

On behalf of the Board of Directors of our Economic Development Council I would like to respond to the proposal before you concerning Bradwood Landing and Northern Star Natural Gas.

For the past 2 1/2 years we have taken a wait and see attitude about the building of an LNG plant across the river from our County. We have studied all of the pros and cons, safety and water traffic issues etc., and we have visited with Northern Star officials.

With our understanding that your county will benefit greatly with a massive tax increase, our board has decided that we want to support the building of this facility at the requested site for the following reasons:

LA1-1

1. Northern Star has committed the docking of three tug boats in Cathlamet. These boats would constitute 35 jobs, plus rent and remodeling of an old building. In addition to maintenance, fuel, food, etc. This operation would greatly enhance our job growth and waterfront development.
2. Northern Star has committed fifty-five living wage jobs at the plant. If our county could earn ten to fifteen of those jobs along with the tug boat jobs, it would make Bradwood Landing our fourth largest employer. See attached Wahkiakum County list of top employers.
3. With the decline in timber revenues that our County uses to fund mandated services, our County medical clinic is in jeopardy. We need industry, growth and funds to help make up this loss in revenue and services.
4. Northern Star has committed to allow Wahkiakum County to bid on manufacturing items to be used in building their plant and giving us a start up business, and development of a business park. In addition to job training for our High School students.
5. Northern Star has committed \$100,000.00 a year to our Wahkiakum Community Foundation to be used to assist with safety issues and address County needs. They have already funded the first payment and will continue annually until the plant comes on line.
6. Northern Star has committed \$500,000.00 a year after the plant is operational for the life of the plant to be used as the County Foundation submits requests for needs.
7. We feel that one of our biggest assets is the river and its ship traffic. Many of our landowners and tourists come to Wahkiakum County to see the ships and river traffic. We feel it will not hurt our growth but add to it.

Thank you for considering our needs and requests.

Cordially,

Richard Erickson
Executive Director

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Bradwood Landing LLC)	Docket No. CP06-365-000
Northern Star Energy LLC)	Docket Nos. CP06-366-000 CP06-376-000 CP06-377-000

COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT BY THE
CITY OF WARRENTON, OREGON

Movant-Intervenor¹ the City of Warrenton, a municipal corporation, through its City Commission, the duly elected governing body for the City of Warrenton (the "City" or "Warrenton"), hereby submits its comments on the Draft Environmental Impact Statement ("DEIS").

Background

As described in the DEIS, the City of Warrenton, Oregon is a municipality consisting of approximately 17 square miles in geographic jurisdiction located at the mouth of the Columbia River. It is the most northwesterly City in Oregon. The former Town of Hammond is merged into Warrenton. The City's year round population is currently 4,645, however based on proposed development plans this is expected to increase to over 7,000 in the next several years. The summer time population can exceed 10,000. The City is directly and significantly impacted by the proposed vessel transits carrying liquefied natural gas ("LNG") to the proposed Northern Star Natural Gas LLC ("NSNG") facility at Bradwood Landing, located at approximately river mile ("RM") 38 upstream.

Included within or immediately adjacent to Warrenton are a diverse number of private and critical government occupancies. Among these are Fort Stevens (Oregon's largest State

¹ On or about July 5, 2006, the City of Warrenton's timely Motion to Intervene was docketed by the Federal Energy Regulatory Commission (the "Commission") as Accession No. 20060706-0160, but to date the City has not been placed on the Service List.

Local Agencies

Park), Warrenton-Astoria Regional Airport (Clatsop County's only commercial airport), Camp Rilea Armed Forces Training Center (Oregon's largest active military reservation), a 100 bed juvenile corrections facility, and two major recreational and commercial fishing boat mooring basins.

Public Safety is provided by local police and fire departments. The Warrenton Police Department is comprised of eight full-time officers and several reserve officers, who are responsible for 24 hour protection of the City's 17 square mile area. The Warrenton Fire Department consists of two full-time personnel, 32 volunteer firefighters, and seven response vehicles. The Fire Department's service area is 28 square miles and includes the numerous facilities noted above. In addition, through existing Mutual Aid Agreements, Warrenton supports the Knappa-Svensen-Burnside Rural Fire Protection District, in which the proposed LNG terminal would be located. The City currently has no marine law enforcement or firefighting capability.

The City has very limited funding resources available for public safety services. It relies on limited property tax revenues that are used primarily for existing personnel expenses. In recent years equipment purchases have depended on grants, loans, **and serial levies.**

The City's public safety responsibility extends for approximately seven miles along the southerly bank of the Columbia River beginning at approximately Clatsop Spit (Buoy 14) then continuing eastward to Smith Point. Approximately four and one-half miles of the Columbia River shipping channel from Hammond Marina east to the Astoria city limits are within the municipal jurisdiction of the City of Warrenton. Warrenton is the first municipality potentially impacted once the LNG Carrier enters the Columbia River. As described in the DEIS (Section 4.7.1), portions of the City are located within all three Zones of Concern, including the Hammond and Warrenton waterfront within Zone 1 (p. 4-273), the Warrenton Waterfront Trail, Carruthers' Park and the community library within Zone 2 (p. 4-278), and the police and fire

Local Agencies

stations are located within Zone 3 (p. 4-327). Within all three zones are many areas where people congregate outdoors including essentially the entire route from Fort Stevens State Park, along the River Walk trail, in the area of Hammond Boat Basin and at Carruthers' Park. Each of these public assembly areas are sufficiently close to the vessel transit route to warrant heightened safety and security measures.

Procedural History

On May 24, 2006, during the Pre-Filing Process, the City of Warrenton wrote to the Commission to advise that the City had a number of safety related concerns regarding the potential transit of LNG carriers through the corporate limits of the City of Warrenton, which would occur should the Bradwood Landing site be approved by the Commission. A copy of that May 24, 2006 letter was also included in the Safety Advisory Report submitted to the Commission by the Oregon Department of Energy, attached as Appendix K to the DEIS. The City timely moved to intervene, which motion was docketed July 5, 2006 as Accession No. 20060706-0160. Since that time, both Warrenton's Police Chief and Fire Chief have participated in various meetings and workshops held in conjunction with preparation of the U.S. Coast Guard Waterway Suitability Assessment Report ("WSR") dated February 28, 2007, attached as Appendix H to the DEIS, and with respect to development of an Emergency Response Plan ("ERP").

Comments on the DEIS

LA2-1

The DEIS repeatedly refers to the same discussion concerning waterway safety and security throughout the voluminous report. Specifically, the DEIS recognizes significant potential impacts within Zones 1 through 3 due to an accidental or intentional breach of an LNG vessel resulting in a release of LNG during transit or while at the berth. It acknowledges the risk of severe consequences, with injuries ranging from mild to fatal, being most severe in Zone 1 and decreasing outward through Zones 2 and 3. See, e.g., DEIS, p. 4-322. Yet, the DEIS

Local Agencies

LA2-1

We have updated section 4.11.5.5 to include a condition which would require NorthernStar to comply with all requirements set forth by the COPT

LA2-1
cont'd

uniformly concludes that "with the implementation of the safety and security measures and conditions outlined in the Coast Guard's WSR (see Appendix H), an LNG release along the waterway would be highly unlikely." *Id.* See also DEIS, p. 4-273 ("Effects on structures within Zone 1 would be most severe, while buildings within Zone 3 would be less impacted. However, with implementation of the mitigation measures described in the Coast Guard's WSR, an LNG release along the waterway would be highly unlikely."); DEIS, p. 4-275 ("With the implementation of the safety and security measures outlined in the Coast Guard's WSR, it is highly unlikely that there would be a release of LNG from a passing LNG ship that would lead to a spill and related pool fire affecting planned commercial or residential developments along the waterway."); DEIS, p. 4-279 ("Those facilities within Zone 1 could sustain damages to structures, features, or vegetation. Facilities within Zone 3 would be less affected. However, with the implementation of the safety and security measures outlined in the Coast Guard's WSR, the chance of a spill would be extremely remote.").

As a result of these findings, the FERC staff made a number of recommendations which are described in detail in Sections 4.11.5.5 and 4.11.6 of the DEIS (pp. 4-429 through 4-436) and further documented in Section 5.2, Conditions 42, 62 and 63. These conditions fail to properly acknowledge, however, that the Coast Guard measures are *necessary requirements* and not simply preliminary recommendations with the details to be worked out later. Compare DEIS, p. 4-432 ("the WSR recommends additional facilities and infrastructure to make the waterway suitable for LNG marine traffic") with WSR, App. H ("I have determined that to make the Columbia River suitable for the type and frequency of LNG marine traffic associated with this project, additional measures will be necessary ... [and] must be put into place").

LA2-2

Additionally, the DEIS minimizes and generalizes the specific requirements outlined by the Coast Guard. For example, on page 4-432, the DEIS identifies one item as "augmentation of shoreside firefighting capabilities to provide protection services to the facility as well as

Local Agencies

2

LA2-2 By necessity, the EIS must summarize information from many sources. The complete WSR is provided as Appendix H.

LA2-2
cont'd

communities along the river" when the original WSR (p.4 of 6) stated "shore side firefighting resources and training will need to be augmented ... [including] adequate cost-sharing arrangements for project related training, equipment, maintenance, and staffing ... for all communities impacted by the project."

LA2-3

Representatives of NSNG have had approximately two years to make firm commitments to state, county and local law enforcement and fire agencies concerning these requirements, and have not done so. The proposed conditions that the WSR be updated annually and NSNG commit prior to commissioning to implement the required measures is simply too little too late. Additionally, the conditions recommending the Emergency Response Plan ("ERP") and cost-sharing plan be submitted prior to initial site preparation likewise do not provide sufficient certainty for local communities, like Warrenton.

As documented throughout the DEIS, implementation of these measures are critical to the viability of the project and the validity of the DEIS assessment. Absent binding agreement with the state, county and local fire and police agencies concerning security and safety requirements, the project cannot proceed and the entire DEIS safety and security analysis is rendered meaningless. Therefore, NSNG should be required, *prior to issuance of the final order issuing certificates ("Order" or "Certificate")* to reach an agreement in principle, in a form acceptable to each respective agency, with each state, county and local municipality affected on the level of resource funding NSNG will commit for safety and security requirements including, without limitation, capital requirements for new equipment, resources for additional staff, and training for all affected personnel (both professional and volunteer). These critical decisions cannot and should not be put off until after the Certificate issues.

The Commission cannot fulfill its statutory duty to address state and local safety considerations required by 15 U.S.C. § 717b-1 (Section 311(d) of the Energy Policy Act of 2005) by simply stating that these important details will be worked out after the Certificate issues. See

Local Agencies

2

LA2-3 See our response to comment PM1-1.

LA2-3
cont'd

DEIS, Appendix K, Response of the Federal Energy Regulatory Commission to the Safety Advisory Report of the Oregon Department of Energy for the Bradwood Landing Project (referring to proposed Conditions 42, 62, and 63). The statute requires meaningful resolution of state and local safety considerations "prior to issuing an order pursuant to section 717b." See 15 U.S.C. § 717b-1(b) and (c). Therefore, NSNG must be required to address Warrenton's requirements (as well as the other jurisdictions affected), outlined in its May 26, 2006 letter, and commit to the funding necessary to implement these requirements, prior to issuance of any Order approving the project.

LA2-4

Secondly, with respect to "the current capacity of the local public services to respond to an incident or fire at the LNG terminal," the DEIS recognizes "that significant gaps exist in fire fighting capacity for both shore and water side fire fighting response." DEIS, p. 4-342. These gaps were also described in the State Advisory Report (Appendix K) filed pursuant to 15 U.S.C. § 717b-1. The DEIS states that "NorthernStar has indicated that trained personnel and fire fighting equipment would be maintained at the LNG terminal in the event of an emergency." Id. However, there is nothing in the DEIS to indicate that NSNG has committed to anything more than that which is required by applicable regulations and requirements found in 49 C.F.R. Part 193 and NFPA 59A. The proposed solution to address this acknowledged issue, the requirement to produce an ERP prior to construction, is simply inadequate.

Given the lack of local capacity and the distance from supporting fire fighting services, NSNG must be required to provide enhanced fire protection in the form of an Industrial Fire Brigade as described in NFPA 600. It is simply insufficient that operations and maintenance personnel will be trained in safe shutdown and evacuation procedures, etc. as already required by applicable regulations. If an incident occurs at night, when only a limited operations crew is working, there may be insufficient personnel to man all of the fire fighting equipment likely to be present. Additionally, by conditioning the Order on implementation and maintenance of an

Local Agencies

2

LA2-4 As discussed in section 4.11.6, NorthernStar would be required to develop an ERP that would be approved by the FERC before any final approval to begin construction. See our response to comment PM1-1.

LA2-4 cont'd Industrial Fire Brigade (NFPA 600), the Commission and the public can be assured that dedicated fire fighters with proper training and equipment will be readily available to address any incident at the terminal.

LA2-5 Lastly, with respect to protection of Cultural Resources in the event of an incident, the DEIS states that "NorthernStar indicates that it would produce a Cultural Resources Management Plan that would outline procedures for coordination with first responders in order to protect historic properties." DEIS, p. 4-359. This commitment is not reflected in any of the proposed conditions prepared by FERC Staff. See Section 5.2. Therefore, Condition no. 36 (requiring such Cultural Resources Management Plan) must be modified to include a requirement to coordinate, and reach agreement, with first responders on the method and means to protect historic properties which are located within the Zones of Concern, especially historic buildings along the waterway which are most likely to be adversely impacted.

Conclusion

As described herein and in its prior correspondence (incorporated by reference), Warrenton requires a commitment to fund necessary capital and on-going expenditures related to police and fire protection before it can agree to any proposed ERP. NSNG should be required to document such commitments, in a form agreeable to Warrenton, before any final Order is issued from the Commission. The proposed mitigation conditions, which delay finalizing such monetary commitments until after the Certificate issues, are inadequate and contrary to statutory requirements enacted as part of the Energy Policy Act of 2005. Additionally, based on the recognized need, NSNG should be required to implement and maintain an Industrial Fire Brigade meeting all requirements described in NFPA 600, and as approved by the City of Warrenton. Lastly, the required Cultural Resources Management Plan must contain provisions addressing the risk to historic properties located within the Zones of Concern and include agreements with local first responders documenting the method and means for protecting these properties and sites.

Local Agencies

2

LA2-5 We agree that the Cultural Resources Management Plan that NorthernStar committed to protect historic properties from the actions of first responders in the event of an unexpected accident should be part of the FERC's requirements to complete compliance with the NHPA. Therefore, we have added to our recommendation in section 4.9.4 the requirement that NorthernStar must provide a Cultural Resources Management Plan, for review and approval by the SHPOs and the FERC, prior to construction.

Respectfully submitted,

Gilbert Gramson

Re: Docket CP06-365-000 and CP06-366-000 et al.
Bradwood Landing LNG Import Terminal Draft Environmental Impact Statement

Dear Ms. Bose:

Cowlitz County is the SEPA agency for the State of Washington. It is our responsibility to ensure that the environmental document adequately addresses local and state issues. To that end the County has reviewed the Draft Environmental Impact Statement (Draft EIS) and compiled comments from the public and local and state agencies. As members of the Board of Cowlitz County Commissioners, we respectfully submit this letter and the enclosed attachments as the County's official comments on the Draft EIS.

Enclosed with this letter are the following documents:

- Cowlitz County official comments on the Bradwood Landing Project Draft EIS
- Public Comments
- Agency Comments
- County Meeting Notes

Overall, we found the Draft EIS helpful in its description of the proposed terminal and operations, and we appreciate the difficulty of completing a thorough environmental analysis for such a large and complex project. Our comments identify our primary areas of concern and make requests for revision to the Draft EIS or for additional analysis.

Sincerely,
Board of County Commissioners
of Cowlitz County, Washington

Cowlitz County Official Comments: Bradwood Landing Project Draft EIS NEPA/SEPA Review

Introduction

This NEPA/SEPA review looked at the Bradwood Landing Draft EIS, Resource Reports for the environmental disciplines for both the Terminal and Pipeline portions of the project, and additional supporting materials found as referenced in the Bradwood Landing materials or referred to the County through public comment. The comments are organized by Draft EIS chapter and section.

These comments represent the official comments of the Cowlitz County Board of Commissioners, the designated State Environmental Policy Act lead agency for the Bradwood Landing Project. Attached with these comments is the full record of comments received by the County during the Draft EIS comment period. The record is organized by public comments, agency comments, and county meeting notes.

Chapter 1 Introduction

- LA3-1 1) **Comment:** (Page 1-2) The description of the proposed LNG import terminal does not mention or describe the development of the foundation for a third LNG storage tank. Because the development of a third storage tank foundation would affect habitat resources at the site, it should be identified as part of import terminal development.
- Request:** The FERC should clarify that a third storage tank foundation will be developed under the proposed LNG import terminal description.
- LA3-2 2) **Comment:** (Page 1-3) Cowlitz County is concerned that the purpose statement and at least one of the stated objectives for the project may be considered too narrow under NEPA. Including "through importation of LNG" in the purpose statement is rather narrow and rules out other sources of new natural gas to the Pacific Northwest. Additionally, the statement "delivering natural gas to the Wauna Mill, Oregon and the PGE Beaver Power Plant at Port Westward, Oregon" and then using this statement as a project objective to rule out alternative sites and pipeline routes may be seen as too narrow for NEPA standards.
- Request:** The FERC may want to consider a more broad purpose statement to meet the intent of NEPA.
- LA3-3 3) **Comment:** (Page 1-8) ODEQ will not review the Bradwood Landing NPDES permit application until Clatsop County has issued a Land Use Compatibility Statement.
- Request:** The review of the NPDES permit application should be made available for review and comment prior to issuance of the Final EIS.
- LA3-4 4) **Comment:** (Page 1-24 and 1-25) The Draft EIS should incorporate all substantial comments submitted during the scoping process. However, the comments included in Chapter 1 do not include comments made about unsuitable soils and geologic hazards or comments regarding economic impacts to landowners along the pipeline.
- Request:** The FERC should include all substantial concerns and comments raised during the scoping process.

Local Agencies

3

- LA3-1 Soil corrections and vibroflotation would be conducted in the entire LNG storage tank area (including the area of the possible third tank); however structural foundations for the third tank would not be constructed.
- LA3-2 Although the purpose statement included the phrase "through importation of LNG" we evaluated system alternatives that included new pipelines (see section 3.1.2.2). Regionally, we considered locations in Puget Sound, Grays Harbor, and Jordan Cove and did not exclude them because they could not supply natural gas to specific end users that the Bradwood Landing Project proposes to serve. However, when we considered the locations on the Columbia River, we did a more detailed comparative analysis and assumed the same delivery points along the sendout pipeline for all of the proposed alternatives for consistency.
- LA3-3 We have revised the EIS to acknowledge that Clatsop County made its land use decision on March 20, 2008. See responses to comments PM6-94, SA1-179, and SA4-3.
- LA3-4 The EIS addresses all general issues raised during scoping. See our response to comment PM3-24.

Chapter 2 Description of Proposed Action

- LA3-5 1) **Comment:** (Pages 2-11 and 4-428) Chapter 2 describes the waterway conditions at the mouth of the Columbia River, for example the potential for a 35-foot standing wave at the bar and the need for large ships to wait for good conditions before leaving or entering the river channel. Page 4-428 explains that there are two anchorages on either side of the channel at Astoria, but that the LNG ships would not use the anchorages. Cowlitz County poses this question because if the location of holding for LNG ships is closer to Washington there may potential impacts to the State of Washington.
- Request:** The FERC should disclose the alternative locations for holding LNG ships while waiting for safe passage conditions to allow for consideration and review of potential impacts.
- LA3-6 2) **Comment:** (Pages 2-27 and 4-9) The Draft EIS indicates gas conveyed by the pipeline would not be odorized. The pipeline alignment in Washington would pass through an area of numerous documented mass-wasting hazards.
- Request:** The Final EIS should include a more thorough risk analysis to address leak detection and pipeline safety given the risk to pipe integrity posed by the geologic setting coupled with the pipeline transport of non-odorized gas.
- LA3-7 3) **Comment:** (Page 2-28) This section briefly describes the Palomar Gas Transmission pipeline project (Palomar). It describes that although NorthernStar has indicated it is seeking capacity on the Palomar pipeline, the construction of the Palomar pipeline is entirely independent of the Bradwood Landing project. As such, the FERC indicates that all analysis of impacts and alternatives for the Palomar pipeline will be conducted separately. This section also indicates that a section of the pipeline connecting to Bradwood Landing would not be constructed if Bradwood were not constructed. Thus, in our analysis, for at least that section of the pipeline, any impacts from the Palomar pipeline are, in fact, dependent on the Bradwood Landing LNG import terminal project.
- Request:** The FERC should evaluate and disclose potential impacts of that section of the Palomar pipeline that is dependent on the Bradwood Landing project. Because these impacts would occur on lands not presently impacted by the project currently under review in this Draft EIS, property owner notification, additional public comment hearings, and additional comment period for an updated Draft EIS would be appropriate.
- LA3-8 4) **Comment:** (Page 2-28) The potential connection of the Bradwood Landing LNG facility to the Palomar pipeline has raised many questions about the future use of gas imported to Bradwood Landing. Many Cowlitz County residents have questioned whether the Draft EIS accurately represents the intent of NorthernStar with respect to the ultimate market destination of imported LNG. The indication in this section that natural gas could be sent through the Palomar pipeline makes Cowlitz County residents question whether the proposed pipeline through Cowlitz County is even necessary, and if the demand for natural gas presented in the purpose and need section of the Draft EIS accurately represents the intended markets.
- Request:** The FERC should closely evaluate the relationship between the Bradwood Landing LNG facility, its proposed pipeline, and the proposed Palomar pipeline. To the extent possible, future plans for capacity on the Palomar pipeline and the proposed Bradwood Landing pipeline for LNG imported through Bradwood Landing should be disclosed.
- LA3-9 5) **Comment:** (Page 2-41) Site preparation may include blasting along the southern boundary of the site and at the existing rock quarry. The Draft EIS states that all applicable federal, state, and local regulations will be adhered to and NorthernStar would employ mitigation measures, as necessary.

Local Agencies

3

- LA3-5 There are no locations planned for holding LNG carriers. If the Columbia River Bar is closed, incoming LNG carriers would stay in the ocean, while outgoing carriers would remain at the LNG terminal. No anchorages would be allowed for LNG carriers along the waterway.
- LA3-6 Section 4.1.4.3 describes the mitigation measures proposed by NorthernStar to address potential geological hazards. The pipeline would be operated under the DOT's pipeline safety standards contained in CFR 49 Part 192, including leakage survey requirements in 192.706. See also our responses to comments PM5-81 and LA7-25.
- LA3-7 Although the segment that would connect to the Bradwood Landing LNG terminal would not be built if the Bradwood Landing Project is not authorized, taken as whole, the Palomar pipeline is not dependent on the Bradwood Landing Project. The environmental impacts of the Palomar project are being reviewed under a separate EIS process, including property owner notification and the opportunity for public review and comment.
- LA3-8 The Bradwood Landing sendout pipeline would terminate at an interconnection with the existing Williams Northwest pipeline system near Kelso, Washington. The Palomar pipeline could be an alternative destination for natural gas from the Bradwood Landing LNG terminal if it is certificated and constructed, but the Bradwood Landing Project would not be dependent on it.
- LA3-9 NorthernStar would develop a Blasting Management Plan which would contain measures for noise mitigation.

K-542

K-543

LA3-9 | **Request:** Prior to completion of the Final EIS and to comply with SEPA, NorthernStar should coordinate with nearby residents at Puget Island regarding potential noise impacts during blasting and should develop a blasting management plan as part of the mitigation for this impact.

LA3-10 | 6) **Comment:** (Page 2-56 through 2-58) The FERC requires that NorthernStar hire an independent third-party contractor for compliance monitoring throughout construction.
Request: The FERC should include stipulations that the third-party contractor be under contract to the FERC, not to NorthernStar to avoid conflict of interest concerns.

LA3-11 | 7) **Comment:** (Pages 2-63 and 3-41) Section 2.9 - Future Plans and Abandonment states "...provisions have been made in the layout of the site to allow for a possible future expansion by adding a third LNG storage tank and associated equipment." Section 3.1.6.2 (page 3-41) states that "...designing a project to allow for future expansion is a typical model for energy projects..." Both sections may be interpreted to mean that a specific terminal area for a third LNG tank may be set aside for future expansion. The Draft EIS does not explicitly state that construction of the foundation and concrete pad is necessary as part of future planning or provisions.
Request: The FERC should clarify in the Final EIS that construction of the foundation and containment berm for a possible third LNG storage tank will be undertaken during terminal development, and that the foundation and relevant section of the containment berm are provisions for future expansion.

Chapter 3 Alternatives

LA3-12 | 1) **Comment:** Overall, the terminal site alternatives analysis as provided in the Chapter 3 of the Draft EIS and in the Bradwood Landing Resource Report 10 fail to meet the standards for alternatives analysis found in Section 10.4 of the FERC's *Guidance Manual for Environmental Report Preparation*, August 2002. Section 10.4 requires that the environmental document "Identify and discuss the decision criteria and weighting used at each decision point and clearly state the basis for each decision." This statement is followed by a list of factors that should be discussed for each alternative site. Of the 17 factors, it appears the Bradwood Landing terminal site alternatives analysis did not specifically evaluate seven of these factors as follows:

- a) Visual impact;
- b) Amount of prime farmland soils;
- c) Presence of HRHP-eligible sites;
- d) Number of noise-sensitive areas (NSAs);
- e) Location of nearby NSAs;
- f) Air quality considerations; and
- g) Noise considerations;

Although the environmental documents state that the alternatives analysis consisted of a three year long evaluation process, there is very little supporting information regarding the alternative terminal sites and no evidence of a weighted criteria system or consistent application of the criteria to each site. Cowlitz County reviewed the alternative locations for the terminal because of the impacts to residents of the State of Washington on Puget Island and because the location of the pipeline is determined by the location of the terminal.

Request: The FERC and NorthernStar should provide documentation of the detailed criteria evaluation for each of the proposed alternative terminal locations and demonstrate how each criterion was equally applied to each alternative site.

Local Agencies

3

LA3-10 | The FERC third-party contracting guidelines establish a separation of the contractor's technical interactions with the FERC staff from the invoicing process, whereby the project sponsor is only involved in paying for the contractor's time, materials, and related expenses. This is so that the applicant has the burden of covering the costs for the review of its proposal, rather than passing on those expenses to U.S. tax payers. This arrangement is similar to what other federal agencies, such as the BLM and USFS, do under their cost-reimbursable contracts with applicants. The third-party contractor is under the direction of the FERC staff, and NorthernStar is prohibited from viewing any work products. There is no conflict of interest. See response to comment PM3-65.

LA3-11 | See our response to comment LA3-1.

LA3-12 | We discuss our criteria for evaluating alternatives at the beginning of section 3.1 and in section 3.1.5.3. We provided information about impacts on specific resources where we have data for alternative LNG terminal sites. We did evaluate visual impacts for certain alternatives. For example, the discussion of the Oregon LNG terminal, in section 3.1.3.4, indicated that it may have greater visual impacts than the Bradwood Landing location because it would be closer to population centers in Warrenton and Astoria. We mentioned that the sendout pipeline for the Oregon LNG Project could potentially impact nine archaeological sites, while 88 archaeological sites were identified along the sendout pipeline for the Jordan Cove LNG Project. NSAs and noise impacts were considered indirectly by an assessment of the closest residence and the population density in adjacent areas. Air quality issues are equivalent, as all of the LNG terminal alternative locations are within areas that are in attainment for all NAAQS criteria pollutants.

K-544

- LA3-13 2) **Comment:** (Page 3-6) Reference to the estimated 1,800 waste sites and radioactive contamination at Hanford Nuclear Site is not explicitly linked to power generation at the Columbia Generating Station. Unless the 1,800 waste sites are a byproduct of power generation they should not be included in the analysis of nuclear energy as an alternative.
- Request:** The FERC should clarify or qualify in the Final EIS the relation and relevance of these waste sites and/or nuclear contamination to nuclear power generation at the Hanford Nuclear Site – Columbia Generating Station.
- LA3-14 3) **Comment:** (Page 3-29) The argument for the dismissal of the Port Westward alternative site is insufficient. This alternative site appears to have important advantages over the Bradwood Landing site, specifically the potential for reuse of waste heat and cool water.
- Request:** To improve the conclusion, the results of additional research into the lease agreement for site feasibility and more clearly quantified potential, incremental negative impacts of the further river travel should be provided.
- LA3-15 4) **Comment:** (Page 3-31 through 3-34) The Draft EIS states that the analysis of feasibility for off-shore LNG import facilities was conducted at one location southwest of Astoria. This location was chosen to provide an efficient pipeline connection to on-shore facilities. We note that for on-shore LNG import terminals the alternative site analysis included sites outside of the immediate proposed project area, as long as a site could meet the purpose of bringing LNG to the Northwest market. By limiting the evaluation of off-shore alternatives to just one location, the alternatives analysis does not evaluate a reasonable breadth of locations.
- Request:** (Page 3-31) The FERC should identify other potentially feasible off-shore locations that could serve the purpose of bringing LNG to the Northwest and should conduct the same analysis for feasibility, and the results should be presented in the Final EIS.
- LA3-16 5) **Comment:** The analysis performed to compare Oregon off-shore conditions to those of the Gulf of Mexico and the Atlantic Ocean near Massachusetts is limited and may not provide a clear picture of the conditions other LNG facilities have been constructed in.
- Request:** The FERC should also include a comparison to the conditions in Nova Scotia where the Keltic Petrochemicals LNG and Bear Head LNG facilities have been proposed with off-shore components.
- LA3-17 6) **Comment:** (Page 3-39) The argument for the dismissal of the Cherry Point alternative site is insufficient. Reasoning for dismissing this site is based on potential restrictions on development due to an August 2000 Withdrawal Order by the Washington Commissioner of Public Lands that created the Cherry Point State Aquatic Reserve (CPSAR). As stated in the Draft EIS, the specific management plan will not be finalized until late 2007 or early 2008. To date negotiations are still underway and include all the stakeholders in the area including industrial developments (www.dnr.wa.gov/hdocs/aqu/reserves). We feel that the existing industrial character of this site, the deep water access, and short distance to the Williams Pipeline make the Cherry Point site a strong alternative to the Bradwood Landing site for bringing LNG to the northwest market.
- Request:** Further investigation of the potential for development of an LNG import terminal should be included before finalization of the Bradwood Landing EIS. For more information, the DNR website references Kyle Murphy (360-902-1073; kyle.murphy@dnr.wa.gov).
- LA3-18 7) **Comment:** (Page 3-48) The reasons given for dismissing the Railroad Route Alternative are insufficient. The Draft EIS states that this alternative fails to meet the project objective of delivery to

Local Agencies

3

- LA3-13 We have revised the text discussing nuclear power as a renewable energy resource alternative in section 3.1.1.3.
- LA3-14 We disagree that our analysis of the Port Westward alternative LNG terminal location is insufficient. We do not believe that the potential to exchange waste heat and cooling water from the Beaver power plant at Port Westward is a critically important advantage. The Bradwood Landing Project would have limited impacts on air quality, as explained in section 4.10. As our discussion in section 3.1.3.4 indicates, the disadvantages of an LNG terminal alternative at Port Westward includes lack of a project sponsor able to prepare a FERC application, unfavorable development conditions for the lease of waterfront property, and longer LNG carrier transit. No additional research is necessary to support those conclusions.
- LA3-15 The data on rough seas conditions, derived from the ABSC report, apply to the entire Pacific Northwest coast line. (See our response to comments PM2-24 and FA2-4.) We picked a hypothetical location off the Oregon Coast, in close proximity to the proposed Bradwood Landing Project, in order to meet the project objectives. The conclusions presented in the EIS are based on an evaluation of technologies that are technically and economically feasible given weather conditions off the Oregon coast. These technologies have certain limitations under conditions that would be present along the entire Pacific Northwest coastline. See also our response to IND115-2 [Bennett and Patricia Garner].)
- LA3-16 We have revised section 3.1.4.1 to better explain how rough sea conditions off the Oregon coast compares to conditions off the Northeast and Gulf coasts. Keltic Petrochemicals of Halifax is proposing a petrochemical plant and a cogeneration plant with an associated LNG terminal, storage, and regasification facility (see http://www.kelticpetrochemicals.ca/projects_lng.html). The Bear Head LNG project has since been discontinued but would have been located on a peninsula on Cape Breton Island, Nova Scotia, Canada (LCG Consulting Energy Online, accessed March 2, 2008 <http://energyonline.com/Industry/News.aspx?NewsID=6951>). With LNG storage and vaporization facilities located onshore, both of these proposed facilities are not conceptually different than the one proposed by Oregon LNG. Regardless, the sea conditions located at these sites are not comparable to the conditions off the coast of Oregon.
- LA3-17 Because of the uncertainty associated with the potential restrictions imposed by the CPSAR, a potential LNG facility developer could not have considered the Cherry Point alternative site under the same schedule as the proposed site. As further discussed in section 3.1.5.3, the Cherry Point location was also eliminated due to the interim restrictions on the development of any new in-water structures within the Cherry Point State Aquatic Reserve. We do not believe this alternative warrants further consideration at this time.
- LA3-18 We believe our conclusions in section 3.1.8.1 sufficiently describe the benefits of the proposed route over the Railroad Route Alternative. The proposed route beyond the PGE Beaver Power Plant at Port Westward would be collocated with the existing KB Pipeline for a significant portion of its length.

K-545

LA3-18
cont'd

the PGE Beaver Power Plant at Port Westward without a pipeline lateral that would significantly extend the length of the pipeline. Considering the objective of delivery to the power plant suggests that another alternative, a hybrid of the proposed pipeline route and the Railroad Route, could have been considered. The route could have followed the proposed route to the power plant and then transitioned to follow the Railroad Route. It appears, without any independent research or analysis, there is potential for a route with fewer environmental impacts (as described by the Railroad Route) that could be developed by such a combination. Additionally, based on Comment 2 in our comments for Chapter 1, this alternative was eliminated for not meeting a project objective that may be seen as too narrow under NEPA.

Request: Before finalization of the Bradwood Landing EIS, this additional alternative should be analyzed.

LA3-19

8) *Comment:* (Page 3-49) The Major Pipeline Route Alternatives Conclusion appears to falsely state that the proposed pipeline alternative is the shortest alternative route, when the description of the Railroad Route of page 3-48 states that the Railroad Alternative is slightly shorter than the proposed route, and Table 3.1.8-1 on page 3-50 shows the Proposed Route length as 36.3 miles and the Railroad route length as 35.8 miles.

Request: This statement should be evaluated and corrected if needed.

LA3-20

9) *Comment:* (Page 3-49) The Major Pipeline Route Alternatives Conclusion statement further claims that the proposed route eliminates constructibility issues. There is no specific evidence provided to measure constructibility issues. Many would argue that the proposed route poses numerous constructibility issues due to challenges of drilling below two major rivers and laying pipeline for approximately 17 miles in terrain with approximately 31 documented landslide features, stream drainages, and other geologic challenges.

Request: Before finalization of the Bradwood Landing EIS, further analysis of constructibility between pipeline route alternatives should be provided.

LA3-21

10) *Comment:* (Page 3-51) Table 3.1.8-2 provides reasons for minor route variations in the proposed pipeline route. While this information is helpful, it is difficult to evaluate the accuracy of the statements because the level of detail provided on the maps in Appendix B is not sufficient to verify the conclusions. Additionally, on the maps, it is unclear whether the red solid line shows the route as indicated with the "selected" notation in Table 3.1.8-2 where the alternative route was selected, or if the dashed line shows alternatives considered in the case where it was selected or where it was not.

Request: Where a minor route variation was determined based on a physical element that can be mapped, more detailed mapping should be provided. Additionally, clarification should be provided for symbolization of the selected route.

Chapter 4 Environmental Analysis

4.1 Geology

LA3-22

1) *Comment:* (Pages 4-20 and 4-21) Section 4.1.4.3 states that horizontal directional drilling (HDD) is proposed for routing the pipeline under landslide features and up to 17 waterbodies. A URS geotechnical investigation (URS 2006b) states for each of the proposed HDD sites, that "the risk of encountering varying geologic conditions is low." Based on a review by Foundation Engineers contracted with Cowlitz County, the Columbia River Basalt underlying many of the sites vary from soil to very hard rock with zones of very close jointing. Therefore, in our opinion, the HDD will likely encounter widely varying conditions. The proposed extensive use of HDD technology appears

Local Agencies

3

LA3-19

The major pipeline route conclusion has been revised in the final EIS.

LA3-20

The constructability issue referred to is specifically the requirement for blasting in proximity to the railroad bed. This has been clarified in the conclusions for the major pipeline routes in section 3.1.8.1.

LA3-21

The legend on each figure indicates that the solid line is the proposed route, which by definition, would be the selected route segment. The EIS is by necessity a summary document and we believe the level of detail in the pipeline route maps, along with the narrative in the text, is sufficient to depict the minor route variations.

LA3-22

See our response to comment SA3-5.

LA3-22
cont'd

to 'push' the limits of the existing technology. In addition, there are no contingency plans for alternate stream crossing methods such as open trenching. The lack of surety regarding whether HDD technology can be used at all the locations it is proposed may present problems with compliance with the Biological Opinion and other agency approvals.

Request: The Final EIS should provide a more thorough discussion of design considerations and the feasibility of using HDD. This discussion should include contingencies in the event that attempts to use HDD fail to a significant degree and should demonstrate approval from regulatory agencies for these contingency methods.

LA3-23

- 2) *Comment:* (Pages 4-20 and 4-84) The Draft EIS recommends preparation of a Final Pipeline Design Geotechnical Report prior to construction but after project approval. The more detailed geotechnical report is to refine the subsurface conditions beneath difficult geometries and/or sensitive watersheds. The potential scope of engineering challenges seems to merit a more detailed analysis of the suitability of the proposed pipeline alignment prior to project approval.

Request: The Final EIS should provide a more detailed assessment of engineering challenges to pipeline installation and integrity posed by local geology that can be compared with other pipeline routes in the alternatives analysis.

4.2 Soils and Sediments

No specific comments.

4.3 Water Resources

LA3-24

- 1) *Comment:* (4-84) The Draft EIS states that up to 17 waterbodies will be traversed using HDD. A URS geotechnical investigation (URS 2006b) that examines thirteen potential HDD sites states that the risk of "frac-out", loss of drilling fluid to the surface is reduced by the subsurface basalt bedrock. In our experience, Columbia River Basalt often includes open joints and zones of high permeability. Therefore, the risk of drilling fluid loss is relatively high.

Request: The Final EIS should include an assessment of cumulative effects from potential multiple frac-outs. The Final EIS should also include a "failure threshold" analysis whereby the use of HDD would be re-evaluated. In addition, because some regulatory approvals (U.S. Fish and Wildlife Biological Opinion and U.S. Army Corps of Engineers Section 404 Permit) are dependant on methods presented in applications based on HDD technology, contingency plans and demonstration of approval from all required regulatory authorities must be provided prior to the Final EIS.

LA3-25

- 2) *Comment:* (Page 4-56) The HDD alignment for the Columbia River crossing falls within the area of influence of a Port of St. Helens, Oregon municipal well that was not discussed in the Draft EIS.

Request: The Final EIS should describe and discuss effects of pipeline construction on the Port of St. Helens municipal well.

LA3-26

- 3) *Comment:* (Pages 4-66 and 4-70) Model predictions taken from the WEST hydrodynamic and sediment transport report prepared for NorthernStar state that dredge-related total suspended solids (TSS) would diminish to 0.1 mg/L before reaching Tenasillahe Island. Teasillahe Island is located approximately 1 kilometer downstream of the edge of the proposed dredging zone. Hunt Creek, which is recognized essential salmonid habitat, is located immediately adjacent to the proposed dredge site.

Request: Clarify in the Final EIS whether TSS concentrations on the order of 0.1 mg/L would be temporary and minor in the vicinity of Hunt Creek during dredge activities, and what effects on natural resources may be anticipated from anticipated TSS concentrations.

Local Agencies

3

LA3-23

The detailed geotechnical analysis for the pipeline requires property access that is currently not available. It is not feasible to include this level of analysis in the final EIS.

LA3-24

The trajectory of the Columbia River HDD would be designed to minimize the potential for frac-outs. The FERC's approval of the project is contingent on the COE's approval of the section 404 permit. In addition, the FERC would not allow construction to proceed until after we have concluded formal consultation with the FWS and NMFS.

LA3-25

Based on the location of the Port of St. Helens municipal water well relative to the trajectory of the Columbia River HDD borehole, we do not believe that the well would be affected by pipeline construction.

LA3-26

Based on figure 44 within the Hydrodynamic and Sediment Transport Assessment conducted for the Bradwood Landing Project by WEST (2006), TSS concentrations would diminish to 0.1 mg/L before reaching Hunt Creek. Sections 4.2.2.2 and 4.3.2.3 have been revised to address this comment. Potential impacts on aquatic resources due to increased suspended sediment and turbidity levels from dredging activities are described in section 4.5.2.1.

K-547

LA3-27 4) **Comment:** (Page 4-70) The Draft EIS states that background levels of turbidity measured in Nephelometric Turbidity Units (NTUs) are on the order of 3 to 10 NTUs in the Columbia River, and that "...turbidity plumes from dredging for the Bradwood Landing Project would return to within 1 NTU of background levels within 1 minute after suspension." This represents a 10% to 33% increase in NTUs over background over a period of 48-72 days, 24 hours per day for the initial dredging to be completed.

Request: The Final EIS should more explicitly characterize whether increases in NTUs reported in the Draft EIS would have significant impacts to natural resources, and should more explicitly characterize the extent and duration of the plume anticipated from dredging activities.

LA3-28 5) **Comment:** (Pages 2-42 and 4-50) The Draft EIS describes dredging a 58-acre basin to accommodate LNG ship movement and berthing. The description of channel habitat affected by dredging does not adequately quantify benthic species and their ecological functions.

Request: The Final EIS should more thoroughly characterize habitat and species usage in the area proposed for dredging, and should discuss how proposed mitigation replaces functions and habitat lost via dredging. The Final EIS should also provide more detail as to why dredge of the proposed scale was determined to be "minor and temporary."

4.4 Wetlands and Terrestrial Vegetation

LA3-29 1) **Comment:** (Pages 4-96) The Draft EIS requests that NorthernStar should file the final wetland mitigation plan with the FERC prior to construction. Wetland and terrestrial mitigation is a key component in the evaluation of environmental impacts and, therefore should be complete and available for review and comment prior to application approval.

Request: The Final EIS should include the final mitigation plan in order to allow adequate evaluation of proposed mitigation.

LA3-30 2) **Comment:** (Page 4-103) The Draft EIS describes recovery of vegetation affected by pipeline construction taking "several years" in the case of shrub-scrub wetlands, and presumably longer for affected forested wetlands. However, the Draft EIS suggests a "minimum of 3 years" of post-construction monitoring. It is typical for wetland mitigation monitoring to extend longer than three years. We recommend a minimum of five years of mitigation monitoring, staggered over a ten-year period.

Request: The Final EIS should include a more adequate post-construction mitigation monitoring program.

LA3-31 3) **Comment:** (Page 4-105) The Draft EIS notes that ten temporary construction areas located in wetlands or within 50 feet of wetlands were not approved by the FERC. The Draft EIS recommends relocating these construction areas or providing better site-specific rationale for their use "prior to pipeline construction."

Request: The Final EIS should include descriptions for all temporary construction areas, and any temporary construction areas that affect wetlands or other critical habitat areas should include site-specific rationale.

LA3-32 4) **Comment:** Proposed wetland mitigation for the Washington section of pipeline includes enhancement of existing wetlands via weed removal and control, and native plantings. In our experience, existing wetland areas that include invasive, weedy species are difficult to enhance without changing base conditions, such as modifying land management practices, manipulating

Local Agencies

3

LA3-27 We believe the potential direct and indirect impacts on aquatic resources as a result of dredging activities are adequately described in section 4.5.2.1. Additional details on the extent and duration of the turbidity plume associated with dredging activities at the LNG terminal site are included in the Hydrodynamic and Sediment Transport Assessment conducted for the Bradwood Landing Project by WEST (2006).

LA3-28 We believe that the discussion of habitat and species usage in the dredged footprint is adequately described in section 4.5.2.1. The adequacy of NorthernStar's Compensatory Mitigation Plan is discussed in the response to comment FA2-10.

We were unable to find any reference within the pages described in the comment (pages 2-42 and 4-50) to impacts from dredging being classified as minor and temporary. We agree that dredging of the ship berth and maneuvering area would result in permanent habitat modification (see table 2.3-1).

LA3-29 See our response to comment FA2-16.

LA3-30 We have included a recommendation in section 4.3.2.4 that NorthernStar consult with the COE, NMFS, FWS, and other appropriate agencies to finalize its Waterbody and Wetland Construction and Mitigation Procedures Plan. The plan would include procedures for monitoring the success of revegetation and weed control efforts. The Waterbody and Wetland Construction and Mitigation Procedures Plan would be filed, along with agency comments, with the Secretary prior to construction.

LA3-31 Temporary construction areas are depicted in the Alignment Sheets for the Bradwood Landing Project. Waterbody and Wetland Construction and Mitigation Procedures Plan. Directions for accessing NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan via the eLibrary can be found in the response to comment FA2-17. In addition, table 4.4.1-7 describes all additional temporary workspaces that would be located within 50 feet of a wetland. Because the EIS is a summary document, we believe that the inclusion of site-specific rationale for the approval or denial of each workspace within 50 feet of a wetland is not appropriate.

LA3-32 See our response to comment SA1-124.

K-548

LA3-32 hydrologic regimes, or other such measures. Proposed mitigation measures do not adequately address existing conditions.

cont'd

Request: The final wetland mitigation plan should include a description and analysis of the base conditions that support weedy species in the proposed enhancement area, and a description of measures undertaken to modify those base conditions in order to decrease the chance of long term mitigation failure.

4.5 Wildlife and Aquatic Resources

LA3-33 1) *Comment:* (Page 4-139) The Draft EIS requests that NorthernStar prepare a bubble curtain contingency plan prior to beginning pile driving activities.

Request: The Bubble Curtain Contingency Plan should be completed and submitted for evaluation prior to release of the Final EIS.

LA3-34 2) *Comment:* (Page 4-147) The Draft EIS requests that NorthernStar submit a facility Lighting Plan "prior to operation of the LNG terminal."

Request: The Lighting Plan should be completed prior to the Final EIS in order to adequately assess effects of facility operation on sensitive species and to comply with SEPA.

LA3-35 3) *Comment:* (Page 4-150) The Draft EIS describes the majority of habitat mitigation occurring at Svensen Island. Svensen Island is located approximately 14 miles downstream of the impact area. The distance between impact and mitigation site seems significant given that significant numbers of species using the Bradwood site are migratory. The Draft EIS does not appear to adequately consider how loss of habitat at Bradwood would affect travel distance for fish species that would otherwise use Bradwood.

Request: The Final EIS analysis should include discussion of the importance and function of Bradwood Landing habitat in the context of its distance from similar habitat areas, and should analyze the effects of habitat loss on species movement.

LA3-36 4) *Comment:* (Page 4-145) The Draft ESA states "NorthernStar would offer contract incentives to the LNG suppliers to retrofit LNG ships to connect with the wharf filtered water supply so that all water withdrawn from the Columbia River would be done via screened intakes constructed by NorthernStar at the LNG terminal." The FERC recommends that NorthernStar prepare a plan "prior to beginning initial site preparation at the LNG terminal" outlining how to ensure that incoming ships are retrofitted to use the screened water intake. The proposed use of "contract incentives" is vague and inadequately described in the Draft EIS.

Request: The Final EIS should state that all ships wishing to unload at Bradwood Landing must be retrofitted to use the proposed facility's screened water.

LA3-37 5) *Comment:* (Page 4-150) Dike breach activities are on the north side of Svensen Island, meaning that access to the island interior would be from the main Columbia River channel only. The south side of the island is in close proximity to streams on the Oregon mainland that outfall to the slough area between the island and mainland.

Request: The Final EIS should provide more detail for the decision to locate dike breaches on the north side of the island, provide a discussion of the function and value of contributing streams from the Oregon mainland, and should assess and discuss the feasibility and desirability of dike breaches on the south side of Svensen Island

Local Agencies

3

LA3-33 As described in section 4.5.2.1, NorthernStar filed its Bubble Curtain Contingency Plan with the FERC on December 21, 2007. This document is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e., CP06-365), and putting in the proper date range.

LA3-34 As stated in section 4.5.2.1, NorthernStar submitted its Lighting Plan for the Bradwood Landing Terminal as part of its response to the NMFS's May 11, 2007 request for additional information to the FERC on July 6, 2007. This document is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e., CP06-365), and putting in the proper date range.

We agree that additional information on the potential impacts of terminal lighting and mitigation for lighting is required; therefore, we recommended in section 4.5.2.1 that NorthernStar continue to consult with the NMFS, FWS, ODFW, and other applicable agencies regarding its Lighting Plan. The final Lighting Plan, along with agency comments, should be filed with the Secretary prior to operation of the LNG terminal.

LA3-35 In addition to mitigation efforts proposed for Svensen Island, it is important to note that the Hunt Creek Mitigation Site, which is located immediately adjacent to the proposed LNG terminal site and is designated critical habitat, is included as part of NorthernStar's Compensatory Mitigation Plan. Hunt Creek is known to provide both spawning and rearing habitat for federally listed salmonids.

It is our opinion that due to the migratory nature of juvenile salmonids, the distance between the proposed LNG terminal site and the proposed mitigation site at Svensen Island would not significantly reduce the benefits of the proposed mitigation for these populations. The adequacy of NorthernStar's Compensatory Mitigation Plan is also discussed in the response to comment FA2-10. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.

LA3-36 See our response to comment PM1-31.

LA3-37 See our response to comment FA2-10.

K-549

LA3-38 6) **Comment:** (Page 4-153) The Draft EIS describes several mitigation measures for impacts to aquatic resources and wetlands. Included as mitigation measures are:

- Place some excavated material along selected dike areas to facilitate growth of shrubs and trees to be planted
- Protect two existing home sites by placing fill around one and raising the eastern cross-dike

The placement of excavated material and the protection of home sites do not appear to be mitigation measures that will benefit aquatic resources or wetlands.

Request: Clarify in the Final EIS how these two measures constitute mitigation for wetland and aquatic habitat loss.

LA3-39 7) **Comment:** (Page 4-169) The Draft EIS states that most of the unstable slopes above sensitive waters would be crossed by the HDD construction method. For reasons stated above, there is concern that HDD construction methods may be difficult, if not impossible in some areas.

Request: The Final EIS should more precisely identify geologic hazards within the pipeline alignment, and should expand on the contingency analysis should HDD be found unfeasible, or should construction lead to unanticipated erosion or frequent "frac-outs." The more detailed geotechnical analysis and contingency plan should be completed prior to, and a discussion of the findings and measures should be included as part of the Final EIS.

4.6 Threatened, Endangered and Other Special Status Species

LA3-40 1) **Comment:** (Page 4-250) The Draft EIS describes potentially adverse impacts to Columbian white-tailed deer as habitat loss (59 acres temporary and permanent), noise disturbance, and potential increased vehicle collisions. Disturbance from facility lighting is not mentioned. Three database records of Columbian white-tailed deer record deer activity less than one mile distant, and place deer activity on three different sides of the proposed facility.

Mitigation for adverse effects to deer populations includes preservation of remaining habitat. The Draft EIS notes that deer remaining in the areas would acclimate to the long-term noise disturbance caused by operation of the facility. Mitigation for adverse effects on Columbian white-tailed deer is inadequate.

Request: The Final EIS should provide a more thorough analysis of effects of LNG terminal development on Columbian white-tailed deer.

LA3-41 2) **Comment:** The Washington section of pipeline passes through an area documented as historical habitat for listed Nelson's checker mallow (*Sidalcea nelsoniana*). The Draft EIS does not discuss or address potential adverse effects of pipeline construction or easement maintenance through this area.

Request: The Final EIS should address potential adverse effects to *S. nelsoniana* habitat.

4.7 Land Use, Recreation, and Visual Resources

LA3-42 1) **Comment:** (Page 4-289) Section 4.7.2.3 states that planned development was researched in Clatsop County in 2005. Although it is understood that the analysis for the Draft EIS began more than two years ago, development is dynamic, and new planned land use actions are likely left out of the Draft EIS analysis. Using January 1, 2007 as a cut off date for determining if a development meets the definition of "planned" under NEPA would likely result in additional developments either in the vicinity of the pipeline or the vicinity of the terminal.

Local Agencies

3

LA3-38 As discussed in section 2.1.5, NorthernStar is currently revising its Compensatory Mitigation Plan. Although NorthernStar proposes to protect two existing home sites on Svensen Island by placing fill around one and raising the eastern cross-dike, we agree that this would not mitigate for impacts on aquatic resources and wetlands; therefore, this statement has been removed from section 4.5.2.1. In contrast, the placement of excavated material along selected dike areas in order to facilitate the growth of shrubs and trees would indirectly provide a benefit to aquatic resources by increasing the quality of riparian vegetation.

LA3-39 See our response to comment LA7-25.

LA3-40 Section 4.6.2.2 has been revised to include additional information on the potential impacts on Columbian white-tailed deer due to construction and operation of the proposed terminal. See also our responses to comments PM3-68 and FA4-6.

LA3-41 Section 4.6.2.3 has been revised to include new survey information for the Nelson's checker-mallow.

LA3-42 We have revised section 4.7.2.3 based on comments we received on the draft EIS.

K-550

LA3-42 | *Request: Prior to completion of the Final EIS, the FERC should provide an updated list of planned land use developments and analysis of potential impacts to these developments along with proposed mitigation.*
cont'd

LA3-43 | 2) *Comment:* (Page 4-308) Access road locations and conditions are listed in a table. They are all listed as private roads and no names are given. This is insufficient information for reviewers considering impacts to access roads.
Request: The location and name (if any) of all access roads should be provided on a detailed map to allow for full consideration and comment.

LA3-44 | 3) *Comment:* (Page 4-310) The Draft EIS notes that a Christmas tree farm will be crossed by the pipeline construction in Cowlitz County between mile posts 31.7 and 32. The Draft EIS notes that after construction is complete, NorthernStar would repair and/or restore all contours and grade to as near original conditions as possible. Because the pipeline easement will require permanent conversion of all land within the easement from productive Christmas tree growing area to unproductive land (i.e., no trees can be grown in the easement in the future), more information on the nature and extent of the impact is required.
Request: The Final EIS should provide:
a) *The proportion of the farmed area will be permanently converted.*
b) *The value of the land for tree production and lost future revenues.*
c) *Proposed mitigation for loss of productive crop land.*
In addition, the Farmland Protection Act (7 CFR 658.1 et seq.) may require a Prime Farmland Conversion Impact Evaluation for much of the timber land being converted in this project. The FERC should evaluate whether this is required and provide updated information in the Final EIS.

LA3-45 | 4) *Comment:* (Page 4-313) The Draft EIS states that NorthernStar has not yet reviewed the zoning of storage and laydown areas along the pipeline with Cowlitz County staff.
Request: The Final EIS should include analysis of land use compatibility of these areas and identify what permits will be necessary for temporary or permanent use of the areas.

LA3-46 | 5) *Comment:* (Page 4-316) The Draft EIS states that no future planned residential or commercial developments in close proximity to the proposed pipeline route in Cowlitz County were identified. Cowlitz County residents William and Marjorie Castle have submitted comments to Cowlitz County that their proposed single family residence is located directly adjacent to the proposed pipeline route and drilling location. Their property is located at 212 Whitewater Road. They submitted a building permit application for the proposed single family dwelling on December 22, 2006. The permit can be reviewed under permit number 06-12-2674.
Request: Because the County is aware of this example of a planned development directly adjacent to the pipeline and the FERC Draft EIS fails to identify it, the County questions the accuracy of the review of other areas along the pipeline, both in Washington and Oregon. The planned development analysis should be conducted again and be provided along with potential impacts and proposed mitigation in the Final EIS.

LA3-47 | 6) *Comment:* The Visual Assessment included as an appendix to Resource Report 8 indicates that the presence of LNG tanker ships at the terminal pose a short duration visual impact. With the proposed frequency of ships per year and proposed duration of 24 hours per terminal visit, there will be a ship

Local Agencies

3

LA3-43 | Many of the access road do not have names and are thus listed as "unnamed." Detailed maps of the proposed pipeline route that show the locations of access roads were filed by NorthernStar as attachments to Resource Report 1 and are available from the FERC's eLibrary site.

LA3-44 | As further discussed in section 4.7.3.1, compensation for impacts for losses resulting from construction, including losses of non-renewable and other resources, damages to property during construction, and restrictions on existing uses that would not be permitted on the permanent right-of-way after construction.

LA3-45 | As discussed in section 4.7.3.1, NorthernStar's proposed pipe storage and contractor yard in Washington is located in a commercially zoned area.

LA3-46 | Based on this comment we have revised section 4.7.2.3.

LA3-47 | This comment refers to the Visual Assessment completed by NorthernStar. Our visual resources discussion in section 4.7.2.7 does not include this language.

K-551

LA3-47
cont'd

at the terminal in view of the residences on Puget Island approximately 34% of the year. This visual presence is inaccurately described as 'short duration'. This kind of visual impact should be considered moderate duration, not short. Additionally, it should not be treated as equal to the visual impact on an LNG tanker passing by any point on the river as it seems to be.

Request: The FERC should consider revising the analysis of the visual impact of the LNG Tankers while docked at the Bradwood Landing terminal.

LA3-48

7) *Comment:* There is no complete evaluation of light scatter and glare, only notation of future collaboration with planners to minimize impacts.

Request: SEPA Rules require evaluation of scatter and glare. Because the terminal will be lighted 24 hours per day and there are residents and wildlife refuge areas with direct visual connection to the terminal site, the Draft EIS should provide more information about nighttime lighting and mitigation for lighting effects.

4.8 Socioeconomics

LA3-49

1) *Comment:* (Page 4-328) The Draft EIS states that "about 1,500 recreational fishing boats go out on the Columbia River between February and October, based on per-day use data from 2004." Based on our review, this statement appears to be inaccurate and misleading in two aspects: the total number of vessels and the reported area of the measurement.

Total number of vessels

Using the "about 1,500" number and the approximately 270 days between February and October, the average number of recreational vessels per day on the river would be 5 - 6 vessels per day. Given that this number seems exceedingly low, we reviewed the *River User Impact Analysis* provided as an Appendix to Resource Report 8. We found that Table IV.1 Recreational Fishing Boats - Average Per-Day Use, 2004 in that report was used incorrectly to generate the "about 1,500" number presented in the Draft EIS. Data in Table IV.1 indicate an average number of recreation vessels using the Columbia River estuary during each month between February and October. It appears that the authors of the Draft EIS added each of the daily averages shown for each month to reach an approximate total of 1,500, and used this number to describe the total approximate usage for the full duration of time between February and October. This incorrect use of data leads to a gross underestimation of total recreational river usage reported in the Draft EIS.

Accurately approximating a total number of recreation vessels from February to October based on the daily averages in Table IV.1 cannot be accomplished. One can generate a very rough total estimate by multiplying the daily average to the number of days in each month, and then summing the total for each month, but because high weekend boating numbers may largely inflate some of the data, a total generated this way may grossly overestimate the total. However, the ODFW estimates annual fishery recreation usage at over 50,000 boats on the Columbia River, which compared to the data provided in the Draft EIS suggests that the full impacts to recreational boaters has not been fully evaluated.

Reported Area of the Measurement

LA3-50

The Draft EIS statement, "about 1,500 recreational fishing boats go out on the Columbia River between February and October, based on per-day use data from 2004" is unclear as to what portion of the Columbia River the measurement applies to. We believe that most readers of the Draft EIS would assume it applies to the Columbia River, generally downstream of the Portland Vancouver Metropolitan area. However, the *River User Impact Analysis* indicates that the data is for the Columbia River estuary. Given this clarification that the data applies to the estuary area only, the data is misrepresented in the Draft EIS and does not cover the full area of the LNG ships transit of the Columbia River.

Local Agencies

3

LA3-48

See our response to comment LA3-34.

LA3-49

Section 4.8.1.7 has been revised to correct the number of recreational fishing boats.

LA3-50

Section 4.8.1.7 has been revised. However, we still conclude that the project would not have significant impacts on recreational users of the lower Columbia River.

LA3-50
cont'd

Request: The addition of an LNG ship traveling either up or down the river every 1.5 days presents both frequent hazards and frequent disturbance and inconvenience to many recreational rivers users that must relocate out of the exclusion area to let a ship pass. With incorrect data presented in the Draft EIS, the FERC appears to have not accurately evaluated the impacts to recreational river users. This error should be corrected and any impacts different from those presented in the Draft EIS need to be disclosed.

LA3-51

- 2) **Comment:** (Page 4-328 and 4-329) The FERC Draft EIS briefly discusses impacts to shipping navigation and traffic with regard to the U.S. Coast Guard's safety recommendations. The Draft EIS concludes that although there will be security zones, ships would not be allowed to overtake an LNG ship, and one-way traffic would be imposed for each LNG ship transit up the Columbia River every 1.5 days, ship traffic delays are expected to be negligible. The Draft EIS notes that there may be delays due to wait times for ships either entering or leaving the mouth of the Columbia River, but does not attempt to quantify the delays.

The River User Impact Analysis provided as an attachment to Resource Report 5 Socioeconomics, indicates that although there has been some volatility in shipping traffic over the last several years, the long term projection is for an increase in cargo shipping on the Columbia River. This report also states:

"With river traffic of roughly 2,000 vessels annually, a ship is going upriver (and down river) roughly once every 4.4 hours. With a 3 hour travel time, there is therefore a roughly 70% chance of meeting oncoming traffic for each of the 250 annual tanker trips (125 upriver and 125 down). The worst-case scenario is that a ship must wait the entire 3 hours that the tanker is traveling. If this scenario came to pass, the estimated annual impacts on shipping would be \$423,165. Delays of less than the entire three hours would decrease the overall cost to shipping accordingly."

A marginal increase in ship traffic could increase the wait time for ships in Astoria occasionally. If a large number of ships arrive at the mouth of the Columbia in a short time period, some may need to wait for a pilot. A similar scenario plays out just upriver of Astoria when Bar and River pilots replace one another."

This estimate of delay is likely substantially understated. Additionally, the report also notes that the full impact of the U.S. Coast Guard's recommended safety zones has not been identified and that future more in-depth analysis would be needed to discern the actual impacts to the shipping industry.

Request: The shipping industry on the Columbia River is an extremely important component of the economy of several northwest states, and the industry is very sensitive to delay. The FERC should conduct a full analysis of socioeconomic impacts due to shipping delays imposed by the addition of the LNG vessels on the Columbia River. This analysis should include modeling of ship traffic based on the best available data and vessel traffic monitoring system information, and should provide data on expected delays based on cargo type to provide analysis of which industries and economies will be most affected. The analysis should also provide a scheduling scenario of a typical trip and encounters with other shipping traffic as well as a worst case scenario for delays imposed by timing restrictions crossing the Columbia River Bar and delays imposed by the U.S. Coast Guard safety zones.

Local Agencies

3

LA3-51

The River User Impact Analysis was prepared prior to the Coast Guard's review of the WSA and release of the WSR. We do not anticipate significant shipping delays would occur as a result of the project. In addition, section 4.8.1.7 has been revised to include additional discussion regarding potential for navigational conflicts LNG carrier traffic may have with other commercial ships traversing the Columbia River bar. See also our response to comment IND33-16.

K-553

- LA3-52 3) **Comment:** The FERC implementing regulations for NEPA [18 CFR Ch. 1 Part 380.12(g)(6)¹] require that the FERC:

"Conduct a fiscal impact analysis evaluating incremental local government expenditures in relation to incremental local government revenues that would result from construction of the project. Incremental expenditures include, but are not limited to, school operating costs, road maintenance and repair, public safety, and public utility costs." (emphasis added)

The FERC did not produce a Resource Report 5 Socioeconomics for the pipeline portion of the project stating that the project is exempt from the Socioeconomics requirements because it is not an above ground facility or a major pipeline project. The incremental local government cost of road maintenance and repair is not sufficiently addressed for the pipeline portion of the project and concerns have been raised about these costs by the local agencies.

Road Maintenance and Repair

In the Draft EIS the subject of local roads is addressed on page 4-353, second paragraph. The Draft EIS indicates that access road modifications will be limited to grading and the addition of gravel to prevent rutting. This is followed by a statement to the effect that previously existing roads used for access would be returned to original or better conditions, or as requested by the owner.

Concern about the future condition of Cowlitz County roads used to access pipeline construction sites was raised during the public open house hosted by Cowlitz County on October 11, 2007. Many of the roads providing access to construction areas are also the only roads providing access to residential properties, and are narrow roads with low average daily traffic and very little truck use. Concerns about the use of County roads can be seen as near-term and long-term. The near term concerns that were not sufficiently addressed in the Draft EIS include:

- a) Scheduling and restricted use of roads during construction causing financial burden on residents due to delays and conflicts with other scheduled road work;
- b) Damage to roadway, underlying utilities and adjacent properties by large trucks and heavy equipment frequently using County roads would be costly for the county to repair; and
- c) No specific description of standards to be followed for mitigation of damage and reconstruction of damaged areas.

The long-term concerns that were not sufficiently addressed include:

- a) Drainage impacts to roads may occur during the subsequent rainy seasons after construction;
- b) Geotechnical issues impacting the road right-of-way that are a result of the initial pipeline construction activities;
- c) Conflicts with future improvements to the County roads that may require pipeline relocation;
- d) Long-term maintenance of the pipeline within County right-of-way; and
- e) Potential issues from pipeline failure.

Request: To comply with FERC guidance, the FERC should inventory County roads to be used during construction of the pipeline and analyze potential impacts to the roadways and the associated costs for repairing damages prior to completion of the Final EIS.

- LA3-53 Additionally, to address the near- and long-term concerns, Cowlitz County requests that the FERC require the applicant to enter into a binding agreement with the County that identifies, but is not limited to items in the following list:

¹ Title 18--Conservation of Power and Water Resources, Chapter 1--Federal Energy Regulatory Commission, Department Of Energy Part 380--Regulations Implementing The National Environmental Policy Act

Local Agencies

3

- LA3-52 NorthernStar prepared environmental Resource Report 5 (Socioeconomics) as part of its application to the FERC in accordance with 18 CFR 380.12(g) which is meant to only address major aboveground natural gas facilities. However, we addressed potential socioeconomic impacts for the entire project in section 4.8 of the EIS

Section 4.8.3.7 has been revised to include additional discussion of NorthernStar's requirements regarding local road permits.

- LA3-53 NorthernStar may voluntarily enter into an agreement with Cowlitz County regarding road repair. We require that all work areas be returned to their pre-construction condition and use, including access roads.

LA3-54

- a) Standards and procedures to be used for weight restricted bridges;
- b) Standards and procedures to be used for work within County right-of-way. If the applicant does not intend to obtain public works permits, then the agreement must specify how all components of the standard permit will be accomplished;
- c) Responsible party for road work inspections;
- d) Implied liability in the absence of a County public works permit;
- e) Impacts to and coordination with utility franchises;
- f) Long term drainage impacts to County roads due to the project;
- g) Process for future road relocations that may affect the location of the pipeline; and
- h) Transferability of the agreement to future owners.

The agreement must clearly specify responsible parties for each aspect of the project and bind the applicant or future owners to financial assurances to the County. The FERC should require that this agreement be signed prior to issuance of the Final Commission Order.

- 4) **Comment:** The FERC implementing regulations for NEPA [18 CFR Ch. 1 Part 380.12(g)(6)²] require that the FERC:

LA3-55

"Conduct a fiscal impact analysis evaluating incremental local government expenditures in relation to incremental local government revenues that would result from construction of the project. Incremental expenditures include, but are not limited to, school operating costs, road maintenance and repair, public safety, and public utility costs." (emphasis added)

The FERC did not produce a Resource Report 5 Socioeconomics for the pipeline portion of the project stating that the project is exempt from the Socioeconomics requirements because it is not an above ground facility or a major pipeline project. The incremental local government cost of public safety preparedness is not sufficiently addressed for the pipeline portion of the project and concerns have been raised about these costs by the local agencies.

Public Safety

Public safety concerns resulting from the presence of LNG tankers on the Columbia River and a new natural gas pipeline in Cowlitz County have been voiced early and often. In the heavily forested area that the pipeline traverses, if a leak and subsequent fire, or an explosion were to occur along the pipeline, Cowlitz County Fire and Rescue services would be responsible for Public Safety. At current funding, staffing, and equipment levels, Cowlitz County is not prepared to suppress a fire of the nature caused by explosion of a natural gas pipeline. The two nearest fire stations of the Cowlitz 2 Fire and Rescue district, the Bakkers Corner and Lexington Stations, are rural facilities with very few staff and limited resources.

Emergency response for a fire or other event on an LNG ship while in transit will rely on the emergency response departments of the five counties surrounding the Columbia River. These county departments will need to be coordinated, trained and ready, and supplied with the appropriate equipment for such an event. At present the counties lack the training, staff, coordinated emergency management plan and equipment to effectively respond to large-scale events on the Columbia River.

FERC guidance for Resource Report 5 Socioeconomics (page 3-57 and 3-58) requires that,

"If concerns are raised during project coordination in the area, this report should be provided for minor projects and those with only below ground facilities. However, for major

² Ibid.

Local Agencies

3

LA3-54 See our response to comment LA3-53.

LA3-55

As discussed in section 4.11.6 of the final EIS, NorthernStar would be required to develop an ERP and coordinate procedures with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies. In addition, the ERP would be required to include a Cost-Sharing Plan identifying mechanisms for funding all project/specific security/emergency management costs that would be imposed on state and local agencies. In addition to the funding of direct transit-related security/emergency management costs, this comprehensive plan would include funding mechanisms for the capital costs associated with any necessary security/emergency management equipment and personnel base.

NorthernStar would be required to submit the ERP, which includes the Cost-Sharing Plan, to the Secretary for review and written approval by the FERC before any final approval to begin construction. If the needed resources are not available and properly funded, operation of the project would not be approved.

K-554

K-555

LA3-55
cont'd

pipeline projects that require an EIS, preparation of all or portions of this report may be necessary. In addition, federal, state or local land managing agencies may require the analysis of the socioeconomic impact of pipeline construction as part of the review process for right-of-way grants."

Request: *To comply with FERC guidance, the FERC should inventory and analyze potential impacts to the cost of preparedness for a natural gas pipeline explosion in Cowlitz County. The County requests that the FERC require the applicant to provide funds to Cowlitz 2 Fire and Rescue district specifically for facility improvement to allow space for needed equipment, equipment upgrades and adequate personnel training for response to a natural gas pipeline incident.*

LA3-56

Additionally, the FERC should require the applicant to conduct a detailed study of emergency response requirements. The analysis must be conducted in coordination with emergency response representatives from the five affected counties, and must include evaluation of the following:

- a) Need for appropriate response equipment for use on the Columbia River.*
- b) Staffing levels for fire suppression of a vessel fire and any subsequent effects to nearby structures, natural areas, or vessels.*
- c) Staffing levels for law enforcement assistance to control water traffic during LNG vessel transit on the Columbia River.*

LA3-57

As a result of the study and prior to final Commission Order, the FERC should require the applicant to sign an agreement with all five counties to provide sustained funding from the beginning of operations through decommissioning of the proposed facility to provide for the necessary additional staff and equipment. Funding should also provide for one full time Emergency Management Planner for each of the five counties whose first responsibility would be to create a collaborative five-county river event response program. Additional responsibilities of this position would include ongoing management of training and exercises to ensure preparedness.

LA3-58

- 5) **Comment:** (Page 4-337) Section 4.8.2.3 discusses effects to property values from the location of the LNG terminal and references two studies that found no appreciable or significant effects. It appears from the discussion in the EIS that these studies focused on actual sale values, but likely did not take into account the effect on reducing the frequency of sales or the time on the market, or the increased or decreased incidence of properties failing to sell when listed. The County has been contacted by at least one property owner that is unable to sell their property, with the most likely reason being proximity to the Kelso-Beaver Pipeline at the location where it is exposed above ground.

The River User Impact Analysis reported a methodology and potential impact specific to evaluating the effect of loss of views on property value specifically for those residences on Puget Island. The report found that a liberal estimate assuming a total loss of view value could cost \$851,253 annually based on the per-day and per-person value of the view for a year. Neither Resource Report 5 on Socioeconomics, nor the Draft EIS introduces this cost impact as part of the analysis on the socioeconomic impact to properties on Puget Island.

Request: *Although the Draft EIS reasons that no property value impact can be determined until there is actual sales data, this valuation of cost due to visual impact should be disclosed in the Draft EIS so it can be reviewed.*

Local Agencies

3

LA3-56 See our response to comment LA3-55

LA3-57 See our response to comment LA3-55

LA3-58 The referenced section of the River User Impact Analysis states that the annual impacts of \$851,253 is the total amount applied to 65 people living in the area, not the per-person, per-day estimated impact, which is identified as \$13,096.

- LA3-59 6) **Comment:** (4-322) Section 4.8.1.2 states that in Astoria there are five hotels with 253 rooms within the Zone 1 hazard zone. Zone 2 contains an additional seven motels and hotels with a total of 333 rooms. In addition, the table below was created using the information on pages 4-322 through 4-328. It shows the resources identified in the Socioeconomics section within each zone.

Zone 1	Zone 2	Zone 3
	• CRM 29	
		• Coast Guard Cape Disappointment Station Mooring
	• CRM 13	
	• Hammond Boat Basin	• Warrenton Police and Fire
	• Youngs Bay Bridge (101)	• Port of Astoria
		• Coast Guard Air Station
	• CRM 13/14	
• Astoria Pier 1 – Cruise ships	• Captain Robert Grey Elementary School (780)	• Astoria Middle School (550)
• Astoria Pier 2 – Commercial fishing and recreation boats	• John Jacob Astor Elementary School (298)	• Astoria High School (760)
• Astoria/Megler Bridge	• Clatsop Care Center	
• Astoria Police/Fire and Emergency Information Center	• Columbia Memorial Hospital	
• Columbia River Maritime Museum	• County Health Services	
• River front trolley	• Coast Guard Base	
• Boat anchorages		
• CRM 33		
• Wahkiakum Fire District #2		
• Skamokawa town center		
	• CRM 39	
		• Wahkiakum Fire District #1
		• Cathlamet Fire District
		• Cathlamet town center

Recommendations for risk management within Zone 1 found in the Sandia³ report include "Incident management and emergency response measures should be carefully evaluated to ensure adequate resources (i.e., firefighting, salvage) are available for consequence and risk mitigation."

The primary fire, police, and emergency control center in Astoria is within the highest hazard zone, and in the unfortunate event that an explosion were to occur at that point along the LNG route, emergency response systems would be severely impacted.

Request: In order to understand how this high risk situation will be mitigated, the Emergency Response Plan must be made public for review. Otherwise, there is insufficient information on which to base a decision for approval of the proposal.

- LA3-60 7) **Comment:** The Draft EIS provides information about the existing public services in the communities along the Washington side of the LNG waterway route, but it doesn't fully address economic cost of responding to a forest fire in Cowlitz County due to a pipeline breach/explosion. In several places the

³ *Guidance on Risk Analysis and Safety Implications of a Large Liquefied Natural Gas spill Over Water*. December 2004 (SAND2004-6258), by the U.S. Department of Energy Sandia Laboratories.

Local Agencies

3

- LA3-59 The ERP is developed under consultation with appropriate federal, state, and local agencies. The ERP is approved by the FERC, not by the public. NorthernStar would be required to submit the ERP for review and written approval by the FERC before any final approval to begin construction. If the needed resources are not available and properly funded, operation of the project would not be approved.

- LA3-60 See our response to comment LA3-55.

K-557

LA3-60
cont'd

text includes language similar to that below, which overly minimizes the risk of fires in this region. We would point to the Tillamook Forest fires in the 1930's, 40's and 50's as examples of how forest fires in similar climate and ecoregions have been devastating when started during the dry summer months.

(Page 4-325) Section 4.8.1.5:

"However, because the hazard area surrounding an LNG cargo vessel is transient (moving with the vessel along its route), it is not possible to accurately quantify the economic impact of an incident. Also, given the precipitation in the region, any project-related fire would likely be of short duration and limited extent. Nevertheless, with the implementation of the safety and security measures and conditions outlined in the Coast Guard's WSR, an LNG release along the waterway would be highly unlikely."

Request: The Draft EIS should disclose mitigation for the impact to local fire and rescue services.

LA3-61

- 8) **Comment:** The Draft EIS uses 125 LNG ships annually throughout the document as a basis for evaluating impacts. However, in some cases the Draft EIS refers to increased capacity from expansion at the terminal by constructing the third storage tank.

Request: The number of ships with the tank expansion should be disclosed and all impacts from that larger number of ships should be analyzed.

4.9 Cultural Resources

LA3-62

- 1) **Comment:** (Page 4-360) There are three unrecorded potential historic-archaeological sites in the Bradwood Landing APE.

- a) Hunt Mill
- b) OTLC Mill
- c) OTLC Mill logging road

Request: The FERC should clarify what is planned for recording these sites.

LA3-63

- 2) **Comment:** (Page 4-364) "NorthernStar has not yet documented any additional consultations with Indian tribes, or that it provided the Confederated Tribes of the Grande Ronde with copies of cultural resources reports as requested."

Request: The Draft EIS should disclose when and how will this information be provided and the results of consultations.

LA3-64

- 3) **Comment:** (Pages 4-364 through 4-366) Several cultural resources issues are unresolved, including:

- a) Effects on previously recorded site 35C016 due to HDD activity under the Columbia River based on Oregon SHPO opinion.
- b) Effects on the historic Hunt Mill pending full results of an archaeological investigation at the mill location.
- c) Status of the mill town of Bradwood under Section 106 of the National Historic Preservation Act due to questions from the Oregon SHPO.

Request: Contrary to the FERC's recommendation that these issues must be resolved prior to beginning construction, these issues must be resolved with the appropriate agencies prior to completion of the Final EIS. This includes any mitigation agreements or Memorandums of Understanding.

Local Agencies

3

LA3-61

See our responses to comments FA2-13 and FA2-14.

LA3-62

As discussed in section 4.9.4, prior to the initiation of construction, we would require NorthernStar to file additional cultural resources survey and evaluation reports, for the review and approval of the SHPOs and the FERC. We would expect the revised report for the LNG terminal tract to address additional investigations to locate, record, and evaluate the Hunt mill, OTLC mill, and the OTLC mill logging road if elements of these resources are still extant and visible.

LA3-63

In section 4.9.3, we added a new condition that would require NorthernStar, prior to starting construction, to file documentation of additional consultations with Indian tribes, and documentation that it sent the Confederated Tribes of Grand Ronde, and other interested tribes, copies of revised cultural resources reports.

LA3-64

We disagree that the FERC must resolve issues related to the identification of historic properties and assessment of project effects prior to the issuance of our final EIS. It is standard FERC practice to complete compliance with the NHPA after an Order is issued, but before we allow construction to begin. This is because cultural resources inventories cannot be done on lands where access was previously denied until after an Order, when the company could use the power of eminent domain to acquire its pipeline right-of-way easement. See our response to the comment from the state of Oregon (SA1) and response to comment LA3-62. Our recommended mitigation measure in section 5.2 ensures that the FERC will be able to review and approve additional cultural resources investigations and plans, that would, among other things, address potential project impacts on archaeological site 35C016, the identification and evaluation of the historic Hunt mill (if remnants are still extant and visible), and the NRHP evaluation of the townsite of Bradwood.

4.10 Air Quality and Noise

Air Quality

LA3-65

1) **Comment:** (Page 4-380) The Air Quality section states:

"The second provision requires that certain emission units at stationary sources meet Typically Achievable Control Technology (TACT). The [submerged combustion vaporizer] SCVs would be subject to TACT because the Bradwood Landing LNG facility would require a permit, and the SCVs each would have emissions of more than 1 tpy and would not be subject to major source New Source Review, New Source Performance Standards, or other emission limits specified in OAR 340-226-130(2)(a). Procedures for identifying air pollution control equipment and emission reduction processes that meet TACT are not included within Oregon's regulatory text. However, if the ODEQ notifies NorthernStar that it intends to make a TACT determination for the SCVs, then the proposed facility would need to submit any requested information and comply with the final TACT determination."

Request: Prior to the completion of the Final EIS, the FERC needs to demonstrate how this standard is being complied with.

Noise

No specific comments.

4.11 Reliability and Safety

LA3-66

1) **Comment:** (Page 4-399 and 4-370 to 4-371) The Reliability and Safety section states:

"Methane vapors, the primary component of natural gas, are colorless, odorless and tasteless, and are classified as a simple asphyxiant. Methane vapors may cause extreme health hazards, including death, if inhaled in significant quantities within a limited time. Although very cold methane vapors may cause freeze burns, any cloud resulting from an LNG spill would be continuously mixing with the warmer air surrounding the spill site. Dispersion modeling indicates the majority of the cloud would generally be within 25° F of the surrounding atmospheric temperature, with colder temperatures closest to the spill source. In addition, this modeling estimates that most of the cloud would be below concentrations resulting in oxygen deprivation effects, including asphyxiation, with the highest methane concentrations closest to the spill source. Therefore, asphyxiation and freezing normally represent a negligible risk to the public from LNG facilities."

This statement indicates a risk of asphyxiation to humans if there is a spill over water, but it minimizes discussion of that risk without providing an evaluation of the potential for humans to be near enough to the source of the spill to be affected.

Request: The Final EIS should answer the following questions. What distance is considered "closest to the spill source" such that asphyxiation concentrations could occur? If, as stated elsewhere in the document, other river users will be allowed to travel in the Coast Guard's required exclusionary safety zones around moving LNG ships on a case by case basis, what is the risk of asphyxiation to the large numbers of recreational boaters annually on the Columbia River, and especially during the summer months and fishing seasons (see Comment 1 for Socioeconomics)?

LA3-67

2) **Comment:** There is no discussion either in the section on impacts to/from geology or in this section on safety concerning the location of the proposed pipeline near BPA transmission lines or towers in Cowlitz County. The towers are located in an area of known landslide hazards and the proposed

Local Agencies

3

LA3-65

As documented in the March 2007 Air Contaminant Discharge Permit application submitted to the ODEQ and filed with the FERC, the SCVs would meet the state TACT requirements by being equipped with low-NO_x burners that achieve an emission rate of 30 ppm NO_x. Emissions of CO would be controlled through good combustion practices to 90 ppm. Emissions of other criteria pollutants would be controlled through good combustion practices and the use of low-sulfur LNG prior to odorization, which minimizes the amount of PM₁₀ and SO_x that would be formed from combustion in the SCVs.

LA3-66

Using DEGADIS, FERC staff modeled the distance to methane concentrations which may result in asphyxiation. Those distances would be within the Coast Guard's proposed safety/security zone of 500 yards. We would not expect large amounts of recreational boaters inside this zone during transit of an LNG carrier. Also, the GAO released a report in February 2007 presenting a survey of experts in areas related to LNG risk, hazards, and consequence modeling. As presented in Appendix III of the GAO Report, the 19 LNG risk and hazard experts unanimously agreed that asphyxiation would represent a negligible risk to the public.

LA3-67

The FERC takes a number of factors into consideration when evaluating proposed pipeline routes. With respect to collocating pipelines with other utilities, such as electric transmission lines, experience has shown that these two types of utilities lines are reasonably compatible from a safety perspective, provided sufficient spacing is maintained. Such collocation serves to limit the number of corridors created in a given region.

LA3-67
cont'd

pipeline will be located both near the towers and near the existing Kelso-Beaver Pipeline. In the event of a geologic event the addition of the new pipeline will add to the hazards in the area.

Request: The FERC should evaluate the hazards or issues due to locating near BPA transmission lines with respect to geologic hazard events in the Final EIS.

4.12 Cumulative Impacts

LA3-68

1) *Comment:* The Port of Vancouver Columbia Gateway project is not included in the list of projects evaluated for cumulative effects in Table 4.12-1. Because this project issued a Notice of Intent (NOI) in September 2006, it would appear to meet the definition of reasonably foreseeable. This project has the potential of adding approximately 365 large vessel ships annually to the total large vessels using the Columbia River. The Bradwood Landing Draft EIS does include the cumulative impacts of the Oregon LNG project with its additional 150 LNG ships, so it appears reasonable that the Draft EIS should also consider the impacts of an additional 365 ships from the Port of Vancouver Columbia Gateway project.

Request: An analysis of how the Port of Vancouver project would add to cumulative impacts should be included in the Final EIS.

LA3-69

2) *Comment:* As an existing past project in close proximity to the proposed pipeline in Cowlitz County, the Kelso-Beaver Pipeline may create a setting where the cumulative impacts of the proposed pipeline could be considered significant. It appears that although the cumulative impacts of the KB pipeline were considered for some elements of the environment, including vegetation, they were not considered for others. Specifically, given the safety requirements for pipelines found in section 4.11.9.1, how does the introduction of a new pipeline adjacent to an existing natural gas pipeline affect safety standards? How does the presence of an older pipeline increase the risk of failure of the proposed pipeline (i.e. if the older pipeline were to suffer a failure and explode, could that cause failure of the proposed pipeline, and if so, what are the additive risks of fire exposure with the added volume of gas from both pipelines?

Request: The Final EIS should evaluate the cumulative safety impacts of placing the proposed pipeline adjacent to the KB pipeline.

Overall Comments

LA3-70

1) *Comment:* The FERC indicates many issues are unresolved in the Draft EIS including evaluation of cultural resources and consultation with responsible agencies and responses to requests for additional information in the Biological Assessment for the National Marine Fisheries Service, and the U.S. Fish and Wildlife Service. There are other instances where the FERC requests that NorthernStar provide a management plan, the Lighting Plan for example, after completion of the Final EIS, but before construction. The NEPA and SEPA processes require that the public and agencies have the opportunity to comment on all pertinent decision making information as part of the evaluation process.

Request: The FERC should address all comments received on the Draft EIS as well as resolve the outstanding issues like those noted above and re-release a new Draft EIS for review that will allow full review of the project components and analysis prior to issuing the Final EIS.

Local Agencies

3

LA3-68

The industrial development district levy intended to fund the Port of Vancouver Columbia Gateway project failed in August 2007 and, therefore, the project is not certain. However, we have included it in table 4.12-1 as a potential development in 10 to 15 years because funding could become available in the future.

LA3-69

The FERC takes a number of factors into consideration when evaluating proposed pipeline routes. With respect to collocating pipelines with other pipelines, minimum off-set distances are required, as are other safety measures such as above-ground markers, signage, and pipeline integrity testing. From an environmental perspective, collocation serves to limit the number of corridors created in a given region.

LA3-70

The FERC is not going to reissue the draft EIS for this project, because that document was adequate to comply with the NEPA. Comments on the draft EIS are addressed in this final EIS, in volume 2, Appendix K. See our responses to comments PM6-94, SA1-179, and SA4-3.

Board of Wahkiakum County Commissioners

George A. Trott
District #1

Daniel L. Cothren
District #2

Blair H. Brady
District #3

December 18, 2007

The Honorable Kimberly D. Bose
Federal Energy Regulatory Commission
888 First Street NE
Room 1A
Washington, D.C. 20426

Re: Bradwood Landing LLC Docket No. CP06-365-000

Honorable Members of F.E.R.C.:

The Wahkiakum County Commissioners are concerned that the Draft Environmental Impact Statement related to the proposed Bradwood Landing LNG Terminal does not adequately consider the needs of Wahkiakum County. The County, having neutral intervenor status in the proposed LNG terminal, requests F.E.R.C. include a permit condition that Northern Star Natural Gas enter into a binding Community Benefit Agreement ("agreement") with Wahkiakum County. This agreement should be included in the Final Environmental Impact Statement, should you approve this project. The agreement is necessary to ensure the needs of Wahkiakum County are permanently aligned with the permit.

Entering into a binding Community Benefit Agreement would be in the interest of all parties interest. We raise this issue because Wahkiakum County is rarely mentioned in the DEIS, despite its close proximity to the proposed facility. In fact, Puget Island is only 500 yards from the proposed facility. The Bradwood Landing LNG terminal may increase the public safety and emergency service costs in Wahkiakum County. The LNG terminal may also affect the county's natural resources, environment, safety, transportation systems, and economy.

Wahkiakum County specifically requests F.E.R.C to require Northern Star Natural Gas (Bradwood Landing) to fund an assessment by an independent entity to determine the emergency service and security requirements of Wahkiakum County, including any gaps in personnel, services, financial resources, and infrastructures. The assessment should also determine the impact the LNG terminal and the proposed dredge disposals will have on Wahkiakum County. An assessment of the economic impacts on the county, both positive and negative also need to be studied. The Final Environmental Impact Statement should include this assessment.

LA4-1

It is not the FERC's practice to require such agreements with local government units as conditions in the EIS process. However, NorthernStar must work with local agencies in development of its ERP. Wahkiakum County is included in the assessment of regional impacts of the project, particularly with respect to the LNG marine waterway. See also our response to comment LA3-55.

LA4-1
cont'd

The results of the assessments will be used to form the basis of the Community Benefits Agreement. Wahkiakum County also requests F.E.R.C. require the Community Benefits Agreement as a condition to be completed as part of the Final Environmental Impact Statement. Along with this, the Community Benefits Agreement should be a condition to the issuance of the F.E.R.C. permit. There are similar agreements in place at other L.N.G. facilities.

Wahkiakum County has requested Northern Star Natural Gas fund the independent assessment that the county requires. It is appropriate for F.E.R.C. to make this a permit requirement and a condition for the Final Environmental Impact Statement.

Sincerely,

George A. Trott
Chairman of the Board

Daniel L. Cothren
County Commissioner, District #2

Blair H. Brady

hansons@co.columbia.or.us

II.

Description of Proceeding

On June 5, 2006, Bradwood Landing LLC filed an application with the Federal Energy Regulatory Commission (the "Commission") pursuant to Section 3 of the Natural Gas Act ("NGA") seeking authorization to site, construct and operate a Liquid Natural Gas ("LNG") terminal in Bradwood, Clatsop County, Oregon, for the purposes of importing LNG into the United States. Also on June 5, 2006, NorthernStar LLC filed an application pursuant to Section 7(C) of the NGA and parts 157 and 284 of the Commission's regulations for (1) a certificate of public convenience and necessity authorizing the construction, installation, ownership, and operation of the Bradwood Landing Pipeline and other facilities, (2) a blanket certificate to construct, operate and/or abandon certain eligible facilities, and services related thereto, and (3) a blanket certificate to provide open-access firm transportation services.

In August, 2007, the Commission issued its Draft EIS and indicated that any person wishing to comment on the proposed

COMMENT ON FILING DRAFT EIS

Page 2

Local Agencies

EIS must do so on or before December 24, 2007. These comments are pursuant to and comply with that notice.

III.

Position Statement/Background

The Columbia County Development Agency was formed on March 28, 2000, with the mission to alleviate blight in Columbia County as defined in Oregon Revised Statutes 457.010 and specifically to alleviate blight in the Port Westward Industrial Area which had precluded industrial development. On September 11, 2001, the Port Westward Urban Renewal Plan became effective, authorizing Columbia County to incur debt in order to make needed road improvements, among others, to attract development at the Port Westward Industrial Site (the "Site").

Urban Renewal Area Developments

Since September of 2001, Columbia County has incurred substantial debt to make road and access improvements to the Site from Highway 30. The total estimated cost of planned road improvements is 16.5 million dollars, which has been partially funded through grants from the US Department of Commerce, Economic Development Administration. The road and access improvements are scheduled to be completed by summer, 2009. The Columbia County Development Agency will use tax increment

captured from the development on the Site to service the Columbia County debt for the road projects. Therefore, it is imperative that these infrastructure improvements are not delayed or otherwise hindered.

The Site consists of approximately 800 acres of property owned by the Port of St. Helens. Part of the Site is subject to a long term lease with Portland General Electric Company ("PGE"). The Site has a deep draft marine facility with a 1200 foot dock on the Columbia River. As a result of the infrastructure improvements mentioned above, three industrial developments are siting at the Port Westward Industrial Site. The first development is a 400 megawatt gas fired power plant operated by PGE which has now been completed, a 260 million dollar investment. The second development is an ethanol plant currently being built by Cascade Grain Products, LLC. The ethanol plant will generate an additional 125 million dollar investment. The third development is also a 536 megawatt power plant to be built by Summit Westward Energy, LLC. This power plant will generate a 320 million dollar investment. All told, the three developments will generate 705 million dollars in the Clatskanie Community and will provide many needed jobs within Columbia County. Therefore, Columbia County must

Local Agencies

seriously consider any proposed development outside of the Industrial Site that could jeopardize the planned developments and correlating jobs for its citizens.

Concerns with Bradwood Landing Project/Pipeline Alignment

LA5-1

1. Pipeline Interference with Port Westward Access Improvements. The proposed pipeline will run from the Bradwood Island site to the Port Westward Industrial Site to connect with the Kelso-Beaver and Mist natural gas pipelines. The route proposed by NorthernStar will run approximately 37 miles, crossing approximately 13.2 miles of property within the County, and running through the Site. NorthernStar's Proposed Route Alignment as shown in Appendix B of the draft EIS, shows the pipeline alignment following Hermo Road from the Collins Road Intersection into the Site. This map shows the pipeline on the east side of the Road, the same side as proposed for the road project expansion. Columbia County is concerned that the 85-100 foot wide construction right-of-way and 50 foot wide permanent right-of-way may interfere with the road improvements. The County has completed engineering and is preparing to construct improvements to Hermo Road, including widening and overlay, an investment of over 11 million dollars. It would be very expensive at this point to make changes to the

COMMENT ON FILING DRAFT EIS

Page 5

Local Agencies

5

LA5-1

Section 4.7.3.3 has been revised to include a discussion about Hermo Road, including our recommendation that NorthernStar document that it has consulted with the Port of St. Helens, the Columbia County Development Agency, and other appropriate agencies and representatives of Columbia County, to determine if its pipeline may have impacts on county improvements in the vicinity of the Port Westward Industrial Area.

LA5-1
cont'd

road project. No final drawings have been provided to Columbia County showing the exact location of the proposed pipeline in relation to the road improvements. NorthernStar has not coordinated its pipeline alignment with the County so as to avoid unnecessary delays and increased costs of Columbia County's project.

The Draft EIS at page 2-53, indicates that NorthernStar plans to use HDD or the bore method only for "major paved highways and railroads where traffic cannot be interrupted". The County is concerned that Hermo Road will not be considered a "major paved highway" and that NorthernStar will use intrusive construction methods, including road interruptions during its pipeline construction. Several industrial developers are dependent upon having Hermo Road open and available for use after completion of the road improvements. Interruptions from pipeline construction will not be acceptable. In addition, Columbia County is expecting that significant wetland mitigation work will need to be done in conjunction with the Hermo Road improvements and is currently waiting for a Wetland Permit from the Corps of Engineers. While representatives of NorthernStar have repeatedly represented that the pipeline easement will not interfere with Columbia

COMMENT ON FILING DRAFT EIS

Page 6

Local Agencies

5

K-567

LA5-1
cont'd

County's improvements, Columbia County has no assurance that there will be no such interference, and has no assurance that the project will not increase the wetland mitigation burden or impact wetland conditions in the area.

In summary, the Hermo Road improvements are of vital importance to the three industrial developers described above, as well as to Columbia County's ability to encourage new development within the Port Westward Industrial Site. Therefore, NorthernStar's immediate coordination and cooperation with Columbia County is imperative.

LA5-2

2. Pipeline Interference with Private Property Ownership in Columbia County.

Approximately 13.2 miles of the pipeline is proposed to be built on private property within Columbia County. Yet, Columbia County has received very little information from NorthernStar as to how NorthernStar intends to mitigate the impacts that the proposed pipeline will have on private property owners within the County. Specifically, NorthernStar has not addressed in detail how it will fairly compensate property owners for the required easements or the terms of such easements. Nor has NorthernStar addressed in detail who will be responsible for damage that may be caused by the pipeline

Local Agencies

5

LA5-2 Landowner compensation and the easement negotiation process are discussed in section 4.8.3.3.

LA5-2
cont'd

while in operation or for environmental damage related thereto. The Draft EIS does not specify any protections that must be included in landowner agreements. The Draft EIS indicates that NorthernStar will need approximately 553 acres of land during construction of the property and 234 during operations. The rights-of-way will ultimately be 50 feet during operations. Columbia County is concerned about the amount of impact this much acreage will have on its citizens, and that its citizens will be unduly burdened by the proposed pipeline. Columbia County desires to assure that its citizens are treated in a fair and open manner during the easement acquisition process.

REQUESTS

LA5-3

1. Columbia County requests that the Commission require as a condition of approval that NorthernStar immediately consult and agree with Columbia County as to the location of the pipeline route alignment along public roads in Columbia County, the timing of construction, the type of construction methods, and liability for any changes or costs incurred by Columbia County as a result of the proposed pipeline alignment and operation.

LA5-4

2. Columbia County requests that the Commission require as a condition of approval that any change in the pipeline

COMMENT ON FILING DRAFT EIS

Page 8

Local Agencies

5

LA5-3

Section 4.7.3.3 has been revised to include our recommendation that NorthernStar consult with Columbia County to determine if its pipeline may have impacts on county improvements.

LA5-4

Section 4.7.3.3 has been revised to include our recommendation that NorthernStar should document consultation with the Port of St. Helens, the Columbia County Development Agency, and other appropriate agencies and representatives of Columbia County, to determine if its pipeline may have impacts on county improvements in the vicinity of the Port Westward Industrial Area.

LA5-4 | route alignment that may affect the Hermo Road improvements or
cont'd | any public road within the County be approved by the Columbia
County Public Works Director prior to construction.

LA5-5 | 3. Columbia County requests that landowner protections
be required of NorthernStar as a condition of approval.

Conclusion

This proposal stands to have potential substantial impacts on Columbia County residents, on the property owners in the Clatskanie area, on the current industrial development at the Site, on anticipated construction of new industrial projects at the Site, and on the recent investments in road infrastructure made to attract new business to the Site. While Columbia County takes no position either in favor or in opposition to the proposed LNG facility and pipeline, the County's concerns must be addressed during this permit process.

Respectfully submitted,

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Bradwood Landing LLC)	Docket No.	CP06-365-000
Northern Star Energy LLC)	Docket Nos.	CP06-366-000 CP06-376-000 CP06-377-000

COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT BY THE
CITY OF ASTORIA, OREGON

Movant-Intervenor the City of Astoria, a municipal corporation, through its City Council, the duly elected governing body for the City of Astoria (the "City" or "Astoria"), hereby submits its comments on the Draft Environmental Impact Statement ("DEIS").

Background

As described in the DEIS, the City of Astoria, Oregon is a municipality consisting of approximately 11.5 square miles in geographic jurisdiction located near the mouth of the Columbia River, in Clatsop County, Oregon. According to the 2000 United States Census data, the City's year round population is 9,813, however based on proposed development plans and population projections, this is expected to increase to 11,205 by the year 2015 as per the April 2007 Clatsop County Coordinated Countywide Population Projections. The summer time population increases with the influx of tourists to the area. The City is directly and significantly impacted by the proposed vessel transits carrying liquefied natural gas ("LNG") to the proposed Northern Star Natural Gas LLC ("NSNG") facility at Bradwood Landing, located at approximately river mile ("RM") 38 upstream.

Included within or immediately adjacent to Astoria are a diverse number of private and critical government occupancies. Among these are Tongue Point Job Corps Training Center and the U.S. Post Office (Federally owned facilities), two US Coast Guard stations (one mooring for USCG cutter vessels and one buoy tender station) and USCG housing area, the County Seat (Courthouse, jail, and central County government offices and services, including the Emergency Operations Center), regional health services (Columbia Memorial

Local Agencies

Hospital, which serves as the region's only trauma center, and various medical facilities), Columbia River Pilots and Bar Pilots services (pilot services for all ships crossing the bar or traveling the Columbia River), Port of Astoria docks and offices, two major recreational and commercial fishing boat mooring basins, and one transient tour boat moorage facility. U.S. Highways 101 and 30 join in Astoria and meet at the Columbia River at the Astoria-Megler Bridge, a major access point between the States of Oregon and Washington.

Public Safety is provided by local police and fire departments. The Astoria Police Department is comprised of sixteen full-time officers and several reserve officers, who are responsible for 24 hour protection of the City's 11.5 square mile area. The Astoria Fire Department consists of twelve full-time personnel, twelve volunteer firefighters, and four response vehicles, including Hazmat van. The Fire Department's service area is approximately 12 square miles and includes the numerous facilities noted above with contract services to the Tongue Point Job Corps. Center. In addition, through existing Mutual Aid Agreements, Astoria supports the Knappa-Svensen-Burnside Rural Fire Protection District, in which the proposed LNG terminal would be located. The City currently has no marine law enforcement or shipboard firefighting capabilities except with land-based shipboard firefighting with the Maritime Fire Safety Association.

The City has very limited funding resources available for public safety services. It relies on limited property tax revenues that are used primarily for existing personnel expenses. In recent years equipment purchases have depended on grants and loans.

The City's public safety responsibility extends for approximately nine (9) miles along the southerly bank of the Columbia River beginning at approximately Smith Point (Youngs Bay Bridge/Highway 101) continuing eastward to and around Tongue Point. Approximately six (6) miles of the Columbia River shipping channel, from Warrenton city limits near Smith Point, east to Tongue Point are within the municipal jurisdiction of the City of Astoria. Astoria is the second Oregon municipality potentially impacted once the LNG Carrier enters the Columbia River. As described in the DEIS (Section 4.7.1), major portions of the City are located within Zone 1 of concern, including the Astoria waterfront, the downtown retail and governmental center, the Astoria waterfront River Trail, City Aquatics Center, Columbia Memorial Hospital and other major regional medical

Local Agencies

Section 4.7.1, the police and fire stations, three public mooring basins, numerous City parks, six motels, and several residential housing areas (including two large condominiums and four proposed, senior housing facility, housing for the disabled, and several single-family residential neighborhoods). Each of these public assembly areas is sufficiently close to the vessel transit route to warrant heightened safety and security measures.

Procedural History

On June 26, 2006, during the Pre-Filing Process, the City of Astoria wrote to the Commission to advise them that the City had a number of safety related concerns regarding the potential transit of LNG carriers through the corporate limits of the City of Astoria, which would occur should the Bradwood Landing site be approved by the Commission. A copy of that June 26, 2006 letter was also included in the Safety Advisory Report submitted to the Commission by the Oregon Department of Energy, attached as Appendix K to the DEIS. On June 26, 2006, City timely moved to intervene, Accession No. 20060706-0181. Since that time, both Astoria's Police Chief and Fire Chief have participated in various meetings and workshops held in conjunction with preparation of the U.S. Coast Guard Waterway Suitability Assessment Report ("WSR") dated February 28, 2007, attached as Appendix H to the DEIS, and with respect to development of an Emergency Response Plan ("ERP").

Comments on the DEIS

LA6-1 The DEIS repeatedly refers to the same discussion concerning waterway safety and security throughout the voluminous report. Specifically, the DEIS recognizes significant potential impacts within Zones 1 through 3 due to an accidental or intentional breach of an LNG vessel resulting in a release of LNG during transit or while at the berth. It acknowledges the risk of severe consequences, with injuries ranging from mild to fatal, being most severe in Zone 1 and decreasing outward through Zones 2 and 3. See, e.g., DEIS, p. 4-322. Yet, the DEIS uniformly concludes that "with the implementation of the safety and security measures and conditions outlined in the Coast Guard's WSR (see Appendix H), an LNG release along the waterway would be highly unlikely." Id. See also DEIS, p. 4-273 ("Effects on structures within Zone 1 would be most severe, while buildings within Zone 3 would be less impacted. However, with implementation of the mitigation measures

Local Agencies

LA6-1 See our response to comment LA2-1.

LA6-1 cont'd	<p>described in the Coast Guard's WSR, an LNG release along the waterway would be highly unlikely."); DEIS, p. 4-275 ("With the implementation of the safety and security measures outlined in the Coast Guard's WSR, it is highly unlikely that there would be a release of LNG from a passing LNG ship that would lead to a spill and related pool fire affecting planned commercial or residential developments along the waterway."); DEIS, p. 4-279 ("Those facilities within Zone 1 could sustain damages to structures, features, or vegetation. Facilities within Zone 3 would be less affected. However, with the implementation of the safety and security measures outlined in the Coast Guard's WSR, the chance of a spill would be extremely remote.").</p> <p>As a result of these findings, the FERC staff made a number of recommendations which are described in detail in sections 4.11.5.5 and 4.11.6 of the DEIS (pp. 4-429 through 4-436) and further documented in Section 5.2, Conditions 42, 62 and 63. These conditions fail to properly acknowledge, however, that the Coast Guard measures are <i>necessary requirements</i> and not simply preliminary recommendations with the details to be worked out later. <u>Compare</u> DEIS, p. 4-432 ("the WSR recommends additional facilities and infrastructure to make the waterway suitable for LNG marine traffic") <u>with</u> WSR, App. H ("I have determined that to make the Columbia River suitable for the type and frequency of LNG marine traffic associated with this project, additional measures will be necessary ... [and] must be put into place"). Additionally, the DEIS minimizes and generalizes the specific requirements outlined by the Coast Guard. For example, on page 4-432, the DEIS identifies one item as "augmentation of shore side firefighting capabilities to provide protection services to the facility as well as communities along the river" when the original WSR (p.4 of 6) stated "shore side firefighting resources and training will need to be augmented ... [including] adequate cost-sharing arrangements for project related training, equipment, maintenance, and staffing ... for all communities impacted by the project."</p>
LA6-2	
LA6-3	<p>Representatives of NSNG have had approximately two years to make firm commitments to state, county and local law enforcement and fire agencies concerning these requirements, and have not done so. The proposed conditions that the WSR be updated annually and NSNG commit prior to commissioning to implement the required measures is simply too little too late. Additionally, the conditions recommending the Emergency Response Plan ("ERP") and cost-sharing plan be submitted prior to initial site preparation likewise</p>

Local Agencies

6

LA6-2 See our response to comment LA2-2.

LA6-3 See our response to comment LA2-3.

LA6-3 do not provide sufficient certainty for local communities, like Astoria.

cont'd

As documented throughout the DEIS, implementation of these measures is critical to the viability of the project and the validity of the DEIS assessment. Absent binding agreement with the state, county and local fire and police agencies concerning security and safety requirements, the project cannot proceed and the entire DEIS safety and security analysis is rendered meaningless. Therefore, NSNG should be required, *prior to issuance of the final order issuing certificates ("Order" or "Certificate")* to reach an agreement in principle, in a form acceptable to each respective agency, with each state, county and local municipality affected on the level of resource funding it will commit for safety and security requirements including, without limitation, capital requirements for new equipment, resources for additional staff, and training for all affected personnel (both career and volunteer). The agreements should address the effects of heightened security alerts and unfunded future governmental mandates. These critical decisions cannot and should not be put off until after the Certificate issues.

The Commission cannot fulfill its statutory duty to address state and local safety considerations required by 15 U.S.C. § 717b-1 (Section 311(d) of the Energy Policy Act of 2005) by simply stating that these important details will be worked out after the Certificate issues. See DEIS, Appendix K, Response of the Federal Energy Regulatory Commission to the Safety Advisory Report of the Oregon Department of Energy for the Bradwood Landing Project (referring to proposed Conditions 42, 62, and 63). The statute requires meaningful resolution of state and local safety considerations "prior to issuing an order pursuant to section 717b." See 15 U.S.C. § 717b-1(b) and (c). Therefore, NSNG must be required to address Astoria's requirements (as well as the other jurisdictions affected), outlined in its June 26, 2006 letter, and commit to the funding necessary to implement these requirements, prior to issuance of any Order approving the project.

LA6-4

Secondly, with respect to "the current capacity of the local public services to respond to an incident or fire at the LNG terminal," the DEIS recognizes "that significant gaps exist in fire fighting capacity for both shore and water side fire fighting response." DEIS, p. 4-342. These gaps were also described in the State Advisory Report (Appendix K) filed pursuant to 15 U.S.C. § 717b-1. The DEIS states that "NorthernStar has

Local Agencies

LA6-4 See our response to comment LA2-4.

LA6-4
cont'd

indicated that trained personnel and fire fighting equipment would be maintained at the LNG terminal in the event of an emergency." Id. However, there is nothing in the DEIS to indicate that NSNG has committed to anything more than that which is required by applicable regulations and requirements found in 49 C.F.R. Part 193 and NFPA 59A. The proposed solution to address this acknowledged issue, the requirement to produce an ERP prior to construction, is simply inadequate.

Given the lack of local capacity and the distance from supporting fire fighting services, NSNG must be required to *enhance* fire protection. It is insufficient that operations and maintenance personnel will be trained in safe shutdown and evacuation procedures, etc. as already required by applicable regulations. If an incident occurs at night, when only a limited operations crew is working, there may be insufficient personnel to man all of the fire fighting equipment likely to be present. The Commission and the public can be assured that dedicated fire fighters with proper training and equipment will be readily available to address any incident at the terminal. Local public safety services will require increased resources to meet this need at the facility and in the community.

LA6-5

Lastly, with respect to protection of Cultural Resources in the event of an incident, the DEIS states that "NorthernStar indicates that it would produce a Cultural Resources Management Plan that would outline procedures for coordination with first responders in order to protect historic properties." DEIS, p. 4-359. Astoria is the oldest city west of the Rockies, and has three National Register Historical Districts, two of which abut the Columbia River. The City has about 800 historic properties and over 70% of the City's housing stock was built prior to 1950. This commitment to protect historic properties is not reflected in any of the proposed conditions prepared by FERC Staff. See Section 5.2. Therefore, Condition no. 36 (requiring such Cultural Resources Management Plan) must be modified to include a requirement to coordinate, and reach agreement, with first responders on the method and means to protect historic properties which are located within the Zones of Concern, especially historic buildings along the waterway which are most likely to be adversely impacted.

Local Agencies

6

LA6-5 See our response to comment LA2-5.

Conclusion

As described herein and in its prior correspondence (incorporated by reference), Astoria requires a commitment to fund necessary capital and on-going expenditures related to police and fire protection before it can agree to any proposed ERP. NSNG should be required to document such commitments, in a form agreeable to Astoria, before any final Order from the Commission issues. The proposed mitigation conditions, which delay finalizing such monetary commitments until after the Certificate issues, are inadequate and contrary to statutory requirements enacted as part of the Energy Policy Act of 2005. Additionally, based on the recognized need, NSNG should be required to implement and maintain an Industrial Fire Brigade as described in NFPA 600. Lastly, the required Cultural Resources Management Plan must contain provisions addressing the risk to historic properties located within the Zones of Concern and include agreements with local first responders documenting the method and means for protecting these properties and sites.

December 21, 2007

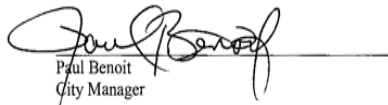

Respectfully submitted,

Willis L. Van Dusen, Mayor
City of Astoria

COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT BY
INTERVENOR, CLATSOP COUNTY

Intervenor Clatsop County, Oregon hereby responds to the Commission's request for comments on the Draft Environmental Impact Statement (DEIS) in this matter.

Due to emergency conditions in Clatsop County resulting from recent high winds and flooding, the County has been unable to independently review the DEIS in a timely manner. However, the County has contracted with the Columbia River Estuary Study Taskforce (CREST), an intergovernmental agency in Clatsop County charged with the responsibility of providing technical advice to member jurisdictions regarding matters pertaining to Coastal Zone Management and the Columbia River Estuary, to conduct the DEIS review on the County's behalf. That review by CREST is attached hereto as Exhibit A and is submitted herewith.

RE: Bradwood Landing Draft Environmental Impact Statement Review
Docket No. CP06-365-000, CP06-366-000

Dear Ms. Bose,

Clatsop County of Northwest Oregon contracted with CREST on October 5, 2007 to review the Bradwood Landing Draft Environmental Impact Statement (DEIS) and provide the following comment letter. Upon approval by the Clatsop County Board of Commissioners and CREST Council, CREST has been authorized to submit this document directly to FERC *on behalf of the County*. Please note that CREST remains neutral in regards to this project and does not intend to submit its own comments on the DEIS.

We have focused our technical review efforts on the project concerns and impacts voiced most often by Clatsop County residents, including environmental impacts to the communities and the estuary, as well as associated recreational and commercial uses supporting the regional economy. Our review excludes project reliability and safety, Chapter 4.11 of the DEIS; please refer to Clatsop County's July, 2007 *Public Safety Assessment for the Proposed Bradwood Landing LLC/NorthernStar Gas LNG Project* report (prepared by PBS&J consultants) for discussion of these issues. In addition, our review excludes the land use issues that are affected by the County's land use decision-making process. Please refer to the local land use process for the Counties' comments on those issues.

Over the last several decades Clatsop County has participated in extensive scientific studies in the Lower Columbia River estuary through membership in the ongoing

Local Agencies

Local Agencies

7

Columbia River Estuary Study Task Force and partnership in major restoration projects and plans. Researchers have shown that the estuary provides critical habitat for a variety of salmon life history stages, from fry to adults. Importantly, juvenile salmonids utilize the estuary as a rearing, refuge, and feeding area prior to transitioning into the ocean environment. Comprehensive plans have been developed by all levels of government over the last 30 years, addressing fish and wildlife restoration in the Columbia River and its estuary. Maintaining and restoring the estuary is a critical part of the long-term multi-billion dollar Columbia River restoration effort. Despite weakened fish stocks, commercial and recreational fishing in the region is still very significant, providing tens of millions of dollars in county revenue annually (Clatsop County Fisheries Project, commercial and sport crab / salmon / sturgeon commercial fishing, etc.). The eventual success of the long-term fishery restoration efforts will yield increased economic benefits to the regional economy by restoring fishing opportunities lost to the protection of weak stocks.

Because the scale of this project is unprecedented in the Lower Columbia, and we feel the DEIS is inadequate in several ways, we recommend that FERC proceed slowly through the permitting process to ensure that the final EIS (FEIS) address all of the concerns brought forward by Clatsop County and the various involved state and federal agencies.

General Review of Clatsop County's Overarching Issues

I Consequences of Major Liquefied Natural Gas and Vessel Fuel Oil Spills to Clatsop County Communities and the Waterway

The risk of a major LNG spill and an associated vessel fuel oil spill on the waterway is taken very seriously by Clatsop County, even though the DEIS indicates there is a low probability of such an occurrence in any given year. The adverse consequences of a major LNG shipping disaster to citizens of affected communities and biological resources of the estuary would be vast, requiring assurances for post disaster remedies. There is no predictive capability for such disasters, and prevention control for LNG transit disasters is worsened post September 11th due to the fact LNG vessels in particular have been identified as a prime target for malicious intent. In addition, this particular LNG transit corridor is very narrow in places and adjacent to shoreline communities, making it difficult or impractical to fully defend. The County wants to make sure that all possible funding mechanisms are in place to assure any major, accidental or intentional, LNG transport incident will be followed up with timely and complete remediation, restitution and recovery to both the human and natural environments.

We understand the difficulty in estimating the level of damage to life and property under different spill scenarios. The DEIS and its references do offer enough information for us to conclude that if a major accident/incident occurred adjacent to a near shore community like Astoria, life and property damages would be substantial and long

K-582

LA7-1

LA7-1 See our response to comment FA2-35.

LA7-1
cont'd

lasting. When a small community endures a major disaster there is a potential to permanently change its character, especially if post emergency disaster response is lacking. In addition, restoration is complicated in old cities like Astoria (oldest west of the Mississippi) having large numbers of heritage sites.

There is also a serious threat to the estuary once an LNG vessel's gas containers become damaged, not due to the LNG, but rather shattering and break-up of the ship allowing a major spill of vessel fuel oil into the water. The Resource Report 9 (Air and Noise Quality) that Bradwood LLC/NorthernStar submitted to FERC states that bunker fuel oil will be used in approaching, maneuvering, and departing from the terminal berth. Industry resources also show that conventional LNG carriers, although often cited as exclusively using LNG cargo boil-off when underway, get about 50% of their energy requirement from heavy fuel oil. Released gas vapors that are trapped in confined areas of the ship after an incident can damage the ship's structure upon ignition or detonation. A spill of tens of thousands of bunker fuel oil would be quickly distributed throughout the estuary by swift river currents and tides to wetlands and shorelines. Bunker fuel oil is made up of compounds harmful to fish and wildlife and known to sometimes cause off-flavor in harvested fish species. During an LNG / oil spill emergency, safety issues delay clean-up, allowing distribution of contaminants.

A major spill of bunker fuel oil could potentially result in significant economic impacts to the region, including suspension of some commercial fisheries due to contamination and possible reduced fishing opportunity over the long term. For example, if there is documented loss of a significant number of salmon listed as endangered species, it may be deemed necessary to further restrict the already severely restricted fishing opportunities in the estuary. A major oil spill would also impact tourism and recreation based economies like those on the Lower Columbia because of the visual blight, off-flavor in fish and pollutant odors.

In order to assure full remediation, restitution and recovery of the community and the estuary following an LNG and/or fuel oil spill it is necessary to have the Federal Energy Regulatory Commission's license require LNG shippers and Bradwood facility operators and their successors to be fully bonded and insured for the worst case spill clean-up and response. This includes damage compensation/restitution obligations for all lost uses over the entire recovery period.

We believe there is Federal guidance for FERC to use license terms and conditions to provide surety for full remediation and compensation. First, LNG vessel transit on the Columbia River is an integral part of the Bradwood project; without it the proposed project could not exist. Federal designations for the Columbia River estuary indicate it is one of the Nation's most important and environmentally sensitive waterways (one of seven nationally designated by Environmental Protection Agency's National Estuary Program). Guidance to FERC is provided by the Federal Power Act requirement "... to consider the extent to which a project is consistent with Federal or state comprehensive

Local Agencies

LA7-1
cont'd

plans for improving, developing, or conserving a waterway or waterways affected by the project" (FPA Section 10(a)(2)(A)). FERC has adopted 25 Comprehensive Plans that address improvement /restoration of the Columbia River for fish and wildlife resources and recreation. The permit authorized by FERC should provide adequate protection and mitigation of fish and wildlife and other beneficial public uses such as recreation. The Federal definition of mitigation does include compensation for an unavoidable impact. Since spills may occur despite every required prevention measure, such spills would be considered unavoidable and therefore require compensation for impacts.

Another source of guidance to FERC is the federal endangered species program recovery plan for the Columbia River, which includes the estuary as critical habitat. The health of the estuary is essential to achieving recovery of the listed anadromous species, all of which spend time in the estuary. Given that recovery plans examine the exposure of weak populations to harmful events over a 100 year period, even events that occur infrequently like LNG / oil spills could reduce chances of recovery for the species without remediation and compensation.

II Recreational and Commercial Fishing Impacts

The DEIS does not adequately analyze or mitigate the significant potential conflicts between the LNG ships using the waterway and recreational and commercial boating activities (sport fishing, commercial fishing, power boating, sailing, paddling, waterfowl hunting). The Oregon Department of Fish and Wildlife (ODFW) estimates the angler boat count downstream of the Astoria-Megler bridge to range between a low of 613 in April to a high of 19,644 in August, with a total of 46,547 boats annually engaged in recreational and commercial fishing for crab, sturgeon, salmon, halibut/bottomfish, tuna, and whiting.

LA7-2

The DEIS states an LNG vessel will initially be seen on the river approximately every 1.5 days. All other vessels are expected to move out of the 500 foot security exclusion zone for a quarter hour or more before resuming their position. Commercial fishermen may face an even longer delay, given the time it takes to retrieve and deploy nets and other gear. In some reaches of river, excluded vessels may have to move to shallow areas where they must contend with wakes larger than other shipping vessels, sand bars at low tide and obstacles in the fog. Some recreational boaters may choose to leave the river, impacting traffic at boat ramps. When considering the entire volume of boat anglers and pleasure boaters cumulatively and the channel conditions, we believe the impact to boat traffic is significant rather than the inconvenience conclusion in the DEIS. Mitigation considered for this significant impact could include: (1) timing LNG transit to avoid peak recreational boating or fishing periods/times of day identified by local and state knowledge, including the Astoria Regatta, Great Columbia Crossing and peak fish migrations; (2) for those fishing periods that cannot be avoided, redirect angling effort to areas outside the exclusion zone by funding the development of strong fisheries in tributaries and side bays of the estuary, and (3) improvement of boat ramp facilities.

Local Agencies

7

LA7-2

Our EIS does not specify any time period (such as a quarter hour or longer for commercial fishing boats) that other vessels may be required to move out of the way of LNG carriers transiting up the waterway to the proposed Bradwood Landing LNG terminal. If the LNG carriers travel at speeds between 8 to 12 knots up, they would be past other boats in a matter of minutes. Thus we are able to conclude, in section 4.7.1.4, that the project would not have any significant impacts on other river users.

LA7-3

The communities on the Columbia River estuary presently have a focus on developing tourism and recreational uses. LNG carriers and their heavily armed escort vessels have a high potential to create an unwelcome and/or unsafe appearance not conducive to many tourists and recreational fishermen seeking a relaxing experience. The uncomfortable response of visitors to LNG transit would be expected to worsen if there are future LNG shipping disaster(s) anywhere in the county. If visitors choose other coastal recreation opportunities because they are uncomfortable with the LNG transit, the regional economy would lose millions of dollars over the long-term spent on retail, hotel and guide services. The DEIS should disclose and analyze the economic value of tourism and recreation to the region and then estimate a range of potential long-term lost visitor use relating to LNG transit, including recreational fishing, visiting cruise ships, the Lewis and Clark National Heritage Park, and the proposed Columbia Pacific Heritage Area. We believe the lost value over the long-term could be significant and recommend conducting an opinion survey of potential visitors that gauges recreational and tourism conflicts with LNG transit in general (thus avoiding potential tourism impacts of the survey itself). If significant losses are estimated, mitigation could be considered in the form of funding tourism promotions to off-set estimated losses.

III Incomplete and Inadequate Draft Environmental Impact Statement

LA7-4

Importantly, there has not been a third-party market analysis concerning whether or not the LNG gas provided via the project fulfills the purpose and need of the project. Spokespersons for the William's Northwest Pipeline say that the company doesn't have room for all of the gas the Bradwood facility would provide and that, even with project declines in supply from Canada and the Rocky Mountains, there is not enough demand for natural gas in Oregon and Washington to utilize all of the Bradwood supply. The evidence indicates that the Bradwood Landing project will be most fully realized when, in the foreseeable future, the Palomar pipeline is connected to the proposed facility. We believe that the Palomar pipeline is therefore not a *related* foreseeable project (i.e. a potential cumulative impact as cited in the DEIS), but rather a project the proposed LNG facility is *dependent* upon. If this is the case, FERC staff should require that the final DEIS be amended to include environmental impacts associated with the Palomar pipeline.

LA7-5

In addition, FERC and EPA approved comprehensive plans for protection and restoration of the Lower Columbia River are an important guide to the Federal licensing process for this large scale project but are omitted from the DEIS analysis. The intent of these comprehensive plans is to restore the fishery, ecological function and fishing opportunity, providing a significant value to the local economy. We recommend the DEIS list and review the 25 FERC approved Comprehensive Plans and use them to guide development of a mitigation package that fully mitigates for all the project impacts to the Columbia River estuary and its tributaries.

Local Agencies

7

LA7-3

We do not believe that LNG marine traffic in the waterway would represent a safety risk to adjacent communities, as explained in section 4.11.5. Nor do we think that the project would have any negative impacts on the local tourist industry. We do calculate the value of recreation and tourism in the region in sections 4.7.1.4, 4.8.1.8, and 4.8.2.8.

LA7-4

As discussed in section 1.0, the Williams Northwest pipeline would have capacity for the natural gas from the Bradwood landing pipeline project. We do not agree that there is not enough demand for natural gas in the Pacific Northwest to utilize the Bradwood Landing Project supply. See our discussion of purpose and need in section 1.1. Also see our response to comment PM1-58. As described in section 3.1.2.2, we consider the Palomar Project to be a separate undertaking from the Bradwood Landing Project. Neither project is inter-dependent on the other. If Palomar is not authorized or built, the Bradwood Landing Project could still go forward, and vice versa.

LA7-5

See our response to comment PM5-28.

LA7-5
cont'd

Clatsop County, Oregon state agencies, and federal agencies commenting on the DEIS have identified currently unmitigated project impacts in the waterway, on the site and along the pipeline(s) and we recommend that their comments produce binding mitigation commitments. In this manner, Clatsop County recommends that NorthernStar use their project development funds for full and complete *mitigation* of the project impacts consistent with the underlying intent of Federal, state and local rules and guidance. We expect that funding such a complete mitigation package would approximate the project proponent's voluntarily offer to spend \$59 million dollars on unspecified salmon *enhancement* (e.g. endowments for mitigation areas, bonding and insurance for spill contingency and damage compensation, various omitted mitigation needs, etc.). This Salmon Enhancement Initiative will be completely outside of any license or permit requirements (enhancement is not ruled to be a necessary environmental commitment for a project). One of the realities of enhancement offers is that they can be readily disregarded by a successor company or owner.

LA7-6

Finally, the DEIS alternatives analysis is superficial and incomplete. We recommend completing a robust alternative analysis worth of the guidance in the comprehensive plans and the community's focus on the estuary. Potentially significant impacts for which we recommend additional analysis in the DEIS are detailed further in the specific comments (including references on key points), including recreational conflicts, wetland mitigation areas and their management, and geologic hazards.

IV Geologic Hazards Associated with the Bradwood Landing Location

LA7-7

The geology and geologic hazards associated with the location of NorthernStar's proposed facility at Bradwood are critical issues. The Oregon Department of Geology and Mineral Industries (DOGAMI) labels the site as having severe natural hazard potential. The DEIS attempts to address the applicable geologic hazards, but in many sections the research is incomplete. The County believes that for the DEIS to be considered complete and adequate it must disclose new specifications and mitigation measures for foundation problems at the facility related to liquefaction and ground stability during major subduction-zone earthquakes, adequate tsunami wave modeling, accurate pre-construction landslide and debris flow characterizations (including records of historical landslides omitted from the DEIS) and new pipeline routes in response to geologic hazards. In addition, it is necessary to address HDD stream crossing methods and landslides associated with pipeline construction potentially impact important tributaries.

V CZMA Consistency Requirements Regarding Federal Actions

The Coastal Zone Management Act of 1972 is based on the premise that such management is best achieved at the state and local level (CZMA Sec. 302(i)). This plan directs the states to create coastal management programs that are consistent with this Act. Oregon's Coastal Management Program, which is federally approved, directs local governments in the coastal zone to create laws and policy consistent with CZMA

Local Agencies

7

LA7-6

We disagree. We believe our alternatives analysis in the EIS is robust and complete.

LA7-7

Concerns raised by DOGAMI regarding geologic hazards are discussed in the responses to comment letter SA1. See also our responses to comments PM3-39, LA7-25, and LA7-31.

objectives. In conjunction with the State program, Clatsop County has integrated the CZMA into its local comprehensive plan and thus become an agent of the State. This gives the County, as directed by the CZMA, the authority to determine if a federal action, such as the siting of energy facilities, is consistent with local land use laws. (CZMA Sec. 307). Specifically, CZMA Sec. 307 states that, "No license or permit shall be granted until the state or its designated body has concurred with the applicant's certification".

LA7-8

The proposed Bradwood Landing LNG terminal site is located within the authority of the CZMA under Oregon designation. Due to this fact and the County's role as an agent of the state on this issue, FERC has the responsibility to integrate Clatsop County's land use decisions relevant to the CZMA into the final EIS. Thus, the decision of the County to concur with or object to the Bradwood Landing proposal must be an integral part of the final FERC approval process. As a result, any conditions attached to a County approval that is relevant to the CZMA must be incorporated into the final EIS by the authority of the CZMA. If the County's decision is to deny, or if NorthernStar asserts that some of the conditions are too restrictive and wants them removed, FERC must prove that the activity is consistent with the CZMA or otherwise necessary in the interest of national security (CZMA Sec. 307(c)(3)(A)).

At the time this document was written, the County is currently in the process of analyzing and deliberating on NorthernStar's consolidated land use application for approval or denial. It is important for FERC to understand that the Oregon DLCD cannot issue the mandatory CZMA consistency certification for NorthernStar's proposed project unless Clatsop County finds it consistent with its Comprehensive Plan, Land and Water Development and Use Ordinance, Standards Document and the Columbia River Estuary Management Plan. All of these documents have been acknowledged by the State as being in compliance with the statewide planning goals and thus are a part of CZMA consistency.

LA7-9

In the final EIS, FERC should be guided by specific CZMA goals regarding development on the coast and the siting of an energy facility. A management objective of coastal development is minimizing the loss of life and property caused by improper development in flood-prone, storm surge, geological hazard and erosion-prone areas. (CZMA Sec. 303(2)(B)). In NorthernStar's case, the Bradwood terminal and pipeline locations are prone to flooding, geologic hazards, erosion and other hazards associated with heavy storms. In addition, the CZMA states that priority consideration should be given to coastal-dependent uses and orderly processes for siting major facilities, such as energy, in locations that are in or adjacent to areas where commercial or industrial development already exists (CZMA Sec. 303(2)(D)). In regards to NorthernStar, the Bradwood location is on property designated for industrial use, but that use is limited by the local comprehensive plan to industrial uses smaller than the proposed facility. Also, there is no adjacent industrial or commercial development near the Bradwood site. The site is surrounded by forested lands and the nearest industrial operator is several miles away.

Local Agencies

7

LA7-8

We have revised the EIS to indicate that on March 20, 2008, Clatsop County made a final decision to approve the land use changes proposed by NorthernStar, subject to specific county-imposed conditions.

LA7-9

See our response to comment LA7-8.

VI Other Primary Clatsop County Concerns

Other County impacts that will be addressed in brief in the Specific Comments section include:

- LA7-10
- Sediment impacts in watersheds along the pipeline route: The focus is on streams tributary to the estuary included in comprehensive restoration plans and/or supporting anadromous fish spawning. Potential sediment impacts can be derived from active landslides triggered by pipeline activities, and pipeline crossings, both open trench and borings. Mitigation measures should include careful monitoring of streams and watersheds for sediment discharges followed by clean up of significant deposits in spawning riffles and juvenile rearing areas.
- LA7-11
- Mitigation Plans: Clatsop County requests to be included among the applicable agencies that will participate in finalizing the Bradwood compensatory mitigation package and third-party monitoring and reporting programs. Site-specific mitigation area agreements are recommended that will minimally include: (1) An endowment to manage each of the areas in perpetuity in a manner that avoids impacts to neighboring properties, (2) funds covering all start-up costs (3) designation of a qualified land management agency, and (4) providing the county with in lieu taxes if the land owner/manager is tax exempt.
- LA7-12
- Fish entrainment at water intakes: Although the proposed facility will have a ballast water and engine cooling installation that prevents entrainment, it is not compatible with all the ships that transport LNG. A requirement is recommended that limits the LNG facility to contract with ships having compatible equipment and an associated monitoring and compliance program.
- LA7-13
- Shoreline erosion caused by LNG vessel wakes: The LNG vessel produces a wake that is larger than the typical cargo vessels. The DEIS does not disclose the presence of numerous dikes along the Columbia River that protect homes and property. Many of the dikes are in need of maintenance and upgrading. County recommends analyzing shoreline erosion affects upon dikes due to the LNG vessel wake and mitigating any unavoidable impacts found to be significant.

Specific Comments Related to Clatsop County's Overarching Issues

Alternatives Analysis

- LA7-14
- The Alternative Analysis should be more robust and complete to utilize the Federal guidance of FERC approved Comprehensive Plans concerning restoration of the Columbia River and its estuary and EPA special designation of the Columbia River in the National Estuary Program (Section 10 of the Federal Power Act). Specifically, off-shore facilities alternatives that avoid impacts to the estuary should receive more analysis

Local Agencies

- LA7-10
- The impacts of pipeline construction and sedimentation on surface waters and aquatic habitats are discussed in sections 4.3.2.4 and 4.5.3.1, respectively. To minimize impacts on surface waters, NorthernStar would implement its Waterbody and Wetland Construction Procedures Plan, pipeline ESC Plan for Oregon, and SWPPP for Washington as well as our Plan and Procedures. In addition, NorthernStar is consulting with the FWS, NMFS, and state agencies regarding potential mitigation for replacement of in-stream habitat. We have included a recommendation that NorthernStar finalize its Waterbody and Wetland Construction and Mitigation Procedures Plan that describes the specific methods of in-water habitat mitigation to be conducted, and file that plan for our review and approval prior to pipeline construction. NorthernStar would compensate for impacts on surface waters and aquatic resources that could not be avoided by setting aside or developing a number of mitigation sites, which are described in its Compensatory Mitigation Plan. See our response to comment FA2-10 regarding compensatory mitigation.
- LA7-11
- County-level involvement is typically welcomed as part of establishing wetland mitigation within the CWA permitting process. Contacting the ODEQ to facilitate such involvement is recommended.
- LA7-12
- See our response to comment PM1-31.
- LA7-13
- See our response to comment FA4-14.
- LA7-14
- We disagree. We believe that no more analyses are necessary for our consideration of a potential offshore LNG terminal alternative. Our detailed feasibility analysis of this alternative is presented in section 3.1.4. The ABS report summarized in our discussion indicates that conditions offshore in the Pacific Northwest result in rougher seas than found offshore of the Northeast and Gulf coasts. See our responses to comments PM2-24, FA2-4, LA3-15, and IND115-2.

LA7-14
cont'd

than that provided in the DEIS. The DEIS does state that "an offshore LNG import terminal alternative would avoid some of the environmental impacts of the proposed Bradwood Landing Project, such as effects associated LNG marine traffic up the Columbia River, critical salmon habitat in the river, nearby population and visual effects, and impacts on terrestrial resources, including wetlands." It then goes on to conclude: "However, based on our review of the analysis conducted by ABSG and NorthernStar, we do not consider an LNG terminal off the coast of Oregon to be a viable alternative to the proposed project because of the rough sea and weather conditions and the additional environmental impacts associated with the longer send out pipeline." The DEIS should place greater weight on protecting the Columbia River and its estuary than the sandy bottomed sea floor area supporting the send out pipeline to the off-shore facility based upon the Federal guidance in both the FERC approved Comprehensive Plans that appear relevant to natural resources and recreation in the Lower Columbia River (see the following list), and EPA's inclusion of the Columbia Estuary in the National Estuary Program (program description also provided below) and the Nation's Great Water Body program. Furthermore, in a relative sense the off shore area has much more dilution capacity than the estuary for assimilating fuel oil spills. In terms of the feasibility of using the off-shore facility, such engineering analyses are outside of our capability; however we note in the following figure from a FERC staff presentation that there are proposed LNG facilities on the New England Coastline, which is at times known for rough ocean conditions, and the Gulf of Mexico which at times has hurricane conditions (see proposed sites number 40 to 43). Therefore it appears appropriate to provide a detailed feasibility analysis of an off-shore facility.

*FERC LIST OF COMPREHENSIVE PLANS
REVISED AUGUST 2007*

Documents that satisfy the Commission's comprehensive plan criteria listed for the Columbia River under Oregon and Washington that are potentially relevant to the Lower Columbia River where Bradwood LNG Project transit corridor and facility site is located include:

THE UNITED STATES ENVIRONMENTAL PROTECTION AGENCY NATIONAL ESTUARY PROGRAMS

The United States Environmental Protection Agency National Estuary Programs was charged with developing and implementing a Comprehensive Conservation and Management Plan (CCMP) which establishes priorities for activities, research, and funding for the estuary. The CCMP serves as a blueprint to guide future decisions and actions and addresses a wide range of environmental protection issues including water quality, habitat, fish and wildlife, pathogens, land use, and introduced species to name a few. The CCMP is based on a scientific characterization of the estuary and is developed and approved by a broad-based coalition of stakeholders. (<http://www.epa.gov/owow/estuaries/ccmp/>) Lower Columbia CCMP, completed in 1999, contains 43 specific actions designed to protect and restore the lower Columbia River. The actions are broadly grouped into three categories - Actions 1-12 address habitat and land use; Actions 13-28 address education and management; Actions 29-43 address conventional and toxic pollutants. www.epa.gov/owow/estuaries/programs/cre.htm

The FERC Permitting and Review Process

Medha Kochhar, Office of Energy Projects, Federal Energy Regulatory Commission

October 24, 2006. Atlantic States Marine Fisheries Commission 65th Annual Meeting

Geology

LA7-15

Page 4-3, Paragraph 2: As stated by Oregon DOGAMI, this is an erroneous technical statement because erosion features do not form deposits. The County is in agreement with DOGAMI that a technical review of the DEIS by URS and relevant consultants needs to be performed to ensure adequate integration of technical analyses and results.

LA7-16

Page 4-3, Paragraph 7, Second Sentence: The statement that most of the natural shoreline is resistant to erosion is unsubstantiated and needs scientific data to support. The DEIS discusses that there has been little change in the river's location over the last 6000 years. However, there is no study cited to support this. In addition, even a minute change in one reach of the river's course can affect County landowner's properties along the river. The DEIS needs a more complete study of the LNG traffic's affect all along the river channel due to channel modifications for the project.

Local Agencies

7

LA7-15 See our responses to comments SA1-4 and SA1-93.

LA7-16 As a clarification, the Columbia River navigation channel would not be modified for this project. See also our response to comment FA4-14.

K-592

- LA7-17 | Page 4-5, Paragraph 6, Second Sentence: Since it is difficult to determine what additional impacts on shorelines the proposed LNG marine traffic would contribute, a baseline study and monitoring program should be implemented.
- LA7-18 | Page 4-9, Paragraph 2, Second Sentence: The DEIS states that debris flows would not reach the terminal site. However, there is no study or modeling shown to prove this point. This type of event should include adequate scientific data to support the conclusion the DEIS reached. A large landslide could potentially damage the terminal facilities and should be better researched to determine if such an event can or cannot occur.
- LA7-19 | Page 4-9, Paragraph 5: The DEIS states that FERC staff could not find any data on a large landslide that occurred in 1965 very near the Bradwood location which caused a tsunami on Puget Island. However, the Wahkiakum County Eagle, a newspaper out of Cathlamet, WA, dedicated an article with pictures to the event (W.C. Eagle, Thursday, Feb. 4, 1965). This is evidence of a lack of complete data on historic landslides in the terminal and pipeline areas. A more complete analysis needs to be performed.
- LA7-20 | Page 4-10, Figure 4.1.3-1: This map identifies only some of the known faults in the area. DOGAMI has stated that this map is incomplete and shows a lack of confidence in the scientific data. A new map showing all of the known faults is needed.
- LA7-21 | Page 4-11, Paragraph 5: This discussion does not include earthquakes with a magnitude between 8.0 and 8.5. In addition, the County agrees with DOGAMI that analysis of OBE-SSE between 8.0 and 8.5 is needed, along with an evaluation of earthquakes not located along the Cascadian subduction zone.
- LA7-22 | Page 4-12, Paragraph 3: In addition to the LNG tanks being supported on deep foundations, the other portions of the facility should be considered for ground improvements beyond vibroflotation and engineered fill.
- LA7-23 | Pages 4-12 and 4-13: The County would like to see that all of the FERC staff recommendations on these two pages be integrated into the final EIS. These include recommendations that the final engineering design needs to incorporate, including detailed seismic specifications and other measures to mitigate the impacts of seismic hazards.
- LA7-24 | Page 4-14, Paragraph 4: Some regional tsunami maps cited by the DEIS are over 10 years old. The terminal site and pipeline areas should be evaluated on a site-specific basis. The data should include the most up to date information available, including the tsunami research currently being performed by Oregon State University.
- LA7-25 | Page 4-20, Paragraph 5: 110 potential landslide areas have been identified along the proposed pipeline route. The DEIS states that these landslide areas may cause changes

7

- LA7-17 | See our response to comment FA4-14.
- LA7-18 | See our response to comment SA1-100.
- LA7-19 | See our response to comment PM3-39.
- LA7-20 | See our response to comment SA1-98.
- LA7-21 | See our response to comment SA1-102.
- LA7-22 | See our response to comment SA1-105.
- LA7-23 | We have included and/or expanded and clarified the same recommendations for the final engineering design in the final EIS as were in the draft EIS. See for example the responses to comments SA1-4 and LA7-25 and related FERC staff-recommended conditions. Should the project be approved, these recommendations would become conditions of the authorization.
- LA7-24 | See our response to comment SA1-106.
- LA7-25 | Additional field mapping and subsurface investigations are required before the final pipeline design geotechnical report can be completed, and access is not available for all of the areas needing to be investigated. Proposed mitigation measures for geological hazards along the pipeline route would be subject to review by the Board of Consultants recommended in sections 4.1.3.3 and 4.1.4.3. The FERC staff has modified the draft EIS recommendation regarding completion of the geotechnical report on the pipeline route to clarify that all significant geological hazards must be further investigated and mitigated through final design measures. The recommendation specifies that NorthernStar must consult with and seek comments from the designated state coordinating agencies (WDE and ODE) prior to filing the report with FERC.

LA7-25
cont'd in the pipeline route or other additional precautions. Alternate routes and precautions are suggested in Table 4.1.4-3 (Page 4-21), however, the DEIS fails to show the final pipeline route. This uncertainty causes great concern to area residents. The final EIS needs to include a final pipeline design geotechnical report showing the chosen pipeline route and its relation to the landslide areas.

Soils and Sediments

LA7-26 Page 4-28, Paragraphs 3 and 4: The environmental site assessment identified six Recognized Environmental Concerns (RECs) on the terminal site. These represent areas have the potential to contaminate the surrounding soils or may already be contributing to their contamination. FERC staff recommends a Contaminated Materials Management Plan (CMMP), if final design demonstrates the need. The County would like a CMMP developed no matter what the outcome. The potential for discovering contaminated soils during construction is high due to the RECs and therefore a CMMP should be included in the final EIS.

Water Resources

LA7-27 Page 4-52 and 4-54: Groundwater uses and Withdrawals. The County would like assurances that the water appropriation at the site will not cause injury to existing users or over-appropriation of the resource. Wells appropriating groundwater for ballast and cooling must comply with Oregon Water Resources Department's statutes and rules governing well construction. The County urges FERC to comply with OWRD's request to require a funding agreement for consultation with OWRD on water rights issues.

LA7-28 Page 4-60, Paragraph 4, second sentence: FERC staff recommend that NorthernStar prepare a CMMP (Contaminated Materials Management Plan) that would specify the procedures to identify, characterize and properly manage potentially contaminated materials, including groundwater, to be submitted to appropriate agencies for approval before construction. This recommendation needs to be incorporated into Section 5.1.3 (Conclusions and Recommendations for Aquatic Resources) and the results need to be disclosed prior to the development of the FEIS so FERC staff can evaluate the contaminant risk of project implementation.

LA7-29A Page 4-66, Paragraph 4, fourth sentence: The DEIS states that LNG vessels "have the potential to resuspend, and subsequently redeposit, sediments, resulting in impacts similar to dredging. Impacts associated with propeller wash would occur more frequently than dredging". The DEIS does not offer any mitigation for these impacts, or monitoring to ensure that ODEQ total maximum dissolved solids requirements are met. Instead, the DEIS states "we do not anticipate that propeller wash from LNG ships and tugs would result in a significant degradation of water quality in the Columbia River".

Local Agencies

LA7-26 The FERC staff's recommendation already would require a CMMP be filed with the Secretary prior to beginning construction regardless of the final design results. It is not necessary for the CMMP to be included in the final EIS.

LA7-27 It is not the FERC's practice to require funding agreements with state and local agencies as conditions in the EIS process. However, other regulatory bodies at the federal, state, and local levels could, if deemed necessary and appropriate, include such agreements as conditions to their permits. Groundwater would not be used for ballast or cooling water requirements at the wharf.

LA7-28 Section 5.0 is a summary of our findings and is restricted in length. Therefore, we are limited in the amount of information that can be included. A CMMP would not provide information on contaminant risk and it is not necessary that it be included in the final EIS.

LA7-29A Mitigation measures are not proposed for propeller wash because the impacts would be localized and minor. The wakes produced by an LNG carrier are only slightly larger than those of the large vessels currently using the Columbia River. In addition, the speed of LNG carriers on the Columbia River would be limited by the tethered tug, thus reducing the potential for shoreline erosion. Shoreline erosion is discussed further in section 4.1.2.3. The volume of LNG carrier traffic is not expected to increase during the life of the project.

- LA7-29A cont'd The EIS should analyze and disclose the level of risk to localized water quality and the structural integrity of the many dikes in the area from the wake and subsequent shoreline erosion caused by LNG transit. The long-term impacts of LNG vessel wakes may be grossly underestimated because the DEIS leaves open the possibility for future increases in capacity and gas send-out, requiring more vessels transiting the waterway. Possible mitigation measures may include reduced speeds to reduce the wakes, installing erosion protection on dikes, and a monitoring plan for TMDL compliance.
- LA7-29B Page 4-72, Paragraph 3, Sentence 3: The DEIS says that if the hydrostatic testing of the two storage tanks is done in conjunction with each other, then it would save 30 million gallons of water. The County requests that this be the only approved process in order to preserve the water resource.
- LA7-30 Page 4-84, Paragraph 4: The DEIS claims that Northern Star's HDD contingency plan provides procedures and measures to mitigate an inadvertent release of drilling mud to the water body. Under Oregon's definition of mitigation there are not suitable mitigation measures contained in the contingency plan. The plan simply commits to stop the discharge of pollutants 30 minutes after detection followed by an inspection of biological resource damages. Feasible mitigation measures recommended for any significant discharge of drilling mud into a fish bearing stream should include: removal of the thicker deposits of drilling mud in stream bottom using sludge pumps and/or restoration of the stream system to mitigate for the lost productivity following a spill. Many streams support spawning salmonids (cutthroat trout, rainbow trout, salmon and steelhead) and the discharge of the drilling mud over spawning beds can suffocate eggs and larvae located within the gravel bed by entombment or sealing off intergravel flow (the drilling mud is used in the bore hole as a sealing compound). In the case of streams that support spawning of resident and anadromous salmonids the HDD crossing should be restricted to the dry season after all the early life stages have left the stream. . In addition, the contingency plan should include on-site quality control monitors/inspectors stationed on a real time basis some reasonable distance downstream from the bore hole. Given the geologic characteristics of the region drilling mud can erupt or vent to the stream bed some distance from the bore hole and the thick rain forest vegetation can restrict its detection.
- LA7-31 Page 4-84, Paragraph 5: The DEIS states that geotechnical investigations were conducted at 13 proposed HDD water body crossing locations to determine suitability of the method. Table 4.3.2-3 of the DEIS, however, lists 19 potential HDD water body crossings. Results from existing geotechnical studies need to be disclosed in the EIS and geotechnical studies of the remaining sites need to be performed and reported to the appropriate agencies prior to the end of the DEIS comment period.

Local Agencies

7

- LA7-29B NorthernStar intends to schedule construction activities so that water used to test the first tank can be reused to test the second tank. However, if construction does not proceed as planned and delays are experienced, the two tanks may need to be tested at different times.
- LA7-30 NorthernStar's HDD contingency plan has been revised. Directions for accessing NorthernStar's HDD Contingency Plan (Frac-out Plan) via the eLibrary can be found in the response to comment FA3-13. See also our response to comment SA3-6.
- LA7-31 The final geotechnical analysis for the HDD boreholes was not completed in time to be incorporated into the final EIS. Geotechnical investigations will be conducted at the remaining HDD locations when access is obtained and the results will be provided to the FERC and made available on the FERC's eLibrary. Also see the response to comment LA7-25.

Wetlands

LA7-32

Page 4-91, Paragraph 3, sentence 7: The DEIS states that "if the LNG vapor cloud were to burn, wetland vegetation along the Columbia River could be damaged" and "with implementation of the mitigation measures described in the Coast Guard's WSR, a release would be highly unlikely". Prevention and low probability of occurrence are not mitigation according to Oregon State Law. Binding language should be inserted into the EIS that requires NorthernStar to produce bonding and insurance for cleanup and restoration of wetlands damaged by an accidental or intentional release of LNG or fuel oil.

Page 4-96, Paragraph 2: NorthernStar has drafted a Mitigation Plan to account for the permanent loss of some wetlands. The following are some of the identified deficiencies in the plan and recommended improvements:

LA7-33

- Some designated mitigation sites, such as Svensen Island, are already functioning as wetlands such that they do not qualify as mitigation (i.e. double counting). Substitute mitigation areas are needed for these sites.

LA7-34

- A mitigation area agreement needs to be developed for all of the mitigation areas that minimally includes:
 - An endowment to manage each of the areas in perpetuity in a manner that does not impact adjacent properties owned by citizens of the county; including proper management of wetland function and water supply, controlling noxious weed seed reservoirs, appropriate control of public access, activities and litter etc.
 - Paying all costs associated with start-up of the mitigation area, including acquisition, transfer of property, water rights, water delivery system and an initial monitoring program that verifying wetland functions will be effective going forward into the future.
 - Turning over the lands to a qualified land management agency
 - Providing the county with in lieu taxes if the lands are turned over to a management agency that is exempted from county taxes.

LA7-35

4-109, Paragraph 1, sentence 2: The DEIS states that "the wakes produced by an LNG ship are only slightly larger than those of the large vessels currently using the Columbia River. As such, we do not believe the LNG shipping activities would adversely affect Priority Habitats found along the lower Columbia River." This statement is entirely inadequate without quantification of the size of the wake behind an LNG ship. The EIS should analyze and quantify wake size and the risk of shoreline erosion, particularly as it relates to potential impacts on priority habitats and man-made structures like dikes.

Local Agencies

7

LA7-32 See our response to comment FA2-35.

LA7-33 See our response to comment FA3-3.

LA7-34 See our response to comment LA7-11.

LA7-35 See our response to comment FA4-14.

LA7-35 cont'd	Possible mitigation measures may include reduced speeds to reduce the wakes, installing erosion protection on dikes, and performing periodic third-party habitat monitoring along the lower Columbia river.
LA7-36	4-109, Paragraph 2: The DEIS dismisses the consequences of a major LNG accident, intentional or accidental. LNG is said to burn back to the spill site, rather than outward towards shoreline habitats, but the DEIS acknowledges the possibility for ignition of LNG vapors to spark a forest fire. Prevention and low probability of occurrence are not mitigation according to Oregon State Law. Binding language should be inserted into the EIS that requires NorthernStar to produce bonding and insurance for the cleanup and restoration of natural and human landscapes damaged by a worst-case scenario accidental or intentional release of LNG or fuel oil. In addition, the EIS needs to discuss not just the possibility of LNG release, but a major spill of bunker fuel oil (used when approaching/maneuvering/departing the berth and, increasingly, the primary fuel in new LNG vessel designs). A fuel oil spill would be very difficult to contain in the dynamic estuary and the ecological and economic consequences would be vast and lasting. Bunker fuel oil is made up of compounds harmful to fish and wildlife and known to sometimes cause off-flavor in harvested fish species. The compounds can linger in the estuary for decades and cause temporary commercial fishing closures, long-term fishing restrictions, and a decrease in tourism. The potential for a fuel oil spill is not acknowledged in the DEIS and needs to be discussed and mitigated fully. In addition, the discussion should disclose if a spill is related to a terrorist incident would that be considered as an act of war under the insurance policy carried by the shipper? If so sufficient bonding should be in place to cover the clean up and damage compensation for a worst case scenario without any assistance from insurance. If the spill places more liability than assets held by the shipper the operator of the Bradwood facility should also have sufficient bonding to step into the shoes of the shipping company should it dissolve due to the incident.
LA7-38	
LA7-39	Page 4-117, Paragraphs 3 – 5: The DEIS states that "reasonable" efforts will be made to obtain straw bales for erosion control that are free of noxious weeds and clean fill soil that is free of noxious weeds. Given the scale of this project, and the very large number of vehicles and people involved, there exists very significant potential for spreading invasive species that, in some parts of the estuary, have all but taken over native habitats. The EIS needs to erase the word <i>reasonable</i> and require the project to procure clean straw bales and fill so as to reduce the likelihood of the pipeline serving as a vector for the spread of noxious weeds. In the same vein, the DEIS should not say "when available, Oregon or Washington certified seed or equivalent will be used for revegetation". This should instead be a FERC condition of approval.

Local Agencies

7

LA7-36	See our response to comment LA3-55.
LA7-37	Potential impacts from an accidental spill or release of hazardous materials on aquatic resources and terrestrial wildlife are discussed in sections 4.5.2.1 and 4.5.2.3, respectively.
LA7-38	See our response to comment FA2-35.
LA7-39	See our response to comment FA3-10.

Wildlife and Aquatic Resources

- LA7-40 Page 4-123, Paragraph 4, first sentence: The DEIS states that "LNG ships transiting the lower Columbia River over the operation life of the LNG terminal are likely to result in the stranding of some sub-yearling fish". Given that strandings will include ESA listed species of salmon, mitigation for strandings should be described. Instead the DEIS states that FERC staff will continue to study this issued and incorporate findings into the revised BA. These findings should be disclosed for FERC consideration prior to the construction of the FEIS, with strategies for lessening the impact, like slower transit to reduce wakes or increased juvenile salmon habitat mitigation.
- LA7-41 4-124, Paragraph 4, first sentence: The DEIS states that "fuel (e.g. diesel) used for vessel propulsion or auxiliary/emergency generators could potentially spill or leak", but claims that the double hull and shipboard SOPEP plans are sufficient to prevent and contain a fuel release. Given that LNG carriers have a heightened risk for incidents because of their status as a terrorist target, binding language should be inserted into the EIS that requires NorthernStar to produce bonding and insurance for the cleanup and restoration of natural and human landscapes damaged by a worst-case scenario accidental or intentional release of LNG or fuel oil. In addition, the EIS needs to discuss not just the possibility of LNG release, but a major spill of bunker fuel oil. Please see Specific Comments for page 4-109 for further discussion.
- LA7-42 4-128, Paragraph 4, first sentence: The DEIS states that adverse affects on Essential Fish Habitat (EFH) "would be limited to accidental spills or leaks of hazardous materials". It goes on to say that minimization of these impacts will be discussed in detail in section 4.5.2.1, but on page 4.148 there is only a brief mention of the ESC Plan being sufficient mitigation for these impacts. Specific measures from the plan need to be detailed in the FEIS, with mitigation for unavoidable impacts.
- LA7-43 4-132, Paragraph 2: The DEIS is inadequate in describing mitigation of potential LNG spills on unique or sensitive wildlife habitats. Please see Specific Comments for pages 4-109 and 4-124 for further discussion.
- LA7-44 4-136, Paragraph 1, first sentence: NorthernStar's hydrodynamic modeling "do not show significant changes to the overall bed conditions in the Clifton Channel" according to the DEIS. Furthermore, for the fish in Clifton Channel, "there will be little impact". These impacts appear to be under-analyzed and underrepresented in the DEIS and need reconsidered by FERC over the long-term life of the project before FERC constructs the FEIS.

Local Agencies

7

- LA7-40 Wake stranding is discussed in the response to comment FA2-19.
The adequacy of compensatory mitigation for impacts on federally listed species is discussed in the response to comment FA2-10.
- LA7-41 See our response to comment FA4-18.
- LA7-42 As described in section 2.4.1, NorthernStar's terminal ESC Plan includes BMPs recommended by the ODEQ's 2005 Erosion and Sediment Control Manual, which describes specifications for hazardous material transportation, handling, storage, spill prevention, and spill response. Because the EIS is a summary document, we feel that the analysis provided on the potential impacts from accidental spills or leaks of hazardous materials in section 4.5.2.1 (including implementation of the terminal ESC Plan) adequately meets NEPA requirements. However, a comprehensive analysis of potential impacts on EFH due to the Bradwood Landing Project will be included in the revised BA and EFH Assessment.
- LA7-43 Section 4.5.1.3 has been revised to include additional discussion regarding potential impacts on unique or sensitive wildlife habitats.
- LA7-44 See our response to comment IND82-5.

K-598

LA7-45 4-141, last paragraph, first sentence: The DEIS states that "filling the log pond at the LNG terminal site would result in a permanent loss of suitable off-channel refugia" for federally listed ESA species. The applicant states that the footprint of the site could not be reduced further to avoid this significant impact, but the DEIS Alternatives Analysis has been cited by various state and federal agencies as insufficient. FERC should preferentially consider project sites that avoid direct impacts on ESA species or Essential Fisheries Habitat.

LA7-46 4-145, last paragraph, first sentence: FERC staff recommend that "prior to beginning initial site preparation at the LNG terminal, NorthernStar should prepare a plan, for the review and written approval of the Director of ODP, which outlines how NorthernStar would ensure that only LNG ships that are retrofitted to use the screened water supply system at the berth are allowed to unload cargo at the Bradwood Landing LNG terminal". Because the measures that NorthernStar has proposed to reduce the potential for introduction of invasive species through ballast water fouling, fish entrainment through ballast water / engine coolant intake, etc., hinge on the ability of a docking LNG vessel to use this system, FERC staff should be provided written documentation of how this guarantee can be made prior to the construction of the FEIS. The FERC permit should include a contracting restriction mitigation measure requiring Bradwood facility to only use LNG transport ships equipped with compatible water intake system for preventing entrainment (incentives are not suitable as there is no assurance they will produce the equipment). Monitoring and reporting for the permit should include the compliance of the contract requirement for shippers to have compatible equipment and effectiveness monitoring of the fish screen system.

Threatened and Endangered Species

LA7-47 Page 4-208, fourth paragraph: The DEIS states that LNG marine traffic would affect salmonids and/or their critical habitat through various activities, including: fish strandings, shoreline erosion, ship ballast and cooling water appropriations and discharges, accidental spill or leak of hazardous materials, and an accidental or intentional breach of an LNG ship. Potential impacts and mitigation are described in brief in Table 4.6.2-1, and in the previous section 4.5.1.1. Regarding wake stranding of small fish, the DEIS claims that strandings appear to be negligible in the lower part of the river where LNG vessels will be transiting. The DEIS also notes, however, that the Pearson et al. (2006) study that identifies contributing factors for wake stranding drew exclusively from studies of three locations upriver of the terminal site. Without additional research, and careful consultation with local experts like NMFS and FWS, FERC staff can not accurately assess the impact of LNG transit on juvenile salmonids in

Local Agencies

7

LA7-45 None of the alternative sites would avoid impacts on ESA species or EFH.

LA7-46 See our response to comment PM1-31.

LA7-47 Wake stranding is discussed in the response to comment FA2-19.

K-599

this regard. Please see Specific Comments on pages 4-109, 4-145, 4-128 and 4-124, respectively, for comments and recommendations regarding shoreline erosion, ship ballast and cooling water appropriations and discharges, accidental spill or leak of hazardous materials, and an accidental or intentional breach of an LNG ship. All impacts regarding salmonids, or other threatened or endangered species, should be carefully considered within the context of ongoing Columbia River estuary restoration efforts and the FERC approved comprehensive plans listed above.

Page 4-235, third paragraph: The DEIS states that the Bradwood Landing LNG terminal would affect salmonids and/or their critical habitat through various activities, including: dredging, shoreline development, pile driving, log pond filling, bridge and railroad improvements, powerline construction, ship ballast and engine cooling water appropriations, hydrostatic testing and fire suppression activities, terminal lighting, accidental spills, routine discharge of condensate water, and operational acoustic effects. Given the diversity and magnitude of these impacts, their cumulative impact is very significant; please see Specific Comments page 4-96 for concerns regarding the inadequacy of mitigation. FERC staff should consider permanent impacts (e.g. log pond filling), and on-going maintenance impacts (e.g. turning basin dredging), to carry more weight than impacts that will be unnoticeable in a matter of years (e.g. pipeline construction or staging areas in non-forested areas). The relative significance of each impact, as well as its cumulative effect over the life of the project, should be disclosed in the FEIS. All impacts regarding salmonids, or other threatened or endangered species, should be carefully considered within the context of ongoing Columbia River estuary restoration efforts and the FERC approved comprehensive plans listed above.

Land Use, Recreation and Visual Resources

Page 4-289, Paragraph 4: This paragraph lists eight noise attenuation measures that NorthernStar would consider to reduce the noise in the nearby noise-sensitive areas (NSAs). The County requests that all of these measures be employed during the construction and operating phases of the project. In addition, the final EIS should demonstrate why it is necessary for the dredging operations to occur 24 hours a day, rather than restricting that activity to daylight hours. If the dredging operations exceed regulatory noise limits, then there should be adequate demonstration of the reasons why those operations should not be limited to daylight hours.

Page 4-294, Paragraph 6: The dredging of the turning basin will interfere with recreational use of the Columbia River. The County recommends that the dredging operations work to minimize its obstruction to navigation on Clifton channel and not allow complete blockage of the channel for extended periods of time.

Local Agencies

7

LA7-48 We agree that long-term and permanent impacts are more significant than short-term impacts. Therefore, portions of the EIS describing potential impacts on various resources (e.g., geology, wetlands, threatened and endangered species) distinguish between temporary and permanent impacts. A description of ongoing recovery efforts will be included in the environmental baseline portion of the revised BA and EFH Assessment; however, because the EIS is a summary document, we do not believe that this level of detail is appropriate.

LA7-49 Noise mitigation would be completed as described in section 4.10.2 of the EIS. As indicated in the EIS, dredging may be conducted up to 24 hours per day due to the time constraints placed on the project over which dredging may occur. We are recommending a noise mitigation plan to minimize dredging noise impacts during construction of the facility.

LA7-50 Dredging activities would be conducted in accordance with applicable laws and regulations under the jurisdiction of the COE, the ODSL, and the ODWR.

Socioeconomics

LA7-51 Page 4-346, Paragraph 2: The DEIS states that operation of the terminal itself would not affect commercial or recreational uses of the Columbia River. This statement is incorrect. The DEIS acknowledges that cruise ships reach Astoria, however, it fails to reflect ongoing cruise ship operations that go from Portland to Astoria. These ships pass right by the terminal and would be impacted by the LNG ships that they would have to pass. These encounters could pose significant economic and scheduling issues. Two cruise lines that should be included in the final EIS are the Majestic America Line and the Cruise West division of West Travel, Inc. In addition, there are various other cruise ships that go by the Bradwood terminal location and additional research into these other operations is needed.

LA7-52 Page 4-350, Paragraph 2: The DEIS references the INGAA Foundation Natural Gas Pipeline Impact Study (INGAA, 2004) and states that the study found that there was not a significant impact on the sales price of properties located along natural gas pipelines. In addition, the DEIS references a Whatcom County, Washington study as well. The County would like the final EIS to reflect exactly what questions the studies were asking as well as a review of all other studies available that reference this subject.

Cultural Resources

LA7-53 Page 4-366, Paragraph 2: To ensure responsibilities under the National Historic Preservation Act, the County requests that all of the recommendations listed by FERC staff be followed and that consultation with the State Historic Preservation Office continue throughout the project construction phase.

Air Quality and Noise

Noise: Please refer to the comments above on Page 289, paragraph 4 for comments on noise.

LA7-54 Page 4-383, Paragraph 2: In addition to the measures proposed here to limit the tailpipe emissions from vehicle traffic, the County also would like to see the following measures added to the project: installing electrification at the dock to reduce ship hotelling emissions, switching to cleaner fuels on all diesel engines, and installing retrofit devices on all diesel engines.

Conclusions and Recommendations

LA7-55 Page 5.1, last sentence: The DEIS geology analysis for the terminal facilities is not complete because it does not disclose the extent of the seismic hazard and specify mitigation for the poor foundation conditions at the site. It has been determined that a

K-601

- LA7-55 cont'd number of additional detailed seismic specifications and mitigation measures are necessary and they are not yet developed and presented for public review.
- LA7-56 Page 5.2, First sentence: The DEIS analysis for the pipeline route is not complete as it as it has been determined that pipeline route through landslide areas may be relocated to undisclosed/undetermined locations or mitigated with other measures. The more important open questions for the relocated segments of the route include the geologic, cultural and biological conditions. There are also known landslide sites along the pipeline route that are not identified as such in the DEIS; such as the 1965 slide near Puget Island. Any landslide sites not yet identified in the document need to be disclosed and addressed with relocation or other mitigation measures.
- LA7-57 Page 5.2, Paragraph 4, first sentence: The DEIS concludes LNG marine traffic may contribute to shoreline erosion along the waterway and that this impact will be further studied. The document is incomplete as it does not make a determination if the impact is significant and if mitigation measures are necessary. The document should disclose that there are numerous dikes in the Lower Columbia where the LNG ships will transit that protect homes and property. Many of these dikes are in very poor condition and do not meet current standards making them very vulnerable to shore erosion. Dike districts lack the funding to improve the dikes. The DEIS should analyze and disclose the level of risk to the dikes face from the wake erosion and develop mitigation measures. Possible measures may include reduced speeds to reduce the wakes, installing erosion protection on dikes and purchase of properties on the interior of high risk dikes to limit property damage associated with dike failure. See Specific Comments pages 4-66, 4-109 and 4-123 for further discussion.
- LA7-58 Page 5-4, Paragraph 2, Sentence 4: The DEIS does not disclose how the proposed terminal would only accept LNG ships that are equipped with the water intake system to prevent entrainment of juvenile fish into the ship ballast water. See Specific Comment 4-145 for further discussion.
- LA7-59 Page 5-4, Paragraph 3, Sentence 3: The DEIS claims that Northern Star's HDD contingency plan provides procedures and measures to mitigate an inadvertent release of drilling mud to the water body. See Specific Comments page 4-84 for further discussion.
- LA7-60 Page 5-5, Paragraph 2, First Sentence: NorthernStar has drafted a Mitigation Plan to account for the permanent loss of some wetlands. See Specific Comments page 4-96 for further discussion.

Local Agencies

- LA7-61 Page 5-5, Paragraph 2, Last Sentence: Clatsop County requests to be included among the applicable agencies referred to here that will participate in finalizing the Bradwood compensatory mitigation package. Also the County is interested in reviewing any mitigation agreements that cover the mitigation package.
- LA7-62A Page 5-5, Last Paragraph, Last Sentence: Concludes that: "Typically, mobile species would relocate to similar adjacent habitat during construction, and return after the area is restored." In practice this assumption is not correct necessitating a mitigation plan. Fundamentally, if there is similar habitat adjacent to the disturbance area it will already support a population of species like that forced to relocate; meaning it typically lack sufficient carrying capacity to support more individuals of that species. The relocated individuals are subjected to the rigors of competition and predation and it is unlikely they would survive for years while the disturbed area grows back to the status of the original habitat. In the case where habitat is being converted from one type to another the relocated species will not find suitable habitat to return to because of the conversion. We recommend eliminating this assumption from the conclusion and compensate for all habitat alteration associated with the proposed project (without accounting for relocation and survival). The mitigation plan should provide sufficiently high ratios of replacement lands that compensate for the lost use while the reseeded habitat grows back.
- LA7-62B Page 5-6, Paragraph 6: The paragraph on Essential Fish Habitat needs to add a fuel oil spill as a potential impact and detail appropriate mitigation. See Specific Comments page 4-109 for further discussion.
- LA7-63 Page 5-7, Paragraph 4, Last Sentence: The DEIS is not complete as it does not disclose a completed Water body Mitigation Plan for public review. We are interested in reviewing the level of protection provided in the more important anadromous streams that are included in the Comprehensive Plans for the Columbia River identified under Section 10 of the Federal Power Act. The DEIS should also mention that pipeline crossings and failed underground borings can produce excessive turbidity in the streams that can interfere with angling activity.
- LA7-64 Page 5-7, Paragraph 6, Third Last Sentence: For the conclusion that the mitigation package represents values equal or greater than habitat permanently lost it will be necessary to add mitigation areas to substitute for Svensen Island which is already undergoing restoration via a natural breach.
- LA7-65 Page 5-7, Paragraph 6, Last Sentence: Although not included as part of the project's compensatory mitigation, NorthernStar has also developed a voluntary SEI that would

Local Agencies

7

- LA7-61 See our response to comment LA7-11.
- LA7-62a The reference to NorthernStar's Compensatory Mitigation Plan has been removed from this paragraph. As described in section 4.5.2.3, animals displaced by construction activities may relocate into similar habitats nearby; however, the lack of adequate territorial space could force some animals into suboptimal habitats. The influx and increased density of animals in some undisturbed areas caused by these dislocations could increase inter- and intra-specific competition and also reduce the reproductive success of animals that are not displaced by construction. The loss of these individuals could result in a decrease in the food stock available for predators of these species. The adequacy of NorthernStar's Compensatory Mitigation Plan is discussed in the response to comment FA2-10.
- LA7-62b Potential impacts on EFH due to an accidental spill or leak of hazardous materials are discussed in the environmental analysis portion of the final EIS, as appropriate. However, because discussion within section 5 of the EIS is limited to a summary of the FERC staff's environmental analysis, it is not the appropriate portion of the EIS to address detailed comments on potential impacts on EFH. See also our responses to comments FA4-13, LA7-36, LA7-37, and LA7-38.
- LA7-63 NorthernStar has filed its Waterbody and Wetland Construction and Mitigation Procedures Plan with the FERC. Directions for accessing NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan via the eLibrary can be found in the response to comment FA2-17. Potential impacts on water quality and water resources due to waterbody crossings are discussed in sections 4.3.2.4 and 4.5.3.1, respectively.
- LA7-64 See our response to comment FA3-3.
- LA7-65 See our response to comment FA4-12.

- LA7-65 cont'd contribute about \$50 million over the life of the project to the recovery of salmon in the Lower Columbia River ecosystem. We are concerned that the funding may be somewhat illusory because this is discretionary funding that does not include any criteria for how or when and under what conditions it can be spent. Because it is not a requirement there will be little incentive to spend this much money on a timely basis. It is difficult to put restoration projects together with multiple funding sources without clear understandings conditions the funding is available. Furthermore, we are concerned that the funding offer may be transitory because NorthernStar could very well turn over the Bradwood facility to another operator or successor not involved in any way with the voluntary offer. We recommend the best use of the funding in the SEI is to fully apply it to mandatory mitigation and monitoring programs associated with the project which are in several instances deficient and need a larger funding commitment.
- LA7-66 Page 5-9, Paragraph 1 Sentence 1: Recommend changing sentence to: The Bradwood Landing Project would have impacts on commercial fishing and recreational users of the Columbia River.
- LA7-67 Page 5-9, Paragraph 1 Sentence 3: Add waterfowl hunters on islands in the Columbia River to the list of boaters that would have to move out of the way of LNG marine traffic heading upriver to the LNG terminal to comply with the Coast Guard moving 500-yard safety and security zone around LNG ships. There is a National Wildlife Refuge in the lower Columbia River that includes hunting areas along with islands outside the refuge.
- LA7-68 Page 5-9, Paragraph 1, Sentence 4: Qualify the sentence as follows: Jet-skiers, wind-surfers, kayakers, and canoeists typically stay in shallow water outside of the navigation channel; however much of the shallow water areas outside of the navigation channel is within the moving 500-yard safety and security zone around LNG ships along the 39 mile reach of river. In some cases at low tide there is no where to go outside of the moving 500 yd exclusion zone due to sand bars that are impassable by boat. The document should describe how the 500 yard safety and exclusion zone will work under heavy fog or storm conditions when poor visibility prevents recognition of an LNG vessel. Will there be a sound used to announce the position of the vessel? If so the document should analyze the noise impact.
- LA7-69 Page 5-9, Paragraph 1, after last sentence add: For many communities, estuaries are the focal point of tourist-related activities and this is the case with Astoria, Warrenton, Ilwaco and Cathlamet. As such the view shed is just as important for visitors as residents.

Local Agencies

7

- LA7-66 We have revised relevant portions of the EIS. While the project may affect commercial and recreational fishing and other river users, those impacts would be brief and not significant.
- LA7-67 It is implicit that all boaters, including hunters, would have to move out of the way of LNG carriers in transit in the waterway to the proposed Bradwood Landing LNG terminal. Section 4.7.1.4 also addresses use of National Wildlife Refuges along the waterway,
- LA7-68 As discussed in section 4.8.1.7, the Coast Guard's moving safety/security and moored vessel security zones would not be treated as absolute exclusion zones that would preclude all other vessel movements. Rather, other vessels may be allowed to transit through the moving safety/security and moored vessel security zones with the permission of the COTP. The expectation is that the COTP's Representative would work with the pilots and patrol assets to control traffic, and would routinely allow vessels to transit the safety/security zone based on a case-by-case assessment conducted on scene. In the case of fog or other low-visibility situations, the security escorts would likely approach recreational river users and communicate verbally regarding the presence of the LNG carrier and security zone. Final details regarding the security zone would be included in the Vessel Traffic Management Plan.
- LA7-69 The suggested text has been added to section 5.1.7.

LA7-69
cont'd

The presence of LNG carriers and their heavily armed escort vessels have a high potential to create an unwelcome or dangerous appearance that is not conducive to tourists or fisherman choosing to recreate in this area.

Page 5-12, Last Paragraph in Socioeconomics Section, First Sentence: Change as indicated in underlined segment: The LNG ships transiting the river during the tourist season have the potential to adversely affect businesses related to tourism. Then add the following: "Perhaps most important, the presence of LNG carriers and their heavily armed escort vessels have a high potential to create an unwelcome or dangerous appearance that is not conducive to tourists or fisherman choosing to recreate in this area. For many communities, estuaries are the focal point of tourist-related activities and this is the case with Astoria, Warrington, Ilwaco and Cathlamet. If these visitors choose other coastal/estuary recreation opportunities, millions of dollars spent locally on retail, hotel and guide services would be lost over the long term." The DEIS should thoroughly disclose the regional economic value of tourism and estimate the range of that economic value that could be potentially lost over the long-term, including, but not limited to, the substantial tourism associated recreational fishing, visiting cruise ships, the Lewis and Clark National Heritage Park, and the proposed Columbia Pacific Heritage Area. Also see comment for Page 5-6.

LA7-70

Section 5.2: Please consider incorporating into this section the mitigation recommendations contained in this comment letter for the waterway, site and pipeline. Thank you for your considerations.

Local Agencies

7

LA7-70

The mitigation recommendations made by the Columbia River Estuary Study Taskforce on behalf of Clatsop County will be incorporated into the environmental analysis portion of the final EIS, as appropriate. However, because discussion within section 5 of the EIS is limited to a summary of the FERC staff's environmental analysis, it is not the appropriate part of the EIS to address detailed comments on NorthernStar's proposed mitigation for project impacts.

December 24, 2007

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E., Room 1A
Washington, DC 20426

Dear Ms. Bose:

Below are the comments of the Port of Vancouver, USA regarding the draft Environmental Impact Statement (EIS) concerning the Bradwood Landing Project proposed by Bradwood Landing LLC and NorthernStar Energy LLC (collectively referred to as NorthernStar).

Port of Vancouver, USA Overview

The Port of Vancouver, USA, is a multi-purpose port authority located in Vancouver, Washington along the banks of the Columbia River and is a critical hub of marine, rail, highway and air cargo transportation for regional, coastal and inland consumers.

Located at the natural transportation hub of the Pacific Northwest on the Columbia/Snake River System, the Port of Vancouver, USA, is an ideal transfer point for cargoes moving to and from the Pacific Rim and the world. Annually, the Port handles over 500 ocean-going vessels, as well as river barges, with a total cargo volume exceeding 5 million metric tons.

The Port is adjacent to north/south and east/west national highways and offers on-site connection to river grade rail traveling between Canada and Mexico and east to Chicago

The Port of Vancouver, USA, has handled a variety of bulk and break bulk cargoes since 1912.

Comments on the Draft EIS:

Vessel traffic destined to upriver ports is critical to the local, regional and national economies and must be allowed to transit the river without additional

Local Agencies

Port of Vancouver, USA Letter to the Federal Energy Regulatory Commission, dated December 24, 2007, SUBJECT: Comments on Draft EIS for the Bradwood Landing Project

constraints and costs. Adding LNG vessels to the river will add additional constraints and potential delays if not properly managed.

- LA8-1 a. The EIS indicates that impacts to other commercial traffic would be minimal unless there was an LNG release into the waterway. Annually, approximately 125 LNG vessels would be expected to travel to the LNG facility. While navigating in the waterway, the LNG vessels would have a 500 foot safety zone. Vessels could not enter the zone without receiving permission from the US Coast Guard Captain of the Port (COTP). According to the COTP letter to the Federal Energy Regularly Commission (FERC) in February 2007, the COTP's representative will, in concert with the river pilots, routinely allow vessels to transit the zone *based on case-by-case assessment conducted on-scene.* (emphasis added)

Concern: Although nice to read, carriers and ports upriver from Bradwood have no assurance that this initial procedure will continue to be followed when LNG vessels actually start transiting the river. No additional information on how the assessments will be conducted (policies, etc) have been made public. For example, what happens to vessel navigation when the region is in Maritime Security (MARSEC) levels two or three?

- LA8-2 b. Regarding vessel meeting situations, the EIS outlines four passing zones along the transit route that would allow two-way traffic. Although the EIS mentions that these traffic patterns are expected to resemble those already in use by deep-draft traffic today, it also mentions that these transits would require careful traffic planning – something already in use today.

Concern: What constitutes careful traffic planning with LNG vessels? How much additional pilot man hours would be required to additionally plan and manage LNG transits? Will those additional costs be solely born by the LNG vessels? Does careful traffic planning also mean that a federal administered vessel traffic system (VTS) would be required to plan and manage vessels traffic on the Columbia River?

- LA8-3 c. The EIS mentions that a marginal increase in ship traffic could occasionally increase the wait time for ships in Astoria. The study indicates that ships may have to wait for pilots. The COTP letter to FERC indicates that *at least initially (first 6 months)*, there will be two pilots on LNG vessels. Additionally, before LNG vessel arrival (at least 24 hours before), federal authorities, and others (including bar and river pilots) will meet to coordinate inbound and outbound transit details.

Concern: Who pays for the extra pilot man-hours required? Making vessels wait for pilots is not acceptable. Current vessel charter rates

Local Agencies

8

- LA8-1 The procedure described is not an "initial" procedure but the procedure expected for the operation of the project. Under higher security levels, all ships would be subject to tighter security measures and a MARSEC level three could shut down the river for all vessels.

- LA8-2 As part of the WSR requirements, an expanded vessel traffic information system would be implemented. We anticipate the cost of this system would be included in NorthernStar's Cost Sharing Plan.

- LA8-3 Scheduling of the pilots and the potential for increased costs due to having to wait for pilots would need to be worked out between NorthernStar and the other river users as the vessel traffic management system is developed.

Port of Vancouver, USA Letter to the Federal Energy Regulatory Commission, dated December 24, 2007, SUBJECT: Comments on Draft EIS for the Bradwood Landing Project

LA8-3 | average \$2300 per hour. In the worst case, a vessel waiting up to 12 hours for
cont'd | the next favorable tide would lose \$27,600. Additionally, liner vessels would
lose at least a half day's travel time – putting them behind in their schedule.
This could result in carriers omitting a Columbia River port call due to
potential delays. At the very least, the vessel would have to increase speed
(with increased fuel costs) to meet its schedule.

LA8-4 | d. The EIS mentions pilot savings for other vessels traveling the river
because Northern Star would contribute approximately 1.6 million in fixed
costs. This is new information not previously known. More information would
be needed to evaluate this claim. Northern Star also claims that additional
pilots would not be needed for LNG vessel traffic – something not confirmed by
the pilot associations.

Summary:

The Port of Vancouver, USA concerns are centered around two areas:
1) Unhindered navigation for vessels transiting to upriver ports and 2)
Additional costs (particularly pilot labor costs) that the maritime transportation
sector may have to assume. The draft EIS does not adequately address these
issues at this time.

PORT OF VANCOUVER USA

Michael J. Schiller
Operations Manager
Port of Vancouver, USA

Local Agencies

8

LA8-4 We have confirmed with Paul Amos, President of the Columbia River Pilots, NorthernStar's statement that additional pilots would not necessarily be required for the LNG carriers. Mr. Amos states that the pilots regularly experience fluctuations per year of larger numbers of vessels without needing to hire additional pilots. They generally look at the previous year and new commodities traveling the river to determine if additional pilots would be needed.

Mr. Amos also clarified that an increase in pilots does not increase costs to anyone else, because the ship's tariff pays for the pilots.

RE: BRADWOOD LANDING DOCKET # CP06-365-000
SUBJECT: VESSEL TRAFFIC MANAGEMENT COORDINATION

ORIGINAL
PORT OF PORTLAND
Marine Division
121 NW Everett Portland OR 97209
Box 3529 Portland OR 97208
T 503 944 7000 F 503 944 7250

2007 DEC 28 P 2:22

LA9-1 The Bradwood Landing Draft Environmental Impact Statement Executive Summary
States on Page ES-4:

"About 125 ships per year would enter and travel along the Columbia River to deliver cargo to the LNG terminal, resulting in about a 7 percent increase in traffic. LNG marine traffic in the waterway may have some minor impacts on shoreline erosion; however, we do not believe that commercial or recreational river users would be adversely affected."

The Port of Portland believes that, as a community of navigation system users on the Lower Columbia River, we have developed a safe, robust, and flexible navigation infrastructure system over many years. This navigation system is in place and benefits all Oregon and Washington shippers and a growing economy based on trade and waterborne transportation.

Our river system can handle additional vessel traffic, and we are continuously improving its capacity to handle the growing volume of trade handled by the Columbia/Snake River system. However, we would be extremely concerned about the impact of new facilities in the Lower Columbia River should their presence place significant restrictions on existing vessel traffic that must transit past the facility and/or utilize the same navigation channel.

It is our understanding, based on the Waterways Suitability Report, that vessel traffic management measures will be required and that vessels' transits (of LNG vessels) will be coordinated to minimize conflicts with other deep-draft vessels, recreational boaters, seasonal fisheries, and other marine events. It is essential for the continuity of existing commercial navigation and the existing maritime investments on the entire river that vessels destined for or departing from locations upstream of the proposed Bradwood facility be able to utilize the channel fully without the creation of a de-facto one-way channel. This will require safe passing zones and implementation of multiple improvements to the navigation system as identified in the WSR report.

Local Agencies

9

LA9-1 The safety/security zone would establish the Coast Guard's authority in the area surrounding the LNG vessel to allow control of the movements of vessels in the security zone area. With expansion of the vessel traffic information system, we do not anticipate significant impacts on shipping traffic during operation of the project. The WSA assumed the larger LNG vessels would be in use and the project would be authorized for 125 LNG vessel round-trips per year.

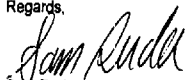

K-608

FERC - Office of the Secretary
Page 2
December 26, 2007

LA9-1
cont'd

It is our specific concern that additional vessel traffic restrictions may be identified in the future based on size of LNG vessels, frequency of LNG vessel calls, or other factors as yet not determined. If this were to happen, it is the Port of Portland's position that liner services, such as the automobile and container carriers which are on fixed schedules and/or tight rotations, need to be provided priority in vessel passage and not unduly restricted by LNG vessel traffic.

Regards,

Sam Ruda
Director, Marine & Industrial Development

FERC
Office of the Secretary
Washington DC 20426

RE: Bradwood Landing Docket #CP06-365-000

LA10-1

This letter is in regard to the application by Northern Star LLC and Bradwood Landing LLC to establish an LNG facility on the Columbia River. As a sponsor of the Columbia River Channel Improvement Project, we wish to ensure that the proposed facility will not interfere or impede established or projected commercial vessel traffic in the river.

Accordingly, as a condition of granting a permit for construction and operation of any LNG terminal on the Columbia River, we respectfully request that FERC require Northern Star to analyze and address the following:

Will the advent of LNG on the Columbia River, as currently proposed, cause commercial or vessel safety impacts that result in the need for increased and/or improved ship anchorages along the river from its mouth to the Portland/Vancouver area?

If thorough study indicates that the arrival of LNG on the river will in fact result in such a need, the establishment of such new anchorages by Northern Star should be made a condition of FERC's siting approval. We also respectfully request the results of this analysis be publicly available for review.

Regards,

Sam Ruda,
Director Marine & Industrial Development

Local Agencies

10

LA10-1

Increased or improved ship anchorages would not be necessary. With careful traffic management, prearrangement of meeting locations in the four established passing zones, and an expanded vessel traffic information system, traffic delays are expected to be negligible.

K-610

CP06-365 CP06-366

Clatsop County

November 12, 2007

Paul Friedman, Manager
Bradwood Landing Project
Office of Energy Projects
Federal Energy Regulatory Commission
Washington, DC 20426

800 Exchange St., Suite 310
Astoria, Oregon 97103

SUBJECT: Conditions of Approval in Clatsop County's Review of Application from Bradwood Landing, LLC, for Land-Use Permits for LNG Marine Terminal at Bradwood, Oregon

Dear Mr. Friedman:

Clatsop County expects to complete its review of the local land-use permit application from Bradwood Landing soon. We conducted two public hearings before our planning commission in July and one public hearing before our Board of County Commissioners on October 22, 2007. The Board of Commissioners will hold another hearing on November 19, 2007, and is expected to reach a decision on the application a few weeks after that. If the board decides to approve the application, the commissioners are likely to adopt conditions of approval regarding critical issues such as emergency services, road access, plant retirement, wetland mitigation, and habitat restoration.

Board of
County Commissioners

Phone (503) 325-1000
Fax (503) 325-8325

At the board's October 22, 2007, hearing we were surprised to hear testimony suggesting that FERC might be able to preempt overrule such local conditions of approval. This is contrary to our understanding of federal law on consistency with the Coastal Zone Management Act and of the Energy Policy Act as well. We therefore ask for your views on this crucial question: *Does FERC have authority to invalidate, waive or modify local land use regulations or local conditions of approval adopted pursuant to the Coastal Zone Management Act, and if so, what criteria does FERC employ in deciding whether to take such action?*

As you know, most of Clatsop County, including the Bradwood site, is in Oregon's coastal zone. The county's comprehensive plan and land-use regulations have been acknowledged by the state's Land Conservation and Development Commission to be the controlling documents for all land use decisions in the coastal zone and for implementing the state's federally approved coastal management plan. We understand the federal consistency

Local Agencies

11

K-611

LA11-1

LA11-1

On April 4, 2008, Mark Robinson, Director of the FERC's OEP, wrote a reply to this letter from Mr. Derickson (see accession number 20080404-3020). While the EPCA 2005 gave the FERC the authority to site onshore LNG terminals, it also stated that the rights of the states under the CZMA would not be affected. The EIS addresses local land use zoning in section 4.7. The EIS acknowledges that NorthernStar has not yet received a determination that its project is consistent with the CMP and recommends that prior to construction, NorthernStar must file documentation from the ODLCD that the project is consistent with the Oregon CMP.

Local Agencies

11

LA11-1
cont'd

provisions of the CZMA to require that any federal action occurring in Oregon's coastal zone that would affect coastal land or water uses or natural resources must be consistent with Oregon's coastal management program and with the local plans and land use regulations that implement it. We further understand the federal consistency provisions to extend to all local decisions that apply the local plans and land use regulations that implement Oregon's coastal management program. We therefore conclude that (a) any decision on Bradwood by Clatsop County to deny, continue, approve, or approve with conditions will be subject to federal consistency provisions of the CZMA, and (b) FERC has no authority to waive or modify any such decision.

We appreciate your attention to this important question and look forward to hearing from you at your earliest convenience.

Sincerely,

Scott Derickson, Clatsop County Manager
800 Exchange Street, Suite 410
Astoria, OR 97103

February 22, 2008

Kimberly Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, DC 20426

Re: Bradwood Landing LLC, Docket Nos. CP06-365-000, CP06-366-000,
CP06-376-000, CP06-377-000
Our File No. 44548-35140

Dear Secretary Bose:

This office represents Clatsop County, Oregon (the "County"), in the above referenced proceedings regarding the Bradwood Landing LNG ("Bradwood") facility and associated pipeline. As the FERC decision-making process nears completion, the County Board of Commissioners remains concerned over the status of local conditions of approval and the adequacy of environmental and safety review. The purpose of this letter is to outline for FERC various questions proposed by the Board of County Commissioners regarding the remainder of the FERC process.

After Bradwood submitted its formal application to FERC, a debate arose regarding the breadth of FERC's jurisdiction over the project. The County initially believed that FERC had exclusive jurisdiction and that the Oregon Department of Energy would review the proposal on behalf of the state and affected local governments. After several months of discussion, however, it was determined by all affected agencies, and at the County's insistence, that Bradwood should seek County land use approval. Bradwood consented to this request and submitted a consolidated land use application to the County for approval of a wide variety of plan and zone changes, variances, and permits to assure compatibility of the proposal with County land use policies and regulations.

The County held two days of hearings before the County Planning Commission and two days of hearings before the Board of Commissioners. The Board of Commissioners ultimately accepted the Planning Commission's recommendation to approve the project subject to a variety of conditions regarding road improvements, dredging, mitigation of environmental damage, and safety, among others.

JORDAN SCHRADER, PC
ATTORNEYS AT LAW

February 22, 2008
Page 2

Contemporaneous with the local land use process, the County contracted with Columbia River Estuary Study Taskforce ("CREST") to prepare comments on the Draft Environmental Impact Statement ("DEIS") issued on August 17, 2007. Those comments were submitted to FERC on December 21, 2007, along with comments by other affected parties. It is the County's understanding that FERC is currently analyzing the comments received in response to the DEIS and preparing a Final EIS that will address the comments filed by the affected parties.

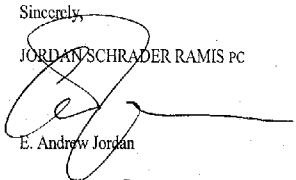

Based on the above background, the County has the following questions:

- | | |
|--------|--|
| LA12-1 | (1) In what manner is FERC going to address the questions, concerns, and comments filed by state, federal, and local agencies in response to the DEIS? |
| LA12-2 | (2) Does a conflict of interest arise when FERC requests that a consultant hired by Bradwood complete a study in order to respond to a comment filed in response to the DEIS? If so, how does FERC manage such a conflict? |
| LA12-3 | (3) If FERC ultimately approves the Bradwood application, will FERC require Bradwood to satisfy the conditions placed upon local approvals by local governmental bodies having jurisdiction over such approvals? |

Once a Final EIS is issued, it is the County's understanding that FERC will prepare an order approving or denying the Bradwood application. Because the County represents the local public interest in this proceeding, it is important that the above concerns be addressed so that the County can take whatever action it deems necessary to ensure the environment and public safety are adequately protected.

Sincerely,

JORDAN SCHRADER RAMIS PC

E. Andrew Jordan

cc: Clatsop County

Local Agencies

12

- | | |
|--------|---|
| LA12-1 | On April 4, 2008, Mark Robinson, Director of the FERC's OEP, wrote a reply to this letter from Mr. Jordan (see accession number 20080404-3020). All comments on the draft EIS have been addressed in the final EIS by providing direct responses to specific questions and concerns, as well as by modifying the text in the EIS, as appropriate (see volume 2, Appendix K). |
| LA12-2 | We do not consider this to be a conflict of interest. All of the information used by the staff to complete its environmental review is independently evaluated. The FERC staff assesses the validity of the study, verifies facts, and reviews the claims of any consultant's study done on behalf of an applicant, before accepting any data for inclusion into our environmental document. |
| LA12-3 | The Commission encourages cooperation between the applicants and state and local authorities, and we expect the project sponsors to submit applications for necessary permits. However, this does not mean that state and local agencies, through application of state and local laws, may prohibit or unreasonably delay the construction or operations of facilities approved by the Commission. Further, state and local permits must be consistent with the conditions of any authorization the Commission may issue. |

Reference Docket #CP06-365-000

Dear Ms. Bose,

Swanson Bark & Wood Products, Inc. in Longview, WA is a manufacturing facility involved in wood residual products. Based on our rather limited knowledge of the NorthernStar Natural Gas Bradwood Landing proposal, we stand in support of this project.

CO1-1 | Businesses need gas, and we're short on natural gas in this area. Specifically, the price of natural gas is hurting southwest Washington's ability to dry wood, as well as generally to attract new business to our county. Approving the Bradwood Landing project will help fill the pipeline, expanding business opportunities and business competitiveness in our part of the state.

CO1-2 | We are confident in your agency's ability to safeguard the population and river habitat surrounding such a facility, and therefore do not feel safety is a major concern.

Sincerely,

John Leber
President/CEO

Re: Bradwood Landing's land use application

CP06-365-000

Dear Commissioners,

CO2-1

We really need natural gas in this area at this time. The price of gas is really hurting industrial manufacturing and, as the pipeline from Canada gets more users than capacity, the problem will get worse.

At this point, the NorthernStar Natural Gas Bradwood Landing project appears to be the best option that's been presented and we urge you to allow it to go forward.

That said, and perhaps as an aside, I've had bad experiences with government condemnations of land. We would rather see you be overly fair with the silly people who demand too much than in any way stomp on the fair people who allow it to go forward with a relatively small amount of resistance.

Sincerely,

John Leber

Washington DC 20426

Re: Docket # CP-06-365-000

Dear Board of Commissioners:

I am writing on behalf of Teevin Bros Land & Timber Co., LLC, a regional employer near Bradwood Landing, the proposed location for the NorthernStar Natural Gas facility, in Clatsop County, Oregon. We are also a neighbor to the proposed facility. Many of our business lines (timber, forestry, and quarry) fall within the impact area of the facility; and many of our employees and their families live nearby.

We have read the information provided by both the proponents and opponents of the project, and after review of facts and empirical evidence, and careful deliberation, we are in agreement with the draft Environmental Impact Statement. We live here, we raise our families here, and we hunt, fish, hike, camp, and otherwise recreate here. We see the project as proposed, having a short-term negative quality of life impact during construction; followed by a long-term positive impact to our community.

Weighing all parts of change, we see this as a net positive for our community. The proposed project will have minimal short-term impacts on the environment, with the mitigating projects having a substantial positive impact on our environment.

This project brings to our community diversification of the local economy, diversification of employment opportunities, sincere focus on preserving and enhancing our flora and fauna, with regional and national benefits of diversifying our source of supply for natural gas.

We realize this has become an emotional issue for many. And many of those opposed do not live here. We live here. We accept there will be some impact. We believe the project will contribute to the greater good of our region and our nation. The draft Environmental Impact Statement answers our concerns. We recommend approval of the EIS and the issuance of permits to construct this project.

Sincerely,

Paul Langner

Re: Comments of NW Natural on Draft Environmental Impact Statement for the
Bradwood Landing LNG Terminal Docket Nos. CP06-365-000, et al.

Dear Secretary Bose:

Northwest Natural Gas Company (NW Natural) has received and reviewed the Draft Environmental Impact Statement (DEIS) for the Bradwood Landing LNG terminal project and the associated pipeline proposed by NorthernStar Energy LLC. The proposed project regards an LNG terminal to be built near Bradwood, Oregon, and the associated send-out pipeline would be located in Clatsop and Columbia Counties, Oregon and Cowlitz County, Washington.

NW Natural is an Oregon corporation that is a natural gas local distribution company serving about 641,000 customers through separate facilities located in western Oregon and southwestern Washington and is regulated by the Oregon Public Utility Commission and Washington Utilities and Transportation Commission, respectively.¹ Additionally, NW Natural is one of the members of Palomar Gas Holdings, LLC, the parent of Palomar Gas Transmission, LLC, which has proposed to build a new interstate natural gas pipeline in Oregon and which has initiated a pre-filing process at the Commission in Docket No. PF07-13-000.

NW Natural files these comments on the Bradwood project DEIS to clarify some inaccuracies in Section 2.1.6 of the DEIS regarding the Palomar pipeline project and its potential interconnections with NW Natural's local distribution system facilities, including its Mist underground natural gas storage facility (Mist). NW Natural's specific comments are set forth below.

In Section 2.1.6, Palomar Pipeline, the tenth and eleventh sentences in this section state, "The Palomar pipeline would then proceed northwest to interconnect with Northwest Natural's existing storage field at Mist. From Mist, the Palomar pipeline could branch

¹ NW Natural is exempt from FERC jurisdiction under Sections 1(b) and 1(c) of the Natural Gas Act for its systems, facilities, and services in Oregon and Washington. Portland Gas and Coke Company, 17 FPC 638 (1957).

CO4-1

off to serve the proposed Bradwood Landing LNG import terminal.” The discussion continues to say, “If the Bradwood Landing Project is not authorized, or not built, Palomar could still serve the Portland metropolitan area, and extend its pipeline out to Northwest Natural’s Mist storage field. Palomar would just not build the last segment between Mist and Bradwood Landing.” These statements are not accurate and must be revised in the FEIS. As explained more fully below, the Palomar pipeline will not directly connect to Mist.

In 1989, NW Natural’s Mist storage field began storage operations for its core gas local distribution customers. Since 2001, NW Natural has made excess and new storage capacity that is pre-built in advance of core need available to customers in the interstate market pursuant to a limited jurisdiction blanket certificate issued by the Commission under its regulations set forth in 18 CFR § 284.224.² The Mist interstate services consist of bundled firm and interruptible storage and related transportation services on NW Natural’s system to and from the Mist storage facility. NW Natural’s primary use of Mist, however, is to provide reliable gas supplies to its core customers. As the needs of its retail customers grow, NW Natural can reduce the amount of storage capacity, not under contract, that is made available to the interstate market.³

Currently, the physical facility set up at Mist is such that it is not possible for a new pipeline to directly connect to Mist. Thus, the statement in the DEIS that indicates that Palomar would directly connect to the Mist storage field is not accurate and needs to be revised. In fact, if there will be any new interconnection(s) between the Bradwood send out pipeline, Palomar, or any other interstate pipeline and NW Natural’s facilities capable of reaching Mist, such interconnection(s) would be accomplished through an interconnection between NW Natural’s local distribution system facilities and the new interstate pipeline facility(ies). NW Natural prefers to expand its own infrastructure to any new facilities because this would enable it to design its facilities consistent with the needs of its system, including any associated upgrades, and will provide additional takeaway capacity from Mist that will facilitate future expansions that can be used for NW Natural’s core customers. It is also possible that any new interstate pipeline interconnection(s) with NW Natural’s system could be used as a receipt or delivery point for NW Natural’s interstate storage customers.

Further, with respect to Palomar, NW Natural would also likely request to have other interconnections on the western zone of the Palomar system located further south (between Mist and Molalla) to enable it to more easily receive gas from Palomar at various locations on NW Natural’s local distribution system where such gas is needed, and to potentially serve other new local distribution customers as well. Such interconnections are still being contemplated and thus no definitive plans currently exist for any such interconnections.

² Northwest Natural Gas Company, 95 FERC ¶ 61,242 (2001); see also 111 FERC ¶ 61,406 (2005) (rate settlement).

³ *Id.* at p. 4.

Companies and Organizations

4

CO4-1

The discussion of the Palomar pipeline project has been moved from section 2.1.6 to section 3.1.2.2 and revised. Section 4.12 has been revised to reflect that the Palomar pipeline’s proposed western zone may have multiple interconnections with Northwest Natural’s local distribution system facilities and would not connect directly to the Mist storage facility.

Companies and Organizations

4

CO4-1
cont'd

For the reasons indicated above, NW Natural respectfully requests revisions to Section 2.1.6 to correctly reflect the facts that (1) Palomar's proposed western zone may have multiple interconnections with NW Natural's local distribution system facilities, and (2) interstate pipeline facilities will only connect to Mist through NW Natural's local distribution system facilities. Since there will not be any direct connection between the Palomar pipeline and Mist, any such references should be removed or revised.

We suggest the following language to replace the relevant portion of Section 2.1.6:

"The Palomar pipeline would then proceed northwest to interconnect with various points on NW Natural's distribution system. The Palomar pipeline could branch off to serve the proposed Bradwood Landing LNG import terminal...The Palomar pipeline would then proceed northwest to interconnect with Bradwood Landing's proposed pipeline near Wauna. If the Bradwood Landing Project is not authorized, or not built, Palomar could still serve the Portland metropolitan area via a planned interconnection at Mollala and via probable future interconnections with NW Natural's distribution system between Mollala and the terminus of the Palomar pipeline's western zone. Palomar would just not build the last segment to the Bradwood Landing pipeline."

CO4-2

Additionally, in this same Section, the sixth sentence should be updated to reflect that Palomar has initiated the pre-filing process at the Commission.

Thank you for the opportunity to provide these clarifying comments. If you have any further questions about NW Natural's comments, please feel free to contact me.

Sincerely,

/s/ Susan B. Bergles

Susan B. Bergles
Attorney
On behalf of Northwest Natural Gas Company

CO4-2

Sections 4.12 and 5.1 have been updated to indicate that Palomar has begun the FERC's Pre-filing Process. See also our response to comment CO4-1.

Subject: DEIS Comments

Request for: A Comprehensive Needs Assessment
A Programmatic EIS

Docket Nos. CP06-365 and 366
NorthernStar Bradwood Landing LNG Project

Dear Secretary Bose,

Thank you for the opportunity to submit comments regarding the proposed project.

Section 4.6.1.2 State Listed Threatened and Endangered Species

CO5-1 Please refer to the Governor Kulongoski/Oregon State Agencies submittal to FERC #20071218-5063, pages 32 and 33 for specific bird information that was not included in the DEIS. Please add this information.

Section 4.6.1.3 Migratory Bird Treaty Act

CO5-2 The DEIS recognizes that the Columbia River estuary is one of the most important sites on the Pacific Flyway for migratory birds, more than 300 species occurring in the area throughout the year. Peak counts in the estuary during migration have been almost 150,000 birds.

Companies and Organizations

5

CO5-1 See our response to comments SA1-146 through SA1-153, SA1-158, and SA1-159.

CO5-2 Sections 4.6.2.2 and 4.6.2.3 have been revised to include additional information relating to the potential impacts on migratory birds due to operation of the Bradwood Landing Project. We believe the analysis of cumulative impacts on wildlife have been addressed adequately in section 4.12. Potential cumulative impacts on wildlife are recognized, but not considered significant due to implementation of our recommendations.

K-622

Secretary Bose
Page Two - 12/21/07

CO5-2
cont'd | While the DEIS does recognize potential impact during construction, there is no mention of the impact to migratory routes arising from noise and light of the terminal during the operational phase. There is no explanation of the cumulative overall impacts, which can be expected over the lifespan of the facility. Please explain.

Section 4.7.2.4 Coastal Zone Management

CO5-3 | Please explain the relationship between 306(c)(5) and ORS 196.435. It would seem that this is a typographical error, because CZMA 306(c)(5) refers to the 'Allocation of grants to coastal states'. 306 (d)(5) would make more sense.

CO5-4 | Coastal Zone Management Act Consistency Certification, was not made a part of the DEIS. It is my understanding that comments, and public hearing(s) regarding the application for certification will be accepted during the 6-month period, which began October 23, 2007.

CO5-5 | In conclusion, the current process of reviewing each LNG terminal proposal on a case-by-case basis is wasteful and draining. I would like to recommend that a Comprehensive Needs Assessment be made along with a Programmatic EIS. If the applicant seeks to involve the whole State of Oregon with its proposed terminal and adjunct pipelines, it is strongly suggested that this be done.

Sincerely,

Gloria G. MacKenzie
Director at Large
Willapa Hills Audubon Society

Companies and Organizations

5

CO5-3 The reference to the CZMA has been changed to section 306(d)(5) in the final EIS.

CO5-4 Section 4.7.2.4 has been revised to reflect this information.

CO5-5 See our response to comment PM5-74.

)		CP06-376-000
)		CP06-377-000

COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT BY
THE NORTHWEST INDUSTRIAL GAS USERS

Intervenor¹, Northwest Industrial Gas Users ("NWIGU") respectfully submit these comments regarding the Draft Environmental Impact Statement in the above-referenced dockets. In support of its Comments, NWIGU states as follows:

I. BACKGROUND

NWIGU is a nonprofit association comprised of thirty-five industrial end users of natural gas with major facilities in the states of Oregon, Washington, and Idaho. NWIGU members include diverse industrial interests, including food processing, pulp and paper, wood products, electric generation, aluminum, steel, chemicals, electronics, and aerospace. The association provides an informational service to its members and participates in various regulatory matters that affect member interests. NWIGU member companies purchase substantial quantities of natural gas in order to operate their facilities in Oregon, Washington and Idaho. Because the proposed LNG terminal and related pipeline project would bring substantial quantities of natural gas into the Pacific Northwest, it is vitally important to NWIGU that FERC properly considers the needs of the Pacific Northwest industrial gas consumers for more gas supplies as it reaches a

¹ See NWIGU's Petition to Intervene filed July 6, 2006 in FERC Docket Nos. CP06-365-000 et al.

Companies and Organizations

6

K-624

decision on NorthernStar Energy's application to construct an LNG terminal and related pipeline facilities in Oregon and Washington.

II. COMMENTS

CO6-1

NWIGU concurs with the conclusions reached in the Draft EIS regarding the growing market demand for natural gas in Oregon, Washington and Idaho. As proposed, the Bradwood Landing LNG terminal and connected pipeline will have the capability to delivery approximately one BCF per day of natural gas into the heart of the Pacific Northwest gas markets. Such a significant new source of natural gas would be available year round to meet future demand for natural gas in our region.

The Northwest Gas Association in its latest update of the supply demand picture for the region shows that the Pacific Northwest needs access to new supplies of natural gas. NWIGU hereby incorporates as Exhibit A to these Comments a copy of Northwest Gas Outlook 2007, Natural Gas Demand Supply, and Service Capacity in the Pacific Northwest. See www.nwga.org

The study reaches the following conclusions that are highly relevant to this proceeding.

- Regional demand for natural gas will grow over the next five years, paced by demand for gas-fired electrical generation and continued growth in the number of residential customers.
- Natural gas consumption in the region (measured by energy content, or decatherms - Dth) can be expected to grow an average of 1.9 percent per year, with a cumulative projected growth rate of 7.2 percent through 2012 (see data table A.1., Appendix page 29). Most of this increase reflects an anticipated rebound in demand by electrical generation as well as continued growth in residential demand.
- Recently adopted climate change policies will drive additional demand for natural gas because its clean-burning attributes are vital in helping to reduce carbon emissions.

Companies and Organizations

6

CO6-1

We have used the Northwest Gas Association's report, Northwest Gas Outlook 2007, along with a number of other sources for information for our analysis of purpose and need in section 1.1.

K-625

CO6-1
cont'd

- Relatively higher natural gas prices and energy efficiency efforts continue to limit growth in industrial demand for natural gas.
- Other regions of North America will increasingly access gas supplies from production areas upon which the Northwest depends.
- To meet future regional and continental demand growth – particularly in response to climate change policies – North America will require new incremental supplies. Sources of additional natural gas are plentiful and include liquefied natural gas (LNG) imported from overseas and new supply sources closer to home such as Alaskan gas, Canadian frontier gas (Mackenzie River Delta), offshore resources and unconventional resources such as coal-bed methane, shale and biogas.
- Like most commodities, natural gas prices reflect the relative balance between supply and demand. Increased demand for natural gas – driven in part by regional climate change policies – and more competition from other North America markets will only tighten the region's demand/supply balance.
- In addition to ensuring that energy is utilized as efficiently and effectively as possible, policymakers must explore and encourage increased access to new and existing supplies.
- New energy policies to mitigate climate change are increasingly driving demand for natural gas both regionally and continentally because its clean-burning attributes are recognized as an important tool in reducing carbon emissions.

Northwest Gas Outlook pp. 1-2.

The uncontroverted fact is that the Pacific Northwest needs access to new gas supplies and that the LNG terminal proposed by NorthernsStar would help meet those needs. What is abundantly clear is that claims by opponents of LNG that new gas supplies are not needed in the Pacific Northwest are patently false. The energy supply picture in the Pacific Northwest overwhelmingly shows that our region will benefit from the siting of an LNG terminal in Oregon. To suggest, as some have, that the only beneficiaries of such a terminal would be California consumers ignores all the realities facing gas consumers in Oregon, Washington and Idaho.

Companies and Organizations

6

K-626

CO6-2

Under federal law, FERC is directed to consider feasible alternatives to the proposed action, and address in the Final EIS the relative environmental impacts of the proposed action and feasible alternatives. Federal law does not require a need determination to be made because no natural gas ratepayers are at risk for higher rates or stranded investment resulting from construction of the marine terminal and the Bradwood Landing Pipeline. Only those that use the terminal and pipeline will pay for the facilities. NorthernStar investors have all of the financial risk of failure. Thus, no traditional utility need determination is mandated by federal law.

CO6-3

By providing more access to natural gas, however the NorthernStar LNG terminal would have positive environmental benefits. Natural gas is the cleanest fossil fuel source for end users, and is an important fuel source for electric generation in the Pacific Northwest. Gas-fired generation is being used in the Pacific Northwest to help replace power that was previously generated by coal, nuclear power plants and hydroelectric facilities. Electricity from coal, nuclear and hydroelectric sources has declined in the Pacific Northwest in the past fifteen years in response to environmental and public safety concerns raised regarding those sources of electric generation. Gas-fired generation fueled by LNG can replace lost generation from other sources that are deemed to have greater environmental impacts. Furthermore, natural gas-fired electric generation will be critical in order to back up new renewable sources of power, especially wind.

CO6-4

Through the National Environmental Protection Act (NEPA) process, FERC is considering the environmental impacts of the proposed action. The impacts are being carefully scrutinized through this process. NWIGU urges FERC to also consider the positive environmental impacts of the infrastructure that is avoided by siting a terminal in Oregon. Given the growing demand for natural gas, if the gas does not come from LNG,

Companies and Organizations

6

CO6-2 Comment noted.

CO6-3 Comment noted.

CO6-4 An expanded discussion of newly proposed pipelines from the Rockies to Oregon has been added in section 3.1.2.2.

K-627

CO6-4
cont'd

it will have to come from Canada, the Rockies or eventually Alaska. To access any of those alternatives, at least hundreds, and more likely thousands, of miles of natural gas pipelines would need to be constructed to deliver an additional BCF of gas into the Pacific Northwest. To bring Rockies gas, pipeline facilities would be needed in Wyoming, Idaho, and Eastern Washington or Eastern Oregon. To deliver Rockies gas to the West side of the Cascades, either a pipeline expansion from East to West would be necessary through the Columbia Gorge, or a new pipeline would have to cross the Cascade Mountain Range. To bring new supplies from Canada, extensive new pipeline facilities would be required through Alberta and British Columbia in Canada, and then from the Washington/Canadian border south through Washington and Oregon. To have Alaskan gas reach this region would require thousands of miles of pipeline facilities and such facilities are many years away, if they are ever to be constructed.

CO6-5

NWIGU suggests that the Northwest Gas Outlook report clarifies that there is no "build no new gas facilities" option available for the Pacific Northwest if the region's energy needs are going to be met at all, let alone at reasonable prices. The LNG terminal proposed Bradwood Landing is part of the energy reality of the foreseeable future. The ways in which the energy requirements of Pacific Northwest consumers will be met are changing dramatically. Natural gas, including LNG, will help provide the region with a bridge to our energy future. Until a technological breakthrough enables us to meet all of our energy needs in an affordable way from energy sources that cause no environmental impacts, policy officials will be forced to make informed choices. NWIGU believes LNG is an important informed solution to meeting the region's energy needs for the foreseeable future.

Companies and Organizations

6

CO6-5 Comment noted.

CO6-6

New sources of natural gas from LNG also will help address unprecedented price increases that Pacific Northwest consumers have faced in recent years. Because of the tight regional supplies and increasing demand, by the winter of 2005-06, natural gas was selling for \$10 to \$12 per MMBtu. Just ten years ago, natural gas prices were regularly below \$2.00 per MMBtu in the winter, and at times sold for \$1.00 in the summer. The rapid rise in natural gas prices has placed unprecedented strains on NWIGU member companies. Large volume users of natural gas struggle to keep their manufacturing facilities profitable despite the price volatility they face when purchasing natural gas. Industrial use of natural gas has declined significantly in recent years, down 45 percent in 2005 from the consumption levels of 1998. Gas Outlook p. 1. *Id.* While some of the decline is due to aggressive implementation of conservation measures, much of the decline is due to demand destruction stemming from curtailed production at manufacturing facilities throughout the region with the corresponding loss of jobs and revenues for local communities.

For NWIGU member companies, high-priced natural gas is an impediment to retaining or expanding their businesses in the region. Many manufacturers in the Pacific Northwest have been forced to reduce production in part because of the exponential increase in natural gas prices, and these manufacturers continue to be constrained by the ongoing high level of natural gas prices. Access to LNG supplies through a marine terminal such as the Bradwood Landing Terminal proposed by NorthernStar would have positive benefits for the Pacific Northwest economy by helping to stabilize natural gas prices and provide industrial consumers with purchasing opportunities that will not otherwise exist.

Companies and Organizations

6

CO6-6 Comment noted.

The record in this proceeding supports a finding in the final EIS that gas consumers in the Pacific Northwest will benefit greatly from the siting of an LNG terminal such as the one proposed by NorthernStar at Bradwood, Oregon. NWIGU urges the Commission to grant the necessary certificates.

		Docket No. CP06-377-000

COMMENTS OF
PORTLAND GENERAL ELECTRIC COMPANY

I. COMMENTS

Portland General Electric Company ("PGE") hereby submits comments in the above referenced proceedings. PGE is a public utility, incorporated in Oregon. PGE provides electric service to approximately 775,000 retail customers throughout a 4,000-square-mile service area. PGE is owner and operator of the Beaver Generating Facility and the Port Westward Generating Facility in Clatskanie, Oregon. The Beaver plant has a 545,000 kW capability and Port Westward provides approximately 400,000 kW of generating capability. Both plants are used to serve PGE's customers.

PGE is a co-owner in the Kelso-Beaver Pipeline ("K-B Pipeline"), a natural gas pipeline that delivers natural gas to the Beaver and Port Westward plants. The K-B Pipeline is an interstate natural gas pipeline subject to FERC jurisdiction that extends from an interconnection with Northwest Pipeline Corporation in Kelso (Cowlitz County) Washington, to a delivery point at PGE's Beaver Generating Facility in Columbia County, Oregon.

Companies and Organizations

PGE supports the development of liquefied natural gas ("LNG") facilities in the Pacific Northwest. The Bradwood Landing LNG importation terminal, storage facility and associated natural gas pipeline (collectively "Bradwood Facility") proposed by Bradwood Landing, LLC and NorthernStar Energy, LLC (Owners) raises certain questions and concerns as it relates to the K-B Pipeline and our Port Westward and Beaver facilities. Those concerns are outlined below and we ask that they be considered in this permitting process.

CO7-1

The close proximity of the proposed Bradwood Facility natural gas pipeline to the K-B Pipeline necessitates safety precautions during its construction.

The Bradwood Facility natural gas pipeline is located approximately fifty (50) linear feet south of the K-B Pipeline for an extended distance. Because of the proximity of the Bradwood Facility natural gas pipeline to the K-B Pipeline, PGE has safety and operational concerns about the construction and operation of the Bradwood Facility.

During construction, physical disturbances, direct damage, erosion or other indirect impacts on the K-B Pipeline caused by the construction are possible. Such impacts could lead to safety risks to PGE employees or other persons located in the vicinity.

Additionally, Bradwood Facility natural gas pipeline construction activities could interfere with PGE or its operator's access and ability to properly maintain or repair the

K-B Pipeline as may be needed. Finally, outages of the K-B Pipeline caused by

Bradwood Facility natural gas pipeline construction may impact the operation of the

Beaver and Port Westward generating plants, ultimately harming PGE's ability to provide reliable electrical service to its customers.

Companies and Organizations

7

CO7-1

As discussed in section 2.3.3, where the Bradwood Landing pipeline would be adjacent to the existing KB pipeline, the proposed temporary construction right-of-way would overlap onto the existing pipeline's permanent right-of-way. The overlap would be up to 10 feet on the spoil side of the pipe trench, but no closer than 15 feet from the existing pipeline. This would allow room to keep construction equipment off the operating pipeline, thus avoiding potentially damaging the existing pipeline. Various activities and practices would be implemented to reduce the risk of damage to existing utilities. For example, prior to construction, NorthernStar would survey and mark its right-of-way and pipeline centerline, and conduct electronic surveys to locate existing underground utilities in the construction work area. NorthernStar would implement an environmental monitoring program to ensure that construction activities are confined to approved work spaces and to address issues such as off-site erosion, should it occur. NorthernStar's erosion control measures are contained in the ESC Plan and SWPPP, which are available on the FERC's eLibrary for PGE's review. This document is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e., CP06-365), and putting in the proper date range.

K-641

Companies and Organizations

7

CO7-1
cont'd

To remedy these concerns, PGE requests that the Federal Energy Regulatory Commission ("FERC") impose the following conditions. Specifically, prior to construction of the Bradwood Facility natural gas pipeline, its developers/contractors ("Bradwood Contractors") shall perform field locations to determine the exact location of the K-B Pipeline and flag the existing right of way for the K-B Pipeline. PGE believes that by keeping the Bradwood Contractors off the K-B Pipeline right of way, it will help protect the K-B Pipeline from equipment damage and will also help keep the existing vegetation undisturbed, thereby reducing erosion problems. PGE requests a daily inspection report from Bradwood Contractors and Owners verifying that they have avoided entering or traversing through the K-B Pipeline right of way.

Additionally, PGE requests to review the Bradwood Facility natural gas pipeline drainage control plan, as well as erosion sediment control plans and to have the opportunity to modify or revise such plans as may be reasonably necessary to avoid potential harm to the K-B Pipeline. We are concerned that check dams, water bars and grade changes could affect the drainage around the K-B Pipeline and result in piping and sinkholes.

PGE is also concerned that construction of the Bradwood Facility natural gas pipeline could activate land slides. PGE requests any land slides activated due to construction or drainage issues related to the construction become the sole responsibility of the Owners and are promptly remedied.

The Bradwood Facility's natural gas pipeline crossing of the K-B Pipeline near PGE's Port Westward Facility requires additional safeguards.

K-642

K-643

CO7-2 In addition to general concerns and safeguards required by the close proximity of the Bradwood Facility natural gas pipeline to the K-B Pipeline, at one specific point the Bradwood pipeline crosses the K-B Pipeline. Such a crossing requires even greater precautions to avoid safety and reliability problems. PGE requests that in addition to the Owners performing field location of the K-B Pipeline prior to construction, that it shall have visually located the K-B Pipeline prior to the excavation of the bore pit. We request that PGE be allowed to be present during the visual location process, and that a forty-eight (48) hour notice be provided by the Bradwood Contractor and Owners to PGE prior to excavation around the K-B Pipeline in order to have PGE personnel or its pipeline operator on site during such work.

CO7-3 **The Bradwood Facility natural gas pipeline requires adequate cathodic protection to avoid harm to the K-B Pipeline.**

The close proximity to, and the crossing of, the K-B Pipeline by the Bradwood Facility also poses a potential cathodic protection ("CP") issue. The Bradwood Facility's chosen method of galvanic and/or impressed current CP has the potential to increase corrosion and possible hydrogen embrittlement on the K-B pipeline, which can ultimately lead to pipeline failure or costly repairs. These problems can be mitigated by coordinating design of CP systems between both the K-B and Bradwood pipelines, so that CP designed to protect one pipeline against corrosion will not negatively affect the other pipeline by reversing the polarity of the ionic charges in the soil in the vicinity of the other pipeline.

To avoid such cathodic harm to the K-B Pipeline, PGE requests that, prior to construction of the Bradwood Facility natural gas pipeline, the Bradwood Contractors

Companies and Organizations

7

CO7-2 Language has been added to section 2.4.2 to address the concerns of PGE regarding crossing the KB pipeline.

CO7-3 The Bradwood Landing pipeline cathodic protection system would be designed and operated in accordance with 49CFR 192 which requires, among other things, the electrical isolation of new pipelines from other underground metallic structures (49CFR 192.467) and that impressed current cathodic protection systems be designed to minimize adverse effects on existing, adjacent underground metallic structures (49CFR 192.473). Additionally, NorthernStar has indicated it would coordinate with KB pipeline during design of the cathodic protection system and monitor for interference during required system surveys.

CO7-3
cont'd

and Owners are required to develop and install such a cathodic protection system for any pipeline that is within an underground distance of one hundred (100) feet of the K-B Pipeline. PGE also requests that it be allowed engineering review and approval of such a system prior to construction of the Bradwood Facility natural gas pipeline.

II. NOTICE

Re: Bradwood Landing Docket Numbers: CP06-365, 366 and 377;
Oregon LNG Docket Number: PF 07-10-000

Dear Secretary Bose,

The Oregon Chapter of the International Non-Governmental Organization, Physicians for Social Responsibility, strongly opposes all four Liquid Natural Gas Terminals and their pipeline delivery systems (three in the Columbia River and one in Coos Bay) that are slated for construction in our beautiful state. The destructive environmental impacts, the possible health risks to our citizens, the continued foreign energy dependence and the potential security risks are too many dangers that we are not willing to accept in trade for minimal economic benefit.

Our membership supports renewable energy resources that reduce carbon footprints for companies, individuals and government. Therefore, we oppose LNG for the following reasons:

- CO8-1 ☐ LNG is not sustainable or clean energy.
- CO8-2 ☐ It has expensive transportation costs since it is imported from countries like Indonesia, Nigeria, Russia and Iran.
- CO8-3 ☐ Oregon does not need this energy source and there is considerable evidence that California does not need it past 2015.
- CO8-4 ☐ Small businesses that we treasure, our local family-owned farms, would be irrevocably harmed, including the habitats and water sources that they work hard to protect.
- CO8-5 ☐ Bradwood Landing, the terminal on the fastest track to approval, will cause enormous ecological damage and consequence to Columbia River estuarine health that is not acceptable.
- CO8-6 ☐ Our forests and private landowners would lose their properties to multinational corporations that do not care about protecting our land as we do.
- CO8-7 ☐ And one accident or terrorist act could cause potential thermal radiation burns a half mile from the initial LNG pool fire.

Oregon Physicians for Social Responsibility works diligently to support energy sources that do not damage our environment or our citizens. We urge federal and state tax dollars that would be

Companies and Organizations 8

- CO8-1 We disagree. While natural gas is a non-renewable resource, we will not be running out of it any time soon. There are about 1,191 Tcf of recoverable natural gas reserves in the United States, and about 5,211 Tcf. world wide. Natural gas is the cleanest burning fossil fuel, and is the energy source most in demand for new electric generation plants because has less impact on air emissions than other fuels, such as oil and coal. Natural gas has and will play an important part in the energy mix of the Pacific Northwest, as explained in section 1.1.
- CO8-2 The cost of LNG may fluctuate over time and place. It could also be imported from Alaska, Australia, and Trinidad and Tobago. LNG may prove to be competitive with domestically produced natural gas, and its importation may result in price stabilization or perhaps even reductions in energy costs, as explained in section 1.1.
- CO8-3 The need for an additional source of natural gas is described in section 1.1. California is not a target market for the project. See our response to comment PM1-23.
- CO8-4 There is no evidence that the project would harm small businesses. In fact, as shown in section 4.8, the project should benefit the local economy. As discussed in section 4.7, the majority of agricultural land would be restored to its previous condition after installation of the proposed pipeline. As discussed in section 4.8.3.3, NorthernStar would compensate the landowner for crop damages and use of the land, through the easement negotiation process. Impacts on waterbodies are discussed in section 4.3.2 and potential affects on habitat are addressed in section 4.4.2.
- CO8-5 The Bradwood Landing is not on a fast track for approval. See response to comment PM2-20. The EIS documents that the Bradwood Landing Project would not cause enormous ecological damage to the lower Columbia River estuary, and the mitigation measures proposed by NorthernStar may result in net benefits for habitat.
- CO8-6 No private lands would be lost to multinational corporations. NorthernStar is incorporated in the United States. It would acquire a utility easement for its pipeline, and the land would still belong to the current owner. Potential impacts on forest and NorthernStar's mitigation measures to reduce impacts are discussed in section 4.4.2.
- CO8-7 With implementation of the mitigation measures described in the Coast Guard's WSR (Appendix H), an LNG release would be highly unlikely. Section 4.11 discusses the hazards associated with a release of LNG and section 4.11.8 discusses terrorism and security issues.

allocated to assist any LNG terminals or pipelines to be re-directed to renewable, local energies such as wind and solar power. We adamantly oppose any State or Federal endorsement of such a dangerous, unnecessary and costly expense to our environment and our health.

Sincerely,

Rachel Larson
Executive Director
Oregon Physicians for Social Responsibility

Re: Draft Environmental Impact Statement (DEIS) for the Bradwood Landing
LNG Project (Docket Nos. CP06-365-000, et al.)

Dear Secretary Bose:

Thank you for this opportunity to comment on the proposed Bradwood Landing LNG facility and associated pipelines. The Pipeline Safety Trust was formed after the pipeline tragedy in Bellingham, Washington that killed three young people in a park, along with every living thing in two miles of a salmon stream that runs through Bellingham. After investigating and hearing that case the U.S. Justice Department and a federal judge saw the need for an independent organization to watchdog both the pipeline industry and the regulators that are supposed to ensure the public's safety. They provided money as part of the criminal settlement of that case to start the Pipeline Safety Trust for that purpose.

Staff of the Pipeline Safety Trust are members of the Washington State Citizen Committee on Pipeline Safety, and the U.S. Department of Transportation's Technical Hazardous Liquid Pipeline Safety Standard Committee and Pipelines and Informed Planning Alliance.

For the past month we have reviewed the DEIS for the Bradwood facility and associated pipelines, and would like to provide the following comments and requests for clarifications and corrections.

Proof of Need

CO9-1 | Clearly the best alternative from the point of public safety and environmental impact is no facility at all. If the need for natural gas is great enough, than a facility with mitigation measures to ensure public safety and

CO9-1 We discuss the no action alternative in section 3.1.1. We have revised section 1.1 to cite other studies from independent agencies and organizations regarding the need for this project. The Commission would make its comprehensive determination of need in the project Order.

CO9-1
cont'd

minimal environmental impacts may be justified. After reviewing the DEIS we did not find any compelling proof of the need for this facility or the associated pipeline. These are our specific concerns:

- In the DEIS (pages 1-4,1-5, 3-2), FERC justified the need for this additional gas by referencing reports from the Northwest Gas Association (NWGA) and Energy and Environmental Analysis (EEA) Inc. The Northwest Gas Association is a trade organization of the Pacific Northwest natural gas industry, and as such has a clear conflict of interest and should not be considered a valid independent source. EEA is a private consulting firm that does a lot of work for the natural gas industry. On their website (<http://www.eea-inc.com/ngservices/marketanalysis.html>) under "Gas Market Scenario Analysis" they state "Construct Your View Of The Future - EEA provides market projections that are based on your strategic planning assumptions." This clear statement that their market projections are based on a client's wishes, not the best available information, should also clearly make their report used to justify the need for this project suspect.

If this project is to be approved based on need, then a more complete, independent analysis of the future need in the Pacific Northwest needs to occur, and we ask that the states of Oregon and Washington be included in designing that analysis.

CO9-2

- The project's need is also based on the future need for more natural gas in the Northwest, yet there is no information in the DEIS that this project will provide **more** gas to market than is currently available. The proposed pipeline will connect the LNG facility at Bradwood to the William's Northwest Pipeline at Kelso, Washington. Williams has stated numerous times that their Northwest Pipeline is at capacity, and there is no indication in the DEIS that there is any plan to expand that capacity in any way. Without such expansion of capacity in the Williams pipeline then this proposed facility would not provide any **more** gas to market, only an alternative source of gas. The DEIS was not based on the need for an alternative source of natural gas, but on the need for additional natural gas. Again, the analysis for this DEIS is flawed and needs to be redone to either show how this facility will provide additional gas, or why an alternative source of gas is necessary enough to justify this proposal. We ask that such additional analysis occur, and that it includes a discussion of how this project compares to other proposals for additional gas to the region from the Rocky Mountains, Canada, and Alaska.

CO9-3

- There are at least four other competing pipelines - the Oregon Pipeline, the Palomar Pipeline, the Pacific Connector pipeline, and El Paso's Ruby Pipeline - proposed to bring natural gas to Oregon. There was no discussion in the DEIS about how these other proposed pipelines relate to the need for this project. In particular the Palomar Pipeline and the Oregon Pipeline

Companies and Organizations

9

CO9-2

The EIS states that the proposed project would bring in new supplies of natural gas through the importation of LNG. See section 1.1. The existing Williams Northwest system does not have to be expanded to handle the additional volumes that would become available through an interconnection with the proposed Bradwood Landing Project. See our response to comment PM1-10.

CO9-3

The EIS has been revised. Section 3.1.2.2 discusses Palomar and Ruby as newly proposed pipeline alternatives. The Oregon Pipeline is discussed as part of the Oregon LNG Project, and the Pacific Connector Gas Pipeline is discussed as part of the Jordan Cove LNG Project in section 3.1.3.4 Proposed LNG Import Terminals in Oregon.

CO9-3
cont'd appear to have the ability to serve this same LNG facility, but these alternative pipelines to the pipeline proposed with this facility was not discussed. If this is to be a regional facility, then the DEIS should address the regional impacts. Why build three pipelines, with three sets of environmental impacts, if one pipeline would be sufficient? This is a critical failure of the DEIS, and we ask that it be addressed by including, at a minimum, the Palomar and Oregon pipelines as part of the alternative review.

CO9-4 • The DEIS also fails to provide any discussion regarding the need for this particular LNG facility compared to the many others proposed for the west coast of the United States and Canada. It is clear that at most only a handful of these facilities will be needed, so why is there no discussion in the DEIS of which facilities will have the least environmental impact and pose the least threat to public safety? Does the Bradwood facility provide for better safety and less environmental impact than the other proposed facilities? Why does FERC continue to place such a financial and emotional burden on multiple states, local jurisdictions, and citizens to review multiple proposals when it is clear that economically not all of them will be built? We ask that a discussion of how this particular facility compares to other competing facilities regarding public safety and environmental impacts be included in the final EIS.

Public Safety of Ships Traveling the Columbia River

CO9-5 There are many unaddressed concerns raised by others more knowledgeable than us regarding the specifics of LNG spill models used in the DEIS to discuss potential public safety impacts. We hope these issues are more fully addressed.

One concern we have with all the LNG proposals we have reviewed is the lack of acknowledgement of the potential for a cascading failure of containment tanks if a terrorist attack was to occur. In February of this year the Government Accountability Office (GAO) made a recommendation to Congress that such a cascading failure of containment after such an attack is the leading concern not currently being addressed, and that further research needs to be done. There was no new research provided in the DEIS, and this concern was not addressed adequately. With LNG tankers transiting many miles up the Columbia River such a cascading failure, particularly near Astoria, Oregon, could have catastrophic effects. We ask that the possibility of a cascading failure be adequately addressed in the final EIS.

Pipeline Construction Issues

We agree with the concerns raised by the Washington State Citizen Committee on Pipeline Safety, and include them again below to lend our

Companies and Organizations

9

CO9-4 The need for this project is discussed in section 1.1. Our alternatives analysis explains why the Bradwood Landing Project would serve a specific purpose that may not be served as well by other LNG import terminals in Canada, Mexico, or California. We offer a comparison of environmental impacts for other proposed LNG import terminals proposed in Oregon, where we have data for those other sites, in section 3.1.3.4. No other project was identified that had significantly less environmental impacts. There is no great burden on states or local governments to review the LNG proposals, because under the NGA and EPCRA 2005 the FERC is the sole agency with authority to site onshore LNG import terminals, and it is our staff which has the burden of reviewing the applications and preparing this EIS. Any project authorized by the FERC would have equal protection for the public with regard to safety and security issues. The FERC does not choose between projects and would review each project independently on its own merits. See also our responses to comments PM2-23, PM2-27 and PM2- 31.

CO9-5 Section 4.11.5.3 includes a discussion on the effects of a cascading scenario on the overall fire hazard and has been updated to include a discussion on the GAO reports position on cascading issues.

support to making sure they are addressed before this project moves forward.

- CO9-6 • We agree with FERC that the current amount of information available regarding seismic and landslide hazards is insufficient, and ask that pipeline construction not begin until FERC, PHMSA, and the WUTC are satisfied with the analysis and any proposed routing changes and mitigation that come from it.
- CO9-7 • We are concerned about possible jurisdiction, coordination, and expertise issues between the Federal Energy Regulatory Commission (FERC), the Pipeline and Hazardous Materials Safety Administration (PHMSA), and the Washington Utilities and Transportation Commission (WUTC). For these reasons we ask that FERC allow the WUTC full access to the pipeline and related construction documents for the purpose of inspection during the construction phase. We also ask that PHMSA grant the WUTC permission to carry out these construction inspections as part of their delegated interstate authority. We ask that this be incorporated in the final EIS.
- CO9-8 • We are concerned that the DEIS does not clearly call for the non-destructive (e.g., radiographic or ultrasonic methods) inspection of every girth weld on the pipeline. Given the difficult terrain, the pipeline is highly susceptible to abnormal loading, we ask that the final EIS makes clear that every girth weld will be 100% inspected by non destructive testing, and that these girth weld nondestructive test records be retained and made available to governmental inspectors for the life of the pipeline.
- CO9-9 • We are concerned with the level of confidence that FERC seems to put in the use of strain gauges for providing warning against landslides. While strain gauges can be valuable for predicting problems on slow moving slide areas, they provide little or no protection for landslides in geologic formations that make them prone to catastrophic failures (e.g. slopes susceptible to high hydrology gradients such as that in Western Washington). This again points to the need for better analysis of landslide areas and rerouting if necessary.
- CO9-10 • The use of HDD to get under streams and landslide areas is extensive in the construction plans. While we do support the use of HDD in such situations, we also know that even with the best geologic analysis HDD can fail. For this reason we ask that the final EIS clearly state what methods will be used in each situation if the HDD methods turns out not to work in an area. For streams this would include which method would be used in place of HDD, and for slide areas this would include whether the pipeline will be rerouted to avoid the slide or what other mitigation may be employed.

9

- CO9-6 Comments CO9-6 through CO9-16 were also submitted as part of comment letter SA3. For these comments, our responses refer to the response previously provided.
- See our response to comment SA3-3.
- CO9-7 See our response to comment SA3-1.
- CO9-8 See our response to comment SA3-2.
- CO9-9 See our response to comment SA3-4.
- CO9-10 See our response to comment SA3-5.

- CO9-11 • Sometimes, during the HDD process under streams frac-outs occur that can dump harmful quantities of fine silt materials into fish bearing streams. In the DEIS it states that response to such frac-outs would occur within 30 minutes. We believe that the detection and response to frac-outs should occur much quicker than 30 minutes and we would like to see this reflected in the final EIS.

Right-of-way Issues

- CO9-12 • It is our understanding that FERC has a policy to encourage the use of existing right-of-ways when possible. It is unclear from the DEIS exactly why this proposed pipeline from the Bradwood facility is not following the existing KB Pipeline for more of its route through Washington. Please either explain this more explicitly in the final EIS, or require this pipeline to follow that existing KB Pipeline right-of-way since they are both going to the same place.

- CO9-13 • The DEIS states that this proposed pipeline would be serving the Beaver power plants. This would appear to make the KB pipeline obsolete, and its existing right-of-way more available for this proposed pipeline. Please discuss the future need for the KB pipeline, and why the replacement of that pipeline with a larger pipeline was not considered as an alternative to the Washington part of this proposal.

- CO9-14 • The DEIS states that after construction trees will be planted on the right-of-way in forest areas and wetlands within 5-15 feet of the pipeline to reduce the visual impact and protect habitat. The DEIS also states that property owners will not be allowed to plant trees anywhere on the permanent fifty foot right-of-way. We support the planting of trees as suggested for forest and wetland areas, and ask that similar planting also be approved for property owners in consultation with the pipeline operator.

- CO9-15 • The DEIS states that after construction trees will be planted on the right-of-way in forest areas and wetlands within 5-15 feet of the pipeline, and that such plantings will create a nearly full canopy cover. While we support this planting of trees, and ask that it remains a part of this plan, it does bring up the question of how the company plans to meet its inspection obligations under CFR 49 Part 192.705. Please describe in the final EIS what inspection methods the company plans to use if a nearly complete canopy precludes aerial inspections.

Proximity to Residences

- CO9-16 • The DEIS states that there are six residences within Washington State, which are within 100 feet of the pipeline. We appreciate the care taken to try to avoid residential areas as much as possible, but according to the C-FER

FEDERAL ENERGY
REGULATORY COMMISSION

Re: Docket No. CP06-365-000 et al.

Dear Ms Bose

CO10-1 I am writing you regarding the natural gas pipelines proposed to cross our state. I am a winery owner in the northern Willamette Valley farming 220 acres of wine grapes. I have met with representatives of the pipeline companies and based on the information they provided I have concluded that construction of these pipelines is and dangerous and unnecessary. They propose to bury a 3-foot diameter high-pressure pipeline 3 feet below ground. In the same section of our vineyard where they would like to place this pipeline just last summer my vineyard crew punctured a irrigation line 4 feet below grade when performing the routine maintenance of replacing an end post. If they had ruptured a gas line five of my crew would have been killed and most probably many members of the families that live adjacent to our vineyard. Farmers regularly disturb soil below 3 feet when installing drainage lines, water lines, fence posts or in the process of sub-soiling. The proposed pipeline installation is dangerous to our farmers, their families and our neighbors. I'm sure the Oregon Department of Agriculture shares these concerns.

CO10-2 The pipeline proposal does not make sense from a need/risk perspective. We don't need this volume of gas in Oregon. The majority of the gas to be carried is to be sent to California customers yet we Oregonians are expected to bear the risks of this project. If Californians need the gas let them accept the terminals on their coastline and the pipelines crossing their properties.

CO10-3 Another problem with this proposal is that the gas companies are not using existing right of ways but rather proposing to cross private lands near homes and schools and across agricultural and forestry lands. This is in direct opposition of the Oregon guidelines for this type of project.

CO10-4 Not least is the issue of environmental impact especially at the coast near the docking terminals. Our Oregon coast is on of the healthiest and most beautiful in the country and a great source of pride for all Oregonians.

As our government representative charged with balancing the energy needs of Americans with safety and impact I respectfully request that you oppose the LNG projects and require the Federal Energy Regulatory Commission to

Companies and Organizations 10

CO10-1 The Bradwood Landing pipeline would not cross any portion of the Willamette Valley, and therefore would not affect the Montinore Estate farm or vineyard.

CO10-2 The purpose and need discussion in section 1.1 has been expanded and clarifies that the natural gas would not be going to markets in California.

CO10-3 See our response to comment SA3-37. The Bradwood Landing pipeline follows existing rights-of-way to the extent possible, for about 22 percent of its route.

CO10-4 The proposed Bradwood Landing LNG terminal is not located on the Oregon coast, but 38 miles up the Columbia River from its mouth.

K-654

consider all of the Oregon LNG projects in a single environmental impact statement that specifically addresses why Oregon should host an LNG plant that is intended to send California gas.

Rudy Marchesi

President, Montinore Vineyards

Companies and Organizations 10

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
CO11-1	There is no proven “need” for the project in the Pacific Northwest. The EIS assumes that LNG is a vital resource for the future of the Pacific Northwest; however, no impartial information is given that shows the need for the enormous scale of the Bradwood Landing proposal. What evidence is there of the need for gas in Oregon; where would the gas that is planned for import to Oregon go?	See our response to comment PM1-8. The Commission will make its determination of need in the project Order.
CO11-2	The draft EIS states that the purpose of this project is to import LNG to supplement regional supplies, when in fact NorthernStar’s purpose for the project is to tap into the California market and supplement California’s natural gas supplies.	See our response to comment PM1-23.
CO11-3	California gas needs should be evaluated as part of the draft EIS needs analysis.	California is not a target market for the Bradwood Landing Project and therefore should not be included in the assessment of need.
CO11-4	LNG imports will help stabilize the supply and price for the region, is a false statement. LNG imports are notoriously unreliable because of uncertainties in the supply and demand of the global market. The purpose and need should be re-evaluated in light of these observations, the effects importing LNG will have on the regional supplies, and prices should be stated.	We disagree based on a number of sources as cited in our discussion of purpose and need in section 1.1.
CO11-5	The draft EIS rests its need analysis largely on a national presumption of need for LNG imports, and is inadequate in its evaluation of the regional need for LNG imports.	See our response to comment CO11-1.
CO11-6	Data from the Northwest Gas Association can not be considered unbiased, due to Northwest Natural Gas, a member of the Association, who is a partner and will likely be a future owner of the Bradwood Landing pipeline.	Section 1.1 was revised to cite a number of independent studies.
CO11-7	The details of Williams pipeline and its lack of capacity to accept NorthernStar’s gas needs to be addressed in greater detail.	Section 1.0 has been revised to include a discussion of the Williams Northwest pipeline capacity. See our response to comment PM1-10.
CO11-8	The size of the LNG ships that will transport LNG to the proposed Bradwood terminal is inconsistent.	The LNG terminal is designed to accept LNG carriers up to 200,000 m ³ . The WSR would limit the size of the LNG carriers to a capacity of 148,000 m ³ until a completed site-specific risk analysis for larger carriers is approved by the COTP. At that time, NorthernStar would prepare a follow-on WSA with the proposed LNG carrier size for approval by the Coast Guard.
CO11-9	The number of LNG storage tanks proposed has been inconsistent (two or three?).	The number of LNG storage tanks has consistently been presented as two in the EIS and in the current versions of the JPA and JARPA. Because two storage tanks were proposed in NorthernStar’s application to the FERC, and analyzed in the EIS, if the Commission authorizes the project, only two tanks could be built at the LNG terminal.
CO11-10	The draft EIS does not provide a description of the routes the LNG vessels will travel to and from the proposed LNG terminal, making it	We have modified section 4.6.2.1 to indicate that NorthernStar would minimize impacts on whales by contractually requiring that the LNG carriers travel in a defined area that would narrow to 10 nautical miles in width between 126

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	extremely difficult to assess vessel strikes.	degrees (west of the toe of the continental slope) to the marshalling area off the mouth of the Columbia River. Also we are recommending that NorthernStar coordinate with the NMFS to determine appropriate LNG carrier speed and seasonal restrictions, or other applicable measures, to avoid or minimize impacts on whales.
CO11-11	The draft EIS ignores the Palomar Pipeline as a connected action.	As discussed in further detail in section 3.1.2.2, we consider the Palomar Project to be a separate undertaking from the Bradwood Landing Project. Neither project is inter-dependent on the other. The two projects can be considered as competitors to supply natural gas from different sources to the same market. The FERC intends to do an independent environmental review of the Palomar Project. See our response to comment PM1-24.
CO11-12	An inadequate analysis of alternatives has been given due to the unreasonably narrow definition of the purpose and need of the project.	As indicated in sections 1.1 and 3.1, the primary objective of the Bradwood Landing Project is to provide a new source of natural gas to the Pacific Northwest through the importation of LNG. In order to accomplish that objective, NorthernStar would need to interconnect with the existing Williams Northwest jurisdictional interstate system, and the existing system of Northwest Natural, which is the nonjurisdictional LDC for northern Oregon and southern Washington. Related to that objective would be the ability to directly serve industrial customers in the Pacific Northwest, such as the Georgia-Pacific paper mill at Wauna, Oregon and the PGE Beaver Power Plant at Port Westward.
CO11-13	There are cleaner, safer, and more affordable energy alternatives.	See our response to comment PM1-12. Natural gas is the cleanest burning fossil fuel. Its affordability will vary with market conditions. See our responses to comments CO8-1 and CO8-2. As explained in section 4.11, natural gas is safe.
CO11-14	Evidence is not provided to support the conclusion that LNG is an economically reasonable source of gas supply for the region.	Market conditions will dictate whether LNG is economical in any given year. As indicated in section 1.1, NorthernStar believes that imported LNG can compete with domestically produced natural gas.
CO11-15	How would the siting of an LNG terminal, in the Lower Columbia act to stimulate or encourage the development of electrical power generating facilities and other energy intensive industries?	One of the goals of the Bradwood Landing Project is to supply natural gas to the Beaver Power plant. As discussed in section 1.1, natural gas is growing as the fuel of choice for electric generation plants because it produces less air emissions than other fossil fuels, such as oil or coal. The conversion of power plants from oil or coal to natural gas could have benefits in terms of better air quality, and lower production of GHG.
CO11-16	The DOE estimates there are decades of natural gas remaining in North America.	The supply and demand for natural gas is discussed in sections 1.1. It has been estimated that there are about 1,191 Tcf of recoverable natural gas reserves in the United States. However, it may not be possible to extract that gas and transport it to markets in the Pacific Northwest in the near future.
CO11-17	The EIS does not consider an alternative that would remove impurities (non-methane components) from the LNG.	See response to comment PM1-22.
CO11-18	How would the proposed project be consistent with Oregon's renewable	We discuss Oregon's renewable energy standard in section 3.1.1.2 of the EIS.

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	energy standard and how could it increase political pressure to weaken the standard to allow for greater combustion of gas?	In an editorial that appeared in The Oregonian newspaper on April 27, 2008, Gregg Kantor, President of Northwest Natural, indicated that renewable energy sources currently account for only 4 percent of Oregon's electricity, and new supplies of natural gas from imported LNG are needed in the near future to bridge the energy gap until Oregon's goal is reached of having 25 percent of its energy produced from renewables by 2025.
CO11-19	The EIS does not consider the Palomar pipeline as an alternative to the proposed sendout pipeline.	As discussed in section 3.1.2.2, the proposed Palomar pipeline would not be a substitute for the proposed Bradwood Landing sendout pipeline; but can be viewed as a newly proposed system that would provide an alternative path for gas supplies to reach markets.
CO11-20	The FERC should more thoroughly evaluate Rockies gas as an alternative, including the Bronco and Ruby pipelines.	The Rockies and Bronco pipelines have been analyzed as system alternatives to the proposed project in section 3.1.2.2.
CO11-21	The draft EIS does not evaluate a range of projections for Canada's natural gas exports to the United States.	Sections 1.1 has been revised to present predictions for future production of natural gas in the WCSB and potential export volumes to the Pacific Northwest.
CO11-22	The EIS should consider potential LNG terminal sites in northern California because a large proportion of the natural gas from the project is planned to go to California.	A large portion of natural gas from the project is not planned to go to California. We considered LNG import terminals in California as alternatives discussed in section 3.1.3.3.
CO11-23	The alternatives section does not justify why open-cut methods are being used to cross waterbodies in some areas.	As discussed in sections 2.4.2.2 and 4.3.2.4, the standard waterbody crossing method is the open-cut method. However, NorthernStar would use the HDD or conventional bore method to cross sensitive waterbodies.
CO11-24	The FERC did not consider a smaller sized facility or smaller sized LNG carriers as alternatives.	Section 3.1.6 of the EIS discusses alternative LNG terminal designs. We feel that NorthernStar's proposed LNG terminal is the smallest footprint feasible to meet its economic and engineering design objectives. An operating terminal covering only 40 acres would be smaller than many other existing and proposed LNG terminals in the United States.
CO11-25	The EIS dismisses alternative regasification strategies.	See our response to IND107-4.
CO11-26	The EIS does not provide adequate analysis of its major pipeline route alternatives.	The analysis of major pipeline route alternatives considered numerous factors (see table 3.1.3-1). We do not believe that any of the alternative routes offer an environmental advantage over the proposed pipeline route.
CO11-27	The dredge disposal alternatives analysis is inadequate.	We believe the various dredge disposal alternatives were analyzed adequately to determine that the proposed action of placing the dredged material at the terminal site and at the Wahkiakum County Sand Pit is a reasonable and environmentally sound alternative.
CO11-28	The alternatives analysis is inadequate and fails to consider reasonable alternatives that would avoid impacts on aquatic ecosystems.	We evaluated a variety of alternatives but did not find any feasible alternatives that had clear environmental advantages over the proposed project and that could meet all of the project objectives.
CO11-29	There are inconsistencies (e.g., with respect to wetlands) between the alternatives analysis in the draft EIS and the JPA and JARPA.	NorthernStar used different assumptions while calculating impacts to wetlands than we did. For example, it did not include permanent impact acreages with its

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
CO11-30	The EIS should evaluate alternatives in light of SIGTTO standards.	temporary impact acreages, whereas our temporary impacts include the permanent impacts. The SIGTTO standards are taken into consideration and implemented as appropriate.
CO11-31	Due to the nature of this facility and its regional location the following geologic hazards were inadequately addressed. <ul style="list-style-type: none"> • Poor foundation soils that have potential to undergo liquefaction. • Volcanism • Seismicity • Tsunamis • Landslides/Rock fall/Debris flow • Slope stability • Shoreline erosion • Subsidence 	See our responses to comments SA1-4, SA1-92, and SA1-100 through SA1-112.
CO11-32	Evaluate OBE and SSE for magnitude 8.0 to 8.5 earthquakes not on the Cascadian Subduction Zone.	The OBE and SSE design response spectra were established per the requirements in the 2001 NFPA 59A standard. In their seismic analysis, URS (2006a) determined that the largest earthquakes producing the largest ground motions at the terminal site would occur on the CSZ. Therefore, the OBE and SSE are based on earthquakes that would occur on the CSZ.
CO11-33	The draft EIS failed to analyze: the adverse impacts on the location, structure, and dynamics of aquatic communities; shoreline and substrate erosion and deposition rates; the deposition of suspended particulates; the rate and extent of mixing of dissolved and suspended components of the waterbody; and water stratification.	The EIS discusses the impacts of dredging on the benthic community at the LNG terminal site as well as indirect impacts on the aquatic resources that forage on benthic species. We also addressed turbidity, sedimentation, and water quality issues associated with dredging.
CO11-34	The draft EIS fails to assess how aquatic life in the estuary will be harmed by the resuspension of contaminated sediments into the water column.	Based on the results of sampling and analysis of the sediments proposed for dredging, aquatic life would not be harmed by the resuspension of contaminated sediments into the water column.
CO11-35	The draft EIS fails to analyze what will be done with any possibly contaminated water from dredging activities.	Based on the results of sampling and analysis of the sediments proposed for dredging, contaminated water would not be generated during dredging activities.
CO11-36	The draft EIS fails to analyze whether the maintenance dredging is realistic, (i.e. NorthernStar predicts it will need to dredge every 2 – 4 years. However, maintenance dredging is required if the turning basin or channel fills in with 1 foot of sediment.)	The frequency of maintenance dredging is an estimate based on modeling. Permits, which require environmental review, would be obtained from the COE for maintenance dredging.
CO11-37	The draft EIS fails to consider the stability of the dredge side slopes.	We have confirmed with the COE that a side slope of 1 (vertical) to 3 (horizontal) is appropriate for the river sediments in the area of the LNG terminal. See also the response to comment IND82-3.

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
CO11-38	The draft EIS failed to qualify how 0.5 percent spillage of sediments during dredging was ascertained.	WEST (2006) determined the spillage rate in its hydrodynamic and sediment transport assessment for the dredging of the ship berth and maneuvering area.
CO11-39	The draft EIS indicates that phytosterols were found in the proposed dredge sediments but fails to analyze the effects phytosterols will have upon aquatic organisms if the phytosterols are released from dredge material.	The relatively low TOC content of the sediments within the dredge prism suggests a limited potential to mobilize phytosterols from the sediments during dredging or from the leave surface during operation of the facility.
CO11-40	The draft EIS failed to produce a plan for contaminated sediments and water from dredging activities.	Based on the results of sampling and analysis of the sediments proposed for dredging, such a plan is not necessary.
CO11-41	The draft EIS does not analyze the capacity of the Wahkiakum County Sand Pit site, or show that the site will be able to accommodate all the dredged materials from initial dredging as well as future maintenance dredging.	The final EIS has been revised to reflect that NorthernStar would place less dredged material at the Wahkiakum County Sand Pit site, up to the amount of capacity that is available.
CO11-42	Bradwood should be required to conduct soil contaminant testing in areas likely to be disturbed during construction by clearing, grading, or excavation activities before any construction ensues.	Prior to construction, NorthernStar would prepare a CMMP that would specify the procedures to identify, characterize, and properly manage potentially contaminated materials.
CO11-43	The draft EIS fails to adequately evaluate the potential for releasing contaminants from the soil during Bradwood road construction.	See our response to CO11-41.
CO11-44	The draft EIS states that the infiltration capacity of the soils will be sufficient for the water to percolate into the ground before running off into the river, but does not provide support for these statements with any reference to calculations or other scientific evidence.	An assessment of the permeability of the soils at the site is based on the geotechnical analysis of the site performed by URS as detailed in "Final Geotechnical Report, Proposed LNG Import Terminal, Bradwood Oregon, 2005" available on the FERC's eLibrary. .
CO11-45	The study conducted by Bradwood to analyze the contamination in the sediments had a flawed design. The replacement cores were lost, and not enough information on these replacements was provided. It should be required that Bradwood not only redo sampling, but analyze individual samples without compositing.	We are satisfied that the sampling and analysis of the sediments at the LNG terminal site met the objectives of the study and provided sufficient information to properly evaluate the materials to be dredged. The sampling and analysis plan was approved by the RMT and we do not believe the deviations from the work plan adversely affected the study results.
CO11-46	The draft EIS does not adequately describe how impacts of dredging are being mitigated.	Some of the impacts of dredging, such as increased turbidity, are short-term and localized and do not require mitigation. We have included new text in section 4.1.3.3 regarding NorthernStar's plan to monitor shorelines in the area of the LNG terminal to determine if dredging has contributed to shoreline erosion and implement mitigation measures if necessary. Furthermore, we added a recommendation that NorthernStar monitor the side slopes of the maneuvering basin for lateral migration and implement slope protection measures if necessary.
CO11-47	Additional pollutants such as excess total organic carbon and total volatile solids were not addressed in the draft EIS.	The total organic carbon and total volatile solids content are an indication of organic matter in the sediments; they are not pollutants.
CO11-48	The Mitigation Plan on file for this project is insufficient. An updated and detailed mitigation plan to account for the full scope of the project	NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan provides details on different BMPs in wetlands and waterbodies. This document is available for viewing by the public on the FERC's Internet web

Companies and Organizations 11

Comment Number	Comment (Summary)	Response
	<p>including the following should be provided:</p> <ul style="list-style-type: none"> What will the final effects of the proposed project be? Provide more detail about how the mitigation measures would be required and if they are not required what basis FERC relies on to assume that they would actually be implemented. 	<p>page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e. CP06-365), and putting in the proper date range. As described in section 2.1.5, NorthernStar is currently revising its Compensatory Mitigation Plan. The revised plan will be submitted to the NMFS and FWS as part of the FERC's BA and EFH Assessment.</p>
CO11-49	The listing of BMPs to be used in the ESC Plans is inadequate for a proper analysis of the probative value of the proposed sediment control measures.	NorthernStar has indicated that it would follow applicable state and local sediment control measures. Furthermore, NorthernStar has agreed to follow the FERC staff's Procedures. In addition, we have recommended that NorthernStar revise its pipeline ESC Plan and SWPPP to include measures from the FERC staff's plan that would provide greater protection.
CO11-50	The draft EIS claims that any scale and sediments in the water from the pipeline hydrostatic testing will be filtered out by straw bales, but provides no basis for the accuracy of this statement.	Because clean, new pipe would be used for the pipeline, no measureable scale or sediment is expected to be produced from the hydrostatic testing.
CO11-51	The Mitigation Plan will be insufficient to mitigate the adverse impacts of the filling of the log pond. A more thorough analysis concerning the filling of the log pond should be provided.	As described in section 2.1.5, NorthernStar is currently revising its Compensatory Mitigation Plan. The revised plan will be submitted to the NMFS and FWS as part of the FERC's BA and EFH Assessment.
CO11-52	The draft EIS failed to consider the impacts from terminal construction on the changes in salinity gradient, nutrient balance, dissolved oxygen balance, and how these changes will adversely affect communities of aquatic life, introduce populations of nuisance organisms, modify habitat, reduce food supply, restrict movement of aquatic fauna, and change the adjacent upstream and downstream areas.	<p>We believe that sections 4.3.2.3 and 4.5.2.1 adequately discuss the potential impacts of construction and operation of the LNG terminal on water resources and aquatic resources, respectively. However, additional information on these topics will be included in the revised BA and EFH Assessment.</p> <p>Section 4.5.2.1 has been revised to reflect the extent of saltwater intrusion into Columbia River. The additional dredging that would occur for the terminal area would be an approximate 0.1 percent increase to the existing dredged navigation channel from the mouth of the Columbia River to Portland. Therefore, effects to saltwater intrusion along the Columbia River are not expected to be significant.</p>
CO11-53	The draft EIS fails to analyze how water temperature will be changed due to increases in turbidity and how any changes in water temperature resulting from increased turbidity due to dredging activities will exacerbate the ODEQ 303 (d) water quality limited status of these waters. How will dredging affect the dissolved oxygen?	As described in the COE's SEIS for the Columbia River Channel Improvement Project, "Navigation channel dredging... would not result in significant water quality impacts. Dredging of fine-grained organic rich sediments could result in limited short-term elevations of chemicals and possible decrease in dissolved oxygen in the immediate area of the dredging." Impacts from the significantly smaller area that would be dredged for construction of the terminal berthing area would also not be expected to be significant.
CO11-54	The draft EIS does not provide any information on the accuracy of turbidity models.	The EIS is a summary document. An assessment of the accuracy of turbidity models is outside the scope of this EIS.
CO11-55	The draft EIS fails to consider the impact on water quality and the fact the proposed dredging, filling, and pipeline construction will cause violations of both Oregon's and Washington's numeric and narrative water quality standards, including harming designated uses.	Potential impacts on water quality due to construction activities associated with the LNG terminal are described in sections 4.3.2.2 and 4.3.2.4, respectively. As described in table 1.3-1, NorthernStar would obtain section 401 water quality certificates from the ODEQ and the WDE demonstrating that the discharges

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
		associated with the project comply with federal and state water quality standards.
CO11-56	The draft EIS does not assess the impacts that the lateral pipelines and power line will have on water quality.	The lateral pipelines are non-jurisdictional facilities that would be constructed by parties other than NorthernStar. No information is available on the routes in order to assess impacts at this time. Additional information discussing the potential impacts on water quality due to construction of the power line has been included in section 4.3.2.2.
CO11-57	The procedures for dechlorination of the hydrostatic test water being discharged back into the river are vague and insufficient to evaluate the procedure proposed.	See our response to comment FA1-12.
CO11-58	The draft EIS fails to assess the impact of permanently filling at least 14 acres of estuarine and freshwater wetlands at the terminal site, and the impact of destroying the log pond habitat.	Section 4.4.1.2 includes a discussion of both temporary and permanent impacts on wetlands at the LNG terminal site, including the log pond. Potential impacts on aquatic resources due to habitat modification at the LNG terminal site are discussed in sections 4.5.2.1 and 4.6.2.2.
CO11-59	The draft EIS fails to consider that construction activities, including terminal construction, replacement of the Hunt Creek Bridge, power line construction, relocation of the railroad tracks, and temporary parking lot construction, will destroy acres of vegetation. The draft EIS fails to adequately analyze the full scope of vegetation removal on surrounding habitats, and the problems associated with revegetating areas in the vicinity of the project site.	The total acres of vegetation impacted by construction and operation of the LNG terminal and associated facilities are provided in table 4.4.2-1. It is important to note that the railroad realignment, widening of Bradwood Road, and Hunt Creek Bridge replacement are included in the total acreage impacted. In addition, specific impacts on vegetation due to construction and operation of the LNG terminal are described in section 4.4.2.2. We believe that our analysis of potential impacts on vegetation, including revegetation, due to construction and operation of the LNG terminal is adequate.
CO11-60	The draft EIS fails to adequately analyze the quantity and type of vegetation to be destroyed as a result of construction activities at and around the proposed terminal site, road improvements, construction of temporary roads, or other various acts of construction.	See our response to comment CO11-58.
CO11-61	The draft EIS fails to take into account the difficulty of establishing some species of trees that will be removed during construction.	Section 4.4.1.2 has been revised to include additional information describing the proposed monitoring at the LNG terminal site to ensure survival and to verify that success criteria are met in areas planted for site restoration and compensatory mitigation.
CO11-62	The vegetation that will be cleared may be disposed of by being burned; the draft EIS does not discuss this source of pollution.	As stated in section 4.4.2.3, no trees, slash, or woody vegetation would be burned during construction of this project.
CO11-63	The draft EIS failed to consider the impacts to the changes in salinity, nutrient balance, dissolved oxygen balance, turbidity, temperature and how these factors will influence the aquatic wildlife.	See our responses to comments CO11-51 and CO11-52.
CO11-64	The draft EIS fails to analyze the effect of light pollution, and fish entrainment during dredging activities.	Section 4.5.2.1 includes a discussion of the potential impacts on aquatic resources due to terminal lighting and entrainment due to dredging activities.
CO11-65	The combination of losing shallow water habitat from dredging and losing shallow water habitat from filling wetlands will be a devastating hit to the	As described in section 4.3.2.3, no shallow water habitat would be impacted by dredging activities. However, potential impacts on aquatic resources due to

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	estuary ecosystem. The EIS must analyze the habitat loss of the dredge and fill cumulatively.	habitat modification are discussed in section 4.5.2.1.
CO11-66	The dredged hole at the head of the Clifton channel will cause a decrease in the velocity of the water which will harm salmon by increasing the travel time for smolts traveling to the ocean. The draft EIS fails to discuss how dredging and the project overall will affect salmon recovery.	Any decrease in velocity associated with dredging at the head of Clifton Channel would be localized to a relatively small area in relation to the migration path, and resulting impacts on travel time due to any decrease in velocity are not expected to have a significant impact on juvenile salmonid out-migration.
CO11-67	The draft EIS does not analyze the impacts of fish entrainment due to dredging.	Section 4.5.2.1 (see <i>Impacts on Aquatic Resources, In-water Construction Activities, Dredging, Entrainment</i>) describes the potential for small fish to be entrained during dredging operations. NorthernStar would minimize fish entrainment during dredging activities by keeping the cutterhead within 3 feet of the river bottom and conducting dredging activities during specified in-water work window when the densities of fish in the project area is lowest.
CO11-68	The draft EIS ignores the impacts of wave action on salmon stranding outside the terminal area.	See our response to comment FA2-19.
CO11-69	The draft EIS fails to adequately consider the impact to the millions of individuals of salmon, sturgeon, lamprey, and other resident species that utilize this area as habitat at various times in their lifecycles. This project will destroy habitat for 13 ESUs of Columbia and Snake River salmon that are threatened under the ESA.	Because the EIS is a summary document, we believe that the level of detail provided in sections 4.5 and 4.6.2 on the potential impacts from the proposed project on aquatic resources (including salmonids) is adequate. However, as they relate to federally listed species and designated critical habitat, these topics will be addressed in additional detail in the revised BA and EFH Assessment.
CO11-70	The draft EIS does not adequately describe the nature and effectiveness of the SEI, or alternatives to the SEI.	See our response to comment FA4-12.
CO11-71	The introduction of invasive species may harm the aquatic ecosystem.	Section 4.5.1.1 has been revised to include additional information on the potential for introduction of aquatic species to the lower Columbia River system.
CO11-72	The draft EIS does not adequately address the monitoring for the presence of pinnipeds and fails to discuss conditions under which more than one monitor could be used, under what conditions monitoring activities will be sufficiently doubtful to stop pile driving, and the methods Bradwood will use to monitor small and elusive marine mammals, such as harbor seals.	See our response to comment FA2-28.
CO11-73	Removal of vegetation near the shorelines of the Columbia River and Hunt Creek during construction activities will also adversely affect aquatic species by removing a source of food.	Potential impacts on aquatic resources due to habitat modification are discussed in section 4.5.2.1.
CO11-74	The draft EIS does not adequately describe how controlling noxious weeds will directly benefit salmon and offset the type of impacts the project will have at the site where terminal construction and dredging will destroy dozens of acres of critical habitat.	See our response to comment FA3-3.

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
CO11-75	The draft EIS fails to consider that a 25 percent increase in deep draft vessels due to the LNG terminal will increase the risk of vessel strikes to marine mammals and sea turtles.	Section 4.6.2.1 discusses the potential for increased ship strikes to both sea turtles and marine mammals as a result of increased vessel traffic during operation of the Bradwood Landing Project.
CO11-76	The release of contaminated water back into the river can be highly toxic to aquatic life. The draft EIS fails to assess the complete impact of contaminants (including but not limited to metals) on salmon, macro-invertebrates, and other aquatic life.	Although discharges into the Columbia River would meet ODEQ standards and NPDES permit requirements, the long-term bioaccumulative effects of pollutants on fish, humans, and other wildlife resulting from construction and operation of the Bradwood Landing Project can not be characterized with the best available science. Bioaccumulative effects can result from a variety of physical, chemical, and biological processes. However, the concentration of contaminant levels reported in section 4.2.2.2 of the EIS does not indicate a significant biological effect is likely.
CO11-77	The wetland fill at the LNG terminal will degrade the habitat used by birds, amphibians, mammals, and invertebrates.	We agree that filling of wetlands at the LNG terminal site would result in a loss of potential habitat for both aquatic and terrestrial wildlife. However, only about 13 acres of wetlands would be permanently filled at the Bradwood Landing LNG terminal, and NorthernStar will be required to mitigate for permanent impacts on wetland habitats through the implementation of its final Compensatory Mitigation Plan. See also the response to comment FA2-10.
CO11-78	The draft EIS fails to analyze adequately the impact on protected wildlife habitat in the Julia Butler Hansen Wildlife Refuge, Lewis and Clark Wildlife Refuge, and Fort Stevens State Park.	Additional information has been added to sections 4.5.1.1 and 4.5.2.1 regarding potential impacts on unique and sensitive wildlife habitats, including the JBHNWR, LCNWR, and Fort Stevens State Park.
CO11-79	The draft EIS fails to consider that noise impacts from construction activities may disturb various birds, including the Bald Eagle, and other animals, like the Columbia white-tailed deer, and cause them to avoid the areas impacted.	Sections 4.5.2.3 and 4.6.2 describe potential impacts on terrestrial wildlife due to construction and operation of the LNG terminal.
CO11-80	The pipeline construction will disrupt fish passage by damming the streams during the trenching and pipeline placement.	Potential impacts on aquatic resources due to pipeline construction are discussed in section 4.5.3.1.
CO11-81	If a frac-out should occur during pipeline boring or HDD, bentonite will be introduced into the waterway. Bentonite smothers fish habitat and fouls streams.	We believe that NorthernStar's HDD Contingency Plan adequately addresses potential modes of failure for each phase of the drilling process as well as mitigation measures for frac-outs to waterbodies.
CO11-82	The draft EIS fails to mention the behavioral modifications to salmonids and other organisms in the area due to noise impacts underwater.	Potential impacts on aquatic resources (including salmonids) due to increased noise levels during construction of the proposed LNG terminal are discussed in section 4.5.2.1.
CO11-83	The analysis for the Columbian White-tailed deer fails to account for fragmentation of habitats between population pockets in the estuary. The draft EIS fails to analyze the potential of fragmentation on terrestrial organisms that migrate through the region.	See our response to comment FA4-6.

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
CO11-84	The draft EIS fails to consider the harm to multiple ESA-listed mammals and turtles including: green leatherback, loggerhead and olive ridley sea turtles; blue, fin, humpback, north pacific right, sei, killer, and sperm whales; and Steller sea lions.	Potential impacts on federally listed species are discussed in section 4.6.2. More specifically, potential impacts on federally listed sea turtles, whales, Steller sea lions, and other marine mammals (i.e., harbor seals and California sea lions) along the waterway for LNG marine traffic are discussed in section 4.6.2.1. Potential impacts on Steller sea lions and other marine mammals potentially occurring at the LNG terminal site are described in section 4.6.2.2.
CO11-85	The draft EIS has failed to consider the cumulative economic effect of Bradwood on the fishing industry and communities dependent upon the fishing economy. The direct harm to fish will harm the fishing industry, as will the lack of access to traditional fishing areas.	Section 4.12 of the EIS describes the potential cumulative impacts from the project in relation to other past, present, and future projects. As discussed in section 4.12.4, because recreational users of the Columbia River have always had to account for industrial and commercial ship traffic, no significant additional cumulative impacts on these activities are likely.
CO11-86	The draft EIS fails to analyze the economic impact, including the cumulative economic harm due to the delay on the importers and exporters of goods, producers, and consumers.	See our response to PM2-19.
CO11-87	The draft EIS fails to consider that dredging will adversely affect the commercial and recreational fishing industry, both vital components of the Clatsop County and State economy. The 24-hour per day dredging will completely block access to the traditional fishing grounds at the head of the Clifton Channel, and may block Clifton Channel, for several months. The LNG tankers will block access to traditional fishing areas along the entire length of the river as well.	Although dredging would occur 24 hours per day, 7 days per week for a period of approximately 48 to 72 days, it is important to note that the dredge would be operating throughout the 46-acre dredged footprint during that time. Potential impacts on commercial and recreational fishing could occur due to dredging activities; however, it is not anticipated that impacts would be isolated on any area for the entire 48- to 72-day period during which dredging would occur.
CO11-88	The draft EIS must consider the advantage of the 35 full-time jobs and the short-term construction jobs versus the detriment to the existing industry in Clatsop County and the State. The draft EIS fails to consider the risk to the multiple industries and municipalities.	We do not believe operation of the proposed project would adversely affect other industries in the project area. Our discussion of potential socioeconomic impacts associated with the proposed project is included in section 4.8.
CO11-89	The LNG tankers and terminal will disrupt the tourism and real estate industries, and burden local communities.	As discussed in section 4.8.1.8, we believe the proposed project would not have a significant impact on tourism in the project area.
CO11-90	The draft EIS fails to consider that construction activities at the proposed Bradwood LNG terminal will substantially increase traffic and decrease safety on Clifton Road.	Potential impacts on Clifton Road and NorthernStar's proposed mitigation measures to reduce impacts are discussed in section 4.8.2.7. Clifton Road is now planned to be widened to 24 feet with 2-foot shoulders on each side.
CO11-91	No consideration was taken for other disenfranchised communities, especially senior citizens and the physically disabled. What percentage of impoverished and/or minority groups would be relevant for a consideration to be made on the impact on those communities?	As discussed in sections 4.8.1.9, 4.8.2.9, and 4.8.3.9, low-income and minority populations would not be disproportionately affected by the proposed project. Executive Order 12898 does not establish a specific threshold (percentage) of minority or low income populations for assessing environmental justice impacts.
CO11-92	Was public notice and documentation of this project provided for the Hispanic, non-English speaking, population?	We did not identify a need to publish notices in Spanish, because the project area does not contain a large Hispanic population, as noted in section 4.8 of the EIS.
CO11-93	How many condemnation actions are expected on both the proposed northern pipeline and on the Palomar pipeline? What is the projected total loss in property value that the proposed pipeline right of way would	Our discussion of condemnation and potential impacts on property values is included in section 4.8.3.3. Even when eminent domain is authorized, in practice it is rarely used. For example, a large natural gas pipeline currently

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	cause as a result of loss of currently allowed uses along the pipeline?	under construction in the Midwest crossed the property of 1,746 landowners. Eminent domain was exercised to acquire land rights to only nine parcels. See also the response to CO11-12.
CO11-94	<p>The draft EIS fails to include discussion of the project's conflict with federal, state, and local plans, policies and controls. The following need to be addressed:</p> <ul style="list-style-type: none"> Conflicts with County land use plans. Conflicts between the Bradwood pipeline and Cowlitz County laws that protect natural resources, economics, and public safety. Conflicts between the Bradwood project and Oregon law and policies, such as: <ul style="list-style-type: none"> the Statewide Planning goal 16, the noncompliance with Oregon's implementation of the CWA's waste water permitting program under CWA section 402 the conflict with Oregon's obligation to certify a project as consistent with water quality standards under CWA section 401 the conflict with Oregon's duty to evaluate whether a water appropriation should be granted by the Water Resources Department the conflict with Oregon's duty to protect the public interest when leasing state land Conflict with federal laws: <ul style="list-style-type: none"> Conflict with the CWA section 404 dredge and fill permit. Conflict with the Endangered Species Act of 1973 	<p>Our discussion of the proposed project's consistency with local plans, policies, designations, and guidelines is included in sections 4.7.2.2 and 4.7.3.2. Because Clatsop County accepted NorthernStar's zoning changes, there is no longer a conflict with Oregon State Planning Goals at the LNG terminal. With regard to Cowlitz County, Washington, see our response to comment PM4-12. As discussed in section 1.3.11, the FERC encourages cooperation between applicants and state and local authorities, and we expect the project sponsors to submit applications for necessary permits. However, this does not mean that state and local agencies, through application of state and local laws, may prohibit or unreasonably delay the construction or operations of facilities approved by the Commission. Further, state and local permits must be consistent with the conditions of any authorization the Commission may issue. There are no identified conflicts with other federal laws, such as the CWA and the ESA. The COE has responsibility for reviewing the JPA and JARPA for consistency with section 404 of the CWA. As described in section 4.6.1.1, the FERC is responsible for complying with the ESA, and submitted a BA and EFH assessment to the FWS and NMFS that we are currently revising. We have recommended a condition in section 5.2 that NorthernStar may not start construction until the FERC has completed formal consultations with the NMFS and FWS.</p>
CO11-95	Further consideration of historic sites such as the LCNHT, Hunt Lumber Mill, historic shipwrecks and site 35CO16 should be made.	We and the Oregon SHPO agree the project would have no adverse effects on the LCNHT. As explained in section 4.9.1.1, it is highly unlikely that LNG marine traffic in the waterway would have any adverse impacts on shipwrecks that are listed or qualify for listing on the NHPA. As discussed in section 4.9.4, we have not yet completed compliance with the NHPA. We have recommended a condition that NorthernStar must provide the results of additional investigations, including data about the Hunt Lumber mill and site 35CO16, for our review and approval, before construction could begin,
CO11-96	Complete section 106 of the NHPA for the entire project prior to the final EIS being published.	It is not necessary that the FERC resolve issues related to the identification of historic properties and assessment of project effects prior to the issuance of our final EIS. It is standard FERC practice to complete compliance with the NHPA after an Order is issued, but before we allow construction to begin. This is because cultural resources inventories cannot be done on lands where access was previously denied until after an Order, when the company could use the power of eminent domain to acquire its pipeline right-of-way easement. Our recommended condition in section 4.9.4 ensures that the FERC will be able to

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
		consult with the SHPO and review and approve additional cultural resources investigations and plans that would address potential project impacts on cultural resources.
CO11-97	The draft EIS fails to assess the impacts of imported natural gas with a Wobbe index higher than the domestic natural gas historically used in Oregon.	See our response to comment PM1-22.
CO11-98	The draft EIS fails to adequately assess the emissions of air pollutants, including greenhouse gases, from the project.	Section 4.10.1 includes information on the estimated emissions generated from the construction and operation of the project. Section 4.10.1 of the final EIS has been updated to clarify key assumptions used as the basis for the emissions estimates from the project and to include emissions of GHG.
CO11-99	The draft EIS fails to adequately assess air quality impacts resulting from the emissions associated with the proposed project.	See our response to comment SA4-11.
CO11-100	The draft EIS fails to adequately evaluate possible mitigation measures to be implemented to reduce air emissions generated from the project.	Section 4.10.1 includes a discussion of the project emission sources, regulatory requirements, and proposed mitigation measures to be implemented in order to reduce air emissions and minimize impacts.
		See our response to comment SA1-87 for additional information.
CO11-101	The draft EIS does not include adequate discussions of the health effects for the air pollutants that would be emitted from the proposed project.	General information related to the health and environmental impacts of the air pollutants that would be emitted by the project during construction and operation, which are regulated by the EPA, ODE, and ODEQ, are widely available to the public. Information specifically related to the proposed project impacts is included in Section 4.10.1.
CO11-102	The draft EIS fails to consider the direct, indirect, and cumulative safety impacts that the project would have related to the LNG tankers, LNG terminal facility, and pipelines that would be associated with the project.	We believe that the safety impacts of the project, including the marine waterway, LNG terminal, and pipeline, have been adequately addressed in the final EIS and the WSR (Appendix G). Reliability and safety is discussed in section 4.11. Section 4.11.5 discusses safety impacts associated with LNG tankers, section 4.11.4 discusses safety impacts of the LNG terminal, and section 4.11.9 discusses safety impacts of the associated pipeline.
CO11-103	Has it been acknowledged that LNG sources that could be used to supply the Bradwood terminal may contain contaminant gas concentrations that exceed 15 percent of the total LNG?	Natural gas is pretreated before liquefaction to remove contaminants at the export terminal before it is shipped. See our response to PM1-22 and PM6-79.
CO11-104	The draft EIS fails to describe what the potential effects of a leak caused by brittle fracture could be and what the resulting effects would be on sensitive resources including humans and onshore structures.	Section 4.11.4 includes a discussion on thermal exclusion and vapor dispersion zones for the onshore facility. Thermal exclusion zones for the onshore LNG tanks are calculated based on 49 CFR 193 and NFPA59A, 2001 edition. Section 4.11.5.3 discusses the hazards associated with a release of LNG from an LNG carrier for varying spill sizes and also includes a discussion on cascading damage due to brittle fracture. It also identifies the zones of concern, the communities located in the zones of concern, and what the potential effects associated with a spill would be in those zones of concern

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
CO11-105	What would the vapor cloud dispersion distance be if wind speeds were 10 mph or other higher wind speeds that would result in a greater dispersion of a vapor cloud?	For the DEGADIS model, farther downwind vapor dispersion distances are produced at lower wind speeds. Increasing the wind speed also changes the stability class and will result in a shorter dispersion distance.
CO11-106	The draft EIS assumption that the outer tank wall would effectively contain LNG lacks a reasonable basis in fact.	As discussed in section 4.11.3, the LNG storage tanks would be full containment tanks. The inner tank would be constructed of 9 percent nickel steel and the outer tank would be constructed of pre-stressed concrete. Both of those materials are designed to withstand cryogenic temperatures and are not prone to brittle fractures.
CO11-107	If an LNG vapor fire ignited on a roofless LNG storage tank, as appears to be presumed in the draft EIS, how long would such a fire burn?	The fire duration would be dependent on a number of factors, including the amount of LNG inside the tank. A full LNG storage tank has enough fuel to potentially burn for up to 2 days, which is similar in total duration compared to oil tanks.
CO11-108	There is a failure to consider or disclose the flammable nature of insulating foam on LNG tankers.	As discussed in section 4.11.5.3, fire-induced damage to foam insulation which could lead to cascading damage was evaluated in the Sandia Report and, while possible under certain conditions, is not likely to involve more than two or three cargo tanks
CO11-109	What would the effects of a cascading fire event on a LNG tanker be from perspective of impacts to humans, private property, and infrastructure on shore? What would the effects of a cascading fire be on the type of 200,000 cubic meter tanker that would be used at Bradwood? How long would a cascading fire on such a tanker likely burn and what would the resulting on-shore effects be?	Section 4.11.5.3 discusses the hazards associated with a release of LNG from an LNG carrier for varying spill sizes and also includes a discussion on cascading damage due to brittle fracture. Cascading events are not expected to increase the overall fire hazard by more than 20 to 30 percent but would increase the expected fire duration by approximately 2 to 3 times according to Sandia. The Coast Guard has limited the size of arrivals until modeling is performed on the larger carriers.
CO11-110	Failure to evaluate an Emergency Response Plan and emergency response capabilities of local emergency responders. There are currently inadequate emergency response assets available to respond a serious event involving a LNG tanker.	See our responses to comments PM1-1 and PM1-15B. NorthernStar is currently in the process of developing its ERP and filed a draft ERP for the FERC's review on March 24, 2008.
CO11-111	The draft EIS fails to consider the cost to the local communities for emergency response and increasing the capabilities of emergency responders.	See our response to comment CO11-110. As discussed and recommended in section 4.11.6, the ERP must include a Cost Sharing Plan which must be approved by the FERC before any final approval to begin construction. If the needed resources are not available and properly funded, construction and operation of the project would not be approved by the FERC.
CO11-112	Failure to consider the effect of Astoria's extensive docks structure over the Columbia River in causing a potential explosion of gas vapors.	Section 4.11.1 discusses the hazards associated with LNG and section 4.11.5.3 discusses the hazards associated with a release of LNG from an LNG carrier for varying spill sizes. It also identifies the zones of concern, the communities located in the zones of concern, and what the potential effects associated with a spill would be in those zones of concern throughout the entire waterway.

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
		including Astoria
CO11-113	Does the proposed site-specific location of the proposed facility make it any more vulnerable to intentional terrorist attacks that could be launched from a shoreline that in many locations is just a few hundred feet from the path of LNG tankers? As a part of this analysis, please discuss the justifications for security exclusion zones on either side of LNG tankers that are typically 1,500 feet.	Terrorist attacks were examined by the Coast Guard during their review. The Coast Guard has determined that the Columbia River would be safe for LNG marine traffic under the conditions described in its WSR. Based on their review, the Coast Guard's WSR establishes a 500-yard (1,500-foot) moving safety/security zone around the LNG carriers.
CO11-114	The draft EIS fails to address the risks of the Palomar pipeline.	See our response to comment CO11-11.
CO11-115	In the event of either an accidental or intentional breach of a LNG tanker, what would be the resulting damage with respect to loss of human life, injuries to humans, damage to private structures and infrastructures, along the tanker's path?	Section 4.11.5.3 discusses the hazards associated with a release of LNG from an LNG carrier for varying spill sizes. It also identifies the zones of concern, the communities located in the zones of concern, and what the potential effects associated with a spill would be in those zones of concern throughout the entire waterway.
CO11-116	The draft EIS significantly underestimates both the thermal radiation and vapor dispersion risks associated with the proposed terminal.	Section 4.11.4 includes thermal exclusion and vapor dispersion calculations which were done in accordance with 49 CFR 193 and NFPA 59A.
CO11-117	The draft EIS modeling of the LNG terminal risks also improperly assumes that should the integrity of the onshore LNG tanks, inlet, or outlet lines be compromised, that gaseous vapors from the spilled LNG would not mix with air thus reducing the vapor dispersion distance.	See our response to comment CO11-116.
CO11-118	It is a concern that due to the high pressure un-odorized gas pipelines, with a blast zone of over 1,400 feet, hundreds of homes, businesses, farms and other sensitive facilities would be at risk.	The safety of natural gas pipelines is addressed in section 4.11.9.
CO11-119	Why would the proposed gas line not be odorized? What would be the cost of adding odor to the line? How would the unodorized gas decrease detection of gas leaks along the Williams pipeline that the proposed northern pipeline would connect to?	See our response to comment PM5-81.
CO11-120	The draft EIS fails to analyze the potential risks of onshore leaks due to chemical composition of the natural gas from the proposed project.	See our response to comment PM1-22. Pipeline safety is addressed in section 4.11.9.
CO11-121	The draft EIS failed to analyze the cumulative effects of the Bradwood dredging, taking into account the channel deepening, increased ship traffic from both the channel deepening and the LNG tankers, the increase erosion from both projects, increased wave action, dredge disposal, and geomorphic and hydraulic changes.	Section 4.12 on cumulative effects does discuss the COE channel deepening project. Based on the COE's EIS, the channel deepening project is not expected to result in increased ship traffic. Dredging for the channel deepening project in the area of the LNG terminal would be completed before construction would begin on the Bradwood project. We are continuing to study the issue of shoreline erosion and will further discuss impacts in the BA and EFH Assessment.
CO11-122	What are the direct, indirect, and cumulative effects of increased industrialization that would be encouraged by the siting of one or more LNG terminals in the Lower Columbia River? Please include impacts to	Section 4.12 on cumulative effects discusses the potential for multiple LNG import terminals located along the lower Columbia River. However, it is purely speculation that several LNG terminals would lead to any more industrial development in the region than can be related to the mills at Longview and

Companies and Organizations 11

Due to the length of the Columbia Riverkeeper comment letter (comment letter CO11), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	air, water, fish, wildlife, humans, traffic, noise, lights and other impacts.	Wauna or the facilities at the Port Westward Industrial Area.
CO11-123	The draft EIS fails to assess the cumulative impact of destroying critical habitat on salmon, and on the economy and ecology of the estuary and the Columbia River Basin.	Section 4.12 on cumulative effects does discuss impacts on aquatic resources, including salmon. All federally regulated projects would need to obtain permits from the COE if they impact wetlands, and would have to comply with the ESA. The COE, NMFS, and FWS would require mitigation to compensate for wetland loss, and lessen impacts on federally-listed threatened and endangered species and their critical habitats. Those mitigation measures may result in habitat improvements for salmon and the estuary.
CO11-124	The draft EIS failed to analysis the increase in development pressures on the lower Columbia River.	See our response to CO11-122.
CO11-125	The draft EIS completely fails to consider the effects that massively increasing the gas supply in Oregon, California, and Washington and the west coast generally would have on incentives for conservation, efficiency, and renewable development.	Increased efficiency and conservation is discussed in section 3.1.1.2. Renewable energy resources are discussed in section 3.1.1.3. As explained in section 1.1, bringing in new sources of natural gas by importing LNG would diversity the energy portfolio of the Pacific Northwest, meet future demands, and may work to stabilize natural gas and electric prices. It would not necessarily reduce the incentive to conserve or develop additional renewable resources. The goals mandated by Oregon's Renewable Energy Standard would not be diminished. See our response to comment CO11-18.
CO11-126	The draft EIS failed to analyze the indirect effect of LNG creating additional gas-fueled power plants, which will decrease the demand for renewable energy, thereby hindering efforts to combat global warming and hindering the economic opportunities that renewable energy has brought to the Pacific Northwest, such as investments in wind, wave, and solar energy.	As mentioned in section 1.1, even without imported LNG on the West Coast, there has been a trend for increasing use of natural gas to fuel electric power plants. This trend would continue, with or without LNG, because natural gas has less air emissions than other fossil fuels, such as oil or coal. Therefore, providing more supplies of natural gas by importing LNG may result in environmental benefits, by helping to reduce GHG and global warming in the future if new or retrofitted power plants used natural gas instead of oil or coal. As discussed in section 3.1.1.3, it is not currently possible for renewable resources to produce the level of energy equivalent to the Bradwood Landing Project. As discussed in sections 1.1 and 3.1.1 of the EIS, the denial of the LNG project may hinder economic opportunities for the Pacific Northwest. However, it is beyond the scope of the EIS to address indirect effects the Bradwood Landing Project may have on creating additional gas-fired power plants, since details are unknown, including the number or location of such speculative plants.
CO11-127	Specific findings on the potential impacts of the project on: physical substrate; water circulation, fluctuation, and salinity; turbidity; contaminants; aquatic ecosystems and organisms; disposal sites' cumulative effects on the aquatic ecosystems; and secondary effects on the aquatic ecosystems need to be provided. The draft EIS fails to assess adequately the tremendous impacts on human environment.	Section 4.12 of the EIS describes the potential cumulative impacts from the project in relation to other past, present, and future projects. The known impacts that are described individually for these various topics in the EIS are not expected to result in significant cumulative impacts. Therefore, we believe that our analysis of cumulative impacts as it relates to these topics is adequate.
CO11-128	The analysis of projects in the Lower Columbia River by CRK's Brett VandenHeuvel should be reviewed and its contents considered and discussed in the context of cumulative impacts on air quality, energy use,	Mr. VandenHeuvel's analysis is available for viewing by the public on the FERC's Internet web page at www.ferc.gov , through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e.

RE: Comments on Draft Environmental Impact Statement, Bradwood Landing Project, FERC/EIS-0214D, Docket Nos. CP06-365-000, CP06-366-000

Ms. Bose,

We submit these comments on the Draft Environmental Impact Statement ("DEIS") Bradwood Landing Project ("Bradwood"), FERC/EIS-0214D, Docket Nos. CP06-365-000, CP06-366-000, on behalf of the following organizations: Columbia Riverkeeper, Columbia River Business Association, Rivervision, Waiilatpu Friends of the River, Landowners and Citizens for a Safe Community, Oregon Chapter Sierra Club, Willapa Hills Audubon Society, Oregon Citizens Against the Pipeline, Friends of Living Oregon Waters, Coalition, Northwest Environmental Defense Center, Willamette Riverkeeper, Rosemead Neighborhood Association, Audubon Society of Portland, Oregon Council Trout Unlimited, Native Fish Society, Citizens for a Clean Columbia Wenatchee, Columbia River Fishermen's Protective Union, Northwest Guides and Anglers, Oregon Wild, and Energy Options (collectively, "the Coalition"). The Coalition includes a broad, local and regional spectrum of business, environmental, safety, and property interests. Each organization has members who would be harmed by LNG terminal.

FERC must circulate a new DEIS

We request that FERC issue a supplemental DEIS for public comment because the current DEIS is wholly inadequate. The DEIS contains major factual errors, fails to address substantial changes to the project, fails to address reasonable alternatives, ignores the Palomar Pipeline as a connected action, and fails to evaluate significant economic, social, and environmental consequences. These errors cannot be correct in the final EIS. FERC's regulations require FERC to supplement the inadequate DEIS, and circulate the supplement draft for public comment. 40 C.F.R. § 1502.9(c).

NEPA requirements

NEPA "is our basic national charter for protection of the environment." *Blue Mountains Biodiversity Project v. Blackwood*, 161 F.3d 1208, 1216 (9th Cir. 1998), quoting 40 C.F.R. § 1500.1(a). "NEPA was passed by Congress to protect the environment by requiring that federal agencies carefully weigh environmental considerations and consider potential alternatives to the proposed action before the government launches any major federal action." *Lands Council v.*

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Powell, 395 F.3d 1019, 1026 (9th Cir. 2005). The purpose of NEPA is to ensure "that the agency, in reaching its decision, will have available, and will carefully consider, detailed information concerning significant environmental impacts; it also guarantees that the relevant information will be made available to the larger [public] audience that may also play a role in both the decisionmaking process and implementation of that decision." *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 349 (1989).

The Council on Environmental Quality ("CEQ") has promulgated regulations that bind federal agencies implementing NEPA. *Sierra Club v. U.S. Forest Serv.*, 843 F.2d 1190, 1193 (9th Cir. 1988). "The procedures prescribed both in NEPA and the implementing regulations are to be strictly interpreted 'to the fullest extent possible' in accord with the policies embodied in the Act." *Id.* (citing *California v. Block*, 690 F.2d 753, 769 (9th Cir. 1982)).

Two primary purposes of the DEIS are: 1) to ensure that the Federal agency implementing an action undergoes a thorough and objective investigation of the likely impacts of the action to the environment, and 2) to disclose to the public and encourage public scrutiny of any action likely to affect the environment before such action is executed. 40 C.F.R. § 1500.1(b) (2006). Adequate public disclosure by the EIS requires a full and accurate disclosure of all likely environmental impacts. *Baltimore Gas and Electric Company v. NRDC*, 462 U.S. 87 (1983). In satisfying the NEPA requirements for an EIS, a Federal agency must include the purpose and need for the action, analyze direct and indirect environmental and economic impacts of the action and any reasonable alternatives to the proposed action, and evaluate the effectiveness of anticipated mitigation measures. Additionally, a consideration of the cumulative impacts of all reasonably foreseeable actions must be included for a full analysis of direct and indirect environmental and economic impacts. 42 U.S.C. § 4332.

Full and Accurate Disclosure

FERC has continually failed to disclose a full and accurate description of the project to the public. Bradwood has submitted contradictory information in its applications to other local, state, and federal agencies, and the inability of FERC to address these concerns in the DEIS problematic. FERC can not make a full and accurate disclosure to the public until Bradwood clarifies the true scope and goals of the project and submits consistent application materials to all permitting agencies.

The inconsistent information submitted by Bradwood at various stages of the FERC process precludes adequate participation by the public. Today, the Bradwood LNG project ("project")¹ proposal dramatically differs from the project evaluated in the DEIS. In addition to precluding public review in contravention of the requirements of NEPA, the inconsistent information submitted by Bradwood prevents FERC from producing a valid final EIS. The everchanging proposal and the differing impact analyses also raises questions about the veracity of the information submitted by Bradwood. Bradwood should not be allowed to submit alternate plans for the Bradwood LNG project with various local, state, and federal agencies and FERC

¹ As used throughout these comments, "project" includes all aspects of the LNG importation, including but not limited to ocean transport, river transport, terminal construction and operation, pipeline and construction and operation.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

should abstain from further evaluation or decision making concerning the project until these uncertainties are resolved. To comply with NEPA, FERC must publish for public comments a supplemental EIS that describes the current project proposal prior to the final EIS. FERC cannot proceed to the final EIS because the project has substantially changed since the DEIS was published.

NEPA grants the public a right to review the current project, not a dramatically different project, which has changed after the publication of the DEIS. Without consistent information, the public cannot evaluate and effectively comment on the project proposed by Bradwood. Due process requires the ability to **effectively** participate, not just submit comments on a former project design. FERC also requires current information to fulfill the NEPA requirements of a thorough investigation of all the direct and indirect environmental and economic impacts likely to occur.

In addition to basing the DEIS on the inconsistent information submitted by Bradwood, FERC has failed to meet the full and accurate disclosure requirements of NEPA by not including the environmental and economic impacts of the whole project. In the DEIS, FERC must analyze the full scope of the project, including connected actions that are closely related to the project. 40 C.F.R. § 1502.4(a). In determining what actions to include in a single EIS, the CEQ regards actions as connected when they "[a]utomatically trigger other actions which may require environmental impact statements," "[c]annot or will not proceed unless other actions are taken previously or simultaneously," or "[a]re interdependent parts of a larger action and depend on the larger action for their justification." *Id.* § 1508.25(a). FERC has failed to assess the impacts of the proposed Palomar Pipeline Project ("Palomar"), which is discussed in detail below, in the Bradwood Landing DEIS, a portion of which will not proceed unless the Bradwood LNG Project is successfully completed. Because a portion of the Palomar Pipeline will not happen unless the Bradwood LNG Project is completed, FERC must include the environmental and economic impacts of that project in the DEIS.

Number of LNG Storage Tanks

Bradwood has presented inconsistent information in various regulatory contexts concerning the number of LNG storage tanks proposed. In applications submitted to Clatsop County, the State of Oregon, and the Army Corps of Engineers ("Corps"), Bradwood admits to pursuing a Bradwood LNG terminal designed for three storage tanks. Specifically, Bradwood states "[t]he terminal is designed for three tanks with a nominal storage capacity of 160,000 m³, for a total nominal LNG storage capacity of 480,000 m³" in application materials submitted to Clatsop County, OR.² Yet, the DEIS states that the project will have two LNG storage tanks. DEIS at ES-2; 2-20 ("LNG unloaded from the ships would be stored in two 160,000-m³ storage tanks).

Bradwood is designing the facility for three storage tanks. In fact, Figure 2.1.3-1 in the DEIS clearly shows the LNG terminal is designed for a third tank. Additionally, FERC acknowledges the terminal will have a potential to deliver 1.3 bcf/d, which would likely require a

² In Bradwood Landing LLC Narrative in Support of Applications for Local Approval of the Bradwood Landing LNG Terminal and Associated Facilities at 9.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

third tank. DEIS at 1-1. A third tank will substantially change the safety, environmental, and economic impacts of the project, and FERC should take this into account in evaluating the project. FERC's failure to address the third tanks is a major oversight.

A three tank design will increase the overall LNG storage capacity of the terminal from the 320,000 m³ contemplated in the DEIS to an actual 480,000 m³. The increase in storage of large volumes of LNG changes the safety considerations involved with the project. Not only is there an increased chance of an accident, natural disaster, or equipment failure leading to a breaching of a tank as a result of there being one additional tank, the larger amount of flammable gas may enhance catastrophic events, changing blast radius dynamics and endangering even more people, vegetation, and wildlife in the area.

Construction of an additional tank will also add to the noise, light, and water pollution of the Bradwood LNG project, both in the short-term and the long-term. Short-term construction activities for a third tank will require more noise producing activities, increased opportunities for polluted storm water runoff in to the Columbia River, and increased light pollution for security and construction activities. In the long-term, additional SCV units will be necessary with a third LNG tank, leading to more air pollution and water pollution through discharge of low pH, chlorinated, high temperature, and toxic water into the Columbia River, endangering aquatic animals and vegetation. Furthermore, the visual aesthetics will be fundamentally changed, with three large tanks blocking views and degrading the beauty of the location to an even further extent, in addition to increased lighting for security purposes.

Another long-term aspect of an increased storage capacity of the terminal caused by a three tank design not evaluated by FERC is an increase in ship traffic. The DEIS states that 125 ships will visit the site per year with varying LNG carrying capacities, but an increase of storage capacity due to the terminal design of three tanks instead of two will require more ships. Increasing the number of ships visiting the site will have substantial impacts upon the environment, economy, and safety of the region. Increasing ship traffic to more than 125 vessels per year will cause environmental harm through increasing shoreline erosion, decreasing water quality by re-suspending sediments due to wake turbulence, and harming aquatic life through vessel strikes, ballast intakes, and other harmful ship effects such as stranding. Economic harm will also result from an increase in ship traffic because other vessels must yield to the tankers to ensure the safety zone requirements are met. This will cause considerably more disruption to commercial fishing and recreation on the lower Columbia River, wasting valuable time of commercial fishermen or driving valuable business away from recreational areas. Finally, increased LNG ship traffic will amplify the safety concerns of the project. More ships will enhance the chances of a catastrophic accident or event by increasing the likelihood for vessel collisions, underwater obstacle strikes, terrorist attacks, equipment failure, and various other dangers.

FERC must assess these environmental, economic, and safety issues pertaining to a three tank design in the EIS. According to materials submitted with other applications, Bradwood is in fact actively seeking to build a facility designed for three tanks and an output of 1.5 billion cubic feet per day ("bcfd"). Although FERC acknowledges Bradwood may seek to expand the facilities in the future, and notes that any such expansion would require further applications and a

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

supplemental EIS for approval, FERC should address a possible third tank now because Bradwood has made clear that it intends to construct the third tanks and has, in fact, submitted regulatory applications that contain the third tank.

At the least, FERC should require Bradwood to clarify its goal and objectives for the project and suspend further consideration until confusion over the discrepancies is dispelled. Even if Bradwood does not plan to install a third tank in the initial phase of construction, FERC should still address the third tank in its cumulative effects analysis in the EIS because it is reasonably foreseeable that Bradwood will install a third tank given the design and their actions of submitting application materials describing a third tank. Furthermore, the mitigation plan on file for the Bradwood LNG project is insufficient to support the current project as described by FERC, not to mention a three tank design and increased ship traffic. Bradwood should be required by FERC to submit an updated and detailed mitigation plan to account for the full scope of the project so that it may be evaluated properly in the EIS.

Size of the Ships

Not only are there discrepancies regarding the number of tanks to be used in the Bradwood LNG project, but application materials submitted by Bradwood and the information used in the DEIS also disagree about the size of the LNG ships that will transport LNG to the proposed Bradwood terminal. The DEIS at 2-3 states that ships ranging in size from 100,000 to 200,000 m³ will transport LNG to the terminal. Contrary to the DEIS, application materials submitted to Clatsop County, State of Oregon, and the Army Corp of Engineers suggest a ship size up to 220,000 m³. For instance, application materials submitted to Clatsop county state that "[i]n order to accommodate the full range of LNG carriers that will serve the terminal, the berth and a contiguous turning basin are designed for LNG carriers with a capacity ranging from 100,000 to 220,000 cubic meters (m³)."³ Therefore, contrary to the assumed ship sizes evaluated in the DEIS, Bradwood is seeking to design the facility for the use of ships up to 220,000 m³.

A number of impacts that the DEIS failed to address will occur as a result of the use of larger ships. Larger ships will increase wake and draft disturbance, erosion impacts, the likelihood of vessel strikes and collisions, likelihood of shoaling, and the amount of water withdrawn from the river to fill ballast tanks. Safety issues also arise because an extra 20,000 m³ of LNG would increase the blast radius if a catastrophic event occurred. Additionally, the Bradwood LNG terminal is being designed based on receiving these larger ships. Could the berth design and dredging activities be scaled back to help mitigate the impacts of the project on the environment if smaller ships only ranging up to 200,000 m³ are used? A berth design and larger turning basin for larger ships are unnecessary unless Bradwood does in fact intend to receive the larger ships at the terminal. If smaller ships than 220,000 m³ are used, will more ship traffic be necessary to meet the needs of the terminal? FERC must address these issues in the DEIS. The DEIS should evaluate the environmental and economic impacts of using ships up to 220,000 m³ in size because Bradwood is actively seeking a berth and turning basin design for these larger ships based on application materials submitted to other local, state, and federal agencies. Furthermore, FERC should evaluate the impacts of increased maintenance dredging in

³ In Bradwood Landing LLC Narrative in Support of Applications for Local Approval of the Bradwood Landing LNG Terminal and Associated Facilities at 6.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

the DEIS, because larger ships will require more maintenance dredging to avoid shoaling or striking underwater obstacles.

Pipeline Projects

The DEIS fails to take into account the Palomar Gas Transmission Project ("Palomar") pipeline, which is dependent upon the completion of Bradwood and, therefore, FERC fails to analyze and disclose the full scope of the Bradwood project. NEPA requires that actions "which are related to each other closely enough to be, in effect, a single course of action shall be evaluated in a single impact statement." 40 C.F.R. 1502.4(a). An EIS is required to consider actions that are "interdependent parts of a larger action and depend on the larger action for their justification." *Id.* § 1508.25(a)(1). The test the Ninth Circuit has used to determine if an action is interdependent with a proposed agency action is the "but for" causation test. *Sierra Club v. Marsh*, 816 F.2d 1376, 1387 (9th Cir. 1987). Under this test, an action is interdependent upon the proposed agency action if but for the proposed action the other action would not occur. *Id.*

Palomar is a joint venture of NW Natural and TransCanada and is designed to diversify the natural gas market in the Western United States. The proposed Palomar Project is a project interdependent upon the Bradwood LNG Project. Although the Palomar claims that the eastern portion of the Palomar Project may proceed regardless of whether the Bradwood LNG Project is completed, the western half of the proposed Palomar Project would not occur but for the Bradwood LNG Project. In fact, Greg Kantor, president and chief operating officer for NW Natural, has stated that the Palomar "project is being designed so that, if an LNG terminal is constructed on the Columbia River, the Palomar pipeline can be extended to serve it." This illustrates that the Palomar project is dependent upon the building of an LNG terminal such as the proposed Bradwood terminal on the Columbia River. Furthermore, Bradwood and FERC have not demonstrated a market in Oregon and the Pacific Northwest for another 1.3-1.5 bcf of natural gas.

Bradwood will likely need the Palomar Project for the Bradwood to be economically viable since the Palomar Project will allow Bradwood to tap into other markets in the Western United States. Therefore, the Palomar Project is an interdependent action with the proposed Bradwood Project. The Palomar Project is also a reasonably foreseeable action, not an action that is purely speculative. In fact, as of October 29, 2007, the Palomar pipeline has been deemed sufficiently foreseeable that FERC has issued a notice of intent to produce an EIS for the project.

Given that NW Natural is Bradwood's agent for building the pipeline for the Bradwood LNG Project, it is likely that NW Natural and Bradwood had planned from the beginning of designing the Bradwood Project for a connection to the Palomar Project. The fact that FERC is allowing Bradwood and NW Natural to stagger the two projects as if they are not interdependent is unacceptable. It is true that there have been plans for years to build the Palomar pipeline segment leading from TransCanada's GTN pipeline system to somewhere south of Molalla in Clackamas County. However, it is also true that the second segment of the proposed Palomar Project was not designed until recently, specifically after Bradwood designed the Bradwood LNG Project. How could there have been plans for the western segment of the Palomar Project before the Bradwood Project when there was no Bradwood LNG terminal to which a connection

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

could be made? Bradwood and NW Natural should not be allowed to separate a pipeline project clearly connected with the Bradwood Project into another project just to avoid the analysis of additional environmental impacts for the Bradwood Project in this EIS.

Because the Palomar Project is connected to and dependent upon the completion of the Bradwood LNG terminal, FERC should analyze the environmental and economic impacts of the segment of the Palomar Project leading to the proposed Bradwood LNG terminal in this DEIS. The pipeline segment at issue is proposed to be 102.5 miles long leading from the Molalla Lateral interconnect to the Bradwood Landing pipeline. This proposed 102.5 mile long 36-inch natural gas pipeline fundamentally changes the scope of the project. The pipeline will cross miles of wetlands and sensitive habitats, not to mention crossing private property and disrupting landowner's uses of their own properties. Many landowners will lose the right to use their lands for economic benefit because of the easements associated with the proposed Palomar Pipeline. Construction of the pipeline will lead to large amounts of timber harvesting through forested areas, destroying bird nesting areas and causing fragmentation of critical habitats for a variety of species. Many threatened or endangered plant species are also located in the area and construction activities will destroy many of these plants. Additionally, construction through wetlands will cause pollution to the streams through increased sedimentation, temperature increases, and introduction of pollutants such as gasoline and oil. Many of these streams are considered critical habitat for a variety of fish and construction activities would put these fish at greater jeopardy.

Noise, air, and light pollution will also result from construction activities, operation, and maintenance of the Palomar pipeline, further exacerbating the already substantial environmental impact of the Bradwood LNG Project. FERC should take all these factors associated with the Palomar Pipeline under consideration in the DEIS and not allow a project clearly associated with the Bradwood LNG Project to be staggered for analysis in a different EIS. The environmental impacts of the Bradwood LNG Project must be considered as a whole, which includes assessment of at least the western segment of the Palomar pipeline leading to the proposed Bradwood LNG terminal. Any omission of the impacts of the Palomar pipeline would be a failure on the part of FERC to fully and accurately disclose the full scope of the Bradwood LNG Project.

Due to the DEIS's failure to adequately explain the currently proposed project and failure to adequately assess obvious impacts and connected actions (e.g. Palomar Pipeline, tanker characteristics), FERC must prepare and circulate a revised draft. 40 C.F.R. § 1502.9(a). In addition, FERC "shall prepare supplements to either the draft or final [EIS] if: (i) the agency makes substantial changes in the proposed action that are relevant to environmental concerns; or (ii) there are significant new circumstances or information relevant to environmental concerns bearing on the proposed action or its impacts." 40 C.F.R. § 1502.9(c). These comments provide multiple examples of changes in the proposal and significant new information that requires FERC to supplement the DEIS.

FERC does not provide an adequate analysis of alternatives

Overview of Alternatives Analysis

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

A critical component of the FERC's EIS process is its alternatives analysis. NEPA mandates that an agency "shall to the fullest extent possible: Use the NEPA process to identify and assess the reasonable alternatives to proposed actions that will avoid or minimize adverse effects of these actions upon the quality of the human environment." 40 C.F.R. §1500.2(c). The agency must also: "Study, develop, and describe appropriate alternatives to the recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses available resources as provided by section 102(2)(E) of ... 40 C.F.R. §1501.2(c)."

In order to issue the permit, the FERC has the burden of demonstrating that reasonable alternatives—including alternative sites—have been considered thoroughly. This section will demonstrate that FERC's alternative analysis does not even come close to evaluating a reasonable range of alternatives. In fact, there are multiple alternatives to satisfy the basic project purpose without disturbing special aquatic sites.

The purpose of Bradwood is to provide natural gas to the western markets. As such, there are a myriad of alternatives to accomplish this purpose. The primary flaw with FERC's alternatives arguments is that FERC claims the terminal must be in the Columbia River to serve customers in Oregon and Washington. The true destination of the vast majority of this gas is California. Therefore, the Columbia River location is not necessary. This opens up multiple reasonable alternatives, including siting an LNG terminal in California closer to the end users. In addition, energy conservation and efficiency is a preferable practicable alternative that FERC dismisses without justification. Offshore LNG terminals are also practicable alternatives. Furthermore, multiple design changes at the Bradwood site itself offers less harmful practicable alternatives.

The FERC does not provide sufficient reasoning or detail to justify its dismissal of many design and project alternatives that could have a less adverse impact on the aquatic ecosystem. In particular, there is little consideration of the relative costs, technologies, and logistics in the alternatives disregarded by the EIS. Many alternatives exist in the Western energy market that could provide cleaner, safer, more affordable energy without the enormous negative impact to the Lower Columbia River. Bradwood has not met its burden of overcoming the presumption that practicable alternatives exist.

The FERC also mischaracterizes the overall project purposes. The scale of the project alone clearly indicates that the proposed terminal will serve a West Coast-wide energy market. Bradwood's likely connection to the proposed Palomar pipeline, which connects Bradwood to the California market, indicates that the purpose of the project is to serve a region-wide demand, including California. Bradwood attempts to obfuscate this broader project purpose in order to avoid discussion of the most obvious alternative – siting the project in closer proximity to its target market in California.

There is no proven "need" for the project in the Pacific Northwest. The alternatives analysis rests, in part, on the assumption that LNG is a vital resource for the future of the Pacific NW. Yet, the analysis provides no impartial information showing need in the Pacific NW that matches the enormous scale of the Bradwood proposal. This overarching problem renders the

20071222-5001 FERC PDP (Unofficial) 12/22/2007 12:24:56 AM

alternatives analysis highly suspect, and any range of alternatives must be evaluated in a West Coast-wide context, and one that fully acknowledges the potential of the proposed Palomar pipeline to connect the Bradwood Project to regional markets.

The FERC has failed to undertake an adequate analysis of alternatives because of an unreasonably narrow definition of the purpose and need of the project which FERC then uses to dismiss reasonable alternatives. The DEIS states, "The purpose of the Bradwood Landing Project is to provide a new source of natural gas to the Pacific Northwest through importation of LNG" (DEIS, 1-3). The purpose of the project should be more broadly stated in terms of supplying the region with natural gas, an analysis for which FERC would include detailed consideration of non-LNG alternatives.

FERC further describes key objectives as supplying industrial and generation facilities in the Lower Columbia, supplying Mist directly with natural gas, and providing gas supply to the Pacific NW region via its interconnect with Williams NW pipeline (DEIS, 1-3). FERC presumes that failure to meet these objectives through importation of LNG will result in the objectives not being met, that no North American gas alternatives can fill these needs through existing infrastructure. However, these primary project objectives do not require a project of the size and scope of the Bradwood LNG terminal, and multiple pipelines already supply these gas users from existing infrastructure and supplies. The main proposed conduit of this gas to the Pacific NW market, the Williams NW pipeline system, cannot currently accommodate the huge quantities of gas that Bradwood seeks to import.

Industrial users and electricity generation in the Lower Columbia, by Bradwood's own estimates, are only likely to use 100 mmcf/d on an average day⁴. ODOE questions even this assumption, noting that operators of natural gas plants in the area are not planning to absorb LNG, currently.⁵ Williams pipeline company has indicated that it does not have capacity to absorb all of Bradwood's gas, and that Bradwood will likely have to rely on the Bradwood pipeline in the future.

FERC does not justify the enormous size and impact of its project, and thus does not demonstrate that more moderate developments (gas storage, conservation, efficiency measures) are not practicable alternatives to meet the modest growth in Pacific NW gas demand. Oregon Department of Energy ("ODOE") recently commented, in its draft comments on the FERC DEIS, "The DEIS provides no independent assessment of the demand for LNG to justify the need for the proposed project."⁶ ODOE's comment highlights widespread skepticism about FERC's characterization of the purpose and need for its project.

Furthermore, FERC relies heavily on data from the Northwest Gas Association ("NWGA"). The NWGA's members include NW Natural gas, a partner and likely future owner of the Bradwood pipeline and proponent of the connected Palomar project. The NWGA data cannot be considered unbiased, as preliminary comments on the DEIS of the Oregon Department of Energy have noted: "The [demand] analysis is based entirely on NWGA forecasts. No

independent assessment of demand. No consideration of demand side reductions."⁷ Other State agencies have raised similar concerns with the FERC DEIS – a document whose alternatives analysis is more extensive than the Alternatives analysis in the Army Corps application but is still deficient.

NOAA has also added its own reservations about the purpose and need of the project, raising the following questions regarding whether the alternatives analysis is artificially constrained in order to justify a high-impact project: "As the stated objective is providing the Pacific Northwest with another natural gas source, it would appear additional data from the region is warranted."⁸ Given broad skepticism about the need for the proposal, the no action alternative may result in the natural gas needs of the Pacific Northwest and California being met and should constitute a practicable alternative. FERC gives very little consideration to the potential for no action.

While the project configuration and pipeline routing are purportedly designed to match the needs of Lower Columbia industrial and electricity generation users, some of those users do not appear to be planning for LNG. For example, comments of ODOE indicate that Port Westward is not factoring LNG into its gas supply needs. PGE, which owns generating facilities there, is not necessarily going to buy large quantities of LNG.

Delivery of gas to the PGE power plants at Port Westward is not a compelling reason to select the preferred pipeline route over alternatives. In the Oregon EFSC review of the Port Westward power plant, PGE did not assume that LNG would be available. PGE also did not assume the availability of LNG in its integrated resource plan review before the Oregon Public Utility Commission.⁹

The Bradwood project is clearly designed to meet its expectation of West Coast-wide energy demands – not those of the Pacific Northwest. FERC's assertion that key project objectives involve delivery of gas to Mist and Columbia River industrial/generation users is severely undermined by the fact that less than 1/10 of the project would currently be likely to go to these users.¹⁰ The quantity of gas proposed for import by Bradwood (1.3 bcf/d) more than doubles Oregon's average daily natural gas use.¹¹

The enormous size of the project shows that a major economic driver for the project is California gas demand, rather than Oregon's or Washington's. California consumes as much gas as the rest of the West combined¹² (see below) and will likely receive most of Bradwood's gas, based on the recently proposed Palomar pipeline proposal (see attached maps). The Bradwood project not only seeks a connection to California's market via Palomar, but it also likely requires

additional pipeline capacity aside from the proposed Bradwood pipeline through Cowlitz County due to the capacity limitations on that pipeline (ICF International study for WA EFSEC).¹³

It is simply not credible for FERC to claim that its project will serve the Pacific NW alone. The Daily Astorian's interview with a Williams Pipeline representative demonstrates that the Williams Northwest Pipeline, which FERC claims will transport the majority of its gas, does not have room for Bradwood's gas. Williams recognized that the Palomar pipeline, which would take gas to California, is necessary for Bradwood.

Williams Northwest Pipeline spokeswoman Michele Swartz said her company doesn't have room for all the gas Bradwood plans to import to its Bradwood facility. 'It does make sense that they signed up on Palomar,' she said. 'Physically, we're capable of receiving it, but it would take the place ... of all the other gas supplies flowing in that system both north and south. We have long-term agreements in place. ... We're unlikely to disrupt the relationship we already have with our customers right now.' Even with the projected declines in supply from Canada and the Rocky Mountains, she said, there's not enough demand for gas in Oregon and Washington to absorb the full volume from Bradwood. But she said there is demand for that volume in California.¹⁴

Exhibit 2.1: Major Pipelines in the Pacific Northwest

Source: ICF International

Bradwood admits that it plans to use the proposed Palomar pipeline to deliver significant quantities of gas to potential customers in California, according to its S-1 filing submitted to the Securities and Exchange Commission.

In addition to the Bradwood Pipeline application, we have recently submitted a request for service to TransCanada and NW Natural for their open season under which they would construct, own and operate a pipeline that would connect the Bradwood terminal to Williams' Northwest pipeline at Molalla and TransCanada's GTN Pipeline near Madras. This will provide Bradwood and/or other shippers with gas transportation service from the LNG terminal to the pipeline systems of both the Northwest Pipeline Company and TransCanada's GTN Pipeline, which

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

can deliver approximately 2.0 Bcf/d into Northern California at the Malin, Oregon interconnect point.¹⁵

Bradwood's SEC filing also touts Bradwood Landing's "convenient access" to the large "Northern and Southern California" gas markets in addition to referencing the smaller Northwest markets (SEC S-1 filing at 2). The SEC filing, submitted to investors, tells a completely different story than the 404 application or the DEIS, submitted to regulators. The SEC filing demonstrates that Bradwood's true intention is to serve California markets. Bradwood's attempt to hide this fact in its FERC application and the failure of the DEIS to consider Bradwood's California connection via Palomar severely undermines FERC's alternative analysis. Based on the true project purpose of serving gas to California, as admitted by Bradwood, the FERC should require Bradwood to submit a new alternative analysis to sufficiently assess the reasonable alternatives of this purpose. The FERC has the burden of assessing all reasonable alternatives. CEQ regulations state, at 40 CFR 1502.14: "(Alternatives shall) rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated." Bradwood's likely use of the Palomar project – a pipeline that will likely send out the majority of Bradwood's gas on an average day in the West Coast energy market – should prompt FERC to assess West Coast-wide energy alternatives to LNG. The DEIS does not undertake a suitable analysis for this purpose.

Bradwood should be considered amidst a wide range of alternatives in the West Coast energy market – including conservation, efficiency, renewable energy, North American natural gas, and other LNG sites. All of these alternatives have potentially less severe impacts to the sensitive aquatic ecosystems in which they might occur. The unprecedented and severe impacts of the LNG proposal at Bradwood pose a huge risk to the aquatic environment, and the alternatives analysis is cursory and omits consideration of key alternatives. The FERC dismisses many of these alternatives based on the false assumption that they will not fulfill key project objectives that focus on Oregon and Washington.

The WA State Pipeline Capacity study, however, concludes that no LNG terminal will be viable in the Pacific NW without a pipeline connection to California:

Local load in the Pacific Northwest is too variable and not large enough to be economic for a LNG terminal. To site a terminal at a size that would be economic, at least 1 Bcf per day to start with, **access to Northern Californian markets would be necessary.**" (emphasis added).¹⁶

As noted in the pipeline capacity study (see figure above) and in the recent Daily Astorian article, the Williams pipeline is not capable of accommodating Bradwood's supply without vacating all of its current contracts for gas – a highly unlikely scenario. The pipeline currently operates near capacity, and long-term supply contracts render the current proposed

¹⁵ Bradwood 12/15/06 S-1 Registration filing with SEC, page 54 (emphasis added)

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

action potentially not viable. The alternatives analysis clearly should not have assumed that space will be available in the Williams system to absorb up to 1.3 bcf/d from Bradwood. Bradwood admits in its SEC filings that it seeks to use the Palomar pipeline to access California's gas market – and the use of the Palomar pipeline may be necessary for the project to even operate near capacity. Clearly, the Bradwood project must be considered in light of numerous alternatives throughout the West Coast due to Bradwood's stated intention of serving California and other West Coast markets in addition to the Pacific Northwest. The high unlikelihood of Bradwood's project operating as described (largely serving Williams NW pipeline) undermines the credibility of the current alternatives analysis, and certainly does not overcome the presumption that alternatives are available.

(Source: EIA. State Natural Gas Summary Data, 2006.)

Ultimately, the FERC must evaluate whether there are preferable alternatives to the Bradwood proposal in areas located closer to the largest target California market. The DEIS critiques potential LNG terminal locations south of the Columbia River for the length of their pipelines, saying that long pipelines render other LNG sites in the Pacific NW not practicable. FERC argues that Bradwood's proposed 36-mile pipeline is the least harmful. However, given the agreement between Palomar and Bradwood to deliver gas to the California energy market via a new 220-mile pipeline that cuts a swath across Oregon rivers, forests, and farms, FERC should acknowledge and evaluate potential alternatives that do not require extensive harm to resources in the Columbia River and all across Western Oregon. As FERC has repeatedly noted, the West Coast natural gas grid is interconnected, and FERC should evaluate whether alternatives to LNG, and whether other LNG sites, might accommodate future demands on the Western natural gas grid.

The Palomar Gas Transmission project (PGT) has also indicated in its own statements that the projects are intimately connected. Recent articles and statements in the FERC scoping hearings for the Palomar project indicate that the Western segment of the pipeline (or at least a significant portion of it) would only be constructed if the Bradwood project is approved. According to Chief Operating officer Gregg Kantor of NW Natural in a recent McMinville News-Register article, "This project is being designed so that, if an LNG terminal is constructed

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

on the Columbia River, the Palomar pipeline can be extended to serve it.¹⁷ Mr. Sipes, representative of FERC, also indicated that the two projects were closely related during scoping hearings for the Palomar project. The FERC is asserting that the projects are “stand-alone”, yet Mr. Sipes and Palomar project representatives have plainly stated that all or a portion of the Western segment of the Palomar project depend on the approval of the Bradwood project.¹⁸

In addition, the FERC defines its project purpose too narrowly, and its alternatives evaluation incorrectly presumes that it is necessary to increase gas supply only through importing LNG, and ultimately only by importing gas into the Columbia River. If the purpose is properly defined as delivering clean, affordable energy into the West Coast market, many other alternatives are available – some of which, including continued or increased reliance on Rockies gas could fulfill all the project purposes. FERC persistently excludes many alternatives from detailed analysis because “of their distance to the target market to be served”, yet the primary target market for Bradwood’s gas is clearly California. Oregon PUC analyst, Ken Zimmerman, stated, “So far, the only people that have shown any interest in contracting with these LNG guys are in California.”¹⁹ Bradwood also acknowledged publicly in recent Clatsop County land use hearings that it already has an agreement to use the Palomar pipeline in the future – an agreement that has been described in Bradwood’s S-1 filing with the Securities and Exchange Commission in December 2006.

FERC does not adequately evaluate alternatives in conservation, efficiency, and renewable energy throughout the West Coast

The Bradwood analysis also fails to accurately assess non-LNG alternatives, such as conservation, efficiency, and renewable energy. In fact, the FERC alternatives analysis fails to acknowledge renewable energy and greenhouse gas emission laws that have recently been passed in Oregon, Washington, and California. These laws require a greater percentage of electricity generation to come from renewable sources, and the FERC alternatives analysis rests heavily on NWGA’s assumption that gas-fired generation will drastically increase. Because LNG is 25 percent more polluting than domestic natural gas in its lifecycle greenhouse gas emissions, FERC cannot assume that LNG has a place in an increasingly carbon-limited energy market.²⁰

Because avoiding the construction of the Bradwood LNG terminal, Bradwood pipeline, and Palomar pipeline would prevent severe damage to the aquatic ecosystem of the Lower Columbia, FERC should give more serious consideration to the impact of increasing reliance on renewable energy on the future of natural gas-fired electricity. The NW Power and Conservation

Council concluded that wind power, conservation and efficiency are capable of meeting load growth and that existing natural gas supplies.²¹ Wind power, alone, has the potential to bring online and additional 5000 MW of generating capacity West of the Continental divide, according to NWPCC’s report.²² The FERC does not fully evaluate the severe environmental and economic costs of Bradwood’s project, and does not attempt to weigh the No Action alternative with readily available alternatives described in the Fifth Power Plan and elsewhere as required under NEPA. NEPA requires that reasonable alternatives be weighed in a logical manner with clear, reasoned criteria used to compare the different alternatives.

Oregon’s Department of Environmental Quality (DEQ) questions whether the impacts involved with Bradwood are necessary and without alternatives in renewable energy and conservation: “Decades of maintaining LNG facilities in Oregon to supply natural gas to California might not be justified, especially given Oregon’s policy to reduce reliance on non-renewable energy sources and the West Coast Governors’ goal to explore new renewable energy options on the coasts.”²³ Oregon’s Department of Land, Conservation and Development agrees: “There should be a rigorous analysis of alternatives and more consideration of conservation and renewable energy.”²⁴

Figure 1. Energy Efficiency and Renewable Energy Potential vs. Natural Gas Demand

The Community Environmental Council in California has concluded that the need future LNG imports can be precluded economically by even a low estimate of energy efficiency

potential (see above)²⁵. Oregon Department of Energy has similarly expressed skepticism about the real need for the Bradwood LNG terminal, citing new renewable portfolio standards in the State of Oregon as a factor that could reduce demand for fossil fuel-powered electricity. Commenting on the DEIS, which was issued after the passage of the 2007 Renewable Portfolio Standard (25 percent by 2025), ODOE noted the following information gap in FERC's need analysis: "The Analysis does not consider the impact of Renewable Portfolio Standards (RPS) adopted by the 2007 legislature."²⁶

The Oregon Public Utilities Commission has identified energy efficiency and conservation as major goals for evaluating future energy policy. Additionally, the California Energy Commission has concluded that gas demand in California is not likely to reach 2000 demand levels for the foreseeable future (see graph below).²⁷ The NWGA presents, in its base case, that Oregon will not reach 2001 usage levels until 2011. Because the Bradwood project is intimately linked with California gas demand, and Oregon is actively moving towards more limited use of fossil fuels, conservation and efficiency are practicable alternatives that have less adverse impact and should be evaluated throughout the West Coast.

In the NW region, the Fifth Power plan concludes that supplies are available to meet gas-fired generation supplies for the foreseeable future. The remainder of future load growth can reasonably be addressed through conservation, efficiency, and renewable energy. Indeed, the passage of a law requiring 25 percent renewable generation by 2025 in Oregon may preclude utilities ability to greatly expand their proportional use of natural gas, limiting the growth in the fossil fuel electricity generation sector.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

FERC offers this cursory conclusion in its alternatives analysis, "It is also conceivable that increasing energy efficiency and use of renewable sources of energy could reduce the projected future demand for natural gas" (DEIS, at 3-7). As noted above, projected future natural gas demand is not necessarily as robust as NWGA indicates, and ODOE and others have identified a lack of independent analysis of the need for natural gas. The DEIS does not provide analysis to evaluate the likelihood of natural gas demand being limited by conservation, efficiency, and renewables. A report produced by the American Council for an Energy Efficient Economy indicates that, by 2010, Oregon can limit its natural gas use by 5 percent, compared to base case assumptions. Looking ahead, natural gas demand could be limited by 8 percent by 2015 and 12 percent by 2020.²⁸

These potential reductions in projected growth could severely undermine the projected 8 percent growth suggested by the NWGA by 2011. The FERC should evaluate independent estimates of future need rather than simply regurgitating information put forward by project proponents. Particularly when NWGA information appears to be contradicted by other projections, the FERC has a responsibility to look at a reasonable range of information. FERC even cites the NWGA's estimate that gas shortfalls might occur by the winter of 2006-2007 (DEIS, 1-4). This scenario did not occur, and the NWGA continues to paint a dire gas supply scenario to justify the Bradwood project.

The FERC does not offer supporting information to dismiss the potential for alternatives to limit growth in natural gas demand, yet the DEIS concludes, "neither conservation measures nor renewable energy sources are expected to replace the need for additional future natural gas supplies in the Pacific Northwest" (DEIS, at 3-7). FERC's confidence that increasing gas demand will necessitate LNG import in the Northwest is clearly not shared by Oregon Department of Energy. It also falsely concludes that independent regional energy forecasts conclude that increasing gas supply and gas-fired generation are necessary for meeting future demand. The NW Power and Conservation Council clearly indicate that wind power is a growing and viable alternative for meeting growth in generation capacity.²⁹ As alternatives to fossil fuels increase in renewable energy, energy efficiency, and conservation, natural gas prices may be relieved of some of the strain and vulnerability to speculation and manipulation that has driven recent high natural gas prices.³⁰ As Oregon State agencies have suggested, FERC must evaluate a reasonable range of alternatives including alternatives to LNG such as renewable energy, conservation, and efficiency.

ODOE addresses FERC's estimate of future wind energy directly in its comments on the FERC DEIS. The alternatives analysis aggrandizes the need for natural gas-fired generation by diminishing the current and future capacity of Washington and Oregon to generate wind-powered electricity. ODOE comments, "The DEIS understates wind capacity, operational and under construction, in Oregon and does not mention Washington at all. The DEIS cites the 2005 ODOE biennial energy plan and states that Oregon has a total capacity of 259 MW wind, with

²⁸ Elliot, R. Neil and Anna Shipley. April 2005. *Impacts of Energy Efficiency And Renewable Energy on Natural Gas Markets*.

²⁹ NW Power and Conservation Council. 2005. *Fifth Power Plan*.

³⁰ Elliot, R. Neil and Anna Shipley. April 2005. *Impacts of Energy Efficiency And Renewable Energy on Natural Gas Markets*. American Council for an Energy Efficient Economy.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

other projects planned for a total of 400 MW." ODOE concludes that the FERC's alternatives analysis "does not use current data for operating and planned wind generation. Information compiled by ODOE's Renewables division suggests over 500 MW of operating renewable generation, and over 3000 MW either under construction or in various stages of permitting. This does not even include Washington."²¹

Reference is made to the discussion of wind power as an alternative energy source found on page 3-5 and 3-6 of the DEIS.²² While it is acknowledged that wind power represents only a portion of the total Pacific Northwest energy portfolio, and requires load shaping from other sources of energy, the dismissive presentation of wind power in the DEIS is a) incorrect, b) is predicated on outdated information from seemingly a single source, and c) does not address the Pacific Northwest as a whole. A far more balanced picture is found in more contemporary information from the intergovernmental Northwest Power and Conservation Council [NWPPCC]. Noted in the Northwest Power and Conservation Council document "The Role of Renewable Sources in the Fifth Power Plan" dated 5 October 2006 at page 6 of the report under the heading: "CURRENT RENEWABLE RESOURCE DEVELOPMENT ACTIVITY":

Over 2600 megawatts of generating capacity of all resource types will have been placed in service in the Northwest between adoption of the 5th Plan in December 2004 and the end of 2008. About 800 megawatts is operating, 960 megawatts under construction and 880 megawatts currently scheduled for completion by the end of 2008 (Figure 2). *About 1720 megawatts (65 percent) of the total are renewable energy resources. Nearly all of this (over 99 percent) is wind capacity.*" (emphasis in italics added).²³

As shown above, the 400MW, wind power figure noted in the DEIS is incorrect. Additionally, while the assertion on page 3-4 of the DEIS that most new electrical generation is from natural gas fired sources was true in 2003, this assertion has been rendered moot by the recent accelerated development of wind powered generation. The following note appeared in the Introduction to latest NWPPCC Biennial Monitoring Report on the Fifth Power Plan dated January 5, 2007: "The Plan found that the region had a surplus of generating capability and that the need for new generation from coal or natural gas likely would not occur until after 2012, after the 5-year action plan period." And in the Summary:

High energy prices and concerns about potential climate-change policy have also led to aggressive development of wind power in the Pacific Northwest in the two years since the Council adopted the Fifth Power Plan. New generation capacity and slow demand growth have increased the electrical supply surplus in the region, which further delays the need for new generating capability.²⁴

Figure 2: Northwest resource development 2005 - 2008

Therefore, the renewable numbers used by FERC are simply incorrect. The FERC must use the best available information to make its decisions, and should not dismiss non-LNG alternatives such as wind based on incorrect estimates of these resources.

With ODOE expressing skepticism that gas-fired generators in the Lower Columbia will use this gas, it is important to evaluate whether LNG is even economic compared with renewable alternatives. The price of LNG will be a key factor in determining how, and if, the fuel is used once it is imported. ODOE concludes that industrial use of natural gas is projected to decline by 4 percent, and that gas-fired generation may grow to meet demands – yet both of these factors depend at least somewhat on price. As noted above, natural gas prices may from North American sources depend on the success of conservation, efficiency, and renewable energy programs and development. The American Council for an Energy Efficient Economy concludes that "significant price reductions are possible by relieving demand" through a variety of efficiency, conservation, and renewable programs.²⁵ Their report specifically cites Oregon's Renewable Portfolio Standard as a potential method for relaxing future growth in demand for electricity from natural gas-fired generation. Hence, comparison of LNG and North American gas costs should take Oregon's RPS and other similar programs in Washington and California into account. The comparison may render LNG even more expensive when compared to LNG.

Furthermore, according to many published reports, current pricing is more reflective of speculation than market fundamentals.

Costs are way below current prices. For the most expensive domestic production, deep water Gulf of Mexico, the full-cycle replacement costs may be as high as \$3.25-3.50/MMBtu, the report says. Imported LNG falls near that range also at \$2.75-3.75. Other North American full-cycle production costs are: overall Gulf of Mexico \$2.75-3.00/MMBtu; onshore

²⁵ Elliot, R. Neal and Anna Shipley, April 2005, Impacts of Energy Efficiency and Renewable Energy on Natural Gas Markets

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Gulf Coast \$2.50-2.75; Canadian \$2.25-2.75; and Rockies \$2.00-2.25 . . .

³⁶

The above statement and EIA data show that LNG is not likely to depress prices below current levels. In fact, conservation, efficiency, and renewable alternatives are economically viable alternatives. The DEIS alternatives analysis does not compare costs or provide a reasonable projection of its own future gas supply costs. When combined with Bradwood's huge negative impact to the aquatic environment, it is evident that FERC has erroneously made the presumption that energy efficiency, conservation, and renewable energy are practicable alternatives to the project as a whole, making the no action alternative both viable and environmentally preferable.

FERC fails to adequately evaluate reasonable alternatives to the project in Rockies and Canadian gas supplies

The project configuration description in the DEIS is incomplete, and the project description should include consideration of the Palomar pipeline project, the Western half of which clearly depends on Bradwood's LNG terminal being approved. Under NEPA, the projects are connected actions – but for the Bradwood LNG terminal, the Western half of the Palomar pipeline (or some significant portion of it) would not be constructed.³⁷ The Palomar pipeline is not a surprising outgrowth of the Bradwood project. For several years members of the public have noted that the Williams pipeline system currently lacks available capacity to take on an additional 1.3 bcf/d. FERC's three-fold description of the project objectives (delivery to industrial/electricity users, Mist, and Williams) cumulatively do not come close to the capacity of the project as a whole. Again, the WA EFSEC study completed by ICF International shows that the region cannot economically absorb the huge amount of gas that Bradwood intends to import:

Each of the proposed terminals has an associated pipeline project. Local load in the Pacific Northwest is too variable and not large enough to be economic for a LNG terminal. To site a terminal at a size that would be economic, at least 1 Bcf per day to start with, access to Northern Californian markets would be necessary.³⁸

FERC's alternative analysis, then, should evaluate methods of meeting regional gas demand in the Pacific Northwest and California because project objectives may be readily achievable through North American sources of natural gas with existing pipeline infrastructure. The ICF International Study completed for WA EFSEC concludes that pipeline capacity is adequate to meet needs of gas users in SW Washington and Northern Oregon, areas of focus for

project objectives.³⁹ Secondly, FERC must evaluate alternative methods of meeting gas demand on a region-wide basis, including Rockies supplies, because the bulk of the gas is likely to go to California to meet that State's energy needs. There are multiple West Coast-wide alternatives that should be considered as reasonable, and for which the DEIS provides no or very cursory analysis.

Domestic Natural Gas Is a Viable Alternative

Northern Star, on its website, claims that "Despite record levels of drilling for natural gas in North America, production in the US and Canada is struggling to keep up with consumption."⁴⁰ The FERC DEIS characterizes U.S. and Canadian gas supplies as in decline, as well. However, this projection ignores that fact that the Department of Energy (DOE) estimates that there are decades of natural gas supply remaining in North America. To quote the DOE,

At current rates of consumption, the Nation has at least 60 years worth of natural gas supplies that are recoverable with current technology. Moreover, as our knowledge of resource characteristics and the potential of new technology increases, estimates of the size of the resource base grow.⁴¹

Natural gas demand has actually decreased nationwide since the DOE report was issued. A glaring omission in any of Bradwood's materials or the FERC DEIS is the lack of detailed analysis of increasing supplies from the Rocky Mountains as a viable alternative to the importation of LNG. Page 3-10 provides a very cursory consideration of other pipeline possibilities, citing the Palomar pipeline as a possible conduit for domestic gas into the Oregon market. Realistically, the Palomar project would be used for the opposite purpose – to import large quantities of LNG via the Columbia River into the Western market. The other project discussed, Kinder Morgan's Rockies express, is cited as a potential drain on Rockies gas supply to the Pacific region. The Rockies Express pipeline, according a presentation given by ICF International regarding the development of their pipeline capacity study, will have the opposite effect than that suggested in the DEIS. By relieving competition pressure from the Midwest for Canadian gas, the project would likely increase the availability of that gas supply while not effectively reducing the amount of Rockies gas also available to the Pacific NW.

FERC must more thoroughly evaluate Rockies gas as an alternative to LNG. No detailed rationale is given comparing the Rockies in price or environmental impact to LNG importation in Oregon. According to the DOE, there are almost 7,000 trillion cubic feet (Tcf) of natural gas in the Rocky Mountains. As their report details, more than 300 Tcf of gas-in-place is currently technically recoverable, though several different estimates done by organizations such as the National Petroleum Council and the EIA demonstrate that the recoverable rates are increasing, and the potential is great.⁴² By way of comparison, the states of Idaho, Oregon and Washington collectively consumed approximately 570 Billion cubic feet per year of natural gas in 2005.⁴³

⁴³ From EIA database: http://onto.eia.doe.gov/dnav/ng/ng_cons_sum_000_gus_m.htm

20071222-5001 PERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Annual production from Rocky Mountain States has risen from 2.3 Tcf in 1990 to over 3.5 Tcf in 2001. According to the DOE,

Assuming ongoing investment in expanding the geologic knowledge base and technology progress, upward trends in resource assessment and recovery are expected to continue...The National Petroleum Institute projects technically recoverable tight-gas sands resources in the Rocky Mountain States to grow from 105 Tcf in 1998, to 137 Tcf in 2010, and to 151 Tcf in 2015.⁴⁴

"Tight sands" is one of several classifications of natural gas deposits in the Rockies.

The DOE report goes on to describe one of the most serious barriers facing natural gas producers in the Rocky Mountain States: lack of access to markets. The report states, "*Severe pipeline constraints have contributed to two decades of depressed natural gas prices in the Rocky Mountain States. In recent years, price volatility, in large part due to limited pipeline infrastructure and market access, has discouraged investments in natural gas production in the region.*"⁴⁵

There is, however, a high-capacity gas pipeline currently under construction, called "Rockies Express Pipeline," being built by Sempra Energy, parent company of SoCalGas, and Kinder Morgan Pipeline Company. This pipeline, over 1,600 miles long, will run east to terminate in Clarington, Ohio. It will deliver up to 1,500 MMcf per day of domestic natural gas to customers throughout the Midwest. This pipeline goes in the opposite direction of utility customers in the Pacific Northwest. The distance between the major energy market of Portland, Oregon and the Wyoming gas fields is approximately 800 miles, about half the distance from these same Wyoming gas fields to Clarington, Ohio.⁴⁶ It would appear, then, that delivery of Rockies gas to the West Coast could also be an economic means of meeting regional energy needs.

Not surprisingly, new pipeline capacity from the Rockies to the West Coast are now proposed in the form of the recently announced Bronco and Ruby gas pipelines. These projects clearly provide an alternative to LNG on the West Coast that the FERC should evaluate. The price of gas traded at Henry Hub on July 6, 2007, which is the benchmark for domestic natural gas pricing, was \$6.14 per MMBTU. The price for natural gas traded at the Opal, Wyoming hub on the same day was \$3.54 per MMBTU.⁴⁷ The typical spread between the Henry Hub and Opal spot prices is more on the order of \$2 to \$3 per MMBTU. The price is low at Opal due to the current lack of pipeline access to markets.⁴⁸ Three new gas pipeline projects are now proposed to carry gas from the Rockies gas basin into the Western U.S. Two of them – the Ruby and

Bronco pipeline projects – exceed 1 bcf/d in capacity and would directly access the Malin, OR, interconnect with TransCanada's GTN system as well as California pipelines.

Statements from the Ruby and Bronco Gas Pipeline proponent indicate that their projects provide an alternative response to the FERC's characterization of West Coast market needs. Jim Cleary, spokesperson for the Ruby Pipeline, said, "Ruby will provide natural gas users in northern California, Nevada, and the Pacific Northwest with competitively priced natural gas from the nation's most important growth supply region." The Ruby project will have a capacity of 1.2 bcf/d and can be expanded to 2 bcf/d.⁴⁹ A representative of Spectra Energy, proposing the Bronco gas pipeline, characterized their project in similar terms: "With the continued demand for clean-burning natural gas to fuel growth in the Pacific Northwest and California markets, the Bronco Pipeline represents an important new outlet for Rockies production to reach these key markets and builds on our long-standing service to this region through our Western Canadian facilities."⁵⁰

The influx of a large quantity of Rockies gas into the West Coast must be considered as an alternative to LNG, and would likely result in less competition for Canadian natural gas. Because Rockies gas is the cheapest North American source and significantly cheaper than LNG, and because Bradwood's proposal requires the large, destructive Palomar pipeline to be viable, the alternatives analysis must evaluate these new proposals as reasonable and potentially environmentally preferable proposals.

Increasing natural gas supplies from the Rockies should clearly be evaluated as a cost-effective and reliable project alternative to importing LNG. The EIA regional natural gas production trends shown in the map below indicate robust supply growth in the Rockies, and steady production in other key major production regions around the country through 2025.

Regional U.S. Natural Gas Production Trends, 2002, 2015, 2025⁵¹

Canada Is Likely to Maintain or Increase Natural Gas Exports

According to the Bradwood website, "Canada's reserves are also dwindling and the Canadian Energy Research Institute predicts that production from the giant deposits in western Canada will stay at current levels only until 2010 and then begin an inevitable slow decline." The FERC alternatives analysis paints a similarly dire picture of the future of Canadian gas exports, arguing in Chapter 1 that Canadian gas supply forecasts show a decline in Canadian exports. Page 3-8 of the DEIS projects a steep decline in Canadian exports to the U.S., from 3.3 tcf in 2005 to 1.2 tcf in 2030. Yet, FERC's analysis does not evaluate a range of projections – several of which do not describe a decline in exports as severe as suggested in the DEIS.

Similar assertions also appear in California Energy Commission, California Public Utilities Commission and EIA data, which state that natural gas imports from Canada will decline 45 percent over the next 15 years.⁵² The agencies are basing this assertion on Figure 77, "Net U.S. imports of natural gas by source, 1990-2030," in the EIA's 2007 Annual Energy Outlook, which shows a 45% decline in Canadian exports to the U.S. by 2020. Figure 77 shows Canadian exports in slight decline in the 2005-2015 period, followed by a much steeper decline in the 2015-2020 period. The steeper decline in the 2015-2020 period accounts for most of the overall 45% decline in the 2005-2020 period.

It appears that the EIA is taking the "worst case" Canadian National Energy Board (NEB) supply-demand forecast scenario and adopting it as the only Canadian forecast. NEB forecasts include multiple supply-demand scenarios. The 2003 forecast looked at two scenarios, one ("Supply Push") where exports gradually decrease through 2015 and then go into a much steeper

⁵¹ Don Van Wageningen, EIA, *Domestic Natural Gas Supply: A Large Resource Base Does Not Guarantee Low Long-Term Prices*, presentation given at NEMS/AEO Conference, March 23, 2004, at 18.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

export decline curve, and the second ("Techo-Vent") where natural gas exports increase through 2015 and return to 2005 levels in 2025.

The NEB is currently working on an update to the 2003 *Canadian Gas Supply, 1990-2025* document that will be published in 2007. The update will include three scenarios:

- 1) "Fortified Islands,"
- 2) Sustainable Economic, Environmental, and Energy – "EEE", and
- 3) "Continuing Trend."⁵³

The term "Fortified Islands" means Canada puts more emphasis on developing its own natural gas resources and reducing internal demand, and less emphasis on imports to satisfy energy needs. The EEE scenario assumes abundant cheap LNG is available and development of domestic resources is de-emphasized in favor of imports. The "Continuing Trend" is a business-as-usual scenario that assumes no national commitment to increasing domestic natural gas production and reducing domestic demand. The NEB "Fortified Islands" scenario matches well with the Techo-Vent scenario included in the 2003 report.⁵⁴

In this scenario Canadian exports increase from approximately 8,000 MMcf/d in 2005 to 10,000 MMcf/d in 2015 and then return to 8,000 MMcf/d in 2025. This scenario starkly contrasts with the DEIS assumptions, and FERC should evaluate this alternate projection of Canadian gas exports in evaluating the need and potential alternatives for the project. Continued reliance on Canadian gas apparently may be a reasonable alternative to satisfy at least a significant portion of the projected shortfall described by the DEIS.

It is reasonable to assume that the "Fortified Islands" scenario is more likely to occur than a scenario that presumes cheap and abundant LNG will cause Canada to put less emphasis on developing its own natural gas resources. LNG is neither cheap nor abundant.⁵⁵ Supply uncertainty and the willingness of major Far East LNG consumers such as Japan, Korea, and China to link the price they pay for LNG to the price of oil make it highly unlikely that "cheap" LNG will ever be available on the West Coast of Canada or the U.S. The likely high price and constrained supply of LNG in the Pacific Rim market will lead Canada to continue to develop its own reserves, potentially leading to an export scenario more like the one we describe—from 8000 mmcf/d to 10,000 mmcf/d and back to 8000 mmcf/d by 2025.

The Washington State Energy Facility Siting Council recently commissioned a study in which ICF International concluded that adequate supply and pipeline capacity exists in the Pacific NW for the reasonably foreseeable future, even in the absence of LNG. In fact, the study highlights increasing Rockies gas reserves as the cheapest source of gas to the West Coast region. Not surprisingly, three recent pipeline proposals now plan to increase the pipeline linkage between the West Coast and Rockies gas producers (Ruby, Bronco, and Kern River

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

expansion). The “System Alternatives” section unreasonably narrows its focus to LNG import possibilities – excluding already planned expansions of these new Rockies imports.

Increased supplies of Rockies gas to the West Coast (whether in California or Oregon) will relieve pressure on Canadian gas, allowing more gas into the Williams system which is largely dependent on Canadian gas. Because pipeline capacity between the Pacific NW and the Rockies is constrained, these new pipelines are not likely to increase starve the Pacific NW of Rockies gas. Essentially, there is enough for both markets, and increasing access from the Pacific to Rockies gas is very likely to relieve pressure on Canadian gas. Additionally, the Rockies Express Pipeline, which will deliver Rockies gas to the Midwest, may also relieve pressure on Canadian gas supplies according to the WA EFSEC pipeline capacity study.⁵⁶ Taken together, the FERC alternatives analysis currently fails to evaluate other potential, proposed influxes of natural gas into the West Coast pipeline system. Hence, the “System Alternatives” analysis is deficient, which only briefly evaluated alternatives and stated without substantial analysis that “modifications or additions (to existing pipelines) would result in environmental impacts that could be less than, similar to, or greater than those associated with construction of the proposed project” (DEIS, at 3-7). Ultimately, the DEIS does not offer a clear comparison of the potential alternatives, including the relative environmental impacts of the different projects and their potential, for instance, for negative impacts to threatened and endangered wildlife and fisheries species.

Due to the tremendous impact on the aquatic ecosystem for Bradwood, the FERC has not met its burden under NEPA in demonstrating that reasonable alternatives have been considered that would avoid many of the negative impacts on the aquatic ecosystem. There are numerous alternatives to the Bradwood Project, all of which have potentially less intensive aquatic ecosystem impacts. There are practicable alternatives in configurations of the terminal, pipeline developments, other LNG import sites, and overall methods of meeting regional energy demands.

Other reasonable alternatives are preferable to the Bradwood site

The FERC dismisses many practicable alternatives for LNG import sites on the grounds that they are too distant from the “target market”, which FERC apparently defines as the Lower Columbia River. Given the enormous size of the project and the statement from ICF International indicating that LNG projects in Oregon are not economically viable without connections to Northern California, FERC’s characterization of the target market is unreasonably narrow. The likely movement of the gas via the Palomar pipeline to California and the unproven need for a huge quantity of natural gas in the Lower Columbia River impugn FERC’s blanket assertion that other LNG sites are too distant. Indeed, even in Bradwood’s own alternatives analysis for its 404 application to the Army Corps, it indicates that only 100 mmcf/d would typically be used in the Lower Columbia area by electricity and industrial users.⁵⁷ The cursory

⁵⁶ ICF International. Nov. 2007. Review of Pipeline Utility Corridor Capacity and Distribution for Petroleum Fuels, Natural Gas, and Biofuels in SW Washington. Submitted to WA State EFSEC.

⁵⁷ Bradwood Landing 404 Alternatives Analysis submitted with Joint Aquatic Resources Permit Application. October 2006. Attachment H, at 3.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

analysis offered in regard to other sites fails to evaluate key differences and potential advantages between sites.

Other LNG sites exist on the West Coast that could potentially provide natural gas sources to California and other markets including the Lower Columbia industrial and electricity generation natural gas users. FERC dismisses many planned and developed facilities as unable to meet its project purposes because of their distance to the “target” Pacific NW market. The FERC rules out California alternatives, saying “the California LNG import terminal proposals... could not meet the objectives of the Bradwood Landing project to supply the states of Oregon and Washington with new sources of natural gas.” This statement from FERC is inaccurate, both because it implies that the central purpose of the Bradwood project is to supply the Pacific NW with gas (when ICF International has indicated that serving California is the primary driver for any LNG terminal), and because it fails to evaluate how a possible influx of natural gas elsewhere into the Western gas grid will allow Canadian and domestic sources of gas to be more available to the Pacific NW.

The West Coast energy grid is interconnected and so dismissing a California terminal is a poor basis for disqualifying other LNG sites. The FERC must evaluate the regional impact of each of these sites, including Semptra’s Costa Azul facility – which FERC only barely acknowledges although it will come online soon and have an enormous potential impact on gas supplies in the Pacific region. Because LNG facilities are so large, they will impact a large geographic range of any region they occupy. The West Coast, as a whole, uses approximately 9 bcf/d. Any LNG terminals that supply a significant percentage of that total could potentially relieve pressure on traditional gas sources, as well, leaving more traditional gas resources for the Pacific NW.

The DEIS states that other LNG import terminals are not considered further in this analysis because gas from this southern location cannot economically be transported to the Pacific Northwest, but it does not evaluate the regional import of LNG imports into California from Mexico. Furthermore, because Bradwood is planning to deliver a large proportion of its gas to California, the alternatives analysis should include potential LNG development sites in Northern California, in particular. There were multiple proposals for LNG terminals in Northern California, including Vallejo and Humboldt Bay. Indeed, FERC suggested to another LNG facility in Oregon (Jordan Cove) that it should defend why it is not locating its facility closer to its target market. The same criticism could be directed at Bradwood, who has an agreement to potentially use the Palomar pipeline in the future. FERC must evaluate alternatives that include siting the facility in the market capable of accommodating 1.3 bcf/d. In siting the facility closer to its true target market in California, Bradwood would likely avoid large pipeline construction and disturbance to the Columbia River. The FERC cites shorter pipeline routes as a reason to dismiss other projects in the Pacific Northwest, but it does not apply the same criteria to its own study and its use of the Palomar pipeline to connect to California.

FERC dismisses the offshore LNG terminal design alternatives based largely on cost considerations. FERC and Bradwood, in other documents, argue that some of these designs require specifically designed tankers, yet the analysis fails to mention that tankers for its own facility will have to be specifically retrofitted to accept filtered ballast water from a screened

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

intake system.⁵⁸ Cost appears to be the dominant consideration in excluding offshore design alternatives, despite the fact that Bradwood has its own offshore proposal and that several others are proposed for the West Coast. Offshore facilities greatly diminish the public safety risk involved with LNG shipping – a factor that FERC does not weigh heavily in its alternatives analysis. NOAA has criticized FERC for disregarding offshore designs:

The DEIS indicates rough sea and weather conditions off the coast of the Pacific Northwest preclude the siting of offshore terminals. To those not readily familiar with the circumstances that differentiate proposed or existing terminals or other similar structures located in harsh environmental conditions elsewhere (e.g., Calypso LNG terminal off the eastern coast of Florida, Troll Natural Gas Fields in the North Sea with depths of 1,100 feet), FERC should explain further why the placement of terminals offshore of Washington and Oregon are not feasible.⁵⁹

FERC does not analyze the potential advantages that other sites may have over Bradwood – particularly offshore sites that do not require turning basin dredging. Because Bradwood's project involves severe disturbance of critical salmon habitat and a large-scale alteration of the Estuary, the alternatives analysis must weigh other potential LNG sites. Sites elsewhere in the Columbia River may not involve the same amount of dredging and disturbance in extremely sensitive habitats. The alternatives analysis paints all of the sites as similar in the extent of dredging. The analysis also states that Bradwood is preferable to Jordan Cove because that proposal's need for a lengthy pipeline – an advantage that obviously evaporates once we consider the Palomar project as part of Bradwood's proposal.

The DEIS alternatives analysis falsely asserts that key project objectives cannot be met through other means, particularly referring to the delivery of natural gas to Mist, to Williams Pipeline, and to Lower Columbia River industrial and electricity gas consumers. Not only can these demands potentially be satisfied through domestic sources of gas, but, as we have already noted, FERC has mischaracterized the project purposes to aggrandize the importance of these smaller goals that are achievable through other practicable alternatives. Because the site has regional significance if it is approved and built, FERC cannot screen out alternatives on the basis of the Bradwood facility being in closer proximity to facilities that may not even use LNG in the future according to ODOE.

Delivery of gas to the PGE power plants at Port Westward is not a compelling reason to select the preferred pipeline route over alternatives. In the Oregon EFSC review of the Port Westward power plant, PGE did not assume that LNG would be available. PGE also did not assume the availability of LNG in its integrated resource plan review before the Oregon Public Utility Commission.⁶⁰

FERC cites other pipeline projects as being more damaging than Bradwood, but several of these pipeline and other system alternatives might require less dredge/fill activity than

⁵⁸ 404 Application from Bradwood Landing, October 2006, Attachment H.

⁵⁹ NOAA DEIS comments, at 2, Submitted Dec. 17, 2007.

⁶⁰ ODOE preliminary State Agency Comments on Bradwood DEIS, Nov. 2007, at 62.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Bradwood. FERC is also misleading in its description of the extent of its pipeline development, giving no acknowledgement of the added dredge/fill impact of the Palomar pipeline, which is clearly a connected action under NEPA guidelines. While other sites on the Columbia River may have longer pipelines, the Bradwood proposal is likely to result in the Palomar pipeline being extended to the Columbia River – adding 100 additional miles or more to the overall pipeline mileage that should be attributed to the Bradwood project.

FERC also characterizes this project as more distant than other alternative sites in Oregon from population centers. This description apparently only considers the terminal site itself – which incidentally is close to both Puget Island and the Washington community of Cathlamet. The Bradwood project also brings Warrenton and Astoria well within 1 mile of the LNG tankers in the shipping channel. Bradwood has significant disadvantages over other sites throughout the West Coast due to its selection of a site in the midst of the busy Columbia River shipping channel. The area between Puget Island and Bradwood is narrow, and the shipping channel is currently unable to accommodate an LNG vessel. Bradwood's 700,000 cubic yards of dredging and construction for its pipeline(s) constitute a massive alteration of the aquatic environment of the Lower Columbia.

FERC also fails to evaluate whether other sites are superior in avoiding sensitive habitats in construction and operation centers. The Bradwood proposal is extraordinary in its selection of a site in the midst of habitats of extreme importance to the Columbian White-tailed deer, habitat for threatened and endangered salmon, and numerous sensitive streams and wetlands for its project area. No other terminal poses the same degree of threats to migration and rearing habitat for juvenile salmonids and Columbia white-tailed deer, in particular. FERC points out that there are trade-offs with each site, but clearly the selection of the Bradwood site in the midst of critical habitat for ESA-listed fish and wildlife species represents potentially the worst alternative for compliance with the ESA on the West Coast.

NOAA has strongly criticized FERC's assessment of alternatives in LNG sites and project design. The criticism leveled at Bradwood and FERC in these statements also apply to the Corps alternatives analysis, which is even more cursory and inaccurate than the Alternatives analysis in the DEIS. NOAA concludes,

The duration and magnitude of impacts do not appear to have been fully considered in the alternatives analysis. Impacts that are permanent or chronic should be given significantly greater weight than temporary or short-term impacts. For example, in most instances when appropriate conservation measures are successfully implemented (e.g., HDD stream crossings), the impact of pipeline construction on aquatic systems can be avoided or be limited to temporary or short-term duration. In such instances the transitory nature of the impact likely limits the magnitude of the environmental effect. Conversely, impacts that are permanent (e.g., aquatic and wetland filling, sequestration of dredged sediment) or chronic (e.g., maintenance dredging, wake stranding of juvenile salmonids) are of considerable environmental concern and are more likely to have significant impacts on sensitive species. FERC needs to consider the

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

duration and magnitude of likely impacts when determining whether environmental advantages exist between alternatives.⁶¹

The Columbia River Estuary, as a whole, is a critical area for the survival of listed salmon and Columbia white-tailed deer populations; hence, it is crucial that FERC evaluate sites, not only in the Lower Columbia, but also throughout the West. It is also important that FERC not dismiss as not practicable alternatives which will serve the true project purpose of delivering LNG into the Western U.S. – including Oregon LNG, Tansy Point, Jordan Cove, and numerous potential sites in Northern California.

FERC fails to provide accurate information on why other sites are not practicable alternatives, in violation of its burden under NEPA. The alternatives are not evaluated in terms of their relative impacts on shipping, habitat, and public safety in a manner that clearly indicates advantages and disadvantages between them. FERC has not provided an analysis adequate to evaluate whether other alternatives might environmentally preferable. NOAA's recent comments on the Bradwood project indicate that practicable alternatives may exist that have significantly less negative impacts on sensitive species, and that FERC failed to weigh the sensitivity of affected species in its alternatives analysis:

The sensitivity of a species or their habitat to change does not appear to have been factored into the alternatives analysis. An alternative that impacts only viable fish populations is preferable to one that impacts at-risk species. Similarly, an alternative that impacts few or no ESA-listed species is preferable to an alternative that impacts many ESA-listed species. FERC should analyze how, for example, endangered, threatened or sensitive species and their associated habitat could be impacted by each of the proposed alternatives. Moreover, NMFS believes that all of the alternatives should include measures to minimize and/or avoid impacts to threatened and endangered species and their critical habitat. This is consistent with the implementing regulations for NEPA, which state that both context and intensity must be considered when determining significance, and that the ESA-status of a species and their critical habitat are one consideration (40 CFR 1508.27). FERC needs to consider environmental impacts in terms of species and habitat sensitivity when evaluating project alternatives.⁶²

FERC does not adequately evaluate alternatives that would reduce impacts on the environment

FERC Fails to Analyze Reasonable Alternatives to Size and Design of the LNG Terminal

FERC should have considered designing the terminal for a smaller footprint and smaller LNG vessels in greater detail. The FERC analysis makes the assumption that a smaller LNG terminal is not economically viable but does not provide data to justify ruling out smaller design alternatives. There is no justification anywhere in the DEIS for the size of the project: at 1.3 bcf/d, the Bradwood proposal will overwhelm the Pacific NW market and is not viable without access to regional markets. If Bradwood seeks to serve primarily Pacific NW markets, it should

⁶¹ NOAA comment letter to FERC regarding Bradwood DEIS. Dec. 17, 2007, at 4

⁶² *Id.*, at 4.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

have evaluated smaller design alternatives with more limited sendout capacity, smaller pipelines, and fewer and smaller tankers.

Due to the lack of consideration of smaller terminal alternatives, FERC does not demonstrate that there are no practicable alternatives to its terminal site design. Reducing the size of the terminal footprint as well as the area that requires dredging are methods of diminishing the impact on the aquatic ecosystem. The size of the terminal itself is a key factor that remains unresolved. FERC should have evaluated the project as a whole for a 3-tank design; clearly, a third tank is reasonably foreseeable. According to page 3-41 of the DEIS, "designing a project to allow for future expansion is a typical model for energy projects of this size and is necessary to make the project viable." Despite this indication that a third tank will be necessary, the DEIS only acknowledges two tanks as the proposed action, with the possibility of future expansion. As discussed elsewhere, and in the comments of Frans Eykel, Marjorie Castle and others, the number of tankers will increase with a three-tank design. Indeed, the Joint Aquatic Resources Permit Application and the Alternatives analysis for the 404 application submitted by Bradwood still describe a three-tank design. The FERC DEIS does not evaluate alternatives that preclude future expansion. Limiting the facility to two tanks is a condition of local proposed land use approval, and it may limit the amount of permanent and temporary negative impacts during construction and operation of the terminal.

The FERC narrowly considers methods of reducing the footprint of a terminal of the proposed size, but does not consider reducing or limiting the actual proposed size of the terminal. There is no factual evidence to support the conclusion that a smaller terminal would not be viable. The Pacific Northwest does not require an LNG terminal of even two tanks, yet FERC does not evaluate the possibility of reducing or limiting the capacity of its terminal in order to reduce its impact on the environment. A third storage tank, 260 feet in diameter and over 160 feet in height, increases the footprint of the area. FERC should evaluate site designs that do not involve the extensive wetland fill that will occur on the site. FERC claims that Bradwood has reduced the amount of wetland fill within its 1.3 bcf/d design, but it must consider whether a facility of smaller size and sendout capacity would require fewer impacts to the environment. Less gas storage would also decrease the number of tankers necessary each year, which would decrease adverse impacts. The FERC has failed to analyze how future expansion plans are increasing the footprint of the currently proposed facility (which will be constructed with a foundation for a third tank), and whether abandoning future expansion or reducing the number and size of tanks is a reasonable alternative. NOAA raises this question in its comments on the DEIS, as well:

The applicant submitted differing proposed actions to the local, state, and federal permitting agencies with regards to whether two or three tanks would be built. The DEIS states that the applicant has not committed to expanding the terminal, however if they wish to expand by way of a third tank, the terminal layout accounts for this. It remains unclear how storage capacity factors into the project's purpose and need, in addition to FERC's alternatives analysis as previously discussed. The applicant's own statements have indicated that storage capacity does not determine throughput (sendout) capacity.⁴ Therefore, the need to accommodate and reserve space for a future third tank appears questionable

20071222-5001 FERC PDP (Unofficial) 12/22/2007 12:24:56 AM

since the terminal is already designed to accommodate a peak sendout capacity of 1.3 billion cubic feet per day (bcfd). As such, the subject of whether the project footprint has been minimized to the greatest degree practicable remains in question. The FEIS should clarify this topic and provide supporting rationale on how the project footprint has been minimized, perhaps through modeling various operating scenarios.⁶³

FERC discounts the possibility of developing a smaller terminal and/or limiting the facility to two tanks by stating that the project would not be economically viable if it were a smaller size. Yet, Bradwood now proposes a two-tank design in its application to FERC, leaving the potential for a third tank in the future. If FERC insists that a three-tank design is necessary for project viability, then certainly this a reasonably foreseeable future action and the entire DEIS should have reflected the ultimate, 3-tank design. The alternatives analysis does not provide adequate data to justify why a smaller site design is not practicable, particularly considering the relatively modest overall gas demand of Oregon and Washington (less than 1.5 bcfd, combined, on an average 2006 day).

FERC asserts that the forecasted demand and life cycle costs make it potentially necessary to expand the facilities to meet future demand, but it does not evaluate the potential benefits to the environment of substantially reducing the scale of the project. FERC has not provided adequate information to support its claim that the Pacific Northwest needs a facility on the scale of 1.3 bcfd, and Oregon Department of Energy and others have raised the problem of no proven need in comments on the FERC Draft EIS. Given the potentially huge range of future demand (FERC relies on the NWGA – a non-objective proponent of the natural gas industry), FERC must consider smaller site designs. The analysis should clearly indicate what environmental and economic benefits to the community might occur in a smaller design alternative as well as the costs to the applicant. NOAA has noted the inadequate nature of FERC's cost analysis in the Alternatives section of the DEIS:

It remains unclear what weight FERC gives to financial costs. In multiple instances FERC appears to dismiss alternatives due to financial considerations without fully evaluating environmental or public safety impacts. FERC should develop and implement a more transparent cost/benefit decision matrix in the alternatives analysis. Furthermore, any financial costs analysis should be comprehensive and include costs associated with each alternative in its entirety (e.g., increased shipping costs to river commerce due to traffic restrictions, impacts to fisheries, increased emergency response capacity).⁶⁴

Oregon Department of State Lands has expressed similar concern with the lack of alternatives analyzed for the design layout of the facility based on the Draft EIS for Bradwood. DSL argues, "Alternative site designs and layouts with a smaller footprint are not discussed in adequate detail as to why the chosen alternative layout is the most practicable with least adverse effects."⁶⁵

⁶³ NOAA DEIS comments, Dec. 17, 2007, at 4.

⁶⁴ NOAA DEIS comments, at 2.

⁶⁵ Oregon DSL Preliminary State Agency comments on DEIS, Nov. 2007, at 31.

20071222-5001 FERC PDP (Unofficial) 12/22/2007 12:24:56 AM

In general, FERC does not demonstrate that its site design is necessary to meet the objectives of the project. Specifically, FERC must evaluate what size of facility it could practicably build without extensive wetland/fill on the site. There are similar considerations for the sendout pipeline(s) as well. Additionally, the Bradwood project will impact areas of the aquatic environment that are not appropriately zoned for industrial development of this type. It is inappropriate for this application to proceed without a land use compatibility statement, in any case, but it is also crucial for a thorough alternatives analysis that Bradwood develop a site design that is consistent with current zoning regulations. Even if Bradwood achieves zoning consistency, these changes are likely to be contingent on only two tanks. FERC does not investigate a true minimal impact site design in its Alternatives analysis, but instead asserts without proper analysis that the project cannot be reduced in size. Most importantly, FERC should evaluate a site design that involves fewer (and potentially smaller) storage tanks and with reduced overall sendout capacity. We agree with the following NOAA comment on this issue, raised in its comments on a similar alternatives analysis for the project in the FERC DEIS:

It remains unclear what role site or capacity expansion plays in consideration of suitable alternatives to the proposed project. Section 3.1.6.2 discusses terminal expansion in terms of the proposed Bradwood Landing LNG terminal, but appears not to do the same for the alternatives. If expansion potential is a decision element, FERC should modify its selection criteria to clarify the weight given to expansion in the alternatives analysis. Furthermore, if expansion potential is not a siting consideration, there appears no reason that reserving space for a third tank at Bradwood Landing should be considered necessary to the proposed project and the facility footprint should be reduced accordingly.⁶⁶

FERC Fails to Address Alternatives for Gasification and Gas Quality Mitigation

FERC's DEIS largely ignores two key issues that will greatly impact the quantity and nature of air emissions for the project. The method of gasification and the quality of gas imported to the site are two crucial factors that are poorly evaluated, and for which FERC does not consider reasonable alternatives. The FERC must consider alternatives that limit air emissions, and the current analysis fails to provide adequate analysis of impacts or the alternatives to the proposed project's emissions.

FERC essentially dismisses alternative gasification strategies. Most importantly, the DEIS concludes the ambient air vaporization is not a reasonable alternative for the Bradwood site due to frequent, cool weather. Yet, Oregon LNG in Warrenton has a similar climatic regime and now proposes to use ambient air vaporization technology. The DEIS must evaluate the relative environmental and economic costs of each technology – including energy usage, effluent (condensate), and air emissions. The DEIS' rationale for dismissal of ambient air vaporization is inadequate, and the DEIS should be amended to include more thorough discussion of this vaporization technique. Ambient air vaporization is less polluting, potentially, than submerged combustion vaporization. The DEIS does not provide an analysis of reasonable alternatives to the method of vaporization.

⁶⁶ NOAA comments on FERC DEIS, December 17, 2007, at 4.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Additionally, FERC does not evaluate the issue of whether imported gas will comply with gas quality specifications in the Pacific Northwest. LNG often contains a higher proportion of non-methane constituents such as propane, ethane, and butane – all of which increase the heating value of the gas (see below). The FERC DEIS must evaluate an alternative that limits the impurities of imported gas by stripping non-methane constituents out of the LNG imports. This process is proposed for Jordan Cove LNG – a proposal which is likely to be seeking LNG supplies from the same Pacific Rim market as Bradwood. The FERC's failure to evaluate terminal design alternatives that limit non-methane impurities in the LNG supply may result in significant increases in NOx and other emissions.

Because FERC has not identified the gas source, the public cannot ensure that gas quality specifications will be met by proposed incoming LNG supplies, and FERC must evaluate this issue in its alternatives analysis. The terminal design can be amended to remove impurities, and FERC provides no basis for excluding this alternative which has potentially significant environmental benefits for the air quality of the Lower Columbia River airshed and all of the markets targeted for LNG use. Currently, there is inadequate gas supply available for "mixing" gas to the Lower Columbia gas users that Bradwood seeks to supply. The DEIS should also evaluate alternatives to ensure that gas can be mixed with North American natural gas to bring LNG within an acceptable range of heating values (known as the Wobbe index).⁶¹

FERC Inadequately Evaluates All Alternatives For Dredge Disposal:

First, dredge disposal plans remain unclear, as Wahkiakum County has not agreed to have its sand pit used for the large quantity of dredge material involved in the project. The application must clarify the proposal before clearly evaluating alternatives to the proposal. There are discrepancies in dredging and dredge disposal plans between the FERC DEIS and the application to the Army Corps. The DEIS provides more discussion of potential dredge disposal alternatives, but this analysis does not appear to be included in the application to the Army Corps. It is difficult for the public, in general, to provide comment on this proposal when major discrepancies in the character and quality of information exist between federal applications.

⁶¹ South Coast AQMD presentation, May 31, 2007, Slide 25 of 31.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Additionally, the piping system described to cross the Columbia River shipping channel raises questions of safety and added disturbance if the dredge material pipe is disrupted by passing vessels. The Alternatives analysis should evaluate alternative methods of transporting dredged material and alternative disposal sites within the Columbia River.

Most importantly, the DEIS alternatives analysis does not evaluate a reasonable range of alternatives for either upland or in-water disposal. The analysis focuses on the proportion of disposal that should occur on land versus water, yet it does not include extensive site-by-site analysis of alternative dredge sites that have been evaluated and why the Wahkiakum County Sand Pit site and the Bradwood site will have the least impact on the aquatic environment. The analysis also does not appear to account for other dredge/fill activities in the area that could limit the availability of the Wahkiakum County Sand Pit site.

FERC indicates that disposal at these sites will have impacts on fish. FERC characterizes these impacts as "minimized" for beach nourishment alternatives without a clear, transparent discussion of avoidance and minimization for different possible disposal sites. NEPA requires that reasonable alternatives be considered and compared for their relative environmental impacts. The analysis that leads to this conclusion is cursory and does not involve in-depth consideration of dredge disposal sites in areas with less valuable fish habitat. FERC does not appear to consider sites further from the Bradwood site, but gives no detailed rationale as to why more distant dredge disposal in the Columbia or the ocean are too expensive.

There are practicable alternative disposal sites throughout the Estuary, ones that may also provide benefits to a "sediment-starved" Columbia River. FERC has failed to meet its burden in considering and thoroughly evaluating all of these practicable alternatives for dredge disposal. Oregon Department of DSL has also characterized FERC's evaluation of dredge disposal alternatives as limited, and lacking evaluation of other practicable in-water disposal alternatives.⁶²

FERC Should Evaluate Alternative Limiting Ship Sizes and Turning Basin

The FERC DEIS does not provide a significant or adequate analysis of turning basin design alternatives. In Section 3.1.9 of the EIS, on page 3-52, FERC simply dismisses the idea of limiting the terminal's turning basin size: "... alternatives requiring less dredging would not be able to safely accommodate LNG ships. As such, we did not consider it feasible to reduce the volume or extent of dredging and still satisfy the objectives of the project at the proposed size."⁶³ Bradwood considers configuration of the dredge area in Section 5.1.4.2 of its alternatives analysis for its 404 application to the Corps, as well, a document that is referenced in the DEIS, and this section fails to demonstrate that the proposed dredging activity is the least damaging practicable alternative.

FERC's blanket assumption that the facility must be constructed at the proposed size has resulted in the DEIS incorrectly dismissing alternatives that involve smaller tankers, a smaller turning basin, and less sendout capacity for the project as a whole. NEPA requires that all reasonable alternatives be considered, and FERC's failure to evaluate alternatives that may

⁶² Oregon DSL Preliminary State Agency comments on DEIS, Nov. 2007, at 31.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

require a reduction in the project size and sendout clearly violates its obligation to provide the public with a thorough assessment of alternatives. The highly restricted range of alternatives evaluated and considered violates the very purpose of NEPA's alternative analysis requirement, to foster informed decision-making and full public involvement.

FERC does not thoroughly evaluate the potential for using smaller vessels to access the LNG site, potentially reducing the size of the terminal overall, and limiting the amount of area to be dredged. As we have discussed above, there are alternative LNG sites throughout the West Coast that do not require 700,000 cubic yards of dredging in critical salmon habitat, and FERC has failed to consider other sites in sufficient detail to show that its own site is the least damaging practicable alternative for delivering LNG into the West Coast market. NOAA also raises this concern, and notes that the alternatives are not balanced or compared with regard to impacts to threatened and endangered species and other important environmental and economic factors. FERC must evaluate alternatives that involve less dredging by using smaller LNG tankers, or it must provide clear reasoning why this is not a reasonable alternative.

There are a range of sizes of LNG vessels (from under 70,000 cubic meters to greater than 200,000 cubic meters). According to Bradwood's analysis for its 404 application, "A depth of ~42 feet was determined necessary based on the need to provide clearance of the *largest size LNG carrier* draft with adequate connections to and from the carrier channel" (emphasis added).⁶⁹ The analysis should evaluate alternatives that accommodate smaller tankers; no rationale is offered in the DEIS or elsewhere as to why the turning basin must be designed to accommodate the largest tankers. Currently, the USCG is recommending a size limitation on incoming LNG tankers, and smaller vessels could result in a significant reduction in the area that needs to be dredged.⁷⁰ This would reduce the overall impacts of the project on the aquatic environment of the Columbia River. FERC should consider a similar condition and limitation on turning basin size and the amount to be dredged.

FERC characterizes the size of the turning basin as a conflict between safety and aquatic habitat impacts. Yet, the safety risks could be reduced by limiting LNG tankers size to the smallest LNG tankers available. FERC does not evaluate in any way the significant advantages to fish species that might occur from reducing the amount of dredging and the size of the turning basin. NEPA requires that alternatives be considered in detail, and FERC has failed to evaluate whether material benefits to fish and aquatic habitat exist from reducing the size of the Bradwood project. The DEIS does not provide an adequate basis for the US Army Corps of Engineers to evaluate the project's least environmentally damaging practicable alternative. Without detailed consideration of a proper range of project size and turning basin alternatives, the analysis is flawed and unreasonably narrow, in violation of NEPA.

The impact to multiple listed species of salmon has been characterized as significant and negative, both by FERC and NMFS. The disruption of benthic habitats, which generate migrating and rearing fish food supply, is also a potential serious impact. We address these impacts in greater detail elsewhere, but FERC should not assume that reducing dredge area will provide no benefits. In fact, differences in site design, according to NOAA and Oregon DEQ,

⁶⁹ Bradwood Landing Joint Aquatic Resources Application, Attachment H, October 2006.

⁷⁰ USCG Waterway Suitability Report for Bradwood LNG Terminal, March 2007.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

may result in significant reduction of negative impacts to the environment (see those agencies comments). The safety of LNG tankers is a high priority, but the FERC incorrectly presumes that the only method of keeping LNG tankers safe is by having a large turning basin, when alternatives in tanker and project size are readily available.

FERC Must Consider Key Alternatives to Pipeline and Its Route.

The need for the project and the pipeline has been questioned by multiple agencies. Alternatives to the construction of the pipeline as a whole appear to have been ruled out by artificially narrowing the project purpose to serving Lower Columbia River industries. The DEIS provides no analysis of alternative methods of meeting those Lower Columbia River needs or consideration of the relative proportion of the project and its impacts that are justified based on the small likelihood of those industries using a large portion of the project's capacity. NOAA questions the overall approach that FERC has taken to its complete its analysis:

"Is the purpose to provide a new source of LNG to the Pacific Northwest? Is the purpose to provide a new source of LNG for Wauna Mill, NW Natural, PGE, and Williams Pipeline? The pipeline alternatives analysis would appear to indicate the latter is true, which greatly constrains the alternatives that meet the project purpose and appears to increase the environmental impacts of other alternatives as they try to service the same potential customers."⁷¹

Because the Bradwood project is clearly linked to the Palomar pipeline, it is difficult to assess alternatives to routes on the Bradwood pipeline through Cowlitz County without asking whether this route is altogether redundant. According to maps submitted by the Palomar Gas Transmission project to FERC, the Palomar pipeline plans to intersect with the Bradwood pipeline near Wauna. FERC should evaluate whether its proposed pipeline across the Columbia River and through Cowlitz County is necessary given Bradwood's stated intention of using the Palomar project in the future. The alternatives analysis does not provide any consideration of the relationship between the Palomar and Bradwood pipelines.

The Palomar pipeline would fulfill the true purpose of the project more effectively than the proposed Bradwood pipeline, which intends to supply 1.3 bcf/d of gas to a pipeline system that cannot accommodate that enormous volume of gas. Williams Northwest Pipeline has indicated that it would have to cancel all current contracts for gas supply to its existing customers – a highly unlikely scenario – in order to accept the huge volume of gas Bradwood proposes to send out each day. Clearly, the Palomar pipeline represents the true conduit for Bradwood's gas to regional markets that can absorb it. Without the Palomar pipeline, the project is constrained to delivering gas to markets that are unable to economically accept it, according to the pipeline capacity study recently completed by ICF International on behalf of WA EFSEC. NOAA addresses the relationship between Palomar and the Bradwood project, and states that the two are clearly interdependent:

FERC's Notice of Intent for the Palomar Pipeline project (PF07-13) indicates the proposed pipeline would terminate at NorthernStar Energy LLC's Bradwood Landing pipeline near Wauna, Oregon. But for the construction of the Bradwood

⁷¹ NOAA comment on FERC DEIS, at 4, Dec. 17, 2007.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Landing LNG import terminal, the Palomar project apparently would not be constructed as proposed (see DEIS 2.1.6). At a minimum, segment 2 of the Palomar project would appear interdependent on the Bradwood Landing LNG project. The 50 CFR 402.02, regulations which implement the ESA, define interrelated and interdependent effects. Interrelated actions are those that are "part of a larger action and depend on the larger action for their justification."⁷² Interdependent actions are those that "have no independent utility apart from the action under consideration." Segment 1 would achieve connection to NW Natural's regional distribution system and provide another natural gas source to the Portland Metro area. Extension of the pipeline to Bradwood Landing would have no utility independent of the proposed action. Extension of a bidirectional pipeline to the Mist Storage Facility would provide indirect access to Bradwood Landing LNG via a proposed lateral pipeline from NorthernStar's pipeline to Mist. Implementation of segment 2 fundamentally alters the Palomar Pipeline's operations from a LNG source for the Portland Metro area to a West Coast distribution network for Bradwood Landing LNG. FERC should include anticipated impacts of segment 2 of the Palomar Pipeline project in the EIS.⁷³

Because the Palomar project will likely be necessary, in any case, for the Bradwood project to viably deliver its gas to market, the alternatives analysis must evaluate whether Bradwood can forego its pipeline through Cowlitz County. This alternative is reasonable and would entirely avoid major negative impacts to aquatic habitats throughout Cowlitz County.⁷⁴ These impacts include the crossing many sensitive wetland areas and open trench pipeline construction across salmon-bearing streams.

FERC does not provide an adequate analysis of route alternatives on its proposed 35-mile pipeline route, either. FERC's description of route alternatives is cursory and does not provide adequate detail and evaluation of potential impacts to rivers, streams, and wetlands from construction and operation of the pipeline. FERC has also failed to evaluate constructing a smaller diameter pipeline, which might allow for more nuance in routing the pipeline around sensitive areas. The alternatives analysis does not include adequate discussion of so-called "minor" route variations within the proposed route. The "minor" variations have enormous potential to enhance or diminish the level of aquatic impacts along the pipeline route. The FERC's project description, in general, is vague and does not account for changes that have occurred – including a potential change in the HDD drill site on the Washington side of the Columbia River.⁷⁵

As an example of FERC's failure to adequately address pipeline route alternatives, there are two areas which stand out among many deficiencies in the DEIS and highlight the inadequate range of alternatives considered. The project proposes to use an HDD in NS-1 to reduce "impacts on environmental resources" but completely fails to integrate consideration of the area immediately East of Bradwood as geologically unstable. Multiple state agencies have indicated

⁷² NOAA DEIS Comments, at 5. Submitted 12-17-07.

⁷³ See Comments of Cowlitz County, prepared by Parametrix, regarding the DEIS. Also see comments of Sandra Davis, Marjorie Castle, and Gayle Kiser.

⁷⁴ See comments of Marjorie Castle on DEIS.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

that the area is seismically active with multiple active landslides nearby, and the very first mile of the pipeline proposes to cross an active landslide area. Residents of Puget Island have repeatedly raised concerns about this portion of the pipeline, which crosses an area that only last winter slid, causing debris to fall on and block the railroad below. Additionally, in the 1960s a landslide caused a tsunami to move across the Columbia River, flooding part of Puget Island and causing one death. Richard Beck has submitted information corroborating this event, which FERC has dismissed saying that they can find "no evidence" of a landslide there.⁷⁶

A second area of serious concern involves a crucial segment of the pipeline as it crosses the Columbia River. The routing for this part of the pipeline is highly sensitive and any adjustment cannot truthfully be characterized as "minor." Shifts by a few hundred yards in either direction will involve very different impacts, resources, and landowners than the proposed route. Unfortunately, the proposed routing of the directional drill is unclear, according to conversations held during the Clatsop County land use process.⁷⁷ Specifically, the alternatives analysis does not weigh the best available information when evaluating HDD routes across the Columbia River. In particular, geotechnical reports indicate that unstable geology and active landslides in this area should warrant a rerouting of this segment of the pipeline. The DEIS states, "impacts on natural resources are generally consistent between the two route segments" – a statement that contradicts the extremely sensitive geology of the area and information in Bradwood's resource reports. The Geohazard Report indicates that rerouting in this area may be necessary, and information in the Geological Hazards section of the DEIS (Page 4-19 Section 4.1.4.3, also see Geologic Hazards Table 4.1.4-3) shows significant hazards in this area. The alternatives analysis seems to indicate no difference in reasonable alternatives regarding environmental impacts, yet information submitted by URS Corporation and issues raised by both Cowlitz County and Oregon Department of Geology raise questions about the validity of these conclusions.

FERC should evaluate alternatives that minimize the use of open-trench construction methods in salmon-bearing streams. The alternatives analysis does not include adequate or specific information describing why HDD or other methods are not practicable in avoiding serious disturbance to habitat for ESA-listed salmon species. FERC does not demonstrate that it has routed its pipeline to avoid sensitive wetland areas. The alternatives analysis must include a detailed description of why the route was chosen and why no practicable alternatives exist to the construction methods and locations for the pipeline. The description of the route and waterbody and wetland crossings and why specific methods were chosen for each crossing, are almost entirely lacking in the Alternatives analysis. FERC does not justify why open-trench methods are necessary for certain areas, and an alternative involving no open trench cuts across streams with essential fish habitat and active runs for threatened and endangered species must be considered.

It is also important to note that information provided by the applicant to multiple federal agencies on this issue is inconsistent. Attachment H, Bradwood's alternatives analysis for its 404/401 applications, appears to provide inaccurate and contradictory information based on revised pipeline routing and crossings reflected in the Draft EIS. For example, dozens of sensitive wetland areas are impacted by the pipeline, and the project description in the

⁷⁵ See comments of Rick Beck on DEIS.

⁷⁶ See comments of Marjorie Castle on DEIS.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Alternatives analysis appears to be grossly inaccurate in its characterization of wetland impacts: "After all of the minor route adjustments and other avoidance and minimization measures are applied, the remaining unavoidable impacts to wetlands and other waters of the U.S. from the proposed route are small and scattered along the route" (BL Attachment H, at 44). This assertion is directly contradicted by the DEIS, which on pages 4-99 and 4-100 provides a table of wetland crossings. Areas to be permanently and temporarily altered by the pipeline amount to 97.9 total acres. The alternatives analysis provided to the Corps, and the current application to the Corps, does not reflect the current status of the project, and clearly the discrepancies between the project described in this application and the EIS are serious and make evaluation of the alternatives very difficult. The Corps cannot reasonably evaluate how to determine if the project proposed is the least environmentally damaging practicable alternative if applications include obviously contradictory information. The DEIS should clarify the role of the Army Corps in evaluating these impacts and how the public should understand a proposal with multiple, contradictory configurations depending on agency and application.

Regardless, dozens of salmon-bearing streams and sensitive wetlands will be crossed by the pipeline. FERC provides insufficient detail in describing how and why the proposed route was selected, and why there are no practicable alternatives exist to avoiding the dozens of acres of sensitive stream and wetland habitats that will be impacted by dredge/fill activities. The Alternatives analysis is both inaccurate and vague, and FERC has failed to evaluate practicable alternatives in the routing of the pipeline.

Specifically, there are numerous fish-bearing streams that Bradwood proposes to cross through open-trench methods, including Larson Slough, McLean Slough, Hammony Creek, Brock Creek, Coal Creek, and Clark Creek. The EIS finds that pipeline construction and operation will result in "substantial adverse effect on Pacific Coast salmon essential fish habitat" (DEIS, at 4-171). Again, FERC, the Army Corps and the public lack specific information to justify the conclusion that there are no practicable alternatives to its proposed routing. FERC must consider reasonable alternatives to the project as a whole, and to routing that damages fish-bearing streams.

FERC fails to offer a thorough description of either its chosen route or major route variations and the relative wetland/stream impacts of each. The alternatives analysis for the alternate routes (Southern Route, Railroad route) do not specifically describe possible reductions in impacts to threatened and endangered species and their habitats. Ultimately, the criteria for determining practicable alternatives are poorly developed in this alternatives analysis. NOAA has noted that the alternatives analysis for the DEIS "appears to dismiss alternatives due to financial considerations without fully evaluating environmental or public safety impacts." The NOAA comment letter continues by arguing that FERC and the applicant "should develop and implement a more transparent cost/benefit decision matrix in the alternatives analysis. Furthermore, any financial costs analysis should be comprehensive and include costs associated with each alternative in its entirety (e.g., increased shipping costs to river commerce due to traffic restrictions, impacts to fisheries, increased emergency response capacity)."⁷⁷ We strongly agree with these conclusions, and the cursory analysis provided by FERC clearly violates

⁷⁷ NOAA comment letter on FERC DEIS. December 17, 2007.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

standards requiring that all reasonable alternatives be evaluated in a logical, transparent fashion with regards to their costs, impacts, and technological feasibility.

FERC fails to adequately address alternatives with respect to tanker traffic for the Coast Guard's analysis

In its analysis of alternatives, FERC does not properly weigh a reasonable range of alternatives for the USCG to consider in whether it permits the facility. FERC and the USCG should consider conditions that include limiting the number and size of tankers that visit the proposed LNG terminal at Bradwood. The alternatives analysis concludes that the no action alternative for the USCG – finding the waterway not suitable for LNG traffic – would fail to meet project objectives. However, as we argue above, there are readily available alternatives to the proposed LNG terminal to serve regional energy needs. FERC should not assume in the DEIS that project objectives cannot be met through continued or increased reliance on Rockies and Canadian supplies of natural gas as well as energy conservation, renewable resources, and energy efficiency.

The FERC should also evaluate project alternatives in light of SIGTTO regulations.⁷⁸ The LNG industry has a good safety track record in shipping LNG cargoes partially because it typically has high standards for site selection for LNG import terminals. The Bradwood LNG terminal fails to meet high international standards for an LNG import terminal in several respects – the channel width is excessively narrow, the berth is proposed to be parallel to the shipping channel on the outside bend of the shipping channel, and there exist significant natural navigational hazards (the Columbia River bar) to safe transit.⁷⁹ FERC and the USCG should evaluate all potential LNG sites with respect to their potential to disrupt shipping traffic and their potential for an accident. The comparison of site alternatives does not include a detailed analysis of this type as required by NEPA, and the USCG cannot rely on the cursory analysis provided in the DEIS to make its recommendation regarding the environmentally preferable alternative for the project.

By narrowing the DEIS consideration of river safety and traffic issues to a few conditions being considered by the USCG, FERC fails to consider the full range of alternatives to the project and falsely creates a dichotomy between the USCG issuing a LOR and project objectives not being approved. The "all or nothing" approach FERC uses to characterize project alternatives does a severe disservice to the public and to cooperating agencies in the Bradwood permitting process; alternatives to the project and to the project design – in ship size, ship frequency, project sendout capacity, and alternatives to LNG altogether – are readily available and have received cursory or no analysis from FERC.

Conclusion for Alternatives Analysis

FERC has failed to consider key practicable alternatives to its project, to the design of the terminal and the turning basin, and to its proposed pipeline. There are numerous practicable

⁷⁸ SIGTTO, Society International of Gas Tanker and Terminal Operators. Site Selection and Design for LNG Ports and Jetties. August 2000.

⁷⁹ Id.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

alternatives available for meeting West Coast energy needs. FERC dismisses non-LNG alternatives, while assuming that electricity generation from LNG-sourced gas will be a major driver for the project. There are many alternative methods of generating electricity that do not involve LNG importation. Energy conservation, renewable energy, and energy efficiency all present practicable alternatives to LNG throughout the West Coast. There are also practicable alternatives available for maintaining gas supplies to the Pacific Northwest and the West Coast, including increasing access to domestic supplies of natural gas. Alternative LNG sites – particularly sites closer to the target market in Northern California – must also be considered and are almost entirely omitted in the alternatives analysis. Finally, FERC has failed to assess reasonable and practicable site alternatives in the Pacific Northwest and to the design of its project that would significantly reduce the negative impacts of its project on the aquatic environment.

The Columbia River Estuary has been considered the “lynchpin” for recovery of ESA-listed salmon species. FERC provides cursory and inaccurate analysis of the impacts of its dredge/fill activities, and the Army Corps must find that practicable alternatives exist to severely undermining the health of the Estuary, both in the Columbia River and in wetlands and rivers impacted by the terminal and pipeline. “An alternative is practicable if it is available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes.” 40 C.F.R. § 320.10(a)(2). The alternatives analysis fails to address many alternatives, and some alternatives are given such cursory consideration that it is impossible to realistically conclude that they are not practicable. This includes changes to terminal design, turning basin size and design, alternative LNG sites, and both major and minor route variations on the pipeline route.

Reasonable and practicable alternatives to the proposed action do exist and have been identified in earlier comments. The alternatives considered, however, were unreasonably narrow and not meaningful in regards to the purposes of NEPA. The highly restricted range of alternatives evaluated and considered violates the very purpose of NEPA’s alternative analysis requirement, to foster informed decision-making and full public involvement. 42 U.S.C. §101; 42 U.S.C. §102(2)(E); 40 C.F.R. §1508.9(b); *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 349 (1989).

Indeed, NEPA’s regulations and Ninth Circuit caselaw require the agency to “[r]igorously explore and objectively evaluate all reasonable alternatives.” 40 C.F.R. § 1502.14(a); *Citizens for a Better Henderson v. Hodel*, 768 F.2d 1051, 1057 (9th Cir. 1985). The Ninth Circuit has consistently held that an agency’s failure to consider a reasonable alternative is fatal to an agency’s NEPA analysis. See e.g., *Idaho Conserv. League v. Mumma*, 956 F.2d 1508, 1519-20 (9th Cir. 1992) (“The existence of a viable, but unexamined alternative renders an environmental impact statement inadequate.”)

The minimal difference among the action alternatives is not consistent with NEPA’s requirement that a range of alternatives be considered especially when given the repeated public requests that alternative sites, alternative natural gas sources to LNG, and alternative energy options (renewables, conservation, efficiency) be fully considered. *State of California v. Block*, 690 F.2d 753 (9th Cir. 1982).

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

FERC misrepresents purpose and need for the project.

Purpose and Need Overview

FERC has vastly overstated the need for a LNG terminal in the Pacific Northwest, particularly Oregon, and misconstrues the real purpose of the Bradwood LNG Project. The purpose and need statement in an EIS is required by NEPA to justify why an agency action is necessary. 40 C.F.R. § 1502.13. The agency action at question here is the approval or disapproval of the Bradwood Landing Project by FERC. In its DEIS statement concerning the need of the Bradwood Landing Project, FERC fails to fully analyze the demand for natural gas in the future and fails to give adequate weight to non-conventional domestic supplies, conservation measures, and current storage capacities. Furthermore, the stated purpose for the project in the DEIS is imprecise because of a faulty assumption by FERC that natural gas imported as LNG to the proposed Bradwood Landing terminal, and distributed there from, will be used to supplement regional supplies, when in fact Bradwood’s purpose for the project is, at least in part, to tap into the California market and supplement California natural gas supplies.

In the purpose and need statement of the DEIS, FERC justifies the need for an approval of the project by citing energy use forecasts predicting increased future demands for natural gas, exacerbated by shrinking domestic and Canadian supplies to the region because of increasing demand elsewhere in the nation. DEIS at 1-4. Therefore, according to the DEIS, international imports in the form of LNG are needed to meet demand and stabilize the market. *Id.* However, a variety of factors indicate that importation of LNG from foreign nations is unnecessary and is likely to destabilize both the supplies and prices for the region.

The demand for natural gas will likely not be as great as the DEIS purports. According to the Northwest Gas Association (NWGA), and acknowledged by FERC in the DEIS, the existing gas supplies and infrastructure will be sufficient to meet demand in the next few years.³⁰ Moreover, although NWGA predicts a shortfall for meeting peak demand conditions in 2010 using a high growth or base growth scenario, the predictions relied upon in the DEIS are based on suspect NWGA assumptions of an 8.1% growth rate for natural gas consumption in the Pacific Northwest through 2011 using its base growth scenario.³¹ On the other hand, longer range forecasts based on reasonable assumptions reported by the Energy Information Administration (EIA) in its Annual Energy Outlook (AEO) predict less than an 8% increase for natural gas consumption in the region from 2005 to 2030.³² FERC should evaluate the need for LNG imports based on the lower projected natural gas consumption estimated by the EIA since those numbers are objective governmental projections less likely to be biased, whereas the NWGA projections are from a group consisting of natural gas and pipeline companies seeking a profitable outlook. Additionally, FERC must evaluate the need for LNG based on an increased focus in the Pacific region on renewable energy, conservation, and energy efficiency – all energy options that are likely to reduce natural gas demand.

³⁰ Northwest Gas Association. 2006. 2006 Northwest Gas Outlook Update. Available online at: <http://www.nwga.org/>. Accessed October 2007.

³¹ *Id.*

³² Energy Information Administration. 2007. Annual Energy Outlook 2007 with Projections to 2030. Report #: DOE/EIA-0383(2006). February.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

There are also serious uncertainties in the projected growth of natural gas consumption regionally and nationally. In fact, the EIA AEO 2007 notes that forecasts for actual national natural gas consumption from 2005 to 2030 have consistently been scaled back over the past couple years due to a variety of factors including greater conservation measures and less predicted reliance on natural gas for electric energy generation. For example, EIA projections in 2006 estimated national natural gas consumption in 2030 to reach 26.8 trillion cubic feet (Tcf), while the 2007 projections are only for 26.1 Tcf of natural gas consumption in 2030.⁶⁵ The DEIS falsely asserts that "much of the demand growth in the NWGA forecast is driven by power generation." DEIS at 1-4. However, the NWGA also acknowledges a lower reliance on natural gas for electric energy generation, given the volatile gas prices and sufficiency of hydropower sources, leading them to lower their projected base growth consumption from over 9.3% to 8.1% through 2011.⁶⁶

The Northwest Power and Conservation Council's Fifth Power plan indicates that gas prices will continue to limit gas-fired production.⁶⁷ These uncertainties regarding the projected consumption of natural gas, both in the short-term and long-term, indicate the growing effects alternative energy sources and conservation measures are having on the regional and national energy market. FERC should reanalyze the growth projections if used to analyze the need for LNG based on demand in the DEIS given its false information about natural gas powered electric production and the current and past trend for lowering natural gas consumption projections.

Yet another factor that FERC failed to properly analyze when determining the need for imported LNG is the forecasted increased production of domestic conventional and non-conventional natural gas. The NWGA admits that production from U.S. Rocky mountain sources is projected to increase by 2011.⁶⁸ Furthermore, the Alaskan North Slope, along with the Mackenzie River Delta in Canada, has enough proven resources to satisfy the whole U.S. natural gas demand for more than a decade.⁶⁹ Natural gas sources from Alaska are predicted to be up and running by 2017, and along with advances in technology for exploration and production, should be sufficient to meet North American demand for a substantial period. FERC properly states that domestic production of natural gas supplies are predicted by the EIA to increase substantially in the coming years as non-conventional sources of gas are tapped into. DEIS at 1-4. However, FERC essentially dismisses these non-conventional sources by implying it is possible that these resources will not be able to be successfully and economically explored and produced.⁷⁰ FERC should include a more thorough analysis of both these conventional and non-conventional sources of natural gas when determining the need for imports through the Bradwood LNG terminal into the region. We discuss alternative sources for natural gas in more detail in our discussion of alternatives to the Bradwood project, including gas supply sources in the Rockies and in Canada.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Increased competition for the resources that the Pacific Northwest relies upon for its natural gas demands is another justification relied upon by FERC for the need of a LNG import terminal at Bradwood Landing. FERC notes that Oregon relies 100% on imports of natural gas for consumption. DEIS at 1-4. However, as noted above, the domestic production is likely to increase over the next few years as new technology for exploration and production comes into play. These additional resources, along with conservation measures and alternative energy, should help alleviate, if not completely offset, the increased demand of the nation and, therefore, competition for Pacific Northwest resources.

FERC claims that the relatively low prices the Pacific Northwest has historically enjoyed will be threatened by competition for the resources the region relies upon, and implies that LNG imports will help stabilize the supply and price for the region. This is a blatantly false statement. Imports of LNG are notoriously unreliable because of uncertainties in the supply and demand of the global market. Indeed, there are currently not enough liquefaction facilities and the current liquefaction facilities are having supply shortages, leading to shortages of LNG in the face of increasing global demand.⁷¹ Additionally, because of increasing oil prices, the global demand for natural gas is predicted to increase substantially leading to a global increase in LNG prices and a predicted lowering of the capacity utilization rates at domestic LNG terminals.⁷² Clearly, LNG is currently not a reliable source of natural gas, nor will it be in the near future. If the region does in fact need a supplemental stable source of natural gas at steady prices, LNG is not the answer. Approval of the Bradwood LNG Project would have the opposite effect on natural gas supplies and prices in the region, leading to possible shortages and increased costs if LNG supplies are relied upon for future needs. FERC should reevaluate the purpose and need in light of these observations and better relate to the public the effects importing LNG will have on the regional supplies and prices, especially given the likely purpose of the project as discussed below.

The claims by Bradwood that the proposed Bradwood LNG Project is being designed to serve the needs of Oregon and the Pacific Northwest is obviously an exaggeration given the information above relating to the already saturated market in the Pacific Northwest. The Pacific Northwest market does not require more inputs of natural gas, especially from unstable foreign sources that will likely cause instability of supply and prices in the Pacific Northwest if relied upon for any supposed future need. The true market in the West is California, which consumes more natural gas than all other West Coast states combined.⁷³ Not only does California use more natural gas than any other state in the region, California is a rapidly growing market.⁷⁴ Regardless of how fast the market for natural gas is growing in California, proposals for LNG terminals in California have been met with very strong resistance due to environmental and safety concerns. To date, no proposed LNG terminal has been approved for California. It goes without saying that the closest alternative sites for LNG terminals are Mexico and Oregon. Proposals for new LNG terminals in Mexico have also been met with resistance because of

⁷¹ Energy Information Administration. 2007. Annual Energy Outlook 2007 with Projections to 2030. Report #: DOE/EIA-0383(2006). February.

⁷⁴ *Id.*

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

environmental and safety concerns, as well as economic considerations. Therefore, a slew of proposed projects have been initiated for Oregon, the next best alternative for an LNG source for California markets. Obviously Oregon and the Pacific Northwest do not require additional natural gas inputs in the form of LNG to meet current or near future demands from one LNG terminal, not to mention the three to five terminals that are under consideration. FERC should seriously reconsider the purpose behind the proposed Bradwood LNG Project and accurately relay the true purpose to the public.

Bradwood and FERC claim that the designated market for the Bradwood LNG Project is Oregon and the Pacific Northwest. However, the justification for this stated purpose is not sufficiently strong to indicate that there is in fact a need and demand in the Pacific Northwest for LNG. The Oregon market can not absorb another 1.3 bcf/d of natural gas from the proposed Bradwood LNG terminal. The only economically viable market for the natural gas is California. The Palomar Project provides a clear conduit to California. Therefore, it goes without saying that the proposed Bradwood LNG terminal will have a viable California market to ship its natural gas to, a market with much higher demand and profit expectations than any other in the region. How can Bradwood honestly claim they are not seeking to serve the California market when that is the market most economically feasible for allocation of incoming natural gas from foreign LNG markets and when there are already plans to build a pipeline connecting the proposed terminal to interstate pipelines leading to California? FERC should undertake further analysis regarding the likely future market to be served by the project, taking the Palomar pipeline into account.

Alternatively, if current sources of natural gas to the Pacific Northwest are rerouted to serve the large and growing California market because of the additional inputs into Oregon via the proposed LNG terminals, Oregon and the Pacific Northwest will be substantially harmed. As mentioned above, foreign LNG markets are notoriously unreliable, and if Oregon and the Pacific Northwest are forced to rely on imports of LNG the supply and prices in the region are very likely to be adversely affected. Oregon should not have to bear the brunt of supply and price fluctuations, in addition to environmental, economic, and safety impacts, so that California may enjoy a steady and price stable supply of domestic gas. There are sufficient domestic and other gas sources other than foreign LNG to serve the whole West coast including California. It is unnecessary to subject Oregon to all the impacts of the proposed Bradwood LNG terminal. At the least, FERC should further evaluate the purpose behind the proposed Bradwood LNG Project and accurately relate to the public the potential impacts of the project.

FERC defines purpose and need too narrowly

The FERC has failed to undertake an adequate analysis of alternatives because of an unreasonably narrow definition of the purpose and need of the project which FERC then uses to dismiss reasonable alternatives. The DEIS states, "The purpose of the Bradwood Landing Project is to provide a new source of natural gas to the Pacific Northwest through importation of LNG" (DEIS, 1-3). The project objectives list key delivery points, and taken with the overall purpose of the project, this section of the DEIS reads more like a description of the project than an accurate characterization of the purpose and need. The purpose of the project should be more broadly stated in terms of supplying the region with energy. An analysis for a broader, more

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

accurate statement of the purpose for the project would lead FERC to include detailed consideration of non-LNG alternatives, other LNG sites, and alternatives to the proposed design of the project.

By narrowing the purpose statement to focus on LNG importation and, specifically, LNG importation on the Columbia River with the potential to deliver gas to Mist, Williams Pipeline, and Lower Columbia industrial and electricity generation users, the FERC has excessively narrowed the scope of its entire analysis. We have described in our comments on the Alternatives analysis how the narrow focus of the DEIS has resulted in reasonable alternatives not being given adequate consideration. FERC similarly errs in narrowing its consideration of the need to be served by the project, failing to justify assumptions regarding the future of natural gas demand and supply in the Pacific Northwest. Indeed, multiple state and federal agencies have questioned the need for the project as it is described, and ICF International concluded that supplies for natural gas were "abundant" for the foreseeable future from either the Rockies or Canadian supply basin: "Gas supply is expected to remain abundant well beyond the forecast period of 2025."⁵³

FERC describes key objectives and included Lower Columbia River industries that cannot absorb a huge quantity of LNG as possible consumers. The primary project objectives do not require a project of the size and scope of the Bradwood LNG terminal, and multiple pipelines already supply these gas users from existing infrastructure and supplies.⁵⁴ The DEIS does not justify the need for the size of the project. At 1.3 bcf/d with the potential for expansion, the project will dwarf any future needed gas supplies. Yet, FERC excludes alternatives because they cannot be built to the size of the project desired by Bradwood. The purpose of the project should not be to build an LNG terminal of the enormous scale proposed, but rather it should be to deliver energy to the Western energy market.

FERC has routinely dismissed alternatives that involve reduction of the project size. Essentially, FERC has defined the project purpose and need so closely to the project description (even requiring sendout capacity of 1 bcf/d or greater with the possibility of expansion), the overall analysis suffers from a lack of regional perspective and even readily available alternatives in adjustments to project site, design, and size. The recently completed ICF International pipeline capacity study (submitted to Washington's EFSEC) indicates that the purpose and need description in the EIS is disingenuous, and that the purpose and need for the project would more accurately be defined as supplying natural gas to the Western energy market.⁵⁵

FERC falsely claims that project's primary purpose is to serve Oregon and Washington gas needs

⁵³ ICF International. Nov. 2007. Review of Pipeline Utility Corridor Capacity and Distribution for Petroleum Fuels, Natural Gas, and Biofuels in SW Washington. Submitted to WA State EFSEC.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

FERC makes broad assumptions regarding the need for LNG in the Pacific Northwest that are unsupported by unbiased evidence. FERC uses outdated data to argue that LNG is needed in the Pacific Northwest while ignoring growing renewable energy, conservation, and efficiency programs in the region. ODOE and other state agencies have asked that FERC consider the impact of renewable portfolio standards. With FERC projecting average growth of 2 percent a year in regional gas use, the impact of conservation and efficiency programs must be considered as a limiting factor. We discuss alternatives to LNG in greater detail in our comments on FERC's alternatives analysis, and FERC has failed to show that a need exists that cannot be satisfied through the no-action alternative.

FERC's need analysis aggrandizes future Pacific NW gas demand based on data from the Northwest Gas Association (NWGA), an industry group whose members include utilities that will be involved in the Bradwood project (NW Natural gas, for instance). ODOE concurs that the NWGA does not constitute an independent perspective on future natural gas demand.⁹⁶ The NWGA data cannot be considered unbiased, as preliminary comments on the DEIS of the Oregon Department of Energy have noted: "The [demand] analysis is based entirely on NWGA forecasts. No independent assessment of demand. No consideration of demand side reductions."⁹⁷ Other State agencies have raised similar concerns with the FERC, as well.

The markets and key industries to be served by the project, as described by the DEIS, are not adequate to support an LNG facility of Bradwood's size. Industrial users and electricity generation in the Lower Columbia, by Bradwood's own estimates, are only likely to use 100 mmcf/d on an average day.⁹⁸ ODOE questions even this assumption, noting that operators of natural gas plants in the area are not planning to absorb LNG, currently.⁹⁹ Williams pipeline company has indicated that it does not have capacity to absorb all of Bradwood's gas, and that Bradwood will likely have to rely on the Bradwood pipeline in the future. These and other pitfalls in the needs analysis are illustrated by the comments of Oregon Department of Energy. Oregon Department of Energy recently commented, in its draft comments on the FERC DEIS, "The DEIS provides no independent assessment of the demand for LNG to justify the need for the proposed project."¹⁰⁰ ODOE's comment highlights widespread skepticism about Bradwood's characterization of the purpose and need for its project.

NOAA has also added its own reservations about the purpose and need of the project, raising the following questions regarding whether the alternatives analysis is artificially constrained in order to justify a high-impact project: "As the stated objective is providing the Pacific Northwest with another natural gas source, it would appear additional data from the region is warranted."¹⁰¹ Given broad skepticism about the need for the proposal, the no action alternative may result in the natural gas needs of the Pacific Northwest and California being met and should constitute a practicable alternative. Bradwood gives very little consideration to the potential for no action.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

While the project configuration and pipeline routing are purportedly designed to match the needs of Lower Columbia industrial and electricity generation users, some of those users do not appear to be planning for LNG. For example, comments of ODOE indicate that Port Westward is not factoring LNG into its gas supply needs. PGE, which owns generating facilities there, is not necessarily going to buy large quantities of LNG:

Delivery of gas to the PGE power plants at Port Westward is not a compelling reason to select the preferred pipeline route over alternatives. In the Oregon EFSC review of the Port Westward power plant, PGE did not assume that LNG would be available. PGE also did not assume the availability of LNG in its integrated resource plan review before the Oregon Public Utility Commission.¹⁰²

The Bradwood project is clearly designed to meet its expectation of West Coast-wide energy demands – not those of the Pacific Northwest. FERC's assertion that key project objectives involve delivery of gas to Mist and Columbia River industrial/generation users is severely undermined by the fact that less than 1/10 of the project would currently be likely to go to these users.¹⁰³ The quantity of gas proposed for import by Bradwood (1.3 bcf/d) more than doubles Oregon's average daily natural gas use.¹⁰⁴ This also renders it highly unlikely that a large proportion of the gas will be delivered into Oregon and Washington. The unlikelihood of the Pacific NW absorbing a majority of the gas is further illustrated by both the ICF International study and by Williams current long-term contracts for supplies on its Northwest pipeline system.

The enormous size of the project shows that a major economic driver for the project is California gas demand, rather than Oregon's or Washington's. California consumes as much gas as the rest of the West combined¹⁰⁵ and will likely receive most of Bradwood's gas, based on the recently proposed Palomar pipeline proposal (see attached maps). The Bradwood project not only seeks a connection to California's market via Palomar, but it also likely requires additional pipeline capacity aside from the proposed Bradwood pipeline through Cowlitz County due to the capacity limitations on that pipeline (ICF International study for WA EFSEC).¹⁰⁶ NOAA concurs that the Bradwood project and the Palomar project are interconnected, or at least the Western portion of the Palomar project appears to depend on the Bradwood project.

The Daily Astorian has reported the Williams Pipeline, by their own estimates, cannot absorb a significant quantity of Bradwood's proposed LNG supply. Furthermore, Bradwood admits that it plans to use the proposed Palomar pipeline to deliver significant quantities of gas to potential customers in California, according to its S-1 filing submitted to the Securities and Exchange Commission. Based on the true project purpose of serving gas to California, as admitted by Bradwood, the FERC should evaluate West Coast regional needs and alternatives for

¹⁰⁶ ICF International. Nov. 2007.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

meeting these needs. The WA State Pipeline Capacity study, however, concludes that no LNG terminal will be viable in the Pacific NW without a pipeline connection to California:

Local load in the Pacific Northwest is too variable and not large enough to be economic for a LNG terminal. To site a terminal at a size that would be economic, at least 1 Bcf per day to start with, *access to Northern Californian markets would be necessary.*" (emphasis added).¹⁰⁷

The pipeline capacity study and the recent Daily Astorian article show that the Williams pipeline is not capable of accommodating Bradwood's supply without vacating all of its current contracts for gas. The pipeline currently operates near capacity, and long-term supply contracts render the current proposed action potentially not viable.

FERC statements from staff evaluating the proposed Palomar project indicate that the Palomar and Bradwood projects are connected actions, and that the Palomar project may be the true recipient of the large proportion of Bradwood's gas that cannot be absorbed in the Williams system and Lower Columbia River industrial and electricity generation users.. Mr. Doug Sipes, who conducted scoping hearings for Palomar in mid-November, 2007, stated,

The Bradwood LNG terminal and its proposed sendout pipelines are being analyzed in a separate environmental impact statement. The Bradwood meetings were being held out here last week that Paul Friedman from our office held. They were the draft environmental impact -- they were the comment meetings on the draft environmental impact statement. Although gas coming into the Bradwood LNG terminal may ultimately be shipped by Palomar, the terminal developers have stated that the Bradwood LNG terminal and its associated pipeline would be built regardless of whether Palomar is built or not. Also, Palomar would be built to serve Northwest Natural's supply reliability regardless of whether Bradwood LNG is built, *although it would probably not need to be built all the way up to Wauna.*¹⁰⁸ (emphasis added)

The above statements, particularly the statement regarding whether or not Palomar would be built to Wauna, indicate that the two projects are connected actions under NEPA. While Mr. Sipes indicates that he does not believe the projects to be connected, the configuration of the Palomar project will clearly depend on whether Bradwood is approved or not, with the entire Western portion of the Palomar project likely being dependent on the Bradwood proposal. NOAA also indicates its skepticism regarding the separateness of the two actions, "FERC should include anticipated impacts of segment 2 of the Palomar Pipeline project in the FEIS."¹⁰⁹

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

FERC must acknowledge that the true project purpose of the Bradwood proposal is significantly altered due to its relationship to the Palomar project. California, which uses vastly more gas than Oregon and Washington combined (see below), will receive significant quantities of gas from Bradwood via the Palomar project if both are built.¹¹⁰ FERC must re-evaluate the purpose and need for the project in this regional, California-driven context. As noted above in our comments on the Alternatives analysis, both Palomar Gas Transmission project representatives (such as Gregg Kantor) and FERC representatives (Mr. Sipes, FERC transcripts for Palomar project) have made statements that support our conclusion that the need analysis for the project must include Californian demand, as it will likely be served from Bradwood via the Palomar pipeline.

The FERC defines its project purpose too narrowly. If the purpose is properly defined as delivering clean, affordable energy into the West Coast market, many other alternatives are available -- some of which, including continued or increased reliance on Rockies gas could fulfill all the project purposes. California gas needs are also a key factor to be considered in the needs analysis, as the project apparently intends to connect to California markets via the Palomar pipeline. Oregon PUC analyst, Ken Zimmerman, stated, "So far, the only people that have shown any interest in contracting with these LNG guys are in California."¹¹¹ Bradwood also acknowledged publicly in recent Clatsop County land use hearings that it already has an agreement to use the Palomar pipeline in the future -- an agreement that has been described in Bradwood's S-1 filing with the Securities and Exchange Commission in December 2006.

California gas needs should be evaluated as part of the DEIS needs analysis. More regional data is required to evaluate whether the project will serve a legitimate regional need (including California), and obviously alternatives must be considered on a regional scale if there is need for increased energy supply -- alternatives including energy efficiency, conservation, renewable energy, alternative natural gas supplies, and alternative LNG sites.

FERC fails to accurately evaluate the need for LNG

FERC must evaluate the need for LNG on a national, state, and regional scale. The DEIS rests its need analysis largely on a national presumption of need for LNG imports, and is inadequate in its evaluation of the regional need for LNG imports. In our Alternatives section we discuss why natural gas supplies from the Rockies as well as renewable energy, conservation, and efficiency initiatives in the Pacific Northwest can provide alternatives to the proposed project. The DEIS does not discuss gas demand adequately for the major market driving the potential need for the project -- California. Because the project will likely serve California if built, the DEIS must evaluate whether the Bradwood project is justifiably serving a need in the Pacific market as a whole -- including California.

Yet, there is ample evidence to demonstrate that California, which drives the regional market for natural gas by using as much gas as the rest of the Western states combined, does not need LNG to meet its future energy requirements. As discussed in our alternatives section, there

¹¹⁰ EIA Gas Summary data for OR, WA, CA. Annual Energy Outlook. 2006.

¹¹¹ "Pipeline Battle Hinges on Need, Livability." Ted Sickinger. *The Oregonian*. August 21, 2007. Ken Zimmerman quoted as energy analyst for the Oregon Public Utilities Commission.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

are many regional alternatives to LNG. Just as importantly, however, the projected demand for natural gas in the West Coast must be considered in light of growing conservation, renewable, and energy efficiency programs. There is enormous potential to limit the use of fossil fuels, and the State of Oregon recently passed legislation that may reduce growth in natural gas consumption to an almost negligible level from the baseline described by NWGA, according to a 2005 report completed by the American Council for an Energy Efficient Economy.¹¹² The report indicates that, by 2010, Oregon can limit its natural gas use by 5 percent, compared to base case assumptions. Looking ahead, natural gas demand could be limited by 8 percent by 2015 and 12 percent by 2020.¹¹³ These gains in natural gas conservation and efficiency would offset most, if not all, of the growth projected by the NWGA. They offset all of the projected 8-9 percent of growth projected by the EIA for 2025. FERC must re-evaluate the need for the project, taking the impact of renewable energy, efficiency, and conservation of energy into account.

California demand reduction should also be considered in evaluating the need for LNG. The ICF International study recently completed for Washington EPSEC shows that no project in the Pacific Northwest is viable without also serving the California market, and FERC should have evaluated the need on a more regional basis, including California. Information from California indicates that there is enormous potential for renewable energy, energy efficiency, and conservation that precludes the need for LNG altogether. In 2006, the Santa Barbara Community Environmental Council (Council) prepared a report analyzing whether California needs LNG to meet its current and future projected energy demands.¹¹⁴ According to the report, California can achieve its energy needs without importing LNG. In fact, the Council concluded that California can satisfy 133-381% of the State's additional natural gas demand through energy efficiency and renewable supplies.

The DEIS concludes, "neither conservation measures nor renewable energy sources are expected to replace the need for additional future natural gas supplies in the Pacific Northwest" (DEIS, at 3-7). FERC's confidence that increasing gas demand will necessitate LNG import in the Northwest is clearly not shared by Oregon Department of Energy. It also falsely concludes that independent regional energy forecasts conclude that increasing gas supply and gas-fired generation are necessary for meeting future demand. The NW Power and Conservation Council clearly indicate that wind power is a growing and viable alternative for meeting growth in generation capacity.¹¹⁵ As alternatives to fossil fuels increase in renewable energy, energy efficiency, and conservation, natural gas prices may be relieved of some of the strain and vulnerability to speculation and manipulation that has driven recent high natural gas prices.¹¹⁶

On a national scale, the DEIS exaggerates the need for LNG tremendously while failing to evaluate a realistic projection of regional needs. According to the U.S. Department of Energy,

¹¹² Elliot, R Neal and Anna Shipley. April 2005. *Impacts of Energy Efficiency And Renewable Energy on Natural Gas Markets*. American Council for an Energy Efficient Economy. at 6.

¹¹³ Elliot, R Neal and Anna Shipley. April 2005. *Impacts of Energy Efficiency And Renewable Energy on Natural Gas Markets*.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

the country has 60 years of natural gas supplies available to meet our needs.¹¹⁷ Given that the alleged need for natural gas is the driving force for this Project and the reason that the range of alternatives has been so narrowly prescribed, this is a critical, threshold issue for the lead agencies to consider. If we don't need LNG, we don't need to accept the tremendous risks and impacts that would result from the proposed Project.

Future expansion of LNG terminals, according to US Department of Energy, may provide a substantial increase in LNG. Terminals under construction and expansion are already expected to greatly increase LNG import capacity in the case that the U.S. opted to use more of this foreign fossil fuel. There are over a dozen approved LNG terminals, and several under construction. Existing facilities will expand, and the EIA estimates that current onshore facilities will provide more LNG than those under construction. Hence, the need for LNG is extremely limited beyond those facilities currently existing or already being built. If, as the EIA indicates, the existing four onshore terminals will expand to import large quantities of LNG, then the remainder of future projected LNG demand can likely be met with as many or fewer terminals. FERC both overstates the need for LNG in the DEIS, and it fails to account for this basic fact – that currently producing LNG terminals and those under construction are likely to fulfill any future LNG needs for natural gas demands on a national scale. The gaps in FERC's analysis for the Pacific Northwest and the West Coast region, as a whole, exacerbate FERC's problems in demonstrating that the Bradwood project is needed.¹¹⁸

FERC falsely concludes that LNG will be competitive in price

The FERC DEIS presumes that LNG will offer a new gas supply at a "competitive price." FERC does not provide evidence to support the conclusion that LNG is an economically reasonable source of gas supply for the region. Indeed, FERC has questioned

¹¹⁷ U.S. Department of Energy, *Natural Gas Fundamentals: From Resource to Market* (2003).

¹¹⁸ EIA. *Annual Energy Outlook*, 2006.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Bradwood's estimates of its supply in previous documents, but the DEIS does not provide adequate analysis to evaluate the potential negative economic impact of reliance on LNG in the future.

The price of LNG will be a key factor in determining how, and if, the fuel is used once it is imported. ODOE concludes that industrial use of natural gas is projected to decline by 4 percent, and that gas-fired generation may grow to meet demands – yet both of these factors depend at least somewhat on price. As noted above, natural gas prices may from North American sources depend on the success of conservation, efficiency, and renewable energy programs and development. The American Council for an Energy Efficient Economy concludes that “significant price reductions are possible by relieving demand” through a variety of efficiency, conservation, and renewable programs.¹¹⁹ Their report specifically cites Oregon's Renewable Portfolio Standard as a potential method for relaxing future growth in demand for electricity from natural gas-fired generation. Hence, comparison of LNG and North American gas costs should take Oregon's RPS and other similar programs in Washington and California into account. The comparison may render LNG even more expensive when compared to LNG.

Furthermore, according to many published reports, current pricing is more reflective of speculation than market fundamentals. North American supply basins are capable of producing natural gas more cost-effectively than LNG:

Costs are way below current prices. For the most expensive domestic production, deep water Gulf of Mexico, the full-cycle replacement costs may be as high as \$3.25-3.50/MMBtu, the report says. Imported LNG falls near that range also at \$2.75-3.75. Other North American full-cycle production costs are: overall Gulf of Mexico \$2.75-3.00/MMBtu; onshore Gulf Coast \$2.50-2.75; Canadian \$2.25-2.75; and Rockies \$2.00-2.25 . . .

¹¹⁹

In contrast, EIA data show that LNG delivery to the Pacific NW is a relatively high-priced alternative for meeting natural gas demands¹²⁰.

¹¹⁹ Elliot, R. Neal and Anna Shipley. April 2005. *Impacts of Energy Efficiency And Renewable Energy on Natural Gas Markets*

¹²⁰ Report by James R. Choukas-Bradley, a principal with the firm Miller, Bulis & O'Neill, and Natural Gas Intelligence, February 18, 2005. *Analysis Assail Hyped Gas Market, See Prices Falling*. ¹²¹ Annual Energy Outlook, 2004. Taken from Loretta Lynch March 2007 presentation, “The Case Against LNG.”

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

North American natural gas production costs and EIA data show that LNG is not likely to depress prices below current levels. In fact, conservation, efficiency, and renewable alternatives are economically viable alternatives to both, particularly LNG. The DEIS alternatives analysis does not compare costs or provide a reasonable projection of its own future gas supply costs. In contrast with supplies in North American, LNG is neither cheap nor abundant.¹²² James Jensen presented his analysis of the global LNG trade, and concluded that the Pacific Rim LNG market will remain tight into the foreseeable future, and that LNG supplies are susceptible to the same geopolitical factors that create instability and volatility in oil pricing. Supply uncertainty and the willingness of major Far East LNG consumers such as Japan, Korea, and China to link the price they pay for LNG to the price of oil make it highly unlikely that “cheap” LNG will ever be available on the West Coast of Canada or the U.S.¹²³

In addition, the track record for other LNG ports around the country provides evidence that such facilities do not operate full-time due to fluctuations in demand and price, as well as competition with foreign demand and market availability. According to a recent interview of Joseph Kelliher, former chairman of the Federal Energy Regulatory Commission,

“The most recent data I’ve seen suggests that [LNG facilities] were operating at less than 40 percent capacity.” When asked why, Mr. Kelliher replied, “It’s because we have to compete with foreign demand. LNG comes to this country either by long-term contract or in spot shipments. We’ve been losing out on a lot of spot shipments to Europe. If prices are higher elsewhere, that’s where the spot shipments are going to go. . . . LNG import facilities are operating at about 50 percent capacity worldwide. The world has twice the capacity to import LNG as it has to make LNG. That gives

¹²² J. Jensen, *Progress Report on Worldwide LNG Trade*, presented at CEC Staff Workshop on the Inputs, Assumptions, and Issues for the Natural Gas Assessment Report, March 26, 2007.

¹²³ Id.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

developers of the liquefaction facilities more choices when it comes to what markets they prefer to use."¹²⁴

An Associated Press news article, entitled "Natural gas imports leave U.S. vulnerable," explains that "as America becomes a bigger player in the global natural gas trade, its vulnerability to faraway production snags and price gyrations will rise, as will its dependence on energy from the Middle East and other volatile regions."¹²⁵ This article, which reports on the fact that U.S. natural gas supplies "tightened in January because LNG originally scheduled for delivery at a terminal in Cove Point, Md., was redirected to Europe," points out that even long-term supply contracts can be affected by the global market. Matthew Simmons and other energy analysts continue to suggest that LNG is trading globally at the lower end of its potential price range.¹²⁶ EIA data also conclude that LNG prices may fail to compete in the future, with tightening global supplies in the Pacific Rim and other basins resulting from competition with Asian and other markets.¹²⁷

To summarize, FERC cannot assume that LNG is providing a competitively priced source of natural gas. There are trends at the regional, national and global scale that may increase the gap between lower-priced North American supplies and likely high-priced LNG. In evaluating the purpose and need for the project, FERC must disclose the basis for its price assumptions, and FERC should evaluate the overall impact of potential gas price increases on the Western energy market.

The DEIS fails to consider connected actions

"The CEQ regulations require 'connected actions' 'to be considered together in a single EIS.'" *Save the Yaak Committee v. Block*, 840 F.2d 714, 719 (9th Cir. 1988), quoting *Thomas v. Peterson*, 753 F.2d 754, 758 (9th Cir. 1985). Connected actions (i) automatically trigger other actions which may require an EIS, (ii) cannot or will not proceed unless other actions are taken previously or simultaneously, or (iii) are independent parts of a larger action and depend on the larger actions for their justification. *Id.* 40 C.F.R. § 1508.25(a)(1).

The Ninth Circuit applies an "independent utility" test to determine whether actions are "connected" within the meaning of these CEQ regulations. *Native Ecosystems Council v. Dombeck*, at 894, citing *Wetlands Action Network*, 222 F.3d at 1118. "Where each of two projects would have taken place with or without the other, each has 'independent utility' and the two are not considered connected actions." *Id.*; see also *Morongo Band of Mission Indians v. FAA*, 161 F.3d 569, 580 (9th Cir. 1998). Where, however, a "close nexus" exists between two actions, such that one would not take place but for the other, the actions qualify as "connected" and must be analyzed in a single NEPA document. *Save the Yaak Committee*, 840 F.2d at 720. For example, the Ninth Circuit has repeatedly required the Forest Service to analyze timber sales and road reconstruction in a single NEPA document where the purpose of the road reconstruction "was to make the log hauling more efficient, productive, and safe," and nothing suggested that

¹²⁴ "Building up Gas," Martin Rosenberg, *EnergyBiz Magazine*, 2006.

¹²⁵ Natural gas imports leave U.S. vulnerable," *Burl Post, Associated Press*, Feb. 12, 2006.

¹²⁶ Simmons Oil Monthly, *Macro Energy Outlook* 2006, at 19.

¹²⁷ EIA LNG Overview, 2004, LNG price projections.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

"the road was reconstructed for any other reason." *Id.* Similarly, where a timber sale would not proceed without construction of a logging road, and the road would not be built but for the contemplated timber sales, the Ninth Circuit has determined that these actions are "inextricably intertwined" and must be analyzed in a single NEPA document as connected actions. *Thomas v. Peterson*, 753 F.2d at 759. Here, neither the Bradwood Terminal nor the 102.5 mile western section of the Palomar Pipeline have any "independent utility." Rather, the two projects are "inextricably intertwined" and failure to analyze them in a single EIS violates NEPA.

As discussed in great detail in the alternatives analysis above, the Bradwood Terminal would not be built without access to the California market provided by the proposed Palomar Pipeline. The natural gas market in Oregon and Washington simply cannot absorb such an increase in supply. Trying to skirt this issue, Bradwood redefines the "Northwest" to include much of the West coast and then analyzes the increased demand for natural gas in the region. However, this increased demand comes primarily, if not exclusively, from California; without access to that market, no reason would exist for building the Bradwood Terminal. The proposed Palomar Pipeline provides that necessary access and, therefore, the two proposed projects must be analyzed together in a single EIS.

Yet, the DEIS asserts that the Bradwood Landing Project is in no "way dependent upon Palomar" because:

Bradwood has proposed its own natural gas sendout pipeline, analyzed in this document, which would connect the Bradwood Landing LNG terminal with the interstate pipeline grid through an interconnection with Williams Northwest pipeline near Kelso, Washington.

DEIS 2-28. However, without access to the California market through the proposed Palomar pipeline, construction of the Bradwood Terminal would make little if any economic sense. Rather, the terminal depends on access to the California markets that the Palomar pipeline will provide and, therefore, the projects must be analyzed together in a single EIS.

The proposed Palomar Pipeline extension would not be built but for the Bradwood Terminal. In fact, the President and Chief Operating Officer of NW Natural, has stated that the Palomar "project is being designed so that, if an LNG terminal is constructed on the Columbia River, the Palomar Pipeline can be extended to serve it." Bradwood has requested such an extension:

[W]e have recently submitted a request for service to TransCanada and NW Natural . . . [to] construct, own and operate a pipeline that would connect the Bradwood terminal to Williams' Northwest pipeline at Molalla and TransCanada's GTN Pipeline near Madras. This will provide Bradwood and/or other shippers with gas transportation service from the LNG terminal to the pipeline systems of both the Northwest Pipeline Company and TransCanada's GTN Pipeline, which can deliver approximately 2.0 Bcf/d into Northern California at the Malin, Oregon interconnect point.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Bradwood 12/15/06 Registration filing with SEC, page 54. While the DEIS notes that the Palomar Project in its entirety "is not dependent upon the authorization or construction of the Bradwood Landing Project," DEIS, at 2-28, it is clear that the extension of the Palomar Pipeline to Bradwood will not be built if the Bradwood Terminal is not constructed.

The potential environmental impact of an extension of the Palomar Project would likely be significant. The pipeline would extend 220 miles from Bradwood to near Madras, Oregon, crossing wetlands and other sensitive habitats as well as the property of numerous landowners. DEIS, at 2-28. Construction through wetlands would likely cause pollution in streams from increased sedimentation and temperature, and deposition of gasoline and oil. Many of these streams are designated critical habitat for numerous species; these construction activities could lead to "take" of these species in violation of the ESA. The construction would also necessitate extensive timber cutting through habitat of a variety of plants and animals listed as threatened or endangered under the ESA, including the northern spotted owl and marbled murrelet. DEIS, at 3-10. Both construction and maintenance of the pipeline extension would result in noise, air, and light pollution. These extensive environmental impacts must be considered together with the environmental impacts of the Bradwood Terminal because neither the terminal nor the pipeline extension would be built but for the other.

As in *Thomas v. Peterson*, the Bradwood Terminal would not proceed without access to California markets and the Palomar pipeline would clearly not be constructed "but for" the Bradwood terminal. 753 F.2d at 758-59. Similarly, as in *Save the Yaak*, the purpose of the Palomar pipeline extension is to connect the Bradwood Terminal to the California market. No indication exists that NW Natural and TransCanada would build the pipeline for any other reason. 840 F.2d at 720. These "inextricably intertwined" projects must be analyzed together in a single EIS. *Thomas v. Peterson*, 753 at 758-59. Failure to do so violates NEPA. 40 C.F.R. § 1508.25(a)(1).

The DEIS dismisses the need to discuss the cumulative impacts of the Palomar Pipeline Project with the proposed terminal by merely asserting:

the current route proposed by Palomar travels south away from areas impacted by the Bradwood Landing Project [and] cumulative impacts associated with the Palomar Pipeline Project would be primarily limited to the area near that Bradwood Landing LNG terminal location.

DEIS, at 4-446; see also DEIS, at 4-454 ("The Palomar Pipeline project would contribute to visual impacts as a result of tree clearing along the right-of-way. The cumulative impacts would be limited to the LNG terminal area since the proposed Palomar Pipeline would progress south and away from the other Bradwood facilities"); DEIS, at 4-456 ("The Palomar Pipeline . . . would be located within the immediate vicinity of the proposed LNG terminal; however, only a small portion of the project would be in the vicinity of the Bradwood Landing LNG terminal. Therefore, potential cumulative impacts on traffic from construction would likely be temporary and short term"). This analysis overlooks the fact that the two projects lack "independent utility" and must be analyzed in a single NEPA document. *Native Ecosystems Council*, at 894, citing *Wetlands Action Network*, 222 F.3d at 1118. Therefore, the proper inquiry is not limited, as the

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

DEIS assumes, to potential cumulative impacts within the geographic vicinity of the terminal; rather, FERC must consider the potential impact of both the Bradwood Terminal and the Palomar Pipeline Extension as one project. *Id.*

FERC Fails to Adequately Address the Environmental Impacts of the Project in the DEIS

One of the primary goals of NEPA is to recognize "the profound impact of man's activity on the interrelations of all components of the natural environment." 42 U.S.C. § 4331(a). The reason behind this goal is to ensure each person "enjoy a healthful environment . . . and to contribute to the preservation and enhancement of the environment." *Id.* § 4331(c). In this DEIS, FERC fails to meet the requirements of a thorough and accurate assessment of all the environmental impacts of the project.

It is difficult to conceive of a project with greater unacceptable impacts to an area of such high ecologic value. The Oregon Department of Environmental Quality stated that it "has not been asked to review a project with in-water and wetland impacts of this magnitude **in the history of the 401 Certification Program**."¹²⁸

DEQ recognized the enormous impact on protected resources, stating that even if mitigation is successful:

the project will still result in a permanent loss of 33 acres of wetland and 58 acres of in-stream areas, as well as temporal losses from an additional 98 acres of temporary wetland impacts. Not only is this **contrary** to both the intent and requirements for mitigation to fulfill permit requirements under the Clean Water Act, but it is of additional significance under the recent EPA elevation of the Columbia River to a national priority.¹²⁹

FERC must make specific findings on the potential impacts of the project on the impact to: physical substrate; water circulation, fluctuation, and salinity; turbidity; contaminants; aquatic ecosystems and organisms; disposal sites; cumulative effects on the aquatic ecosystems; and secondary effects on the aquatic ecosystems. The DEIS fails to assess adequately the tremendous impacts on human environment.

Terminal Dredging

Physical and chemical impacts

Dredging will degrade flow and create a sediment trap

The DEIS failed to consider the impacts of the dredging on the Columbia River. The proposed 58-acre hole dredged to 43 feet will permanently modify the geomorphology of the river bed, which will affect flow and erosion. The large hole will be located at the head of Clifton channel. The hole will decrease the river's velocity both within Clifton Channel and the

¹²⁸ Oregon Draft State Agency Comments. Oregon DEQ, at 10

¹²⁹ Oregon Draft State Agency Comments. Oregon DEQ, at 8

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

mainstem of the Columbia. The decreased velocity will harm salmon by increasing the travel time for smolts traveling to the ocean.¹³⁰ Increased travel time for smolts is already a severe problem for the affected salmon populations.¹³¹

The decreased velocity will also impact the geomorphology and aquatic life both upstream and downstream of the 58-acre hole. DEQ noted that these upstream and downstream impacts of the geomorphic changes "have not been fully analyzed by the applicant." The potential upstream and downstream impacts of the 58-acre hole include "unacceptable levels of erosion (banks on either side and around multiple in-stream islands), introduction of toxics to the waterway, habitat loss, and wetland loss – all of which reduce water quality."¹³²

While the hole will decrease velocity, it will increase flow into Clifton Channel. Increasing flow into a channel will decrease channel stability, thereby decreasing substrate stability and increasing erosion.¹³³ Not only will there be increased flow into the Clifton Channel, but this increased flow will likely cause erosion at the mouth of the channel leading to further deepening. Removing sediment and leaving a hole in a river can cause downstream erosion of the channel bed.¹³⁴ This further deepening of the channel will in turn result in greater flows into the Clifton Channel.

Downstream of the dredge hole, the velocity will increase, which will cause scouring and erosion of the channel bed and shorelines. The erosion will be further exacerbated because there will be a lack of sediments to replace the channel bed sediments removed because of erosion. The dredged hole will act as a huge sediment sink, permanently starving the downstream area of Clifton Channel of sediments. This increases erosion and harms aquatic life that depends on sediment for habitat and the associated nutrients. This lack of replacement sediments is permanent because the maintenance dredging will continually remove the captured sediment from the system. When extraction of sediments outpaces the amount of sediments being transported from upstream, there will be a net loss of sediments for the system.¹³⁵

FERC has failed to independently assess the veracity of the models used by Bradwood to predict the impact of the dredging on hydrology. Therefore, the DEIS fails to assess or fully disclose the environmental impacts. DEQ raised concerns about the Bradwood's modeling, stating, "initial review of the modeling presented raises questions about the appropriateness of the models used (e.g. why a 2-D model was used rather than a 3-D model which is available),

¹³⁰ Rhodes, Summary of Review of FERC Biological Assessment and Essential Fish Habitat Assessment for Bradwood Landing LNG Terminal. Report to Columbia River Intertribal Fish Commission, at 5.

lack of a physical basis for models used, and their predictive abilities given average results and highly complex relationships between erosion, sediment transport and deposition."¹³⁶

The DEIS stated that modeling activities conducted by Bradwood indicate "hydraulic characteristics of the Columbia River and its channels caused by the proposed project would generally be minor." DEIS at 4-40. FERC should not have relied completely on modeling to assess changes in sediment and stream flow characteristics because models have a tendency to produce inaccurate data when trying to characterize highly complex systems. Models are useful to predict possibilities and for learning how different factors interact in a system. However, models do not predict the truth, only possibilities, and FERC should have taken into account other studies and observations pertaining to changes in stream flow and sediment transport resulting from changes in stream morphology due to dredging.

The Columbia River system is highly complex system, and it is unlikely that a model could account for all the factors in the system. For instance, factors that affect stream flow in the Columbia River include river flows, tides, flooding, river slopes, channel cross-sectional geometry, sediment characteristics, bedforms, shoreline stability, and many more factors too numerous to list. Failure to include even one factor in a model could produce results that are completely wrong, although past trials have produced results that closely resemble the river system under specific conditions. Despite these problems, FERC failed to assess the veracity of the models used by Bradwood for modeling the Columbia River.

FERC must further analyze stream flow characteristics and sediment transport through research of the literature or require Bradwood to conduct further studies. FERC improperly bases its conclusion on the models used by Bradwood and fails to conduct the thorough and accurate analysis required by the CWA.

Changes in current pattern and flow can degrade environmental values. The DEIS failed to analyze the adverse impacts to the: location, structure, and dynamics of aquatic communities; shoreline and substrate erosion and deposition rates; the deposition of suspended particulates; the rate and extent of mixing of dissolved and suspended components of the water body; and water stratification." 40 C.F.R. § 230.23. Because of the very large scale of the Bradwood dredging in a vital area of the estuary, FERC must thoroughly analyze each of these adverse impacts.

In addition, the geomorphic modification due to dredging affects the normal water fluctuations. The DEIS failed to consider the impacts to the changes in salinity gradient, nutrient balance, and dissolved oxygen balance. The DEIS failed to consider how these changes will adversely affect communities of aquatic life, induce populations of nuisance organisms, modify habitat, reduce food supply, restrict movement of aquatic fauna, and change the adjacent upstream and downstream areas.

FERC must also address concerns raised by NMFS that are not adequately addressed by the DEIS. NMFS noted that dredging has the potential to cause: changes in the morphology and hydraulics of the Clifton Channel; alteration of sediment transport in the main navigation channel and impacts to downstream Tenasille Island and the Lewis and Clark National

¹³⁶ Draft State Agency Comments. Oregon DEQ, at 4.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Wildlife Refuge; change in water circulation in the dock area to adversely affect shallow water habitat; scour at the shoreline from altered depth contours and from vessel berthing and unberthing at the terminal' and turbidity from the dredge activity, including suspended solids concentrations, size and duration of the plume. The DEIS's analysis of these issues, if it occurred at all, is wholly inadequate, and does not satisfy NEPA's duty to consider the environmental impacts of the project.

The DEIS acknowledges that the dredging will have "an influence on flow and sediment transport within the main navigation channel." DEIS at 4-40. Yet, it fails to discuss the extent of the change and the affect on aquatic life. In addition, Bradwood's models of sediment transport relied on in the DEIS are based on the incorrect assumption of uniform deposition within the turning basin. FERC must analyze the impacts under physically realistic conditions in which deposition will be greatest adjacent to the navigation channel.

Bradwood's assumptions regarding maintenance dredging are also problematic. Bradwood predicts it will need to dredge every 2 to 4 years. However, maintenance dredging is required if the turning basin or channel fills in with 1 foot of sediment. This may happen much quicker than 2 to 4 years. For example, the models indicate that in just 10 days of high flood water, a half foot of deposition would occur. The DEIS fails to analyze whether the maintenance dredging is realistic, especially in light of the predicted increased flooding due to global warming.

Further, the DEIS fails to consider the stability of the dredge walls. Bradwood proposes that the sides of the dredged area would be cut to a 3 (horizontal) to 1 (vertical) slope. This slope is too steep for the instable Columbia River sediments. Slope failure will occur, which will cause additional turbidity, toxic sediment problems, and require more frequent maintenance dredging. FERC must investigate the appropriateness of the 3 to 1 slope specific to this location.

Dredging will increase turbidity, temperature, and decrease dissolved oxygen

The DEIS fails to consider adequately the impact of pollutants caused by dredging. Dredging associated with the proposed Bradwood LNG Project will increase the turbidity of the river and lead to higher water temperatures. Turbidity has a number of adverse effects on water quality, including reducing light for photosynthesis by algae and plants, increasing temperature, and decreasing dissolved oxygen levels. Increases in temperature as a result of turbidity are caused by the suspended particles absorbing more heat from sunlight and, therefore, increasing the temperature of the water around the particles. The DEIS fails to analyze how water temperature will be changed due to increases in turbidity, and how any changes in water temperature resulting from increased turbidity due to dredging activities will exacerbate the ODEQ 303(d) water quality-limited status of these waters. Also, as a result of turbidity and increased water temperatures, dissolved oxygen levels and light will be decreased harming aquatic biota including federally protected fish species. The DEIS also fails to disclose and consider that the dredging will violate water quality standards ("WQS") in Oregon and Washington.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

The potential turbidity increases and the impact to aquatic life are great due of the large size and long duration of the dredging. DEQ stated:

Dredging is proposed to occur **non-stop** (24 hours per day, 7 days per week) for 2-3 months. No other proposal for dredging in the Columbia has operated 24-hours per day, 7 days per week for multiple months. Impacts to **13 listed salmonid species/ESUs, sturgeon** . . . , resident aquatic organisms (mammals, fish, amphibians and reptiles, invertebrates, sediment dwellers), and terrestrial species are not fully identified or known based on non-stop action over this duration, as it is unprecedented. **Potentially debilitating impacts to these species include noise, continuous light, suspension of sediment, turbidity, loss of salmonid habitat** and ability to rest or avoid predation, and potential attractant for sturgeon to a dangerous construction zone.

Oregon Preliminary Comments at 11. The DEIS fails to consider adequately any of this impacts described by DEQ.

Consultant Jonathan Rhodes noted that dredging will significantly increase turbidity, which will have negative effects on salmonids by impairing their ability to feed and by causing gill damage.¹³⁷ Elevated turbidity can also adversely affect benthic macroinvertebrates, upon which salmon and other organisms rely for food.¹³⁸ The long-term and constant nature of this dredging are particularly troubling and distinguish this project from smaller dredging operations that occur in the Columbia River. This controversial project requires close scrutiny. FERC must analyze and make findings on the size, scope, duration, and intensity of the dredging, and how each affects aquatic life.

The DEIS also suffers from factual errors, faulty analysis, and a simply lack of depth of understanding. The DEIS states that dredging will "result in a temporary increase in suspended solids in the water around the dredged area and the subsequent settling of the suspended particles, or sedimentation." DEIS at 4-69. In addition, the DEIS states that "[t]he maximum additional suspended solids concentration in the water column resulting from dredging activities would range from a high of 1 milligram per liter (mg/L) at the dredge site to less than 0.1 mg/L before reaching Tenasillahe Island." DEIS at 4-41. FERC provides no justification for these assumptions. Are they from modeling and, if so, what assumptions were used? FERC gives no basis to evaluate these numbers. Model predictions for turbidity "are often highly inaccurate."¹³⁹ The DEIS does not provide any information on the accuracy of models, despite the widely known belief of the inaccuracies of turbidity modeling.

In addition, the DEIS asserts that there will only be 0.5 percent spillage of sediments during dredging, but again fails to qualify how it reached that number. DEIS at 4-69. In fact, research has revealed that problems leading to increased turbidity can arise using cutterhead

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

dredges when dredging hard-packed sand.¹⁴⁰ The DEIS notes that “[t]he results of grain size analyses indicated that the sediments in the proposed dredging area generally consist of sands.” DEIS at 4-33. But, the DEIS also states that sampling zones in the proposed dredging areas include “dense gravel layers, wood, and densely packed sands.” DEIS at 4-32. The DEIS concluded that dredging activities will lead to minor turbidity impacts, but it failed to properly analyze the impact of diverse substrates. The hydraulic cutterhead dredging equipment may encounter difficulties that may lead to further turbidity and pollution due to gravel, wood, and densely packed sand. The DEIS fails to evaluate how the cutterhead dredging equipment will operate under these conditions. FERC should require Bradwood to propose a plan to deal with difficulties encountered during dredging.

Although some specially designed hydraulic cutterhead dredges may reach 0.5 percent spillage, the DEIS fails to disclose what kind of cutterhead dredge will be used by Bradwood for dredging. This is vitally important information for the public to assess the veracity of these statements because without knowing what type of cutterhead dredge will be used, the public can not begin to evaluate what kind of sedimentation will be caused by Bradwood’s dredging activities. Furthermore, any modeling conducted on behalf of Bradwood is suspect until justification is given for using a 0.5 percent spillage rate. All cutterhead dredges are not the same. Studies indicate that conventional cutterhead dredging “can liberate considerable amounts of turbidity and associated contaminants to overlying water.”¹⁴¹ Additionally, selection of the proper cutterhead for the type of sediment, in addition to correct rotational speed and hydraulic suction, to obtain reduced suspension rates of sediments is rarely achieved. (Herbich 2000). Therefore, knowing not just the type of cutterhead dredge used but the anticipated methods of using the dredging equipment are important factors that must be disclosed for the public to properly analyze the effects of dredging at the proposed Bradwood LNG Project. FERC must make specific findings on the types of dredging equipment in order to fully analyze the impacts dredging will have on turbidity and overall pollution.

DEQ recognized that Bradwood’s proposed dredge equipment may be inadequate:

All dredging is proposed to be accomplished via hydraulic suction. However, 12 of 31 cores planned for sediment sampling to depth (-43 ft) hit refusal before reaching proposed depth. The contractor’s assumption was that obstructions were caused by dense gravel layers, wood and densely packed sand comprising an identified layer of consolidated sediments. No information is offered as to the ability of the proposed hydraulic equipment to penetrate the consolidated materials. Procedures proposed by FERC for removing obstructions in channel deepening include using a clam shell bucket and blasting. Both of these methods may result in significantly deeper disturbance and greater impact to remove erratic materials. Further analysis and justification is required for such contingency measures.

Oregon Preliminary Comments at 5.

FERC, therefore, must analyze the turbidity caused by the various types of dredges that may be utilized, including clam shell dredge and blasting. These dredge methods will produce significantly more turbidity.

In addition, the DEIS failed to consider adequately the impacts of maintenance dredging. Maintenance dredging will result in further degradation of water quality through repeated resuspension of sediments. The DEIS asserts that maintenance dredging will occur about every 2 to 4 years and Bradwood estimates they will dredge approximately 80,000 cubic yards of sediment during each maintenance cycle. DEIS 4-76. However, the DEIS fails to inform the public how Bradwood calculated the maintenance dredging frequencies and amounts. Furthermore, the large variation in frequency shows a substantial uncertainty in the calculations. If dredging must be conducted every 2 years as opposed to 4, there will be twice as much disturbance and twice as much dredged material removed, leading to higher turbidity impacts upon the river. A great number of complex factors are associated with how often dredging will be needed, including whether over-dredging will be allowed initially and sediment transport processes of the dynamic Columbia River. FERC must reanalyze maintenance dredging and provide a more thorough analysis on how often dredging activities will be conducted and how much dredging material will be removed. Without this information the public and FERC can not possibly evaluate the impact maintenance dredging will have on water quality and the effects on organisms in the river.

The DEIS also fails to analyze what will be done with any possibly contaminated water from dredging activities. Hydraulic cutterhead dredging techniques require a lot of water to be sucked up with the solid sediments. If Bradwood encounters a contaminated area when dredging, how will they dispose of the contaminated sediment and water associated with the contaminated sediments? Worse, how will they know that the sediment is contaminated?

Release of such contaminated water back into the river after mixing with contaminated sediments can be highly toxic to aquatic life. Additionally, release of the contaminated water onto land can contaminate ground water resources or run back into the river. Bradwood proposes that “all or most of the dredge water will percolate into the sandy soil at the site.” DEIS at 2-40. First, there is no analysis of the volume of water discharged by the hydraulic dredge and the permeability of the soil to absorb this volume. Second, there is no analysis of the run-off of water into the Columbia River if only “most” of the water is absorbed. Third, there is no analysis on the effect of toxic or other contamination percolating into the soils, and potentially reaching the groundwater or being discharged back into the river via surface or subsurface flows. Last, there is no analysis of the contamination of the soil on site and the associated effects on plants and animals. The DEIS fails to analyze each of these issues and FERC has failed to require Bradwood to produce a plan to deal with contaminated sediments and water from dredging activities before approving the project. FERC cannot produce a final EIS without such a plan.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

The DEIS also failed to analyze how Bradwood's long-term dredging will increase water temperature in the Columbia River near the dredging. Dredging increases temperature because the suspended particles absorb more heat from sunlight. In response to channel deepening dredging on the Columbia River, DEQ stated, "this project is expected to result in an increase in surface water temperatures during the low flow time of year both during dredging and flowlane disposal as a result of increased turbidity. . . . Temperature contributions are particularly problematic given the water quality limited listing for temperature in the lower Columbia River."¹⁴²

The DEIS also failed to analyze adequately how dredging will decrease dissolved oxygen near the site because dredging increases the oxygen demand by disturbing sediments. In response to the proposed channel deepening dredging on the Columbia River, DEQ stated, "this project is expected to exert an oxygen demand both during dredging and flowlane disposal."¹⁴³ Similarly, Bradwood will exert an oxygen demand during and after initial dredging and maintenance dredging. The oxygen demand will increase when Bradwood dredges through organic matter, uses alternative dredging methods, such as blasting and clam shell dredges. The oxygen demand will also increase due to shoreline erosion caused by the hydraulic and geomorphic changes in the river. Like temperature, the Columbia River is water quality limited for dissolved oxygen so no increase in oxygen demand is acceptable.

All of the physical and chemical changes discussed above are exacerbated by the large-scale channel deepening in the lower Columbia River, which the DEIS fails to consider at all. The channel deepening alone will have detrimental impacts on the physical and chemical characteristics of the lower Columbia River. The DEIS failed to analyze the cumulative effects of the Bradwood dredging, taking into account the channel deepening, increased ship traffic from both the channel deepening and LNG tankers, the increase erosion from both projects, increased wave action, and geomorphic and hydraulic changes.

Dredging will introduce toxic pollutants from bed and shoreline sediments

The DEIS fails to assess how aquatic life in the estuary will be harmed by the resuspension of contaminated sediments into the water column. This harm will be especially acute adjacent to or in the dredging area. Sediments in rivers are often implicated for their tendency to store large amount of contaminants, which may turn into a significant source of contamination to aquatic and terrestrial organisms if disturbed.¹⁴⁴ This is a particularly serious problem in the Columbia River estuary. FERC must examine all available data, including data generated from the channel deepening, to determine potential contaminants. FERC must also conduct a site-specific analysis at Bradwood, as well as all of the upstream and downstream areas where hydraulic and geomorphic modifications may mobilize sediments. The DEIS fails

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

entirely to assess the complete impact of contaminants on salmon, macroinvertebrates, and other aquatic life.

The DEIS claims that no contamination in the proposed dredging area would adversely affect water quality based on studies conducted by Bradwood. DEIS at 4-39. However, based on the information given in the DEIS, the sampling methods were flawed and were not representative of the potential contamination in the area. Furthermore, FERC was unable to address the negative impacts to aquatic organisms that are associated with the presence of phytosterols in the DEIS. FERC must reevaluate the sampling procedures and require Bradwood to conduct a more accurate and thorough sampling process. The DEIS also failed to obtain information on the effects phytosterols may have on aquatic organisms in order to more accurately assess the danger of dredging activities to the ecosystem.

The study conducted by Bradwood and used by FERC for analysis of contamination in the sediments in the DEIS has a flawed design and was not able to accurately represent whether sediments in the area are contaminated. According to Bradwood's own Sampling and Analysis Plan ("SAP"), the sampling approach used to test sediments in the dredge area for contamination was a "biased sampling approach." Bradwood, and the company they hired to conduct the sampling, claimed that such an approach has the benefit of concentrating on areas where greater volumes of sediment are to be dredged. This is a fundamentally flawed approach, as bias is a prejudice that all truly scientific methods seek to avoid. Picking and choosing where to sample is not an acceptable method to obtain reliable data on whether sediments in the dredge area are contaminated. A truly random sampling approach would have yielded much more reliable results. Granted, transects may be used to concentrate on specific areas of interest. However, the SAP and the DEIS make no mention of any random sampling techniques to be used along the transects to choose sampling locations. The use of the biased sampling approached fails to analyze the toxic contaminants and fails to inform the public of the environmental risks.

Not only are the results flawed because they depend on some biased sampling location selection method, but the DEIS does not present any statistical analyses to justify how such a sampling scheme could possibly represent whether the sediments in the dredge area are uncontaminated. FERC cannot rely on such questionable scientific methods.

How did Bradwood reach the conclusion that five core locations within seven horizontally delineated areas were sufficient to represent contamination of the whole dredging area? Furthermore, why did Bradwood think that areas with the thickest deposits of proposed dredge material would be inherently more reliable in testing for contamination in the dredge material than other areas? Even a random sampling technique has problems associated with missing "hot spots," as discussed below, but the sampling technique used by Bradwood does not even approach the statistical and methodological reliability of a random sampling technique and is, therefore, practically meaningless. These blatant oversights indicate the lack of depth of analysis that FERC and Bradwood have conducted in evaluating possible contamination in the dredge area. Based on these sampling techniques, the public can not make any meaningful evaluation of whether contaminated sediments are present in the dredging area. FERC must review the sampling location techniques used by Bradwood and require a more thorough and reliable examination of contamination in the dredge area sediments.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Not only were there problems associated with a biased sampling approach, but there were also problems associated with the methods of actual collection and analyzing of the samples collected. FERC states that there were a number of partial refusals at various locations throughout the sampling area. DEIS at 4-32. The company hired by Bradwood to conduct the sampling then omitted those samples with partial refusals from compositing and analysis in the laboratory. *Id.* However, NMFS required Bradwood to go back and sample at least 7 of the 12 sites where partial refusals occurred. *Id.* Why didn't FERC require Bradwood to collect samples at all 12 sites where partial refusals occurred? Not only does the lack of these samples further degrade the reliability of an already flawed sampling regime, but it completely ignores the possibility of contamination in those locations. Just because there were partial core refusals in those locations does not mean Bradwood will not dredge those locations to their full depth as required by the plans. The DEIS failed to analyze contamination at the partial core refusals. Contamination may be concentrated in these areas due to accumulation in organic matter or different types of sediments. If FERC will not require a more reliable sampling and analysis scheme as discussed above, at the very least these sampling locations must be included to analyze for possible contamination.

After NMFS requested additional laboratory analyses on some of the previously taken samples, FERC found that these samples had been "inadvertently discarded by laboratory staff." DEIS at 4-32. In order to rectify the situation, Bradwood collected "replacement samples" from the "same seven core locations" in February 2007. *Id.* The DEIS fails to give enough information regarding these replacement samples. It goes without saying that a laboratory that discards unanalyzed samples after such a short period of time shows an alarming lack of competency. The DEIS fails to support with evidence its contention that the dredging contamination will not significantly affect aquatic resources.

The problem of missing samples is further compounded by Bradwood retrieving samples from the "same seven core locations." Either FERC has not adequately explained the retrieval of replacement samples, or Bradwood actually did carelessly sample from the same exact locations. Sampling from the same locations to where the original samples were taken would not represent contamination in the surrounding areas because the sampling location would likely have been filled back in with new sediments that filled the hole where the last core was taken. Even if Bradwood did not use the same exact core location, care should have been taken to ensure a retrieval of replacement samples from undisturbed sites, especially if very near to the original coring sites. The original core could have moved sediments around and destroyed the integrity of the surrounding sediments. Therefore, FERC should require Bradwood to collect new samples that are more likely to represent the sediments in the dredged area.

Compositing multiple core samples can also cause a serious problem with measurements of contamination in sediments. FERC states in the DEIS that material from specific strata were composited together by same area to yield a total of 18 sediment samples. DEIS at 4-30. Although this method helps save time by reducing the amount of samples to be analyzed, in addition to arguably representing an average of the area, more reliable data on the contamination of sediments can be achieved by analyzing each sample separately. Compositing samples together by strata may cause dilution of any contaminants found in one sampling location. For

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

instance, a sampling location may have high levels of dioxins, but when mixed with sediments from another core may reach levels below the threshold levels required to be reported as toxic to humans or aquatic species. This phenomenon represents the "hot spot" theory, where contamination may be localized in small areas. Bradwood's practice of compositing samples together essentially ignores the possible existence of "hot spots," where high levels of contamination may be present. When disturbed by the dredging, these hotspots may adversely affect aquatic life. Therefore, compositing samples by strata from the same area is not a reliable method to test for contamination.

In addition, compositing samples only works to get an average contamination for an area when the ratio of the number of samples to the area of sampling is relatively high. In Bradwood's study, large sampling areas were used with relatively few samples. Additionally, many areas had partial refusals and samples were omitted from laboratory analysis, thus further destroying the integrity of the compositing method. Bradwood should not be allowed to conduct a very cursory examination of contamination in the dredge sediments. Costs may be higher if each sample is analyzed individually, but the reliability of the data is worth the cost when the safety of this fragile ecosystem is at stake.

Not only does compositing multiple core samples cause problems such as missing "hot spots," but using large vertical sections, or strata, to delineate samples can also cause problems. The DEIS states that three strata were considered for each sample: 1) the top 4 feet, 2) the region from 4 feet to 10 feet, and 3) the material from 10 feet to project depth. DEIS at 4-30. What justification did Bradwood give for using such depths to delineate between samples? These cross-sections of the cores seem too large to accurately represent whether contamination is present in the soil. For example, if there is a contamination "hot spot" in only a few inches of sediment near the top of the core, the contamination is diluted when mixed with the sediment from the rest of the stratum, especially when multiple samples are composited as Bradwood did in this study. Therefore, using such large strata may not accurately represent the presence of contaminants at certain vertical layers of the sediment in the proposed dredging zone. FERC should require a more thorough analysis of the sediments based on these observations and require Bradwood to use smaller strata for sampling procedures. Based on the available sample data, that Corps cannot demonstrate that dredging will not unacceptably harm aquatic life.

FERC should require Bradwood to not only redo sampling as discussed above, but analyze individual samples with out compositing. As the data presented in the DEIS stands, the public can not meaningfully evaluate the contamination levels because of these flaws in the sampling techniques. Other studies funded by the Lower Columbia River Bi-State Commission and conducted by Tetra Tech, Inc. indicate high levels of contamination in the vicinity of the proposed Bradwood LNG Project.¹⁴⁵ The data from these studies has been submitted to FERC on previous occasions but has been virtually ignored. Data from these studies show contamination in the area based on tissue studies of various aquatic organisms, including resident and migratory fish. These studies have the advantage over the inadequate sampling techniques carried out by Bradwood because they more fully represent contamination levels in sediments and the water column around the Bradwood Landing area. This fish tissue study was conducted by a true scientific method with little to no bias in sampling, as opposed to the methods used by

¹⁴⁵ Bi-State Commission, Lower Columbia River Contaminant Ecology, April 1996.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Bradwood. In addition, the fish tissue sampling techniques takes into account "hot spot" areas of contamination because they are in effect sampling the contamination levels of all sediments in the area, as opposed to picking and choosing which sediments to test. Moreover, fish tissue studies take into account bioaccumulation, which is an important factor to consider when determining the health of the ecosystem and possible detrimental impacts of the system due to dredging activities. The DEIS fails to analyze or disclose the fish tissue data from the Bi-State Commission studies. This data is critical to understand future impacts to the system from the proposed dredging. Also, given the observations above concerning the inadequacy of the sampling and analysis methods used by Bradwood, and given the Bi-State Commission data clearly showing contamination in the area, FERC should require Bradwood to conduct a more thorough and accurate sampling and analysis of the dredge area.

The DEIS indicates that phytosterols were found in the proposed dredge sediments but fails to analyze the effects phytosterols will have upon aquatic organisms if the phytosterols are released from dredge material. DEIS at 4-38. As the DEIS points out, phytosterols "may have reproductive effects and be responsible for some types of reproductive dysfunction observed in fish" *Id.* The DEIS further acknowledges the uncertainties regarding how the observed levels of phytosterols found in the sediment might affect fish, but also attempts to reduce concern about phytosterols by simply relating them to TOC levels found in the proposed dredge materials and noting the limited potential for mobilization of phytosterols based on this relationship. *Id.* This characterization is an oversimplification of the possible hazards to fish and other aquatic species from possible exposure to phytosterols from dredging activities. The DEIS fails to explain how phytosterols enter the food chain nor the bioaccumulation effects of these chemicals. FERC admittedly does not fully understand the toxicity of phytosterols. Not only are FERC's statements in the DEIS suspect due to the lack of knowledge concerning the effects of this chemical, but the public can not properly evaluate the dredging activities as a result of this lack of knowledge.

In addition, the DEIS failed to consider that the Bradwood dredging may degrade water quality conditions by introducing, resuspending, or making bioavailable the additional pollutants. DEQ noted that the geomorphic and hydraulic changes in the river due to dredging may cause erosion that introduces new toxic materials from the banks. DEQ stated:

Although in-stream sediments proposed for removal have been tested for contaminants, bank materials which may be eroded inadvertently have not been tested. No information is provided as to the historical and current pesticide and fertilizer applications in areas potentially susceptible to erosion and which have been exposed to agricultural or silvicultural practices. Inadequate analysis of bank stability during dynamic adjustment of the river to dredging could introduce bioavailable toxics to the water column and sediments that were previously tied up in upland material. Precaution in this regard is particularly important as data is scarce and implications are just beginning to be studied through the initiatives of EPA's and DEQ's toxics reduction goals in the high priority Columbia River system.

Oregon Preliminary Comments at 11.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

FERC must address these concerns. FERC must thoroughly analyze any possible input of sediments from the shorelines that may contain toxic contamination. It is highly likely that the former industrial site at Bradwood is contaminated, and adjacent sites may also contain contamination from upstream sources. DEQ specifically notes that dredging could cause bank failure of the contaminated soils at Bradwood. DEQ stated:

Additionally, stability of the former log pond at various stages of fill has not been analyzed with regard to dynamic changes to the river induced by dredging at the berth/burning basin and for channel deepening. Side slope sloughing in-stream caused by dredging could result in bank failure, which may release dredged sediment to fill the former log pond. The DEIS needs to thoroughly evaluate and address the impacts to the stream and habitat from a sudden release of up to 300,000 cy of sediment under this potential scenario.

Oregon Preliminary Comments at 11.

FERC must analyze the impact of hydraulic and geomorphic changes due to dredging, which causes erosion and introduces toxic materials from the shorelines. FERC cannot rely on FERC's analysis because, as noted by DEQ, FERC did not analyze this potentially serious impact.

The dredge samples also demonstrate that the Bradwood area contains heavy metals in concentrations toxic to fish and other aquatic life. FERC fails to analyze the cumulative effects of the metals, including the additive and synergistic effect of the combination of metals, on aquatic life. Bradwood's dredging samples detected arsenic, chromium, copper, lead, nickel, and zinc, along with mercury and selenium. The chromium exceeded the reference levels, which indicates high chromium levels that may be harmful to aquatic life. While the other metals were, according to FERC, "within the range of nearby background levels," DEIS at 4-34, this does not mean that the toxic metal levels in the sediments are safe for aquatic life. First, the reference levels may also be unsafe. FERC does not explain the purity of the reference locations so the relative comparisons do not mean anything. Second, because these metals are acutely toxic, small variations can have a strong adverse effect. Therefore, FERC must analyze the metal concentrations in the sediments and assess how the toxic pollutants will affect aquatic life once the sediments are disturbed by dredging, maintenance dredging, and the long-term disruption of flow patterns. FERC should note that the metal concentrations in the sediments exceed the water quality criteria for each pollutant. The DEIS fails to inform the public about the toxic pollutants in the sediment.

Additional pollutants also raise concerns which are not analyzed in the DEIS. For example, excess total organic carbon may degrade water quality. Dredge samples showed a value of total organic carbon up to 0.78 percent, compared to reference sites of 0.05 percent. In addition, total volatile solids samples of up to 1.61 % were twice as high as the value of reference sites.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

FERC must also analyze the affect of the organic compounds made available by dredging on aquatic life. Bradwood has identified samples containing PAHs and phthalates above reference levels. Due to the former industrial activity at the site and the upstream industries, the site may also contain PCBs, pesticides, dioxin and furans, sulfides, and ammonia. FERC fails to analyze whether the dredging will introduce any of these pollutants into the water column or the biota.

NMFS raised concerns about the presence of guaiacols, retene, and resin acids due to the site's history as a lumber mill. Several of these compounds do not have a screening level. FERC must analyze and make findings on whether the dredging of sediments containing these compounds may adversely affect aquatic life. If FERC is unsure of the data or the toxicity levels to fish, FERC must make these uncertainties clear and fully disclose all potential impacts. See 40 C.F.R § 1502.22

Biological impacts

Dredging will cause loss of habitat

Bradwood's dredging acres will result in the permanent destruction of at least 58 acres of prime salmon habitat. A portion of the dredged area is critical shallow water habitat. The area adjacent to Bradwood is widely recognized as vital fish habitat. The Columbia River is considered the "lynchpin" of salmon recovery.

The Bradwood Biological Assessment stated:

The Lower Columbia Estuary has been identified as a **critical area for restoration** (Johnson et al., 2003, Bottom et al., 2005). **Restoring diverse, complex, and interconnected wetland habitat would increase productivity and availability of shallow-water habitat, and expand transition areas for juvenile salmon** (Lott, 2004). Additionally, it is believed that improvements to estuarine habitat would result in significant population increases (Kareiva et al., 2001, Bottom et al., 2005) ... Juvenile salmon occur in the estuary all year, as different species, size classes, and life history types continually move downstream and enter tidal waters from upstream (Bottom et al., 2005). **Reconnection of isolated high-quality fish habitats is a high priority to restoration strategies for the watershed and for fisheries restoration projects generally** (Roni et al., 2002). Restoring the tidal estuarine habitat of the lower Columbia River is a priority in many conservation plans for the area including the Lower Columbia Salmon Recovery and Fish & Wildlife Subbasin Plan (2004), Lower Columbia River Estuary Program Comprehensive Conservation and Management Plan (1991), and recovery plans for salmon ESUs occurring within the lower Columbia River (NMFS, 2006f).

Biological Assessment at 6-2.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

The proposed dredging is the antithesis of salmon recovery and restoring estuarine habitats, as described in every local, state, and federal management plan. Quite simply, we cannot recover threatened salmon while simultaneously permitting this huge dredging project. Bradwood is a prime example of an unacceptable project due to its size, scope, and location in critical salmon habitat. The DEIS fails to discuss how the dredging and the project overall will affect salmon recovery. Thus, FERC violates 40 C.F.R § 1502.16(c) by failing to discuss possible conflicts between the project and the objectives of federal, state, local and tribal conservation policies for this site and the estuary.

The project will destroy habitat for 13 ESUs of Columbia River and Snake River salmon that are listed as threatened under the ESA, in addition to multiple other non-listed salmon and other species that rely on the estuary for rearing and migration. Each fish species likely passes directly through the proposed site. The DEIS fails to adequately consider the impact to the millions of individuals of salmon, sturgeon, lamprey, and other resident species that utilize this area as habitat at various times in their lifecycles.

FERC must evaluate the impact of the dredging and the project overall on estuary and fish health. FERC cannot rely on the insufficient DEIS in this regard. Despite its bulk, the DEIS fails to include any new field data regarding the impacts on salmon. The DEIS fails to include background information on fish migratory and behavior. FERC cannot assess the impact of this project is it does not present basic data on the aquatic resources present and how these organisms utilize the region. The DEIS also fails to assess the how the aquatic life, including salmonids, will be affected by the dredging and associated habitat changes. Assessing the impacts is a common scientific practice under readily available methods. It is shocking that the FEIS presented no data whatsoever on salmon migration, rearing, or spawning use of Clifton Channel, Hunt Creek, the adjacent mainstem, Puget Island, Tenasillahe Island, or other affected areas. FERC cannot evaluate the impact on salmon, or issue this site certification, without collecting site specific data and analysis on salmon.

Compounding the problem of dredging at this location is the fact that the Bradwood area is listed as designated critical habitat for threatened salmon species. This habitat must be protected. Yet, if FERC approves this permit, the destruction of critical shallow water habitat "will be certain, permanent, and immediate."¹⁴⁶ The DEIS fails to assess the cumulative impact of destroying critical habitat on salmon, and on the economy and ecology of the estuary and the Columbia River Basin. The DEIS focuses on mitigation, but fails to discuss adequately less harmful alternative that eliminate or minimize the impacts.

Dredging will introduce pollutants

As discussed above, the dredging will harm aquatic life by introducing multiple pollutants contained in the dredge sediments and on the shorelines. FERC must evaluate the effect of each pollutant, alone and synergistically, on the health of salmonid and other aquatic life. The adverse effects of excess temperature, turbidity, oxygen demand, chromium, and silver and other toxic pollutants is well known. The dredging will increase each of these pollutants,

¹⁴⁶ Rhodes, Summary of Review of FERC Biological Assessment and Essential Fish Habitat Assessment for Bradwood Landing LNG Terminal. Report to Columbia River Intertribal Fish Commission, at5.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

which will harm aquatic life. In addition, FERC must understand the effect of multiple each toxic, organic and traditional pollutant associated with dredging and erosion near Bradwood. The DEIS failed to collect adequate data. Other than a few questionable sediment cores (discussed above), the DEIS presents no data on the contaminant levels, and absolutely no data on the impact to fish. Because the adverse effects on fish is a major impact, the DEIS should have contained significant coverage of this issue.

Surprisingly, FERC did not analyze the tissue sample studies in this region that show high concentrations of toxic pollutants in fish tissue. The bi-state commission concluded that tissue samples were a more reliable measure of the pollution problem in the vicinity of Bradwood, and study of these tissues indicated significant chemical contamination problems in the Bradwood area. Disturbance of the area is likely to exacerbate the problem. Additionally, studies indicate that sediments prone to contamination should not be disturbed, and that the Bradwood site (which is close to the study area for LCREP, the Julia Butler Hansen Wildlife Refuge) should raise more serious concerns about the potential for release of bioaccumulative chemical contamination. Ultimately, the DEIS fails to examine how potential bioaccumulation will impact key wildlife species such as osprey, peregrine falcons, bald eagles, cormorants, river otters, and other predators. FERC must assess these impacts.

Dredging will decrease the velocity of the river in Clifton Channel

In addition, as discussed in detail above, the dredging will harm salmon and other aquatic life by reducing river velocity due to the modified hydraulic and geomorphic regime. The decreased velocity will slow the out migration time of smolts on the way to the ocean. FERC must analyze the cumulative impacts of this harm to salmon and whether alternatives exist to minimize the harm.

Dredging light, noise and vibrations will harm species

The intensity of Bradwood's dredging is unprecedented in the Columbia River. DEQ stated:

Dredging is proposed to occur **non-stop** (24 hours per day, 7 days per week) for 2-3 months. No other proposal for dredging in the Columbia has operated 24-hours per day, 7 days per week for multiple months. . . . **Potentially debilitating impacts to these [aquatic] species include noise, continuous light, suspension of sediment, turbidity, loss of salmonid habitat** and ability to rest or avoid predation, and potential attractant for sturgeon to a dangerous construction zone.

Oregon Preliminary Comments at 11 (emphasis added).

The DEIS fails to analyze adequately the effect of this barrage of noise, light, and vibration on salmonids and other resident species. The DEIS acknowledges that sound pressure levels produced during dredging activities could affect some fish, marine mammals, and other aquatic organisms, but also notes the paucity of information on the effects of exposure to underwater sound on most aquatic organisms. DEIS 4-135. Furthermore, the DEIS states the

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

range of sound levels from dredging activities can be quite variable and attempts to dismiss the adverse impacts to aquatic organisms by citing studies (Richardson et al. 1995; Hanson et al., 2003) that purport sound ranges from dredging generally range from 112 to 160 dB, which is unlikely to cause physiological harm. *Id.* This analysis is completely insufficient to address the possible impacts to aquatic organisms from sound produced during dredging activities. If the sound levels are highly variable, as the DEIS points out, the sounds can reach levels higher than those listed by the studies above and may in fact cause physiological harm to organisms. The DEIS must consider the effects of this harm.

Furthermore, FERC admits there is a lack of information about the effects of sound levels to aquatic organisms, especially fish. What are the effects on aquatic organisms from long duration exposures to different levels of sound? This is important to know because Bradwood admits dredging activities may last up to 72 days and be conducted 24 hours a day, 7 days a week. FERC must require Bradwood to conduct further studies on how the fish and other aquatic organisms specifically found in the area to be dredged will be impacted by increased sound levels and the effects of long duration exposure to those sound levels during dredging. The DEIS fails to assess the impact on individuals and the cumulative effects on populations and aquatic communities due to dredging disturbance.

The DEIS also fails to analyze the effect of light pollution during dredging activities. Numerous studies show light can affect a variety of aquatic organisms and may attract or repel such organisms. According to the DEIS, dredging activities will be conducted 24 hours a day and 7 days a week. DEIS at 391. The DEIS does not indicate whether lighting will be used on the dredging ships during times of darkness. If so, lighting impacts to aquatic species during dredging activities should be analyzed by FERC. Possible adverse impacts caused by lights during dredging activity could be attraction of fish or aquatic organisms to the dredging area, causing harm either by increased sound levels, turbidity levels, or the possibility of harm from contact with the cutter head dredging equipment. FERC should analyze the effects any lighting during dredging activities will have on aquatic organisms so that FERC and the public may fully evaluate the impacts of dredging activities.

Dredging will entrain salmonids

The DEIS fails to analyze the impact of entrainment of salmon and fails to consider dredging alternatives. The proposed hydraulic cutterhead dredge method will entrain juvenile fish, including threatened salmonids, as well as benthic organisms critical to salmon diets. The DEIS stated, "hydraulic dredging has the potential to capture small fish and aquatic invertebrates in the flow of water and entrain them along with dredge materials being suctioned." DEIS at 3-52. These suctioned dredge materials and the fish will be deposited on shore, where the fish will asphyxiate if they survive the transport through the suction hose. With mechanical dredging, which Bradwood does not plan to use, "fish would be less likely to be entrained with the dredged materials compared to hydraulic dredging." DEIS at 3-53. Bradwood chose hydraulic dredging because it is not as cost effective as hydraulic dredging. The DEIS failed to analyze the alternative methods of dredging or alternative means to mitigation harm to fish.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

FERC must analyze the impacts of fish entrainment due to dredging. FERC must consider the fact that the fish killed will include salmonids listed as threatened under the federal ESA and the Oregon ESA. In analyzing the impact to salmon and aquatic life, FERC must consider that cumulative impacts on aquatic life, including the impacts from dredging, terminal construction and operation, pipeline construction and operation, as well as the impact of the channel deepening dredging.

Dredge material disposal will harm aquatic life

Not only will the actual dredging of the berth and ship maneuvering areas have a substantial impact on the environment, but the disposal of the 700,000 cubic yards of dredge spoils will also cause problems. According to the DEIS, Bradwood plans on placing between 350,000 and 400,000 cubic yards of dredge material at the LNG terminal site. DEIS at 4-70. The remaining 300,000 to 350,000 cubic yards of proposed dredge material will be disposed of at the Wahkiakum County Sand Pit site. DEIS at 4-71. Yet, the DEIS fails to analyze the impact of this substantial dredge disposal, and fails to consider the cumulative impact of this dredge disposal with the dredge disposal from the channel deepening dredging.

Disposal of dredge material at the terminal site will result in pollution to the Columbia River. Bradwood proposes to construct a perimeter berm to form a basin into which dredge materials will be placed. Filling this constructed basin with dredge materials will not only destroy the log pond, which is critical habitat for federally protected salmon, but may also result in polluted water runoff in to the Columbia River. The DEIS fails to analyze the impact of this pollution.

Hydraulic cutter head dredging requires large amounts of water to be sucked up along with the dredged sediments. The water taken up can often be in excess of the sediment removed depending on the type of cutter head dredge used. During this process, the water will mix with any contaminated sediments that may be present, resulting in pollution of the water. The DEIS claims that the infiltration capacity of the soils will be sufficient for the water to percolate into the ground before running off into the River. DEIS at 4-70. However, the DEIS fails to support these statements with any references to calculations or other scientific evidence, in violation of 40 C.F.R. § 1502.1, which requires that all statements be supported by evidence. The DEIS simply states the expectation that the water will infiltrate at a rate sufficient to accommodate the water deposited from the dredge spoils, without analyzing how much water will be included in the dredge spoils and calculating how much will infiltrate. *Id.*

Even if the dredge spoil water does sufficiently percolate into the ground, there is a good possibility the water will still run into the river by transport through the ground. However, the soil at the site will likely be compacted due to construction activities such as building the berm around the basin where the dredge materials will be placed. This soil compaction will invariably lower the infiltration rates of the soil, resulting in increased runoff. The DEIS fails to adequately address the amount of water to be deposited from dredge spoils and soil compaction due to construction activities in determining the amount of water that will not percolate into the ground. The total lack of analysis makes it impossible for FERC or the public to adequately analyze the possibilities of water runoff into the river from dredge materials. Therefore, FERC should

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

reevaluate how much water will be deposited with the dredge sediment and the infiltration rates of the soil, after possible compaction through construction activities, where the dredge materials will be deposited.

The DEIS proposes that any water that does not percolate into the ground will flow into the log pond where any suspended sediments will be settled out before the water percolates into the ground or is discharged to the river through an overflow structure. *Id.* As a result, any contaminated water collected with the dredged materials and deposited in the basin may still pollute the River. The DEIS acknowledges that water may be continually present in the log pond, further reducing its capacity. *Id.* Bradwood proposes to prevent any overflows of the berm by installing an overflow structure that will release "clarified water" back into the river. DEIS at 4-71. The DEIS does not discuss the pollutant content of the "clarified water." The "clarified water" will contain pollutants, which must be described. Also, retention in the log pond does not insure any dissolved pollutants are removed from the water. FERC should analyze the possibility of dissolved pollutants from dredge spoils being released back into the river through the overflow structure. Water allowed to collect in the log pond and discharged back into the river will also likely have increased in temperature. The DEIS fails to analyze the impact of a new source of temperature pollution when the Columbia River is already water quality limited (303(d)-listed) for temperature.

The Wahkiakum County Sand Pit does not have the capacity to accommodate the dredge materials over the life of the Bradwood LNG Project. The DEIS completely fails to analyze the capacity of Wahkiakum County Sand Pit site. The DEIS has not shown that the site will be able to accommodate all the dredge materials from initial dredging as well as future maintenance dredging. NMFS has continually voiced concerns over the capacity of Wahkiakum County Sand Pit site to hold the initial 300,000 to 350,000 cubic yards of dredge spoil as well as dredge spoils from maintenance dredging. FERC must assess the ability of the Sand Pit to accommodate this large amount of spoils and how this will impact water quality.

Additionally, Bradwood has failed to obtain approval for disposal of all dredge materials at Wahkiakum County Sand Pit. If Bradwood can not obtain approval for disposal at the Wahkiakum County Sand Pit, where will the dredge materials be placed? The Corps may wish to use the Wahkiakum County Sand Pit for disposal of materials from future maintenance dredging of the main channel. The DEIS fails to consider the reduction of dredge material disposal site due to Bradwood's dredging.

The DEIS fails also fails to take into account the capacity of the Wahkiakum County Sand Pit site for disposal of dredge materials over the 40-year life period of the project. According to calculations conducted by NMFS, the Wahkiakum County Sand Pit site only has capacity for a range of years between 12 and 29 years. Therefore, the Wahkiakum County Sand Pit site will not be sufficient to accommodate disposal of dredge materials over the life of the project. FERC must determine whether a sufficient location for the disposal of dredge materials is found, and the environmental and economic impacts of using such a site. The DEIS is insufficient for not containing this information.

FERC must also consider the distribution of dredge materials along the shoreline of Puget

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Island from the Sand Pit. The DEIS acknowledges that a specific model has not been conducted to assess any increased turbidity levels associated with the distribution of dredge materials on the beaches of Puget Island. DEIS at 4-71. FERC attempts to alleviate this lack of analysis by simply saying the water quality impacts would be temporary and minor based on the grain size of the sediments in the dredge material. DEIS at 4-72. However, the shores of Puget Island are subject to constant erosion from wind, tides, and ship wakes. Placing large amounts of structurally unstable and possibly contaminated dredge sediments will likely increase the rate of erosion and, consequently, the amount of turbidity and pollution in the waters of the river off of Puget Island, causing harmful effects to fish located in the area. The DEIS provides no adequate basis for concluding turbidity increases will be "minor," in addition to completely ignoring possible contamination of the water column from contaminated sediments. Additionally, constant erosion of large amounts of material may last over a substantial period of time and will be anything but "temporary." FERC must conduct actual analysis of any expected turbidity and pollution increases and adverse biological conditions resulting from placement of dredge materials on the beaches of Puget Island and not rely on simple "expectations" based on general observations.

Economic and human use impacts

The DEIS fails to consider that dredging will adversely affect the commercial and recreational fishing industry, both vital components of the Clatsop County and State economy. In Oregon, Washington, and Idaho, 3,600 people earn their livelihood from salmon and steelhead fishing for a personal income of \$109 million. The recreational fishing industry is worth millions more. The continued success of these industries depends on the recovery of healthy populations of fish and continued access to the traditional fishing areas. Bradwood's dredging will adversely affect both of these requirements.

First, the dredging will degrade vital fish habitat, which will reduce health of the fisheries. The commercial salmon fishery is already severely limited due to dwindling populations. Bradwood's permanent destruction of key salmon habitat will further degrade the fishery, and, in turn, degrade the opportunities for commercial and recreational fishing, as well as tribal fishing rights throughout the Columbia River Basin.

In addition, the 24-hour per day dredging will completely block access to the traditional fishing grounds at the head of Clifton Channel, and may block Clifton Channel, for several months. This will seriously degrade commercial and recreational fishing and violate the public trust. The DEIS fails to analyze this impact on the public interest.

Terminal Fill

The DEIS fails to assess the impact of permanently filling at least 14 acres of estuarine and freshwater wetlands at the terminal site. The fill will modify the physical characteristics by replacing wetlands with sand and then concrete. The fill may contain toxic sediment, which will leech into surrounding wetlands or into the river. The fill will decrease the filtering capacity of the wetlands, which will lead to increased run-off, turbidity, and water temperature. The FEIS

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

failed to assess the cumulative effect of this action on the hydrology, water quality, and aquatic resources in this area.

The biological impacts of the fill are severe. We have already lost 80% of the lower Columbia River's wetlands. In this degraded state, every remaining acre is important. The Bradwood location contains an impressive array of healthy wetlands that have returned to healthy habitat in the 50 years since the former mill closed. Bradwood dismisses the habitat value of former log pond, but this area is not a pond at all. It is now a healthy backchannel habitat, connected to the Columbia River, that is utilized as crucial shallow water habitat by threatened salmonids. The DEIS fails to assess the impact of destroying the log pond habitat, considering the historical destruction of wetlands in the estuary.

The log pond is designated critical habitat for 13 species of salmonids and is a valuable rearing habitat for these species. Bradwood proposes to mitigate the filling of the log pond through a Fish Salvage Plan, which would result in the "capture, record, release of as many salmonids as possible." DEIS at 4-212. Unfortunately, no matter how careful Bradwood is in implementing the Plan, some fish will invariably not survive the process or will be harmed. The ESA forbids the taking of any protected species by private or federal entities. If Bradwood is allowed to fill the log pond, it will result in the unavoidable taking of a federally protected species in direct violation of the ESA. Additionally, filling of the log pond will be destruction of critical habitat for a federally protected species, therefore jeopardizing the continued existence of 13 ESA-listed species.

In addition, the estuarine wetlands provide a nursery for young salmon and other aquatic life. The combination of losing shallow water habitat from dredging and losing shallow water habitat from filling wetlands is a devastating hit to the estuary ecosystem. The EIS must analyze the habitat loss of the dredge and fill cumulatively.

The wetland fill will also degrade habitat utilized by birds, amphibians, mammals, and invertebrates. For example, bald eagles utilize the Bradwood site for perching and hunting.¹⁴⁷ On one visit, a biologist recorded six different individual eagles perching at the Bradwood site and the mouth of Hunt Creek, and hunting over the wetlands and river. *Id.*

Bradwood states that it will mitigate the impacts to the species affected by destruction of critical habitat through their Mitigation Plan. The DEIS fails to provide enough details of the Mitigation Plan to assess its value. The DEIS is deficient for relying on an incomplete plan, and failing to assess the final plan.

The Mitigation Plan will be insufficient to mitigate the adverse impacts of filling the log pond. The filling of the log pond and its resulting destruction will be certain, permanent, and imminent. In contrast, the measures to be implemented in the Mitigation Plan and the effectiveness of such measures are highly uncertain. Furthermore, even if the measures of the Mitigation Plan are successfully implemented, the benefits from the measures may accrue slowly while the endangered or threatened species are put in further jeopardy by a lack of critical habitat. FERC should take these factors under consideration and provide a more thorough

¹⁴⁷ Cascade Avian Consulting at 1 (attached).

analysis in the EIS concerning the effectiveness of the Mitigation Plan.

Terminal construction and operation

Terminal construction and operation will have long-term adverse effects on the lower Columbia River ecosystem, economy and safety of the residents.

The terminal construction and operation will degrade the ecosystem

Construction Activities at the Proposed Terminal Site Will Disturb or Contribute to Contaminated Soils and Increase Sedimentation and Pollutant Transport into the River through Storm Water Runoff.

Approximately 70 acres are proposed to be disturbed by the construction of the LNG terminal. DEIS at 4-27. Construction activities at the terminal will have multiple long and short term adverse effects on the environment, including the disturbance of contaminated soils, water pollution from storm water runoff during construction, removal of vegetation, increased air pollution, substantial noise and light pollution, and the use of large quantities of water for hydrostatic testing of the tank and pipelines. The DEIS fails to analyze these impacts adequately, as discussed below.

The DEIS acknowledges that there are potentially contaminated soils present at the proposed terminal site. DEIS at 4-28. In fact, the DEIS states that "the Environmental Site Assessment did identify several Recognized Environmental Concerns (REC) on the property, including two gasoline underground storage tanks (UST), an area where a former train/maintenance shop building was located, asbestos containing cement board, solid waste disposal and burn areas, and the potential presence of polychlorinated biphenyls (PCB) and dioxins in dredged sand deposited at the site." *Id.* However, the DEIS also notes that the assessment only inspected known contaminated sites, and did not conduct any soil testing for contaminants at other locations. *Id.* It is alarming that FERC acknowledges the potential for contaminated soils at the proposed terminal site, yet does not require any further testing of the soils to ensure contaminated soils are identified and properly handled during construction. The DEIS does state that FERC is requiring Bradwood to develop a Contaminated Materials Management Plan (CMMP) before construction ensues, but only requires the identification and management of contaminants if any are encountered during construction. DEIS at 4-29. These precautions are inadequate to ensure the safety of the environment as well as the construction workers at the site. FERC should require Bradwood to conduct soil contaminant testing in areas likely to be disturbed during construction by clearing, grading, or excavation activities before any construction ensues. If these precautions are not taken, the possibility for soil contaminants uncovered during construction to adversely impact aquatic and terrestrial habitats will be unnecessarily high. Therefore, without soil testing for contaminants prior to construction, FERC and the public can not evaluate the possible environmental impacts from construction activities.

The DEIS fails to analyze the adverse environmental impacts to the river due to construction activities at the proposed terminal site. These impacts will occur through increased

erosion and sedimentation processes. In fact, construction activities often result in runoff that can increase total suspended solids to levels near 3000 mg/L (Barrett and Molina, 2000), a level harmful to many aquatic organisms. The potential for soil contaminants to be transported into the river due to storm water runoff is also greatly increased during construction activities. Construction activities will result in soil compaction and increases in impermeable surfaces, therefore creating a much greater potential for runoff into the river. Therefore, any possible contaminants spilled during construction activities will likely runoff into the river unless proper measures are taken. The DEIS states that Bradwood will attempt to mitigate these impacts through the use of its terminal Erosion Sediment Control ("ESC") Plan. DEIS at 4-29. However, the DEIS does not assess the environmental impact of construction when the ESC is employed. In addition, the detention ponds in the ESC for storm water runoff do not eliminate impacts to aquatic habitats.¹⁴⁸ The DEIS also fails to discuss construction alternatives that will eliminate or minimize adverse effects. There are multiple techniques and theories on management construction sites and stormwater pollution, but the DEIS fails to discuss any alternatives.

The ESC Plan fails to disclose specific information for adequate evaluation of the mitigation designs and procedures to be used mitigating these environmental impacts. FERC and the public can not possibly evaluate the effectiveness of any mitigation plans proposed by Bradwood without the specifics of the plans. Simply stating that BMPs will be used is insufficient for evaluation of mitigation measures specific to this site. For instance, when describing measures to be taken during "Phase 1" of construction, the ESC Plan simply states that "[s]tructural BMPs to be implemented as part of Phase 1 construction activities include perimeter controls (silt fencing, secondary perimeter controls for sensitive areas, and shrubbery), construction access, safety fencing, revegetation and vegetation maintenance, runoff discharge and disposal facilities, wheel wash, instream sediment management, and sand bag barriers." Terminal ESCP at 5-5. This listing of BMPs to be used is inadequate for a proper analysis of the probative value of the proposed sediment control measures.

In an attempt to provide some detail, Bradwood refers the reader of the Terminal ESC Plan to see the figures and lists of BMPs attached to the plan for the specifics of BMP measures to be used during certain construction activities. However these figures and lists do not adequately explain the aspects of the BMPs to be used at this site. For example, Bradwood lists the BMP for preservation of existing vegetation/ buffer strips, but fails to explain the detailed measures to be taken given the specifics of the site. Details of the measures Bradwood should include are the size of the buffer strips and the types of vegetation to be planted for buffer strips. Bradwood should be able to, and in fact be required to, disclose the specifics of the BMPs to be used based on current designs and local requirements. The description of a general BMP without site specific considerations is worthless to the public, and FERC, for proper evaluation of the measures to be used for mitigation of environmental impacts caused by construction activities.

FERC further asserts that a lack of specificity in the design of some aspects of the terminal site is a valid reason for not producing a detailed sediment control plan for certain aspects of the project. *Id.* If FERC is not sure of the design or preventative measures to be taken to mitigate environmental impacts, then the DEIS is by definition deficient because it cannot

¹⁴⁸ Booth, D.B., D. Hartley, and R. Jackson. 2002. Forest cover, impervious-surface area, and mitigation of stormwater impacts. *J. Amer. Water Resour. Assoc.*, 38:835-845.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

evaluate the effects of the ESC. FERC must require Bradwood to produce a more specific Terminal ESC plan and provide a more thorough analysis. Furthermore, FERC should thoroughly evaluate the possibilities of increased sedimentation and contaminant transport into the Columbia River through storm water runoff as a result of the construction activities.

The DEIS lacks adequate detail regarding the water quality and habitat impacts of the improvements to Bradwood Road and other roads. DEIS at 2-31, 2-41. Specifically, Bradwood fails to assess how much of an increase in impervious surfaces will result from road improvements, and how surface flow runoff will be affected from said road improvements. Increased storm water runoff resulting from greater areas of impervious surfaces from road construction will possibly increase pollution into Hunt Creek and Columbia River. These forms of pollution could be increased sedimentation due to the increased surface flow runoff, or debris and hydrocarbons such as oil washed from the road surfaces during storm events. FERC should evaluate the effects of greater impervious areas and changes in storm water drainage dynamics resulting from road widening and construction, and also evaluate the potential from increased pollutants entering Hunt Creek or Columbia River from resulting increased storm water runoff.

The DEIS fails to adequately evaluate the potential for releasing contaminants from the soil during road construction. According to the DEIS, Bradwood plans on widening Bradwood Road. DEIS at 4-344. Elsewhere in the DEIS, the area along Bradwood Road is designated as a REC, with possible soil contamination from solid waste disposal and burn areas. DEIS at 4-292. How does Bradwood plan on handling possible soil contaminants encountered during road improvements on Bradwood Road? The DEIS currently does not address this issue, which is of concern since road construction activities along with storm water runoff could release these contaminants and carry them to adjacent water bodies. FERC should require Bradwood to provide a plan on dealing with any soil contaminants encountered during road construction activities and analyze the possible environmental effects from the release of any such contaminants.

Bradwood proposes to replace the Hunt Creek Bridge, but the DEIS fails to adequately address the environmental impacts of the bridge replacement, including the bridge design and the potential for uncured concrete to be washed into Hunt Creek. As NMFS notes in their letter regarding the BA for the project, Bradwood has not adequately informed the agencies on how they propose to keep uncured concrete from entering Hunt Creek. Bradwood also fails to demonstrate how rainfall that comes in contact with uncured concrete during construction will be kept from discharging into Hunt Creek, and what controls they will employ to ensure concrete does not enter Hunt Creek. Additionally, the bridge design proposed by Bradwood shows a slope on the bridge with a curb to direct water runoff. Bradwood does not address the issue of how the bridge will keep storm water runoff from entering Hunt Creek while vehicles cross the bridge. Vehicles will displace rain water as they pass over the bridge, and the lack of a curb on the upslope of the bridge may allow for storm water runoff to flow directly into Hunt Creek. Storm water runoff from the bridge flowing directly into Hunt Creek is a problem because it will contain contaminants and sediments. FERC should address these issues with bridge construction and design as relates to the potential for polluted storm water runoff.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

In addition, the DEIS does not adequately analyze the environmental impacts of the proposed railroad realignment. NFMS expressed concern that Bradwood did not discuss what kind of treated wood will be used for the new railroad ties. If the railroad ties are treated with chemicals such as creosote, ammoniacal copper zinc arsenate, or chromated copper arsenate, the potential for soil contamination is highly likely. Furthermore, the DEIS did not evaluate how any contamination from the railroad ties will move through the soil.

The removal of vegetation will affect the ecosystem

The DEIS fails to consider that construction activities, including terminal construction, replacement of Hunt Creek Bridge, power line construction, relocation of the railroad tracks, and temporary parking lot construction, will destroy acres of vegetation. The DEIS recognizes that construction activities at the proposed LNG terminal would have a substantial impact "on riparian forest and scrub-shrub communities due to their high productivity, species diversity, and contribution to both aquatic and upland ecosystem function (Knutson and Naeff, 1997)." DEIS at 4-110. However, the DEIS fails to adequately analyze the full scope of vegetation removal, the effects of vegetation removal on surrounding habitats, and the problems associated with re-vegetating areas in the vicinity of the project site.

First, the DEIS fails to adequately analyze the quantity and type of vegetation to be destroyed as a result of construction activities at and around the proposed terminal site. For instance, the DEIS explains that in response to concerns raised by NFMS, Bradwood hired biologists to count cottonwood trees at the proposed terminal site. DEIS at 4-110. However, only cottonwood trees over 20 feet in height were included in the count of cottonwood trees at the site and the rest were considered riparian scrub shrub vegetation. *Id.* FERC gives no basis why a 20 foot height was used as the limit for cottonwood trees to be counted. Using an arbitrary height of 20 feet with no basis or justification is unacceptable for a valid survey.

FERC is also not clear regarding the amount of vegetation that will be removed due to road improvements or the construction of temporary roads. The terminal ESC Plan submitted by Bradwood mentions possible road improvements to Bradwood Road and Clifton Road as well as construction of temporary roads. The DEIS states "Bradwood would widen Bradwood Road to 24 feet by clearing and grading the area directly adjacent to the existing road." DEIS at 4-344. Also, Bradwood may make improvements to Clifton Road "consist[ing] of widening the roadway by 2 to 3 feet at selected locations based on available area." DEIS at 2-41. The DEIS fails to analyze how much vegetation is to be removed as a result of these construction activities and what kind of mitigation measures Bradwood proposes to conduct.

FERC also fails to consider the direct and indirect effects of vegetation removal during various aspects of construction. Adverse impacts on aquatic habitats through the removal of shoreline vegetation is well documented and, as the DEIS confirms, can lead to increased sedimentation and temperatures in waters adjacent to areas cleared of vegetation. DEIS at 4-140. However, FERC only attributes increases in water temperature to indirect effects such as increased solar radiation of the land, and the subsequent heating of runoff water running into water bodies. *Id.* Direct solar radiation to the Columbia River and Hunt Creek will also be increased due to the removal of shade produced by vegetation. The Columbia River is already

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

water quality limited due to high temperatures. Any subsequent increases in temperature due to the removal of vegetation during construction will further endanger federally listed species in the Columbia River and Hunt Creek through adversely affecting critical habitat and EFH for these species. As the DEIS states, increased temperatures can lead to decreased salmonid productivity and the possibility of other species out competing salmonids. DEIS at 4-140, 4-141. FERC cannot allow the further degradation of critical habitat of federally listed aquatic species by Bradwood's proposed construction activities and must further analyze the effects removal of vegetation will have on the temperatures of the Columbia River and Hunt Creek in the EIS.

Removal of vegetation near the shorelines of the Columbia River and Hunt Creek during construction activities will also adversely affect aquatic species by removing a source of food. It is well established by numerous studies that riparian vegetation provides a valuable food source for fish, especially juveniles.¹⁴⁹ The food source is the result of invertebrates in the detritus, understory, and canopy of riparian vegetation. Many of these invertebrates find their way into the water and are subsequently eaten by fish. Clearing vegetation along the shore of the Columbia River and Hunt Creek will destroy this habitat for invertebrates, thus destroying a valuable food source for fish along the stretches of these water bodies. The DEIS ignores these impacts completely. The analysis of food source impacts due to removal of vegetation conducted in the DEIS is limited to possible increases in food in the form microorganisms and aquatic invertebrates in the water due to increased temperatures. DEIS at 4-140. However, FERC notes that any increase in food due to increased water temperature will be limited to the summer and be offset by increased fish loss due to loss of cover. *Id.*

Any increases in food by increased production of microorganisms and aquatic invertebrates will further be offset by losses of invertebrates along the shoreline due to the removal of vegetation. FERC should consider the impacts to fish and other aquatic organisms resulting from the removal of a valuable food source, in the form of invertebrates, through the destruction of terrestrial vegetation along the shores of the Columbia River and Hunt Creek, in the DEIS.

The DEIS completely fails to analyze the potential of fragmentation on terrestrial organisms that migrate through the region. Removal of vegetation, such as along the proposed power line corridor and around the proposed terminal, can result in a barrier to wildlife movement and cause a severance of connectivity between ecosystems.¹⁵⁰ Such fragmentation can exacerbate extinction pressures on animals because small populations are split off from each other, increasing the chances of adverse conditions completely eliminating a population.¹⁵¹ Therefore, removal of vegetation during construction around the proposed terminal and along the power line may cause fragmentation that can harm animals such as the endangered Columbian white-tailed deer. This is a permanent effect that the DEIS essentially ignores. Although, according to the DEIS, Bradwood has contemplated installing a corridor for animal movement

¹⁴⁹ Wigfli, M.S. 1997. Terrestrial invertebrates as salmonid prey and nitrogen sources in streams: contrasting old-growth and young-growth riparian forests in southeastern Alaska, USA. *Canadian Journal of Fisheries and Aquatic Sciences*. 54: 1259-1269.

¹⁵⁰ Rosenfield, R. N., C. M. Morsky, J. Bielefeldt and W. L. Loope. 1992. Forest fragmentation and island biogeography: a summary and bibliography. National Park Service Technical Report NPS/NRUV/NRTR-92/08

¹⁵¹ Soulé, M. E., editor. 1987. *Viable populations for conservation*. Cambridge University Press, Cambridge, United Kingdom.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

around the terminal fence, DEIS at 4-158, such measures would not be practical or possible for the barrier introduced as a result of construction of the power line. FERC should analyze habitat fragmentation due to the removal of vegetation and construction activities around the proposed terminal and power line, and should further analyze the possible adverse effects to animals such as the endangered Columbian white-tailed deer from fragmentation.

Bradwood asserts that it is committed to mitigating the adverse effects of the project and providing a net benefit to the ecosystem. However, not only are the mitigation plans vague and incomplete, mitigation measures carried out by Bradwood will not mitigate the immediate adverse impacts caused by the destruction of vegetation around the proposed terminal site. For example, the DEIS states that it will attempt to replace trees removed during construction in a 5:1 ratio. DEIS at 4-141. Nevertheless, the DEIS fails to take into account the difficulty of establishing some species of trees that will be removed during construction. As discussed above, Bradwood will remove hundreds of cottonwood trees around the terminal site and along Hunt Creek. These cottonwood trees are notoriously hard to re-establish because of their phreatophytic nature that requires precise soil conditions for successful establishment.¹⁵² Furthermore, seedlings and small trees replanted are very susceptible to grazing by various animals, making it even more difficult to re-establish trees. The preliminary mitigation plan by Bradwood does not adequately assess the possible mortality rates of trees that Bradwood will attempt to re-establish, and the measures Bradwood will take to ensure high survival rates. Additionally, neither the DEIS nor the mitigation plan adequately provide assurances that these trees will be protected during their early life stages from herbivory. FERC must include more detail in the plan for revegetation in the vicinity of the proposed terminal.

Construction Activities Degrade the Air

The DEIS fails to consider the temporary increases in air pollution resulting from construction activities. Numerous activities conducted during construction of the proposed Bradwood LNG terminal will cause increases in air pollutant levels in the region. These activities include anything from increases in vehicle traffic to and from the site to the burning of vegetation removed during clearing of the site. Also, construction equipment, including dredge ships, and vehicles transporting construction supplies will add to the emissions. FERC states in the DEIS that "[i]mpacts associated with construction vehicles are difficult to estimate based on the time and space variant characteristics of the emissions." DEIS at 4-383. After making this statement, FERC then concludes that emissions are not likely to exceed NAAQS. *Id.* This level of analysis is insufficient to address the environmental impacts from construction emissions. The DEIS shows that certain emission (NO_x and VOCs) will raise regional emissions by more than 10% during construction, a substantial increase. *Id.* If regional emissions are raised by more than 10% in some instances, the local effect may be sufficient to cause some respiratory distress in humans or animals. The DEIS ignores these important impacts.

Additional sources of increased air pollutant emissions may originate from burning vegetation removed from the site. According to documentation submitted by Bradwood, such as

¹⁵² Steinberg, P. D. (2001). *Populus balsamifera* spp. *trichocarpa*. Fire Effects Information System, [Online], USDA Forest Service, Rocky Mountain Research Station, Fire Sciences Laboratory (Producer). 2005.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

the terminal ESC Plan, vegetation cleared from the site may be disposed of by being burned. The DEIS does not discuss this source of pollution.

Construction Activities Will Cause Noise and Light Pollution.

The DEIS fails to consider that noise and light levels during construction of the proposed Bradwood LNG terminal will reach levels that could be a nuisance to humans and cause harm to animals. Noise will originate from a variety of sources during construction, including increased vehicle and railway traffic, engine driven construction equipment, pile driving, and blasting activities. The impacts from these sources of noise are either inadequately addressed by FERC or the mitigation measures to be used are not sufficiently clear or effective to prevent nuisance or harm to humans and animals in the affected region. In addition, light from construction activities and the overall terminal lighting plan can adversely affect animal behavior. FERC does not adequately assess the possible impacts of construction and terminal lighting.

The noise impacts underwater from various construction activities could produce substantial harm to animals. The DEIS notes that threshold levels for salmonids and pinnipeds will not likely be exceeded due to blasting, DEIS at 4-148, however acknowledges that the behavior of pinnipeds may be altered. Nothing is mentioned in the DEIS concerning the behavioral modifications to salmonids in the area and, for that matter, any other organisms present in the affected vicinity. FERC should more thoroughly evaluate and report the possible consequences the noise from blasting will have on not just the physiological but also the perceptual and behavioral well being of all animals in the vicinity.

In addition to blasting and dredging, pile driving will have a substantial adverse impact upon underwater organisms. FERC has provided a number of proposed mitigation measures to alleviate some of the harm of pile driving, DEIS at 4-137, 4-138, 4-139, but nonetheless has failed to analyze the harm that will occur to organisms in the vicinity, especially pinnipeds and salmonids. FERC relies entirely on the mitigation measures, but misses the fundamental purpose of NEPA to assess environmental harm. First, even if all the mitigation measures proposed by Bradwood work, the threshold level for physiological harm for salmonids of 180 dB re: 1 µPa will not be met within approximately 33 feet of the pile driving. DEIS at 4-138. Furthermore, even with the mitigation measures the noise levels will still exceed the behavioral impact levels of 150 dB re: 1 µPa more than a mile away. *Id.* Given that the pile driving is estimated to last for approximately 4 months, many endangered fish and other animals could be killed, or at the very least harmed, by this activity. The DEIS fails to discuss the fact that this project will violate the threshold harm limits for salmon.

Bradwood's proposed mitigation may not even work to reduce underwater noise. The DEIS notes that there is the possibility the bubble curtains proposed to be used by Bradwood may not have their full intended mitigating effect, *Id.*, and NMFS has echoed concerns about the efficacy of bubble curtains in their May 11, 2007 letter to FERC. The DEIS recommends that Bradwood file a contingency plan if the bubble curtains do not work as intended before pile driving commences. DEIS at 4-139. Yet, the DEIS failed to assess whether a contingent plan is likely to be effective and what effects are expected from alternative plans.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

As for the safety of pinniped species, Bradwood proposes to incorporate a safety, buffer, and impact zone. DEIS at 4-247, 4-248. As the DEIS pointed out though, Bradwood originally only proposed such measures for the Stellar Sea Lion. DEIS at 4-139. Additionally, the monitoring for the presence of pinnipeds within these zones is inadequately addressed by DEIS. The DEIS fails to discuss conditions under which more than one monitor could be used, under what conditions (i.e. bad weather) monitoring activities will be sufficiently doubtful to stop pile driving, and the methods Bradwood will use to monitor small and elusive marine mammals, such as harbor seals.

The DEIS also fails to consider that noise impacts from construction activities may disturb various birds, including the Bald Eagle, and other animals, like the Columbian white-tailed deer, and cause them to avoid the areas impacted. According to the FERC, these impacts will be temporary and the Columbian white-tailed deer, for instance, is likely to become acclimated to the noise. DEIS 4-250. But, the construction will last three years, and the noise will continue after the construction ends. FERC offers no evidence that the impact is temporary. In addition, avoiding traditional habitat may cause these animals to travel to less healthy habitat, thus increasing the danger to these animals.

Finally, the FERC recognizes that artificial lighting can have adverse effects on wildlife in the areas surrounding the proposed LNG terminal. DEIS 4-157. However, the NMFS in their May 11, 2007 letter notes, and DEIS confirms, that Bradwood has not submitted a detailed final lighting plan for either construction or terminal operations. DEIS at 4-147. The DEIS, therefore, is deficient because it does not contain a final lighting plan. FERC must analyze the impact of light on aquatic and terrestrial species.

The Removal of Large Quantities of Water for Hydrostatic Testing Will Harm to the Environment.

The DEIS fails to analyze that Bradwood will remove large volumes of water from the Columbia River to test the reliability of numerous pipes and tanks during construction of the proposed terminal. DEIS at 4-72. Bradwood proposes to appropriate water directly from the Columbia River using pumps with fish screens on the intake valves. DEIS 4-144. These fish screens will not prevent all fish impingement or entrapment. In the May 11 letter, NMFS pointed out that the fish screen design proposed by Bradwood will likely be insufficient for proper functionality.

Water will be discharged back into the river after use for hydrostatic testing of the LNG tanks, the pipeline, and the fire suppression system. DEIS at 4-72, 4-77, 4-86. The procedures for dechlorination (if chlorine is initially added to kill bacteria) described in the DEIS are vague and insufficient to evaluate the efficacy of the procedure proposed. Additionally, Bradwood claims it will test the water for any contaminants, but fails to explain what contaminants it will test for. Will water temperature also be tested prior to discharge of the tank hydrostatic testing water?

The DEIS claims that any scale and sediments in the water from the pipeline hydrostatic testing will be filtered out by straw bales, but provides no basis for the accuracy of this

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

statement. DEIS at 4-86. Although Bradwood states that it does not anticipate contaminants, construction is far from a sanitary business, and contaminants could inadvertently be present within the fire suppression system or pipeline.

Increased Ship Traffic Will Adversely Impact the Environment.

One hundred twenty five LNG tankers will serve Bradwood each year. This number will greatly increase if Bradwood installs a planned third storage tank. The DEIS fails to analyze the from ship traffic, including vessel strikes, wake stranding, increased noise, entrainment and impingement of fish during ballast filling, and shoreline erosion.

Increased Ship Traffic Will Result in Vessel Strikes and Wake Stranding of Fish, Mammals, and Sea Turtles In and Around the Columbia River Estuary.

The LNG terminal will increase the number of deep draft vessels by 25%. This is a substantial increase of the largest ships with the largest wakes. FERC fails to analyze the ecosystem impacts of a 25% increase in deep draft ship traffic. The deep draft vessels are of greatest concern because of large wakes, increased vessel strikes, and sediment resuspension.

The DEIS does not provide a description of the routes the LNG vessels will travel to and from the proposed LNG terminal. Without detailed submissions of the possible routes LNG vessels will take on their way to the proposed Bradwood LNG terminal, the number and types of vessel strikes is extremely difficult to assess. NMFS raised concerns about LNG tankers striking whale, pinnipeds, and sea turtles.

The DEIS fails to consider that wake stranding of juvenile salmon is common in the lower estuary, and fails to consider the impacts due to increased ship traffic. Wake stranding will increase greatly due to the additional deep draft ships. Further, turning of the LNG tankers with high thrust tugs will increase wake stranding and disorientation of salmon. Bradwood argues that because ship wakes may increase due to speed, and because the Pearson et al. (2006) study indicated that 62% of the vessels causing wake stranding were traveling faster than 12 knots, then LNG ships that will not likely exceed 12 knots will not likely cause fish stranding. DEIS at 4-123. However, this statement does not take into account the size of the ships, which also substantially affects the size of the wake. LNG ships will be some of the largest vessels navigating the Lower Columbia River and the wakes of these large vessels can be much larger than even small vessels traveling at high speeds because of the amount of water displacement. Additionally, the DEIS has notes that "[t]he wakes produced by an LNG ship are only slightly larger than those of the large vessels currently using the Columbia River." DEIS at 4-109. Therefore, to insinuate that because LNG ships traveling to the proposed terminal will only be going approximately 12 knots, without taking into account vessel size, then the LNG ships will not likely produce wakes large enough to strand fish is absolutely groundless. As the NMFS May 11, 2007 letter fittingly affirms, Bradwood's "anecdotal analysis is inadequate" concerning juvenile fish wake stranding.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Increased Noise from LNG Ship Traffic Will Harm to the Environment.

The DEIS fails to consider that the noise emitted from LNG ships is above the NMFS's noise threshold for physical harm to fish. LNG ships are considered cargo vessels and "[c]argo vessels are known to emit high levels of low frequency sound (6.8 to 7.7 hertz (Hz) at 181 to 190 dB, re: 1 μ Pa) capable of traveling long distances (Richardson et al., 1995)." DEIS at 4-224. As mentioned above, "[t]he NMFS' current noise thresholds for fish are a peak pressure of 180 dB re: 1 μ Pa for physical harm and an impulse pressure, or root mean square (rms), of 150 dBrms re: 1 μ Pa for behavioral disruption (NMFS, 2007a)." DEIS at 4-137. As the DEIS notes, noise from LNG vessels can have some adverse affects on whale behavior. DEIS at 4-244. However, FERC fails to address the adverse affects underwater engine noise from LNG vessels will have on salmonids and other aquatic species.

Removal of Engine Cooling and Ballast Water for LNG Vessels Will Cause Harm to Salmonids.

The DEIS fails to consider that the removal of water from the Columbia River for use in the cooling of engines and filling ballast tanks for LNG vessels will cause harm to salmonids through entrainment and impingement. The screens proposed to be used by Bradwood for water intake have been criticized by NMFS. DEIS at 4-145. Bradwood proposes to design the screens to minimize entrainment and impingement of fish and construct a system capable of supplying filtered water to the LNG ships for engine cooling and ballast using such screens. *Id.* For this system to work, the LNG ships docking at the proposed Bradwood LNG terminal must undergo significant retrofits. According to Bradwood, incentives will be offered to ships to retrofit. *Id.* However, offering incentives does not ensure that ships will in fact be properly equipped for using Bradwood's system, and therefore does not ensure the minimization of entrainment and impingement of fish. The DEIS fails to consider the impacts if the retrofits do not occur or are not effective. The DEIS fails also to consider alternative solutions to the ballast water problem.

In addition, the ballast flow volume calculations in the DEIS are questionable. The required ballasting flow volume rate is approximately 1.5 X the maximum usual output of the circulating pump for cooling water to the condenser aboard the ship. The flow rate is more than 2.5 X the usual flow rate for port operations. Bradwood proposes to have the ballast water go through the cooling system prior to entry into the ballast water piping. How will flow be controlled? In the DEIS, FERC states that each vessel will need 20 to 50 million gallons of ballast water and cooling water. If 50 million gallons are needed for any vessel, it will require a flow rate of 10,521 m³/hr. FERC and the public cannot assess the impacts to aquatic resources, the technical viability of the proposed system, or the practicable alternatives because even the basic piping diagram is classified as CEII.

Increased LNG Ship Traffic Will Cause Shoreline Erosion.

The DEIS fails to consider that increased LNG ship traffic will cause shoreline erosion because of the large wakes these ships produce during transport. Both the adverse impacts of shoreline erosion and suspended sediments have been discussed above. The DEIS simply states

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

that “LNG marine traffic should not result in wakes causing significant shoreline erosion compared to existing ship traffic because LNG ship speed and size would be similar to existing deep-draft vessels currently using the Columbia River.” DEIS at 4-357. This utterly fails to consider that Bradwood will increase the deep draft vessels by 25%, which will cause more significant erosion.

The DEIS goes on to further state the existing causes of shoreline erosion and the characteristics that cause wakes from ships. DEIS at 4-450. The DEIS comments that ship speed is the most important factor determining wake size, DEIS at 4-5, 4-450, but contradicts itself by reporting “[a]n analysis undertaken for the COE concluded that the size of ship-produced waves in the Columbia River depends on the blockage ratio, which is the ratio of the cross-sectional area of the ship to that of the channel (COE, 2003).” DEIS at 4-5. The COE study clearly indicates ship size is the primary factor in wave size and FERC’s reliance on ship speed as the “most important” factor determining wake size seems to be little more than an attempt to lessen the actual severity of the wakes LNG ships will cause. The large size of the LNG tankers and the 25% increase in deep draft tankers will cause significantly more erosion, which will harm aquatic life.

The Draft EIS Fails to Adequately Address Air Quality

The DEIS does not adequately analyze or evaluate the direct, indirect or cumulative air quality impacts that could occur as a result of the Bradwood LNG project. Thus, the DEIS fails to comply with NEPA. Under NEPA, FERC has obligations to assess and report the cumulative impacts of expected emissions from the Bradwood LNG project on air quality. Moreover, the DEIS fails to comply with NEPA because it fails to specify mitigation for air quality impacts.

The proposed facility will be a large industrial source of air pollution on the Columbia River. The LNG carriers, associated support vessels, and terminal sources will emit large amounts of particulate matter (PM), including fine particles (PM10 and PM2.5), nitrogen oxides (NOx), carbon monoxide(CO), sulfur dioxide (SO₂), volatile organic compounds (VOCs), and hazardous air pollutants (HAPs). See Resource Report 9. Many of the individual emissions units combust fossil fuels, and therefore emit carbon dioxide (CO₂).

These pollutants have serious, long-term and short-term impacts on public health and the human environment. As the U.S. Environmental Protection Agency (“EPA”) recently explained with regard to pollution from large ocean going vessels:

The health and environmental effects associated with these emissions are a classic example of a negative externality (an activity that imposes uncompensated costs on others). With a negative externality, an activity’s social cost (the cost borne by society imposed as a result of the activity taking place) exceeds its private cost (the cost to those directly engaged in the activity). In this case, emissions from Category 3 marine engines impose public health and environmental costs on society. However, these added costs to society are not reflected in the costs of those using these engines and equipment. The market system itself cannot correct this

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

negative externality because firms in the market are rewarded for minimizing their operating costs, including the costs of pollution control.¹⁵³

The public must bear the cost of this externality through an increased incidence of serious public health problems including premature death, cardiovascular diseases, and respiratory ailments. *Id.* at 11. In addition, many of the LNG carrier ships will be diesel propelled, and diesel exhaust has been classified as a likely carcinogen by EPA since 2002 – even at environmental exposure levels.¹⁵⁴ *Id.*

The DEIS fails to adequately address impacts on human health and the environment from the air pollution associated with the Bradwood Landing project. The Air Quality and Noise section of the DEIS (Section 4.10) does not contain any information on the public health and welfare effects of the air pollution associated with the likely pollutants from the project. Instead, the EIS implies that compliance with the National Ambient Air Quality Standards (“NAAQS”) and state ambient air quality standards ensures that there are no impacts on human health from the air emissions – that is, the DEIS fails to discuss human health impacts of air emissions at all. Compliance with the NAAQS is not an appropriate surrogate for a full and accurate analysis of air pollution impacts in the EIS, however, for at least two reasons. First, the ambient air quality standards are not protective of public health because the NAAQS are out of date and do not represent an ambient concentration under which no health or welfare effects will be experienced. Second, the DEIS’ analyses of the project’s emissions and the dispersion of those emissions are seriously flawed.

AMBIENT AIR QUALITY STANDARDS ARE NOT A REPLACEMENT FOR AN ADEQUATE DESCRIPTION AND ANALYSIS OF HEALTH AND WELFARE IMPACTS FROM THE PROJECT’S AIR EMISSIONS.

The DEIS does not discuss health and welfare impacts related to the project’s emissions. The DEIS seems to depend on modeled compliance with the NAAQS and state ambient air quality standards to demonstrate that the project does not have significant impacts on air quality, and thus human health and welfare. See DEIS at 4-383-84. The DEIS states that “[t]he NAAQS were set at levels the EPA believed were necessary to protect human health (primary standards) and human welfare (secondary standards).” DEIS at 4-367. In many cases, however, EPA has not satisfied its mandatory duty to review thoroughly and update as necessary the air quality criteria and NAAQS for air pollutants every five years. 42 U.S.C. § 7409(d)(1). Moreover, the NAAQS do not represent a level of pollution under which no health or welfare effects will be experienced, however. Thus, the DEIS cannot depend on compliance with the NAAQS or state ambient air quality standards for a sufficient analysis of impacts on the human environment.

For example, EPA has not reviewed the NAAQS for CO for over 13 years. EPA first set primary and secondary CO NAAQS in 1971 at 9 ppm over an 8 hour averaging time and 35 ppm

¹⁵³ U.S. EPA, *Advance Notice of Proposed Rulemaking: Control of Emissions from New Marine Compression-Ignition Engines at or Above 30 Liters per Cylinder 10* (signed Nov. 29, 2007) (attached as Exhibit).

¹⁵⁴ The DEIS contains no discussion of diesel exhaust occupational exposure or human/environmental health impacts of diesel exhaust.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

over a 1 hour averaging time. 36 Fed. Reg. 8186 (April 30, 1971). The primary NAAQS itself has never been revised from the initial level, though the secondary NAAQS was revoked in 1985. 50 Fed. Reg. 37,484 (Sept. 13, 1985). The last time EPA published a review of the CO NAAQS and a decision on whether to revise the CO NAAQS in the Federal Register was 1994. 59 Fed. Reg. 38906 (August 1, 1994). Thus, EPA has not satisfied its mandatory duty to review and decide whether to revise the CO NAAQS every five years, and the DEIS should not depend on compliance with an outdated NAAQS to demonstrate a lack of impacts on the human environment.

Similarly, the last time EPA completed a review to update the air quality criteria for NOx and the NAAQS for NO2 was in 1996. 61 Fed. Reg. 52,852 (Oct. 8, 1996). The 1996 review culminated in EPA's decision to retain the then-existing primary and secondary NO2 NAAQS, each an annual arithmetic mean of 0.053 parts per million (ppm). 61 Fed. Reg. 52,852. This review relied extensively on a 1993 air quality criteria document for NOx and a 1995 EPA staff paper that reviewed and integrated the research findings compiled in the earlier document. 61 Fed. Reg. 52,853. Even assuming the 1996 review was adequate, EPA has failed to satisfy the Clean Air Act's requirements, and a review of the NOx air quality criteria and the NO2 NAAQS is seven years overdue.

For SO2, the story is the same. The current NAAQS for SO2 has not changed since 1971 (though minor technical changes to the SO2 NAAQS were made in 1996). EPA's most recent consideration of the efficacy of the existing NAAQS for SO2 proceeded in two stages. In 1993, EPA elected to retain the existing secondary SO2 NAAQS, and in 1996 EPA came to the same conclusion regarding the existing primary NAAQS. See 58 Fed. Reg. 21,351 (Apr. 21, 1993) (retaining existing secondary SO2 NAAQS); 61 Fed. Reg. 25,566 (May 22, 1996) (retaining existing primary SO2 NAAQS). EPA's 1996 decision to retain the existing primary NAAQS for SO2 was challenged, and upon concluding that EPA had not adequately explained its rationale for retaining the existing primary SO2 NAAQS the District of Columbia Circuit Court remanded the decision to EPA. *American Lung Assn. v. EPA*, 134 F.3d 388 (D.C. Cir. 1998). Although it has now been over nine years since this remand, EPA has neither provided a new justification for its 1996 decision to retain the existing primary SO2 NAAQS nor completed a new cycle of review of those standards. Thus, the DEIS' reliance on the SO2 NAAQS to establish an acceptable level of air pollution impacts is unacceptable.

Even if the NAAQS were reviewed every five years, as required by the Clean Air Act, EPA sometimes sets NAAQS at levels that do not ensure that air pollution will not cause death and disease in the human population. For example, in the most recent review of the fine particulate matter health based ambient air quality, EPA was unable to discern a threshold level of pollution under which the death and disease associated with fine particles would not occur. 71 Fed. Reg. 2620, 2635 (Jan. 17, 2006). Studies reviewed by EPA revealed a linear or almost linear relationship between diseases like cancer and the amount of fine particulate matter in the ambient air. *Id.* Put simply, the more fine particulate matter emitted into our air, the more death and disease. Thus, the NAAQS, which allow a certain concentration of fine particle pollution in the air, does not ensure that public health impacts are eliminated, or even minimized. In fact, the NAAQS for fine particles and ozone are not set at the levels indicated as adequately protective by the Clean Air Scientific Advisory Committee ("CASAC") and the Children's

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Health Protection Advisory Committee ("CHPAC"), EPA's own scientific advisors. See Letter from Dr. Rogene Henderson, Chair, CASAC, to Stephen L. Johnson, Administrator, U.S. EPA, re: CASAC's Peer Review of the Agency's 2nd Draft Ozone Staff Paper, EPA-CASAC-07-001 (Oct. 24, 2006); Letter from Dr. Melanie Marty, Chair, CHPAC, to Stephen L. Johnson, Administrator, U.S. EPA, re: Proposed NAAQS for Particulate Matter (March 3, 2006). Because the NAAQS are not set at levels that prevent all human health and environmental impacts from the air pollutants that the project will emit, the DEIS must adequately discuss the health and welfare impacts associated with the pollution. Because it contains no discussion of human or environmental impacts of air pollution, the DEIS is inadequate.

In addition, there are no ambient air quality standards for hazardous air pollutants, many of which potentially or probably cause cancer. The DEIS contains no discussion of the human health and environmental impacts of the hazardous air pollutants that will be emitted as a result of the project. Therefore, the DEIS is inadequate.

In short, simply pointing to ambient air quality standards as surrogates for determining impacts on public health and welfare is not sufficient under NEPA. FERC must take a hard look at the health and welfare effects. In so doing, FERC must describe the impacts to be expected from the pollution that the project will emit into our air.

HEALTH IMPACTS OF BRADWOOD LNG'S AIR EMISSIONS

As stated above, the proposed project will emit large amounts of PM, PM10, PM2.5, CO, NOx, SO2, VOCs, and HAPs. See Resource Report 9. The DEIS is utterly devoid of any discussion of the health effects of these pollutants. Some discussion of the health impacts that FERC should consider follows, though this discussion is provided only to demonstrate the lack of any health and welfare information included in the DEIS, not to replace the agency's own analysis of health and welfare impacts.

Health Impacts of Particulate Pollution

Particulate pollution, also known as soot, has a variety of serious adverse health effects including premature death, heart attacks, strokes, birth defects and asthma attacks. Particulate pollution has also been linked to Sudden Infant Death Syndrome and low birth weight. The elderly, children, and those with respiratory disease are the most affected by particulate pollution. Particulate matter consists of small particles and liquid droplets that can be inhaled deep into the lungs and cause serious health effects. U.S. EPA. Air Quality Criteria for Particulate Matter (October 2004), Vol. 1, EPA 600/P-99/002aF-bF (both volumes available at <http://cfpub.epa.gov/ncea/cfm/recordisplay.cfm?deid=87903>). PM can cause a variety of health problems include respiratory difficulties and illness, decreased lung function, aggravated asthma, chronic bronchitis, irregular heartbeat, heart attacks, and premature death in people with heart or lung disease. U.S. EPA, Health and Environment, Particulate Matter, <http://www.epa.gov/air/particulatepollution/health.html> (last visited Dec. 2, 2007). In addition, exposure to even low levels of fine particles has been linked to low birth weight. Michelle Bell, *et al.*, "Ambient Air Pollution and Low Birth Weight in Connecticut and Massachusetts," *Environmental Health Perspectives*, Vol. 115(7); 1118-1124 (July 2007) (this study also found

that exposure to nitrogen dioxide and carbon monoxide put children at increased risk for low birth weight). The impacts of particulate matter pollution on birth weight may be disproportionately borne by minority populations. *Id.*

Health Impacts of Sulfur Dioxide Pollution

Since the 1980's, courts have recognized that SO₂ pollution is "a medically recognized threat to human health" and that "high levels of pollution sustained for periods of days can kill." *Ohio Power Co. v. US EPA*, 729 F.2d 1096, 1097, 1098 (6th Cir. 1984). In addition, long-term exposure to SO₂ produces significant health effects, including "[a]cute respiratory infections in children, chronic respiratory diseases in adults, and decreased levels of ventilatory lung function in both children and adults." 729 F.2d at 1098. Like particulate matter, SO₂ aggravates respiratory illnesses. SO₂ is a lung irritant and can cause breathing difficulties, respiratory illness, and aggravation of existing heart disease. U.S. EPA, Health and Environmental Impacts of SO₂, <http://www.epa.gov/air/urbanair/so2/hlth1.html> (last visited Dec. 2, 2007). SO₂ reacts with other chemicals in the air to form sulfate particles that are associated with increased respiratory impairment and disease, difficulty in breathing, and premature death. *Id.* SO₂ is also a precursor chemical to fine particulate matter. 70 Fed. Reg. at 25,162. In addition, when sulfur dioxide emitted from industrial sources reacts with other elements in the atmosphere, it forms sulfates, sulfuric acid mist and other chemical derivatives that tend to stay airborne for days and affect areas at great distances downwind.

Health Impacts of Nitrogen Oxide Pollution

Nitrogen oxides ("NOx") are highly reactive gases emitted primarily from the combustion of fossil fuels in mobile and stationary sources. 70 Fed. Reg. 8880, 8888 (Feb. 23, 2005). NOx can cause respiratory problems such as asthma attacks, respiratory tract symptoms, bronchitis, and decreased lung function. Committee on Environmental Health, American Academy of Pediatrics, *Ambient Air Pollution: Health Hazards to Children*, 114 PEDIATRICS 1699, 1701 (Dec. 2004). Nitrogen oxides are among the main ingredients of ground-level ozone, or smog, which can trigger serious respiratory problems.

Health Impacts of Ground Level Ozone (Smog)

Although ozone ("O₃") serves a beneficial atmospheric purpose when located in the stratosphere ten to thirty miles above the earth's surface, ground-level ozone is a harmful pollutant. *Proposed Rule to Implement the 8-Hour ozone standard*, 68 Fed. Reg. 32802, 32804 (June 2, 2003). Ground-level ozone is created by a chemical reaction between NOx and volatile organic compounds in the presence of sunlight. *Id.* According to EPA, short-term ozone exposure "can irritate the respiratory system, causing coughing, throat irritation, and chest pain ... reduce lung function and make it more difficult to breathe deeply." 70 Fed. Reg. 25162, 25169 (May 12, 2005). Exposure to ambient ozone also exacerbates asthma, causing increased asthma attacks, and increases hospital admissions and emergency room visits due to respiratory problems. *Id.* Longer-term exposure can lead to permanent and irreversible decreases in lung function. *Id.* Sadly, active children are one of the groups at the highest risk from ozone exposure. *Id.* Courts have recognized that ozone is very harmful to human health. See e.g. *1000 Friends of*

Maryland v. Browner, 265 F.3d 216, 220, n2 (4th Cir. 2001).

Health Impacts of Carbon Monoxide Pollution

CO is a colorless, odorless gas emitted primarily through the incomplete combustion of fossil fuels in mobile and stationary sources. U.S. EPA, *Air Quality Criteria for Carbon Monoxide*, EPA 600/P-99/001F, at 3-1 - 3-6 (2000) [hereinafter CO 2000 AQCD]. CO is deadly to humans and other animals at high levels. At lower levels, CO has serious adverse effects on human health. Exposure to CO results in cardiovascular system problems, central nervous system problems and developmental toxicity effects. CO 2000 AQCD, Chapter 6. These effects are generally related to reduced levels of oxygen in the blood caused by CO's reaction with hemoglobin. These reduced oxygen levels result in tissue hypoxia. *Id.* at 5-22. According to EPA, CO may affect human health in other ways as well. *Id.*

For instance, exposure to CO has been linked to adverse effects on the cardiovascular and nervous systems of both adults and developing children, including exacerbation of heart disease, contributing to low birth weight, and increasing the daily frequency of respiratory illness. *Id.* at 6-1. Effects are most prevalent in the elderly, small children, fetuses, pregnant women, and people with anemia or pulmonary and heart disease. *Id.* at 4-3.

Significant new information has been published about CO's impact on fetuses since the CO 2000 AQCD. Since 2000, at least three studies have confirmed that CO exposure is linked to low birth weight. At least one study of children in the urban northeastern United States indicates a correlation between low birth weight and elevated ambient CO during each trimester. Mildred Maisonet, *et al.*, "Relation Between Ambient Air Pollution and Low Birth Weight in the Northeastern United States," *Environmental Health Perspectives* Vol. 109, Supp. 3, pp. 351-356, 353 (June 2001). The Maisonet study identified an increased risk of low birth weight at ambient CO levels greater than 1.46 ppm, a threshold level significantly lower than studies identified by EPA in the 2000 CO air quality criteria review. *Id.* at 355. Another study of children born in California during 1975-1987 noted a correlation between decreased birth weight and CO exposure in the first trimester. Muhammad T. Salam, *et al.*, "Birth Outcomes and Prenatal Exposure to Ozone, Carbon Monoxide and Particulate Matter: Results from the Children's Health Study," 113 *Environmental Health Perspectives* 1638, 1641 (Nov. 2005). That study noted that a correlation between low birth weight and exposure to CO is plausible because of the effect of CO on maternal hemoglobin (reducing oxygen available to fetal circulation) and direct effects on fetal hemoglobin - which has a greater affinity for binding CO than adult hemoglobin. *Id.* at 1642. This study also described a correlation between low birth weight and CO exposure at ambient levels greater than 1.4 ppm. *Id.* at 1643. A study of air pollution impacts on fetuses in Seoul, South Korea, found an increase of carbon monoxide concentrations during the first trimester was a risk factor for low birth weight in full term infants. Eun-Hee Ha, *et al.*, "Is Air Pollution a Risk Factor for Low Birth Weight in Seoul?" *Epidemiology* at 643-48 (Nov. 2001). The current National Ambient Air Quality Standards (NAAQS) of 9 ppm over 8 hours and 35 ppm over 1 hour does not protect pregnant mothers and fetuses from these adverse effects.

Health Impacts of Hazardous Air Pollutants

20071222-5001 PERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Hazardous air pollutants (“HAPs”) are those pollutants suspected or known to cause serious health effects or adverse environmental effects. Although Congress initially established the list of known HAPs to be regulated under the Clean Air Act, EPA must “periodically review the list” and add pollutants which

present, or may present, through inhalation of other routes of exposure, a threat of adverse human health effects (including, but not limited to, substances which are known to be, or may reasonably be anticipated to be, carcinogenic, mutagenic, teratogenic, neurotoxic, which cause reproductive dysfunction, or which are acutely or chronically toxic) or adverse environmental effects whether through ambient concentrations, bioaccumulation, deposition, or otherwise[.]

42 U.S.C. § 7412(b)(2). Exposure to HAPs can occur through inhalation, consumption of contaminated food products, consumption of livestock that consumed contaminated plants, consumption of plants that grew in contaminated soil, drinking contaminated water, or dermal contact with contaminated soil, dust or water. U.S. EPA, About Air Toxics, <http://www.epa.gov/ttn/atw/allabout.html> (last visited Dec. 2, 2007). Potential human effects include cancer, damage to the immune system, and other neurological, reproductive, developmental and respiratory problems. *Id.*

ENVIRONMENTAL IMPACTS OF BRADWOOD LNG’S AIR EMISSIONS

In addition to health impacts, the criteria pollutant and hazardous air pollutant emissions associated with this project will have impacts on the human environment that have not been sufficiently analyzed in the DEIS. Many of the individual emissions units combust fossil fuels, and therefore emit carbon dioxide (CO₂).

Environmental Impacts of Particulate Pollution

Particulate pollution is linked with environmental damage such as reduced visibility (haze), altered nutrient balances in waters and soils, acid rain, and various other negative impacts on ecosystems. For a comprehensive review of particle pollution impacts on the environment, see U.S. EPA, Air Quality Criteria for Particulate Matter (October 2004), Vol. 1, at 4-1-4-230 EPA 600/P-99/002aF-bF (both volumes available at <http://cfpub.epa.gov/ncea/cfm/recordisplay.cfm?id=87903>). Fine particles are the major cause of reduced visibility – including in national parks and scenic areas. See *Introduction to Visibility*, Section 4, William Malm, National Park Service and Colorado State Institute for Research on the Atmosphere (May 1999).

Environmental Impacts of Sulfur Dioxide Pollution

SO₂ emissions contribute to impaired visibility in scenic areas and acid deposition (acid rain), which damages building materials and has deleterious impacts on plants and fish. U.S. EPA, *Latest Findings on National Air Quality, 2002 Status and Trends Summary* 12 (2002) available at <http://www.epa.gov/air/airtrends/aqtrnd02/2002_airtrends_final.pdf> (hereinafter

20071222-5001 PERC PDF (Unofficial) 12/22/2007 12:24:56 AM

2002 Air Trends). SO₂ also contributes to acid rain, and sulfate particles are the major cause of haze throughout the country, even in our national parks.

Environmental Impacts of Nitrogen Oxide Pollution

Much like SO₂, nitrogen oxides also contribute to acid rain, diminish water quality, and impair visibility. NO_x emissions directly result in nitrogen deposition in the aquatic and terrestrial ecosystem. See 70 Fed. Reg. 8892 (Feb. 23, 2005). Elevated soil nitrogen levels exacerbate the effects of acid deposition. *Id.* at 8893. Elevated nitrogen levels in water contribute to eutrophication, which depletes dissolved oxygen and can lead to “dead zones” in water bodies. EPA has stated that “airborne releases of NO_x are the largest source of nitrogen pollution in certain water bodies, such as the Chesapeake Bay.” 2002 Air Trends, at 2, 6. NO_x emissions also exacerbate atmospheric ozone depletion, and some nitrogen oxides are greenhouse gases.

Environmental Impacts of Ground Level Ozone

Ozone causes damage to vegetation and wildlife. 70 Fed. Reg. 25162, 25169. EPA acknowledges that ozone and its precursor pollutants can travel hundreds of miles from their sources. 2002 Air Trends, at 8.

Environmental Impacts of Carbon Monoxide

Animals exposed to CO experience similar effects to those experienced by humans. CO also has indirect effects on the atmosphere that the EPA even admits may contribute to or exacerbate global warming. U.S. EPA, *Greenhouse Gases and Global Warming Potential Values: Excerpt from the Inventory of U.S. Greenhouse Emissions and Sinks: 1990-2000*, EPA 430-R-02-003, at 4 (April 2002). CO reacts with hydroxyl (OH) radicals, which serve a mitigation role by decreasing the lifetimes of strong greenhouse gases like methane and assisting in destroying ground level ozone. *Id.* at 7. CO’s reactions with hydroxyl radicals decrease their availability to mitigate the effects of strong greenhouse gases and decrease ground level ozone. Moreover, CO in the atmosphere is eventually oxidized to Carbon Dioxide (CO₂), which directly contributes to climate change and global warming of the Earth’s surface. *Id.* at 6 (quoting the Intergovernmental Panel on Climate Change, *Climate Change 1995: The Science of Climate Change* (J.T. Houghton *et al.* eds., Cambridge U. Press 1996)).

Environmental Impacts of Carbon Dioxide

Heat-trapping gases, including CO₂, that cause global climate change come largely from burning fossil fuels. The proposed project features ocean-going vessels and industrial sized combustion equipment that will burn fossil fuels. Thus, the DEIS must consider the potential of the project to exacerbate global climate change. Global climate changes are already occurring. These include increased frequency and intensity of storms, and more frequent and severe heat waves, droughts and floods. In addition, the glaciers are rapidly retreating, and Cascade snowpack is melting earlier and faster each spring. These changes in the water cycle, along with other global climate changes, threaten crops, salmon, recreation, fishing, and water supplies. Global climate change also affects the reproductive success, range, and diet of vulnerable

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

species. Both the Intergovernmental Panel on Climate Change (IPCC) and the National Research Council (NRC) have developed extensive data and information on climate change that should be considered when discussing and analyzing the impacts of the proposed project. See IPCC, *Climate Change 2001: Impacts, Adaptation and Vulnerability* (2001), available at http://www.grida.no/climate/ipcc_tar/wg2/index.htm; IPCC, *Climate Change 2007: The Synthesis Report* (2007), available at <http://www.ipcc.ch>; NRC, *Climate Change Science: An Analysis of Some Key Questions*, (2001) available at <http://books.nap.edu/html/climatechange/>.

THE DEIS FAILS TO PROPERLY QUANTIFY POTENTIAL EMISSIONS FROM THE PROPOSED PROJECT.

The DEIS must provide a quantitative assessment of the effects on the environment and public health from the maximum emissions that the project will generate. The DEIS provides a table of "Estimated Air Emission from the LNG Ships, Tugs and Security Vessels." DEIS at 4-370. The DEIS also provides a table of "Operating Air Emissions Summary for Proposed LNG Terminal." DEIS at 4-374. The DEIS also includes a table of "Estimated Total and Peak Daily Construction Vehicle Tailpipe Emissions for LNG Terminal." DEIS at 4-383. The DEIS also includes a table of "Estimated Total and Peak Daily Construction Vehicle Tailpipe Emissions for Pipeline." DEIS at 4-386. For a number of reasons, the potential emissions calculated and relied upon by FERC understate emissions. Thus, FERC has not taken the requisite hard look at the environmental impacts of air emissions because the applicant has not appropriately quantified emissions.

The type of ship to be used and the potential pollution control equipment the ships might employ is not disclosed in the EIS or any other publicly available documents. See DEIS at 2-1 – 2-2. FERC based its estimate of air emissions from LNG ships on the applicant's expectation of the number of "typical" LNG ships that will visit the terminal each year (125 ships.) DEIS at 2-3. Moreover, FERC based its estimate on emission factors from EPA documents. Many ocean-going LNG carriers exist. Thus, the emissions estimates should be based on actual source testing. The emissions estimates included in Resource Report 9 do not estimate the maximum emissions from the proposed project, and therefore do not provide the requisite hard look at air impacts.

The DEIS analysis must be based on the maximum air pollution emissions possible under the physical and operational design of the facility. That means that the maximum number of ships and the worst-case (that is, most polluting) ships must be considered, unless otherwise limited as to number or type by a permit, a law, or the physical or operational design of the facility. Because it is based on typical or expected conditions, rather than maximum emissions, the DEIS significantly understates emissions from LNG ships and support vessels.

For fugitive emissions from valves, seals, and lines (Table 9-A-11), the Resource Report upon which the DEIS is based does not indicate the source of the emissions factors.

THE DEIS FAILS TO INCLUDE APPROPRIATE EMISSIONS DISPERSION MODELING.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

The modeling analyses submitted by NorthernStar are flawed in several respects, primarily with regard to the validity of the model for this application, characteristics of the source, and background data. Adequate modeling was not performed to demonstrate compliance with the NAAQS, state ambient air quality standards, PSD increments, and Class I area air quality related values from all of the sources of air emissions that will be employed in constructing and operating the LNG terminal. Moreover, the modeling completed, even if it meets the requirements of the Clean Air Act, does not provide sufficient information about the dispersion and impacts of air pollutants associated with the project on public health and welfare values for FERC to draw a reasonable conclusion about air quality impacts.

The DEIS claims that "[u]sing an EPA-approved dispersion model, impacts of criteria pollutants from the LNG carriers plus the preliminary modeled impacts from the LNG terminal, competing sources, and background concentrations were added together and compared to the applicable federal NAAQS and Prevention of Significant Deterioration (PSD) Increments." DEIS at 4-370. For the results and methodology of this dispersion modeling, the DEIS refers to a March 22, 2007, Air Quality Modeling Report to the ODEQ. DEIS at 4-378.

There are several issues with these statements in the DEIS. First, the applicant has never completed dispersion modeling for impacts of criteria pollutants from LNG carrier emissions. The applicant modeled the emissions impacts from LNG carriers while hotelling at the terminal, but the applicant never modeled emissions calculated in the Air and Noise Quality Resource Report submitted to FERC. The calculated emissions included LNG carrier emissions from entry into US waters to hotelling at the terminal and on to exiting US waters, and assist tug emissions. See FERC Section 3 Application, Resource Report 9, Tables 9-A-13 – 9-A-19. The only LNG carrier emissions impacts modeled by the Applicant were for hotelling. Thus, the statement that the applicant modeled "impacts of criteria pollutants from LNG carriers. ..." is simply not true.

Second, because the applicant never modeled the impacts of emissions from LNG carriers and assist tugs, FERC cannot draw a rational conclusion about the effects of the project on the human environment, including impacts on PSD increment, Federal Class I areas, and other resources. FERC simply lacks information necessary to quantify and/or analyze the effects of the project on air quality values. Moreover, impacts from LNG carriers should be evaluated using an offshore model, OCD. See 40 C.F.R. Part 51, Appendix W.

Third, the modeling completed by the applicant did not model all relevant pollutants. Again, the DEIS claims that NorthernStar used an EPA-approved dispersion model to model the impacts of criteria pollutants from the LNG carriers and terminal, but this is simply not true. The March 2007 ACDP application indicates that NorthernStar modeled CO and NOx emissions from terminal stationary sources, and did not model SO₂, VOC, particulate matter (PM), PM₁₀, or PM_{2.5}. ACDP App. at 6-1. NorthernStar modeled only the emissions of CO and NOx from the Submerged Combustion Vaporizers, Emergency Diesel Generator, and Diesel Firewater Pump. See ACDP App. at 6-3, Table 6-2. Thus, impacts of all criteria pollutants were not modeled. Importantly, the applicant completed no modeling of PM_{2.5} impacts. See FERC Section 3 Application, Resource Report 9, Attachment 9A-4. Modeling of PM₁₀ impacts is not

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

an appropriate surrogate for PM2.5 impacts because PM2.5 dispersion is generally much further than PM10.

FERC should have considered PM2.5 modeling results because there is no significant impact level for PM2.5, thus the SIL is zero. 40 C.F.R. § 52.21(b)(23)(ii); 40 C.F.R. § 51.166(b)(23)(ii). In the absence of a designated significance level, the SIL is zero for regulated pollutants. Thus, any impact exceeds the SIL and requires further modeling. Moreover, dispersion of PM2.5 is significantly different than dispersion of PM10.

Fourth, the model used was not appropriate and likely understated emissions impacts. NorthernStar employed the AERMOD program, version 07026, with PRIME downwash algorithms. DEIS 4-378; ACDP App. At 6-2. AERMOD is a steady state dispersion model with a boundary layer. It is possible for a steady state dispersion model with a boundary level to predict that a source will inject pollutants above the boundary layer and the computer assumes the pollution is lost. The other EPA "Preferred/Recommended" dispersion model, CALPUFF, does not "lose" pollution like that. Thus, even in near field applications, CALPUFF is a more reliable modeling program. CALPUFF is a non-steady-state puff dispersion model, and is appropriate for long-range transport and complex terrain. See 40 C.F.R. Part 51, Appendix W; EPA Technology Transfer Network Support Center for Regulatory Atmospheric Modeling (SCRAM) <http://www.epa.gov/scramp001/dispersionindex.htm>.

Fifth, FERC should not accept modeling using AERMOD to accurately reflect impacts on Class I areas more than 50 km away from the proposed project. Here, the applicant used impacts at 50 km in the direction of the Class I area to judge impacts inside the Class I areas. AERMOD is only applicable to a distance of 50 km. ACDP Application, App. B at 21. Thus, the applicant should have used, and FERC should have reviewed, CALPUFF modeling results to quantify and describe impacts to Class I areas and the Columbia River Gorge.

THE DEIS FAILS TO DISCLOSE, DISCUSS OR CONSIDER ANY AIR EMISSIONS CONTROL TECHNOLOGIES APPLICABLE TO THE BRANDWOOD LANDING LNG PROJECT.

Control technologies exist that are applicable to the types of equipment proposed for Bradwood Landing, and for the LNG ships and other vessels. For instance, engine-based and add-on control technologies are available to control NOx from ocean-going vessels. See U.S. EPA, *Advance Notice of Proposed Rulemaking: Control of Emissions from New Marine Compression-Ignition Engines at or Above 30 Liters per Cylinder*, Chapter 6 (signed Nov. 29, 2007) (attached as Exhibit X). In addition, control technologies are available to control particulate matter and SOx emissions from ocean-going vessels. *Id.* The SCVs are essentially industrial boilers, control technologies for which have been in use for decades. Moreover, the DEIS failed to consider use of a flare to control fugitive VOC and HAP emissions. This failure to disclose that air pollution control technologies exist that could be used to minimize impacts, even if rejected, renders the DEIS inadequate.

The EIS does not adequately consider the adverse effects of nitrogen emissions

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

While the DEIS admits that nitrogen gas would be emitted during normal operations of the terminal facility there is not an adequate discussion of the impacts of increased nitrogen releases on either air quality or potential effects of nitrogen deposition around the project site or regionally that could contribute to increased nutrient levels in the Columbia River and its tributaries. This should be specifically discussed and considered in the EIS.

The DEIS needs to evaluate the impacts that would result from increased gas combustion that the proposed project and related projects would stimulate in the Lower Columbia River

Importing 1.3 bcf/day or more into the Lower Columbia River could create a significant incentive for the development of gas generating facilities in or around the proposed LNG terminals. This impact would only be increased should both the Oregon LNG and Bradwood terminals be approved and constructed. Similarly, the importation of large quantities of gas would similarly act as an incentive for gas intensive industries to locate along the Columbia River.

The combined presence of water from the Columbia River, an industrial land base, and a major influx of LNG derived gas would create significantly increased development pressures on the lower Columbia River that were ignored entirely in the EIS.

Question: How would the siting of an LNG terminal, or even two, in the Lower Columbia act to stimulate or encourage the development of electrical power generating facilities and other energy intensive industries? Please specifically consider the existing and potential transmission capacity to California as well as California's electrical demand. Similar evaluations should be made for Oregon, Washington and surrounding states that could create a demand for Oregon-produced electricity based on new gas supplies provided via the planned LNG terminals.

Question: What are the direct, indirect and cumulative effects of increased industrialization that would be encouraged by the siting of one or more LNG terminals in the Lower Columbia River. Please include impacts to air, water, fish, wildlife, humans, traffic, noise, lights and other impacts.

Concerns about the real potential for this increased industrialization is supported by the recent development of both PGE's Port Westward power plant (see attached article on Port Westward) and the development of the Mint Farm electrical generating plant in Longview (see attached article on Mint Farm). The attached analysis of projects in the lower Columbia River by CRK's Brett VandenHeuvel should be reviewed and its contents considered and discussed in the context of cumulative impacts on air quality, energy use, GHG emissions and their related impacts, including human health and environmental impacts.

The EIS should evaluate and consider the fact that the largest new gas-fired electrical generating plants in the Northwest have been planned for the Lower Columbia River and discuss how this reflects the areas likely increased attractiveness in the event the proposed LNG terminals are in fact sited.

Greenhouse Gas Emissions

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

The impacts of global climate change represent what is likely the single most significant threat facing the planet today. That human combustion of fossil fuels is the leading cause of climate change is now beyond serious dispute. This is clearly described in the Intergovernmental Panel on Climate Change Fourth Assessment report, *Climate Change 2007: Synthesis report*, which is attached here. The extremely broad yet locally and globally significant impacts of climate change effects include: flooding; drought; heavier precipitation and storm events; more frequent heat waves; fires; heat stress; vegetation changes; sea level rise; rapid snow and ice melt; increased intensity of hurricanes; retreating glaciers and potentially significant impacts on virtually every aquatic and terrestrial species on Earth.¹⁵⁵ In popular literature, Time Magazine's cover story (attached) clearly places the threats of global warming among the most serious issue facing humans today.

The DEIS fails to properly evaluate the projects direct, indirect and cumulative effects that would result from the greenhouse gas (GHG) emissions that the project would cause. The proposed project would cause significant increases in GHG emissions as a result of both carbon and methane emissions related to the proposed facility. Contrary to the assertions of project proponents, LNG is not a "clean" fuel source. In fact, LNG is a fossil fuel and intensifies the pollution and global warming impacts of natural gas due to the need to liquefy, transport, and regasify the gas prior to bringing it to market. The EIS should evaluate the total lifecycle GHG emissions that would be associated with the project. This includes the GHG impacts from gas drilling, transport to liquefaction facility, liquefaction, transport, regasification, transfer through proposed pipelines and ultimate combustion.

This evaluation should specifically consider the increased lifecycle GHG impacts of LNG when compared to domestic or Canadian gas supplies. As supported in the attached studies from Heede, Jaramillo and Powers, the lifecycle GHG impacts from LNG are significantly greater than the impacts of domestic natural gas and this factor needs to be openly disclosed to the public and evaluated by decision makers. These studies support that the lifecycle GHG impacts of LNG are 30 to 40% greater than the GHG impacts of domestic natural gas and this was not evaluated or disclosed in the DEIS. While NorthernStar has admitted increased GHG emissions on the order of 20% this underestimates the actual GHG costs of LNG when compared to domestic or Canadian NG.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

The EIS should also consider the effect of increased CO₂ content of the imported LNG when compared to domestic/Canadian gas. This was not considered in the EIS and the most likely sources of LNG for the Bradwood terminal should be considered for the CO₂ content of its gas, as well as, the content of other contaminant gases that are present in addition to the methane.

As a part of this analysis the EIS should consider the increased air pollution and related global warming impacts that would be caused due to a higher Wobbe index of the imported gas. The higher Wobbe index of LNG imported gas will lead to higher air pollution levels of NO_x and other contaminants when the gas is burned and create significant impacts on a wide variety of gas users. How this would affect air quality from all gas combustion scenarios in Oregon, Washington and California needs to be specifically analyzed in the EIS. The impacts of LNG imports on increasing the Wobbe index of NG is supported in the attached documents including the Report on the Joint Workshop on Natural Gas Quality Standards, Feb. 17-18, 2005, California PUC, CA Energy Commission, April 4, 2005 and South Coast AQMD, Reducing Air Pollution, GHG Emissions, and Petroleum Dependence May 31, 2007 2nd AB32 ETAAC Meeting as well as numerous documents on the issue that are already in FERC's possession. All documents in FERC's possession relating to the impacts of increased Wobbe index should be considered and disclosed in the EIS and the record for this project.

Question: What would the total lifecycle GHG emissions from the proposed project be?

Question: How would this affect total GHG emissions from Oregon, Washington, and California?

Question: Even assuming Oregon's use of gas did not increase if the Bradwood facility started importing 1.3 bcf/day, how would the increased GHG emissions from LNG affect Oregon's overall GHG emissions? This analysis should consider a scenario that NorthernStar has claimed would occur under even a 1 bcf/day import scenario where virtually all of Oregon's natural gas would come from LNG as shown in the diagram to the right taken from the Wood Mackenzie report which NorthernStar contracted for.

Question: How would the project affect GHG emissions for both California and Washington under scenarios that assumed the projections in the Wood Mackenzie report were accurate? How would GHG emissions be affected based on FERC's own projections of how the project would affect the source of gas being used by all west coast states?

Question: How would the effects of imported gas with a higher Wobbe index be on Oregon especially under any gas use scenario, but especially including a scenario where upwards

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

of 92% of Oregon's gas supply would be from LNG as projected by Bradwood? What would the likely Wobbe index of imported LNG gas be and how would a high Wobbe index affect end users?

Question: How would a high Wobbe Index gas affect gas emissions in residential, commercial, industrial and electrical generating scenarios? How would indoor air quality in residential and commercial uses be affected and what would the effects on sensitive populations, such as children and asthmatics be? How would these increased emissions affect Class I airsheds, airsheds that are in non-attainment or close to non-attainment for the pollutants at issue, and important airsheds, such as the Columbia River Gorge where air quality is already significantly impaired?

The subject of climate change and greenhouse gas emissions is a significant omission in the EIS that must be addressed because of the global and local effects of global warming. In the context of the Columbia River Basin, the projected effects of global warming have been considered in the document entitled "Climate Change Impacts on Columbia River Basin Fish and Wildlife" which was produced by the Independent Scientific Advisory Board in 2007. This attached document should be the starting point for evaluating the effects that the increased GHG emissions would contribute to in the Columbia River Basin. Given the significant direct impacts that this project would have on species within the Basin that are already being impacted by global warming the need to carefully evaluate how this project would affect the Columbia Basin ecosystem is particularly important. The EIS, however, needs to evaluate and consider how the GHG impacts of this project would affect, both directly and cumulatively, the natural resources and human population of Oregon, the west coast United States, the United States and global environmental resources.

As a starting point the EIS needs to evaluate what the existing and projected impacts from global warming are and then consider how these impacts would be increased or exacerbated as a result of the increased GHG emissions from the proposed project.

Question: What would the cumulative, direct and indirect impacts of GHG emissions from the project be in the Columbia River Basin, Oregon, west coast U.S. and the United States? To what extent would the project exacerbate global warming over the life of the project?

Question: How is global warming likely to affect salmon species in the Columbia River basin, their habitat, and the hydrologic cycle (rainfall, snowmelt, glacial melt, timing of snow and rain, drought, water temperature, etc.)? How would increased GHG emissions from the project cumulatively affect salmon and other aquatic resources that are being impacted by global warming?

Question: How are terrestrial species in the Columbia Basin being affected by global warming and what are the projected impacts to these species, such as Columbia white tail deer? How would the proposed project cumulatively increase impacts to these species?

The GHG impacts of natural gas production, distribution and use has been described in the attached U.S. EPA's 2007 "Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990 -

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

2005." This document identifies the significant contribution that natural gas production and combustion plays in the United States overall GHG emissions and should be considered as a part of evaluating the overall impacts of this project.

Question: How do the GHG emissions associated with the proposed project compare to GHG emissions from existing gas use in Oregon, California and Washington and how would the proposed project increase these emissions.

Question: Because FERC has not prepared any programmatic EIS that considers the cumulative effect of its approval and support for new LNG import terminals across the country, FERC must evaluate as a part of the current EIS the cumulative effects of the LNG projects it has approved, as well as, the projects it anticipates it may approve in the near future. How many LNG projects has FERC approved in the last ten years, how many applications for new project does FERC have? What would be the total GHG emissions that result from these projects including the lifecycle GHG emissions that would result specifically from the increased GHG impacts of LNG when compared to domestic, Canadian or Mexican gas?

The attached report by Rick Heede of Climate Mitigation Services that quantifies greenhouse gas emissions from the Cabrillo Port LNG terminal that has been proposed for California provides valuable information regarding the impacts of LNG import terminals on GHG emission and the information contained in this report should be evaluated, disclosed and relied on by FERC in evaluating the impacts of the proposed project.

Gas liquefaction will result in greenhouse gas emissions from refrigeration compressors, other plant electricity demands, acid gas venting, flaring, methane venting, and minor amounts of nitrous oxide emissions. Shipping LNG from its source to Oregon emits greenhouse gases as a result of converting propulsion fuel into carbon dioxide and methane. Operation of the LNG terminal, results in emissions during the transfer of the LNG to the terminal, flue consumption for tenders and tug boats and crew boats, vaporization, and electricity to power the facilities. Methane emissions will occur from incomplete combustion of fuel and fugitive releases. Construction activities will add to these emissions. Finally, combustion of natural gas by consumers causes significant greenhouse gas emissions.

According to Mr. Heede's analysis, the supply chain emissions for the Cabrillo Port project will range between 23,564,431 and 26,728,883 U.S. tons per year and a similar analysis based on the specifics of the Bradwood Landing project should be prepared.

Because methane is 20 times as powerful of a GHG than carbon, the EIS should specifically evaluate the total methane releases that will result from this project, again looking at the entire lifecycle of impacts that relate to this project from production to shipping to end use combustion.

Question: How much methane would be released into the atmosphere and local environment as a result of the proposed project? Values should consider the total life cycle impacts of LNG including fugitive releases during drilling, transport, combustion and distribution.

20071222-5001 PERC PDF (Unofficial) 12/22/2007 12:24:56 AM

All of the GHC impacts should consider the cumulative effects of other proposed fossil fuel projects that are proposed in the region. For example, the GHG impacts from the proposed coal plants in Kalama and Port Westward should be evaluated, as should the impacts from the LNG projects planned for Warrenton (Oregon LNG) and Coos Bay (planned by PGE). The effects of the PGE's newly constructed gas powered electrical generating plant (Port Westward facility-see attached article from Portland Business Journal) should be evaluated in addition to other major GHG emitters such as the Wauna mill and industrial gas generating facilities planned for Longview (Mint Farm) and other industrial GHG emissions in the Lower Columbia River basin. Please review the attached summary of Lower Columbia River projects by CRK's Brett VandenHeuvel.

Question: What would the cumulative lifecycle GHG emissions be should the Coos Bay, Oregon LNG and Bradwood projects be constructed? What would the cumulative impacts be if two of these projects were built?

Question: What effect would increased gas supplies have on existing contracts for domestic/Canadian gas with lower lifecycle GHG that Oregon is currently using from the Rockies and Canada?

Increased use of fossil fuels and impacts on conservation, increased efficiency, and renewables

The DEIS completely fails to consider the effects that massively increasing the gas supply in Oregon, California and Washington and the west coast generally would have on incentives for conservation, efficiency and renewable development. Assuming that Bradwood's claim that the imported gas was actually intended for the Oregon and Washington market was accurate, the proposed project would more than double current gas use in Oregon. See attached EIA documents reflecting current gas use in Oregon, Washington and California. The impacts of such a significant increase in gas supply were ignored in the EIS. There is little question that flooding the Oregon and Washington markets with LNG derived gas would undermine the incentives for conservation which are triggered by supply limitations.

Question: How would significantly increased gas supplies in Oregon/Washington decrease incentives for conservation, efficiency and renewables?

The EIS projects that significantly increasing gas supplies would not have any measurable impacts on gas use or undermining incentives for conservation is without merit. Assuming that NorthernStar's claims that LNG would be price competitive with NG was true, the influx of a large new LNG supply would create significant pressure to weaken Oregon's recently adopted renewable energy standard to allow for greater gas combustion.

Question: How would the proposed project be consistent with Oregon's renewable energy standard and how could it increase political pressure to weaken the standard to allow for greater combustion of gas? The EIS should specifically address how the proposed project would be consistent with Oregon's goal of significantly decreasing its reliance on foreign fossil fuels?

20071222-5001 PERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Question: What independent evidence is there of the need for gas in Oregon? How does this compare to California and elsewhere? Where would the gas that is planned for import to Oregon go? Would the project proponent have any actual control over where the gas went? Specifically, even if the project proponent wanted to isn't it true that they could not prevent California from becoming a lead consumer of the gas which Oregon would bear the impacts of importing? As discussed elsewhere, FERC needs to clearly assess whether there is a need for additional natural gas supply in Oregon since such a determination is fundamental for determining whether the project would have the effect of stimulating increased gas usage above an existing need. Relying on the over stated projections of the NW Gas Association, whose leading members stand to profit from the proposed projects in the Lower Columbia River again reflects that FERC appears to see itself as more of a project booster than a guardian of the public trust which is charged with ensuring compliance with existing state and federal laws.

Geologic Hazards

The DEIS must analyze all the hazards associated with the facility. The geologic hazards at Bradwood may lead to human safety for workers and the public and ecological damage.

The DEIS fails to consider that impacts of siting a high risk gas terminal and pipeline in a high risk geologic area. There are clearly practicable alternatives that are less hazardous and will have less adverse impacts on aquatic resources that the DEIS failed to consider. The Oregon Department of Geology and Mineral Industries, who are the experts most familiar with Oregon's geology, stated:

High risk [site] because of the combination of a proposed hazardous facility and the high (severe) geologic hazards. The site has very poor foundation soils, is in a high seismic hazard area, and potentially subject to other severe geologic hazards.

Oregon Preliminary Comments at 23 (parenthetical term "severe" in original).

The poor foundation soils consist of recent dredging fill and very thick Columbia River alluvial deposits. The DEIS fails to consider that the construction of a large industrial site containing extremely heavy LNG storage tanks on top of loose, uncolidated soils is dangerous. The facility would be constructed on an astounding 190 feet of unconsolidated soils, sand, silts, and clays. Bradwood proposes to add another 10 feet of fill to bring the industrial site above the 100-year floodplain. It is unlikely that Bradwood will be able to anchor its tanks or other components into bedrock due to the thick alluvial deposits. If Bradwood does reach bedrock, the bedrock itself is unstable and unsuitable for anchoring. The soils could fail due to the weight of the facility, landslide, tsunami, seismic event, seiche, and increased pore pressure due to high water. A failure resulting in the release of LNG could have catastrophic effects humans and aquatic resources.

DOGAMI also stated that Bradwood is a high risk site because it is in a high seismic hazard area. The United States Geologic Survey also classifies the Bradwood area as a "High"

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

hazard area for earthquake potential. FERC must evaluate the earthquake risk, the consequences of an earthquake, and the impact on the public interest.

The DEIS seeks to downplay the geologic hazard of this area and suggest that "design criteria" could mitigate the effects of ground shaking. DEIS at 4-11. But, FERC fails to include any support for this statement except for the vague statement that final engineering designs, which have not been submitted, will mitigate hazards. DEIS 4-12. FERC cannot rely on vague, future designs that have not been submitted. The high seismic danger of this project weighs strongly against the public interest.

The Bradwood site also suffers from extreme landslide and rock fall hazards, which could cause significant damage or breach of the LNG storage tanks. FERC stated that "the separation distance between the cliffs and the nearest LNG storage tank is about 250 feet, greater than likely rock fall runout distances." DEIS 4-9. This is a highly questionable statement because rockfall are known to travel much further than 250 feet. FERC offers no citation or scientific support for its conclusions.

FERC does not even mention the hazard of debris flows in the DEIS, even though debris flows or landslides are common in this area. So common, in fact, that "Landslide Debris" is listed as a stratigraphic unit in pipeline section of the DEIS. A recent example of a landslide occurred west of Clatskanie on December 10, 2007. This large slide caused a leak in a Northwest Natural natural gas line, destroyed homes and closed Highway 30 for nearly a week. This landslide had a far greater runout than 250 feet.¹⁵⁶

DOGAMI states that the DEIS is incorrect in multiple important conclusions. FERC should defer to DOGAMI's local expertise in Oregon geology. DOGAMI made the following comments regarding the geological analysis in the DEIS:

A hazardous facility proposed at the site and the site is potentially subject to severe geologic hazards. No mention of technical peer review of the submitted detailed geotechnical and seismic reports to ensure technical competency. Reference to or completion of technical peer review of the detailed geotechnical and seismic reports. An independent (non-government agency) technical peer review should be performed on the detailed geotechnical and seismic reports to ensure technical competency. Review should be done by qualified and licensed geologists and engineers.

Erroneous technical statements raise overall concerns about the qualifications of the applicant with respect to technical issues. No reference to detailed geotechnical and seismic reports (URS reports) on some very complicated geotechnical issues (specific examples are given below). Also erroneous statements which do not match the URS reports. Reference to detailed geotechnical and seismic reports (URS reports) on some very complicated geotechnical issues. Adequate integration of technical issues into the DEIS. A technical review of the DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results.

¹⁵⁶ See Oregonian, "Mudslide" December 12, 2007.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

The site has very poor foundation soils, is in a high seismic hazard area, and potentially subject to other severe geologic hazards. The role of the geotechnical and geologic hazard information and project members appear to be inadequate. The geotechnical and geologic hazard information has not been fully considered in the DEIS. Effectively integrate geotechnical/geologic hazard project members into the design, construction, inspection and operations so that the site's severe geologic hazards are mitigated adequately.

Discussion of vertical deformation rates appear to only consider long-term rates (hundreds of thousands of years) based on geologic studies. Contemporary vertical deformation rates may be different. Evaluation of contemporary deformation rates. The DEIS should differentiate between long-term and short-term (contemporary) uplift rates at the site and evaluate the potential for earthquake-related subsidence at the site.

Erosion features do not form deposits. Example of global item #2. Erroneous technical statement. Such erroneous technical statements raise overall concerns about the qualifications of the applicant with respect to technical and public safety issues. A technical review of the DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results.

Since significant dredging is proposed, shoreline erosion may not be the only geologic hazard affected or influenced along the waterway. Does not consider other hazards such as slope stability. Scientific data to support the statement. Increase in depth of channel may cause slope instability along with shoreline erosion. Detailed study or evaluation by a qualified and licensed geologist or engineer. Evaluate potential slope stability due to increase channel depth.

This statement is unsubstantiated and may be inaccurate. May not consider geologic processes and hazards such as river course migration and slope stability. Scientific data to support the statement. Analysis is missing. Increase in depth of channel may cause slope instability along with shoreline erosion. Detailed study or evaluation by a qualified and licensed geologist or engineer. Evaluate historic current shoreline stability (including potential slope stability). Evaluate shoreline with proposed facilities and channel modifications.

DEIS reports that LNG tanker wave heights would be "slightly larger" than other smaller, but similar sized tankers and does not report on the resulting erosion potential from this generalized wave height. Does not report how big the resulting waves will be and the erosion potential from these waves. Scientific data to support the statement. Detailed study or evaluation by a qualified and licensed geologist or engineer. Study that provides specifics about the boat wakes generated by the vessels, their impact at the shore (which is currently vague as it stands). Also baseline study and monitoring at the site.

Since it is difficult to determine before hand, some sort of baseline study and monitoring program should be implemented. Does not propose an idea to solve and/or determine the potential impacts. Proposed solution. Baseline study and monitoring.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Since there is a hazardous facility proposed at the site, reclamation should be performed to adequate standards for this type of facility. DEIS proposes standard reclamation. Reclamation should be performed with the proposed hazardous facility in mind. Reclamation should be performed with the proposed hazardous facility in mind. Propose reclamation not to standard regulations, but to levels so that a hazardous facility can operate without influence in any way from the reclaimed area.

Significant landslide hazards like debris flow impact, should be evaluated in detail by a qualified licensed geologist or engineer. No reference to a detailed study or evaluation by a qualified geologist or engineer. Scientific data to support the statement. Detailed study or evaluation by a qualified licensed geologist or engineer. Modeling to show debris flow won't impact the site.

Significant landslide hazards like rock fall impact, should be evaluated in detail by a qualified geologist or engineer. No reference to a detailed study or evaluation by a qualified geologist or engineer. Scientific data to support the statement. Detailed study or evaluation by a qualified licensed geologist or engineer. Modeling to show rock fall won't impact the site.

This is not a map of known faults. It is simply a copy of the USGS fault and fold map, which identifies only certain types of faults. Example of global item #2. Detailed geotechnical evaluation for pipeline indicates that the pipeline will cross 4 mapped faults. These 4 faults are not shown on the map. Such erroneous technical statements raise overall concerns about the qualification of the applicant with respect to technical and public safety issues. A technical review of the DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results. Show ALL faults on the map or indicate map is not complete.

Ground motions are not expressed in terms of "acceleration due to gravity" as stated in the DEIS. Example of global item #2. Ground motions are not expressed in terms of "acceleration due to gravity." Erroneous technical statement. Ground motion maps are usually expressed in term of "percent of gravity." Such erroneous technical statements raise overall concerns about the qualifications of the applicant with respect to technical and public safety issues. A technical review of the DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results.

What about earthquakes between 8.0 and 8.5? Why only earthquakes occurring on the CSZ? Text is not substantiated. I don't see any references to magnitudes of earthquakes for OBE and SSE in the URS reports. FERC's draft seismic design guidelines on OBE (section 5.2) are based on probabilistic ground motions (not maximum earthquakes). Magnitudes between 8.0 and 8.5 and earthquakes not on the CSZ. Approach is not documented. Evaluate OBE-SSE between 8.0 and 8.5 earthquakes not on CSZ. Substantiate approach. A technical review of the DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results. Provide consistent statements based on URS analyses.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

The susceptibility, severity, extent and risk of lateral spreading was not discussed. The global stability of the site was not discussed with respect to lateral spreading, including the extent inland, the potentially impacted area, and the associated risks. The site requires safety and stability from damaging permanent ground deformation from lateral spreading. Discuss the global stability of the site with respect to permanent ground deformation from lateral spreading including severity, extent and risk. Discuss mitigation measures that specifically address lateral spreading risks.

Additional parts of the support facility should be considered for ground improvements against liquefaction in addition to the tanks. Support facilities are important and deep foundations should be considered as well. Potential deep foundations under support facilities. Evaluate and state why no deep foundations under support facilities or add.

The proposed facility should be evaluated on a site-specific basis. Regional maps developed over 10 years ago are cited. Site should be re-evaluated on a site-specific basis and include recent scientific data. Site-specific evaluation. New modeling.

Conclusions like impacts to the site from locally derived tsunamis should be from qualified professionals. No reference to a detailed study or evaluation by a qualified geologist or engineer. Scientific data to support the statement. Detailed study of evaluation by a qualified geologist or engineer. Modeling to assess local tsunami impact to the site. Should include detailed landslide map of the area and dynamic slope stability analysis.

This does not consider that the FEMA maps maybe out of date and/or simply incorrect because they are based on old topographic data. Also does not consider potential dam break. FEMA maps maybe out of date and/or incorrect. Does not consider dam break and subsequent inundation/flooding levels. Scientific data to support the use of old FEMA maps. Missing dam break completely. Evaluate old FEMA maps and evaluate dam break.

URS report (Dec 2005) indicates "softer compressible soils" and significant settlement. DEIS does not consider regional seismic induced subsidence. No reference to URS report of subsidence and settlement. Inconsistent statement to URS report. A technical review of DEIS by URS and relevant consultants to ensure adequate integration of technical analyses and results. Provide consistent statements based on URS analyses. Also consider settlement monitoring during operation.

Pipeline report indicates significant landslides adjacent to the site. No reference to a detailed study or evaluation by a geologist or engineer. Scientific data to support the statement. Detailed study or evaluation by a qualified geologist or engineer to support statement.

How was this landslide determined to have "lack of recent activity"? No reference to a detailed study or evaluation by a qualified geologist or engineer. Scientific data to

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

support statement. Inclinometers or some type of monitoring to determine it is not currently moving.

This statement and the sentence after are inaccurate. Also inconsistent to the references referred. DEIS states that future Mt. St. Helens eruptions will be reduced because of the explosion in 1980 thereby precluding lahars over the design lifetime of the pipeline. Scientific data to support the statement. Detailed study or review by a qualified geologist of engineer to support statement.

Oregon Preliminary Comments at 24-28.

As shown by these comments, the geology section of the DEIS is inadequate and inaccurate. DOGAMI's questioning of the FERC's scientific competence makes FERC look very bad and calls into question the entire DEIS. DOGAMI's analysis is also relevant to the practicable alternative analysis because any geologic event has the potential for great damage to the LNG terminal, which will adversely affect aquatic resources. FERC failed to analyze alternatives in terms of better geologic settings.

In addition, the DEIS failed to analyze the alternative pipeline routes. As stated in a letter from Dan McShane, the proposed pipeline route crosses landslide hazard areas and areas containing bauxite soils that are difficult to revegetate.¹²⁷ The DEIS must consider the cumulative impacts of this route and consider alternatives.

a. The project will harm fish and wildlife

The DEIS fails to adequately analyze the impact to fish and their habitat, including the 13 threatened ESUs of salmonids, non-listed salmonids, green and white sturgeon, eulachon, shad, striped bass, starry flounder, three spine sticklebacks, pea mouth, Pacific and river lampreys, marine fish (including tomcod, surfperch, rockfish, sandlabs, smelt, English sole, Pacific staghorn sculpin) and crab. The DEIS also fails to analyze adequately the impact to terrestrial wildlife and their habitat, including each species listed in DEIS Table 4.5.1-2.

The DEIS fails to analyze the project's harm to Essential Fish Habitat for salmon, groundfish, coastal pelagic species, and highly migratory species.

In addition, the DEIS fails to analyze adequately the impact on protect wildlife habitat in the Julia Butler Hansen Wildlife Refuge, Lewis and Clark Wildlife Refuge, and Fort Stevens State Park.

Specifically problematic, the analysis for the Columbian White-tailed deer fails to account for fragmentation of habitats between population pockets in the Estuary. The overall population is more stable if there is some degree of mobility from more stable to less stable populations. The relatively large, stable population in the Julia Butler Hansen Wildlife Refuge acts as a source for Columbian White-tailed deer to other areas. The fragmentation of habitat is not mitigated by one area of mitigation at Peterson Point, and it does not appear that mitigation

¹²⁷ Letter to FERC from Dan McShane, Licensed Engineering Geologist.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

will occur along the pipeline route, which impacts hundreds of acres of Columbian White-tailed deer habitat.

The project will harm marine mammals and sea turtles

The DEIS fails to consider that The LNG terminal and the tankers will harm marine mammals due to habitat destruction and vessel strikes. NMFS described the presence of marine mammals, as follows.

The following non-ESA-listed marine mammals are likely to be present in the immediate project vicinity during construction or seasonally abundant in the near or off shore approaches to the Columbia River:

California sea lion (*Zalophus californianus*) – U.S. Stock. Peak abundance in the Columbia River estuary from late fall through spring, mainly absent during the summer breeding season.

Harbor seal (*Phoca vitulina*) – Oregon/Washington Coastal Waters Stock. Common in the Columbia River estuary year round, resting areas (haulouts) documented within five miles of construction site. Peak in winter months and move upriver. Decrease in spring. Seals pup at Desdemona Sands and use haul-out sites up to RM 45. Spring smelt run is important prey resource. In May, after the run is over the counts decline to about 1/3 of winter counts. Adult female dive time recorded in excess of 17 minutes (Bowen *et al.* 1999)

Gray whale (*Eschrichtius robustus*) – Eastern North Pacific Stock. Abundant passing the Columbia River mouth in late fall (south bound) and spring (north bound), feeding animals may be present outside of the migratory periods.

NMFS BA comments at 23.

In addition, multiple ESA-listed mammals and turtles are also present, including: green leatherback, loggerhead and olive ridley sea turtles; blue, fin, humpback, north pacific right, sei, killer, and sperm whales; and Steller sea lion. Each of these ESA-listed species, as well as the non-ESA-listed species, will be adversely affected by the proposed project. The DEIS fails to consider the harm to these species. This is particularly problematic because NMFS has not completed consultation yet, so FERC is blindly proceeding with the EIS.

The DEIS fails to consider that the 25 % increase in deep draft vessels due to the LNG terminal will increase the risk of vessel strikes of marine mammals and turtles. The NMFS' unpublished data compiled indicates 9 vessel strikes were either reported in the Region or detected during necropsy by the NW Marine Mammal Stranding Network between January 2002 and January 2007. Fin whales (6) were encountered most frequently, with individual strikes reported for blue, sei and humpback whales. Seven of the strikes were reported from Washington and two from Oregon, during the four year period (start of 2002 through start of 2007). The closest strikes to the proposed action area involved a fin whale that came into the Port of Portland on the bow of a vessel in September 2002, and a blue whale that was reported struck and killed off Tillamook, Oregon, in January 2007. Far more actual strikes occur than are reported. FERC must assess the impact of these strikes to individuals and populations. FERC

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

must fully understand the tanker route to the Columbia Bar and the tanker routes in the Exclusive Economic Zone.

The project will introduce and increase invasive species

Bradwood will introduce or allow the proliferation of invasive species to the Columbia River, the terminal site, and the pipeline route. First, ships from foreign ports will transport exotic species on multiple surfaces and in water releases from ballast or engine cooling water. These species may harm the aquatic ecosystem. Second, the removal of vegetation, and long-term disturbances, at the site will allow the introduction and proliferation of exotic species, which will harm native ecosystems and may require herbicides and pesticides to manage. Third, a large swath of clearing and ground disturbance across Oregon and Washington for the pipeline will create an ideal site for exotic species to thrive and harm native ecosystems, forestland, and farmland.

LNG terminal operation harms the local and state economy

FERC fails to consider the economic impacts of Bradwood. The DEIS cannot simply repeat the applicant's position that the 35 full-time jobs and increased tax base automatically makes this facility economically advantageous. The DEIS must consider the advantage of the 35 full-time jobs and the short-term construction jobs versus the detriment to the existing industry in Clatsop County and the State.¹⁵⁸ The DEIS fails to consider the tremendous risk to multiple industries and municipalities.

The LNG tankers and terminal will disrupt the fishing industry

A moving tanker will have a minimum safety/security zone of 500 yards. Therefore, during the tanker approach and docking, the southern access to Clifton Channel will be shut off. In addition, there will be a minimum 200-yard security zone around docked tankers. This will impair access to traditional fishing grounds offshore of Bradwood and impair use of productive drift lines. Further, simply the threat of delay or unknown security problems may force fishermen off the traditional fishing grounds at Bradwood and Clifton. The size of the exclusion zones are subject to increase at any time, which would have serious consequences on fishing access. The DEIS fails to consider these impacts.

In addition, the LNG tankers will block access to traditional fishing areas along the entire length of the river. Each time a tanker enters the river, commercial and recreational fishermen will have to leave traditional fishing areas. Gillnetters in the estuary will need to haul in nets. The hugely popular Buoy 10 salmon fishing location will be disrupted when tankers arrive because boats within 500 yards of the shipping channel must clear the area. During peak fishing season, even a slight delay is significant.¹⁵⁹ ODFW stated:

¹⁵⁸ See Gustanski, J. Preliminary Assessment of Economic Impact from the Propose Bradwood LNG Terminal

¹⁵⁹ In commenting on the proposed LNG terminal in Warrenton, local salmon and crab fishermen stated that an hour delay during peak season may cost them \$1000.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

"The moving 500-yard safety and security zone around 125 LNG ships per year (2 – 3 per week) as they move up the Columbia River will be very disruptive to commercial and recreational fishing boats." State Comments at 54.

The DEIS fails to evaluate adequately the impact of the LNG tankers on the commercial and recreational fishing industry and fishing access. The DEIS states: "[t]he Columbia River is also visited¹⁶⁰ by commercial and recreational fishing boats. An estimated 1,500 fishing boats use the Lower Columbia River in a year." DEIS 2-12. According to ODFW, over 46,000 commercial and recreational fishing boats use the Columbia River estuary each year for fishing and transit to the ocean. State Comments at 56 (from table titled, Estimated average monthly boat count by fishery in the Columbia River downstream of the Astoria-Megler Bridge). FERC's highly inaccurate data on the use of the river renders the impact analysis in the DEIS useless.

Each of these 46,000 boats will have to avoid the 500 yard safety zone around LNG tankers. This will cause delay and headaches in the extremely short and regulated commercial fishing season, and frustrate recreational anglers. Due to heavily regulated fishing seasons, missing just one drift could cost thousands of dollars. Further, LNG tankers and fishing boats will both want to cross the notoriously dangerous Columbia River bar at favorable tides. Because the LNG tankers would have priority, fishing boats are left with more risky crossings.

The LNG tankers and terminal will disrupt the shipping industry

In addition to fishing boats, the 500 yard safety exclusion zones apply to all other ships. Thus, container ships bound for the Port of Portland or Port of Vancouver, must avoid the LNG tankers. Any delay in shipping caused by the LNG tankers will cause significant economic harm. The DEIS fails to analyze the economic impact, including the cumulative economic harm due to the delay on the importers and exporters of goods, producers, and consumers. In addition, FERC must consider the impact of delay cause ports to lose clients, and the cumulative impact of reduced shipping jobs and income. In addition, the DEIS fails to analyze the cumulative effects of impact to the shipping industry due to LNG accident, terrorist attacks, or threatened terrorist attacks.

The LNG tankers and terminal will disrupt the tourism and real estate industries, and burden local communities

Economically, the proposed terminal and accompanying carriers will cause economic harm inhibiting the flow of boat traffic, diminishing the tourism appeal of the area, and negatively impacting the housing market.¹⁶¹ In addition to these delays faced by tourist vessels, LNG would diminish tourism in the area in general, a \$352 million industry for Clatsop County. Economic Impacts Assessment at 10 (See also Don West, *Letter to Clatsop County Planning*

¹⁶⁰ Commercial fishermen, some from 5th generation families of fishermen, do not "visit" the Columbia River, but live in river towns, depend on the river for their livelihood, and spend much of the lives on the river.

¹⁶¹ See Gustanski, J. Preliminary Assessment of Economic Impact from the Propose Bradwood LNG Terminal

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Commission, June 15, 2007) (“Don West Letter”). As put by Don West, President of the Astoria Lodging Association and Vice President of the Columbia River Business Alliance, “LNG . . . carries with it a connotation of being unsafe.” Don West Letter. In an industry where “[p]erception is reality,” “tourism as an economic generator depends on a positive perception of the area.” *Id.* Thus, “[m]ilitarizing the mouth of the Columbia to protect LNG shipping from terrorists” would change tourists’ perception of the area for the worse, thereby leading to decreased tourism, decreased jobs, and a decreased taxable base for the County. *Id.* Additionally, property values of areas near Bradwood landing or anywhere along the LNG tanker pathway would experience a considerable decrease, due to factors such as the diminished aesthetic appeal of the area as well as the ongoing subjection to the blast zone of the LNG carriers.¹⁶² Also associated with the risks inherent in LNG are increased insurance costs. The DEIS fails to consider these costs.

In addition, the DEIS fails to consider that the LNG terminal will require significant investments by local communities, including costs related to emergency response costs and the increasing the capabilities of emergency responders. See comments by Clatsop County and Cowlitz County, PBSJ Report to Clatsop County.

Furthermore, Bradwood has not provided protection against abandoning the site, the consequences of which would fall on the taxpayers. Oregon’s DOE stated:

[Oregon] rules require a detailed engineering estimate of site retirement cost, and a surety to provide adequate funds. Without the study and the surety, FERC has no basis for the statement that future abandonment can meet applicable regulations. In fact, there is no protection against the licensee declaring bankruptcy and abandoning the site. Department of Energy, at 63.

As DEQ summarized:

“The proposed Bradwood Landing project would place additional burdens on coastal communities related to emergency response costs and measures, declining fishing and recreation industries, and unknown safety concerns due to geologic instability and proximity to rising river waters due to global warming.” Oregon Preliminary Comments at 9.

The LNG terminal and tankers will disrupt recreation and recreation-based businesses

The DEIS fails to consider the impacts to recreation in the estuary. In addition to recreational fishing, the estuary is a popular location for kayaking, boating, bird watching, botany, plant collection, hiking, aesthetic enjoyment, drawing, and picnicking. The DEIS fails entirely to assess the impacts on these activities. A large industrial site will disrupt the enjoyment of the estuary and will preclude some recreational activities. The recreational impact is especially large because the tankers will travel the length of the river from the mouth to Bradwood, passing by the City of Astoria and popular waterfront recreation areas along the way.

¹⁶² *Id.* at 11.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

The impacts are compounded because LNG transport is a dangerous activity that many people will avoid.

In addition, a significant portion of the Clatsop County economy is based upon recreational businesses.¹⁶³ In addition to the tourism industry discussed above, Clatsop County has kayaking, boat rentals, gear stores, outdoor clubs, supply stores, gas stations, and hotels that benefit from locals and visitors recreating on the Columbia River. The DEIS fails to assess the impact of the LNG terminal and tankers on local businesses.

Construction Activities Will Disrupt Local Use of Clifton Road.

The DEIS fails to consider that construction activities at the proposed Bradwood LNG terminal will substantially increase traffic and decrease safety on Clifton Road. Clifton Road is already a dangerous road to traverse, with numerous sharp turns and narrow paved surface. If construction of the Bradwood LNG terminal and related facilities is allowed to proceed, the use of Clifton Road will become even more perilous to local residents using the road to get to and from Clifton. Bradwood proposes to cycle traffic one-way through the 2.5 mile affected portion of Clifton Road. DEIS at 4-345. This would be both inconvenient and unsafe to local residents and construction workers because of the estimated average 10 minute wait times for vehicles at the one-way section of road. This may delay emergency vehicle access.

The DEIS suggests that the increased traffic due to construction is an acceptable impact because of the temporary nature of the construction, but the construction activities will last for 3 years, DEIS at 4.344, a substantial period of time to disrupt local resident’s commute to and from Clifton. Additionally, Bradwood has failed to propose sufficient safety measures for the 2.5 mile stretch of Clifton Road. *Id.*

The DEIS grossly fails to evaluate the direct, indirect and cumulative impacts of the proposed project on public safety

The DEIS glosses over and ignores the serious safety treats of the proposed project and reads more like a public relations document for the project developer than the type of unbiased evaluation that the public has a right to expect from FERC. The DEIS fails to consider the direct, indirect and cumulative safety impacts that the project would have related to the LNG tankers, LNG terminal facility, and LNG pipelines that would be associated with the project. The project’s safety threats are significantly exacerbated because of its site-specific location 38 miles up the Columbia’s narrow river channel, but this fact is essentially ignored in the EIS. The EIS should specifically disclose the relative safety threats associated with this inland proposed port compared to other proposed LNG terminals that are offshore or on the coast.

Question: Does the proposed site-specific location of the proposed facility make it any more vulnerable to intentional terrorist attacks that could be launched from a shoreline that in many locations is just a few hundred feet from the path of LNG tankers? As a part of this analysis please discuss the justifications for security exclusion zones on either side of LNG tankers that

¹⁶³ See Gustanski, J. Preliminary Assessment of Economic Impact from the Propose Bradwood LNG Terminal

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

are typically 1,500 feet. Since it would be geographically impossible to actually provide these buffers on tankers traveling to the Bradwood site how would this factor increase the overall risk of an attack on an LNG tanker? This risk should be compared to risks at other proposed LNG sites on the west coast where the safety security zone would not be rendered meaningless as a result of encroaching shoreline.

The safety risks of the proposed project can be broken down into the risks associated with LNG tankers, the LNG terminals and the LNG pipelines associated with the proposed facility.

LNG tanker risks

LNG tankers carrying 30 millions gallons or more of LNG present a significant safety threat to those who live, work and recreate along the lower Columbia River. LNG tankers contain an extremely large amount of energy and an LNG release due to either accidental or intentional (terrorist) acts could cause a fire of unbelievable proportions. Sandia National Labs has projected that an intentional breach of an LNG tanker that spilled just 10% of an LNG tankers load could produce a vapor cloud that could affect a 1.5 mile radius from a given tanker. The attached map shows the vapor cloud overlay map for Astoria and the Puget Island that would result from LNG tanker traffic associated with the proposed project.

The Government Accountability Office, however, has indicated that the risk projections in the Sandia Report are likely underestimates since they ignore the potential for the type of cascading fire on an LNG tanker that would likely occur if one LNG tank ignited and therefore spurred additional ignitions of adjacent tanks. The GAO has called for additional study of this threat and this risk needs to be directly considered in the EIS given dramatically larger risks associated with a cascading fire and how it would affect the vapor cloud and thermal exclusion zones around an LNG tanker. The significant risks of LNG accidents are further supported by the attached report by Dr. Jerry Havens on the general safety threats related to LNG.

The DEIS appears to tacitly acknowledge the threats of a cascading fire but without any explanation explains that it is "not likely to involve more than two or three cargo tanks." DEIS at 4-426. The DEIS does not explain why if a one tank fire was hot enough to cause a rupture in an adjacent tank that the combined fire from two tanks would not be sufficient to rupture a third tank and so on until all tanks on a given tanker were ruptured and ignited. The DEIS appears to dismiss the increased effects of a cascading fire while at the same time suggesting that such an event could cause up to a 30% increase in the fire hazard distance and a longer fire duration. DEIS at 4-426.

Despite acknowledging that a cascading event could result in a longer fire duration, the DEIS makes no evaluation of how long of a fire duration such an event may cause. This is significant given that the damage that a given fire may cause correlates directly with the length of time a given target is subjected to a given heat intensity resulting from a fire. Whether considering the impacts on humans or structures the DEIS should have considered the effects of how a cascading fire would affect sensitive resources including humans, homes, businesses, forests along the shoreline and other combustible structures within the vapor cloud and thermal impact zones.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Question: What would the effects of a cascading fire event on an LNG tanker be from the perspective of impacts to humans, private property and infrastructure on shore and what facts does FERC rely on to support its findings on this issue?

The DEIS's limited reference to potential thermal radiation hazard distances is also flawed since it only assumes a breach of one tank on a 140,000 cubic meter tanker. DEIS 4-426. The DEIS should have considered the effect of a breach on the 200,000 cubic meter tankers the proposed facility is being planned to accommodate and should not be limited to the unrealistic assumption that only one tank on a given tanker would breach. As is supported by the 2007 Government Accountability Office report on LNG tanker pool fires, the risk of a cascading fire is a genuine threat in the event of an LNG tanker fire. The unsupported dismissal of any real consideration of the effects of a cascading fire event on an LNG tanker is contrary to the requirements of NEPA and should be remedied in a subsequent EIS.

Question: What would the effects of a cascading fire be on the type of 200,000 cubic meter tankers that would used at Bradwood? How long would a cascading fire on such a tanker likely burn and what would the resulting on-shore effects be?

The DEIS also uses an assumed 4.5 mile per hour windspeed estimate to project its vapor dispersion calculations, but this may not represent the scenario which would result in the greatest dispersion distance.

Question: What would the vapor cloud dispersion distance be if windspeeds were 10 mph or other higher windspeed that would result in a greater dispersion of a vapor cloud?

The DEIS appears to try to justify its near complete failure to discuss or consider the potential effects of an LNG tanker accident (even for the vapor cloud dispersion effects that are described) by the fact that the Coast Guard has responsibility for the operational safety of the LNG tankers. EIS at 4-436. The DEIS is conflicting in its treatment of the potential terrorist threats facing LNG tankers. On one hand the DEIS admits that, "terrorism has become a very real concern for the facilities under the Commissions' jurisdiction," while at the same ignoring almost entirely what the effects of a potential terrorist attack may be. This has the effect of essentially removing any ability of the public or expert agencies to evaluate the potential effects that a terrorist attack could have were the proposed project approved. While we understand some limits on how the effects of a terrorist attack maybe described, the complete absence of any clear evaluation of what the effects of a tanker breach may be, whether accidental or intentional, undermines the most important function of NEPA and is not justified by any rational national security concerns.

Question: In the event of either an accidental or intentional breach of an LNG tanker what would be the resulting damage due to loss of human life, injuries to human, damage to private structures and infrastructure, along the tanker path? This should specifically include scenarios for the type of intentional tanker breach evaluated in the Sandia Labs report should such a breach occur off the shoreline of Astoria, as well as at the proposed terminal location.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Question: What would the vapor cloud and thermal impact zones be and how many people and structures would fall within these zones assuming that 200,000 cubic meter tankers are used at the Bradwood facility which is being specifically designed to support this size tanker? What would the economic impacts of this vapor cloud and thermal impact zone be in the event of a tanker breach?

The DEIS provides only a cursory and vague evaluation of the risks of an LNG tanker fire, either from accidental or intentional causes. No clear evaluation is made of the actual impacts that would occur in the event of an LNG tanker breach on the Lower Columbia and this analysis should be provided in the FEIS.

The DEIS fails to consider size of ships that are likely to use terminal

The evaluation that the DEIS does provide is flawed since it unreasonably assumes that the LNG tankers would be 140,000 cubic meters, despite acknowledging that Bradwood tanker facility as currently designed has a capacity to accept ships up to 200,000 cubic meters. ES-L. The EIS should evaluate the effects of tankers, on both safety and other considerations, of tankers that are 200,000 cubic meters in size, as well as, the tankers that are currently being planned and constructed for use in the U.S. market that are 265,000 cubic meters in size or larger. See attached article from MarineLink.com.

<http://www.marinelink.com/Story/Linde+Group+to+Supply+for+LNG+Tankers-207124.html>
Additionally, Bradwood has proposed using tankers that were 200,000 cubic meters as a part of their permit application to the Army Corps of Engineers. Notice for Permit Application, U.S. Army Corps of Engineers, Oct. 18, 2007.

Question: What basis does FERC have for only considering 140,000 cubic meter tankers in the EIS when the proposed facility is intended to accommodate significantly larger ships and new LNG tankers under construction are significantly larger than the 140,000 cubic meters?

That the Coast Guard may require additional evaluations before allowing ships larger than 148,000 cubic meters to use the proposed terminal fails to release FERC from its obligation to evaluate the effects of the larger ships that the facility is actually being designed for. DEIS 4-427. Regardless of what the Coast Guard does, the effects of FERC's action in approving the proposed facility needs to be specifically considered in the DEIS prior to project approval and this evaluation cannot be delayed until after the project is constructed simply because the Coast Guard may require some vague and undefined additional analysis in the future. The use of larger tankers and three tanks at the facility is clearly reasonably foreseeable and must be considered by FERC per NEPA and its implementing regulations.

All impacts of these larger ships, from increased stranding of juvenile salmon to increased risks from an LNG tanker accident, should be considered in the final EIS.

DEIS underestimates projected ship traffic

The DEIS is also inherently flawed in that it only assumes ship traffic of 125 ships per year and a two tank terminal design despite the fact that the facility is being explicitly designed

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

to support three tanks. The foundation for a third tank is even being designed specifically into the project plans and the proposed pipeline is being sized for a 1.5 bcf/day sendout rate which would similarly support three tanks. Because a three tank design is reasonably foreseeable the DEIS must evaluate the increased tanker traffic that such a facility would allow and the DEIS's failure to do so seriously undermines its evaluation a broad spectrum of impacts relating from projected ship traffic. This includes the DEIS's evaluation of factors such as the impacts on non-LNG ship traffic, recreational use, impacts to salmon, air pollution impacts related to ships, and the risks of an LNG tanker accident to name a few.

FERC's willingness to evaluate the proposed project based on an intentionally minimized scale and scope instead of based on the size of the facility that is actually being designed is unreasonable and only emphasizes that FERC appears to see its role more as a promoter of the planned terminal than a neutral reviewer.

Question: Is it foreseeable that Bradwood will use three tanks because the Bradwood facility is being designed with a foundation for a third onshore LNG tank, with space for vaporizers and other equipment necessary to handle the LNG capacity a third tank would provide and with a pipeline that is sized to facilitate a third tank scenario?

Failure to consider or disclose flammable nature of insulating foam on LNG tankers

The DEIS fails to address the fact that a majority of LNG tankers use a flammable foam as insulation around on board LNG tanks that could significantly increase the risk of a cascading failure. The attached documents attached as "Collection of LNG tanker insulation risk does" directly support that the potential risks of a cascading fire resulting from insulation failure and/or ignition needs to be considered in the DEIS as an inherent safety weakness of LNG tankers. This needs to be evaluated in the EIS

Question: Does FERC acknowledge that the foam used in the majority of LNG tankers in use today is flammable? Please discuss the factual basis for any answer to this question. How would this design flaw increase the risk of a cascading fire and how does this consideration alter the DEIS's discussion of the likely vapor cloud impact distances that are discussed in the DEIS?

Question: How would the effects of a prolonged fire resulting from a cascading fire event on an LNG tanker increase the impacts of such an event on shore, particularly in the area of downtown Astoria and the terminal site including Puget Island?

Failure to adequately consider the risks of the impacts that brittle fracture could have on LNG tanker or terminal facility

While briefly acknowledging that brittle fracture is a possibility that could be caused by an LNG leak on an LNG tanker, the DEIS fails to describe what the potential effects of a leak caused by brittle fracture could be and what the resulting effects would be on sensitive resources including humans and on shore structures. The Lloyds Register study prepared for the proposed Boston harbor and referenced in the DEIS LNG terminal supports that the risks of brittle fracture are significant and should have been considered in the DEIS.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Failure to evaluate an Emergency Response Plan and emergency response capabilities of local emergency responders

The DEIS fails to discuss or describe the Emergency Response Plan (ERP) or the effects, impacts, or mitigating effects of such a plan because no such plan had been prepared at the time of the DEIS to the frustration of local fire districts and governments alike. This is only one of the numerous impacts from FERC's rush to issue the DEIS prior to being providing fundamental information about the project, its operations, and safety protocols. FERCs attempt to cover up for its lack of basic information by repeatedly making suggested "recommendations" to NorthernStar as to what it should do or prepare is no substitute for the type of actual review and analysis that NEPA requires. This information should have been prepared in the DEIS and FERC should re-issue a supplemental DEIS before proceeding to a final EIS so that the public, state and expert agencies can have a reasonable chance to evaluate the effects of the proposed project.

The DEIS fails to discuss in any detail how the local communities along the proposed LNG tanker route would be able to respond in the event of a tanker incident either accidental or intentional and should have done so. The EIS, for example, did not disclose the fact that there is no burn center in Clatsop County and that emergency response capabilities are wholly inadequate for responding to a potential LNG tanker breach or even a tanker grounding that threatened a tanker breach. Essentially, the EIS hides behind the assumption that because a breach of an LNG tanker is unlikely there is no need to plan for a realistic scenario that evaluates how the communities along the tanker route and terminal maybe affected by an LNG accident or tanker breach. This is inconsistent with the requirements of NEPA.

Question: Does FERC acknowledge that there are inadequate emergency response assets currently available to respond to a serious event involving an LNG tanker?

Failure to evaluate effects of cost-sharing plan

The DEIS ignores the potential fiscal impacts that a cost-sharing plan would have on local and state governments. The impacts that having to re-direct scarce resources away from essential public services to LNG security and emergency response protocols would have on local and state governments was also not considered. Despite the DEISs regurgitation of NorthernStar's unsubstantiated claims about the tax revenues that the proposed project would create there is no evaluation about whether the LNG related costs that local governments would have to share would exceed the projected tax revenues the project may create. The costs of local government's emergency response responsibilities could significantly exceed the tax revenues the project would create and this should be disclosed and discussed in the EIS.

Failure to consider unconfined vapor cloud explosion

While the DEIS generally dismissed the potential for an unconfined explosion in the event of an LNG tanker accident it ignores the fact that should non-methane gases account for 15% or greater of the LNG content then such an explosion is in fact possible.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Question: Does FERC acknowledge that LNG sources that could be used to supply the Bradwood terminal may contain contaminate gas concentrations that exceed 15% of the total LNG? Does FERC acknowledge that the Coast Guard and others have recognized the potential for an explosion if non-methane gases exceed 15% of an LNG source? What would the effects of such an explosion be?

Failure to consider effect of Astoria's extensive dock structure over the Columbia River in causing a potential explosion of gas vapors

A significant amount of Astoria's shoreline is composed of extensive pier structures that extend out hundreds of feet over the water and contain numerous structures and businesses on top of these piers that create what is at least a partially confined environment where there would be a significantly increased risk of explosion in the event of an LNG leak. The DEIS completely fails to discuss let alone assess the potential effects of the unique shoreline environment that characterizes Astoria.

Question: Does FERC acknowledge that the unique pier and dock structure along Astoria's shoreline creates what is at least a partially contained environment that would pose an increased risk of an explosion caused by LNG vapor? What would the effects of such an explosion be on the structures and humans that occupy and use these structures?

LNG terminal risks

The LNG terminal similarly poses significant risks to the public and particularly those who live on Puget Island that make clear that the proposed project is not in the public interest. The risks include the thermal and vapor dispersion risks that could affect those using the Columbia River, as well as, areas such as Puget Island and Clifton. The DEIS significantly underestimates both the thermal radiation and vapor dispersion risks associated with the proposed terminal and this undermines the purpose and intent of NEPA. Additionally, the design considered in the DEIS is inconsistent with the design requirements of NFPA 59A and 49 CFR 193 and this should have been disclosed and evaluated in the DEIS.

As discussed above, the DEISs first failure is that it only considers the effect of a two tank facility despite the fact that a three tank facility is reasonably foreseeable and must be considered as a part of the current EIS. Additionally, the DEIS failed to consider that the facility is designed to handle LNG tankers with a 200,000 cubic meter capacity. This is important because although FERC failed to consider the potential for a terminal based fire to cause an ignition of LNG tanks on board a docked tanker it should have.

The DEIS is also inadequate because of a number of significant technical and legal failures related to its analysis of the safety risks associated with the LNG terminal. These failures are discussed in Dr. Jerry Havens comments on the project which we incorporate here by reference. DEIS failures to address the safety issues surrounding the LNG terminal at Bradwood include:

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

Improper use of the DEGADIS model for estimating the facilities vapor dispersion zone

The DEIS analysis of the Bradwood vapor dispersion zone relies on the improper use of the DEGADIS model. As discussed by Dr. Havens, one of the authors of the DEGADIS model, DEGADIS is not appropriate to use when attempting to calculate vapor dispersion rates from liquid impoundment sumps. Instead, as is supported by FERC's own regulations, the proper model to use when accounting for the effects of a containment berm is the FEM3A model. The improper use of the DEGADIS model undermines the accuracy of the analysis required by NEPA and constitutes a violation of application FERC regulations. This inconsistency with applicable law needs to be disclosed and considered under NEPA and its implementing regulations.

Failure to use proper design spill criteria

The vapor dispersion modeling contained in the DEIS was improperly based on a design spill from the 6-inch diameter recycle line attached to the unloading line rather than the 32" unloading line that would actually carry LNG from the tanker to the on shore tanks. Allowing NorthernStar to rely on a spill from its 6" line instead of a much more likely rupture of its 32" line is arbitrary and capricious and fails to reasonably evaluate the potential effects of the proposed project. While we believe that this is supported by the requirements by NFPA 59 A and 49 CFR 193 regardless of these design regulations an evaluation of the vapor dispersion impacts from a breach of the 32" transfer line is warranted under NEPA since the breach of the offloading line clearly a reasonably foreseeable impact of the proposed project.

The DEIS admits plainly that a spill from the transfer line would result in a 529,091 gallon leak after ten minutes. DEIS 4-414. While we support the fact that FERC staff plan to require a spill impoundment area that is sized to contain this size spill, this requirement does serve to support that this sized spill event is reasonable to plan for and evaluate in the EIS. Again, irrespective of design criteria requirements of NFPA 59 A and 49 CFR 193 NEPA's requirement to inform the public and decision makers about the potential effects of the proposed project require a clear evaluation of the vapor dispersion that would result from a breach of the transfer line. An evaluation of a 6" line breach is not a reasonable proxy for such evaluation and is inconsistent with how FERC has calculated design spills for other LNG terminals it has reviewed. See attached excerpts from Weaver Cove LNG terminal. We request that FERC specifically discuss and disclose how it has calculated design spills for vapor dispersion calculation in other proposed LNG facilities. The attached document prepared by Dr. Jerry Havens comparing vapor cloud exclusion zones as calculated by FERC for various LNG terminals further supports that FERC's determination of the proposed vapor cloud dispersion zone is arbitrary and capricious and inconsistent with NFPA 59 A and 49 CFR 193.

Question: What is the vapor dispersion zone when calculated using the FEM3 model and a design spill that was based on the 32" rupturing as opposed to merely the 6" line? How would this enlarged dispersion zones affect a LNG tanker that was docked in the event a transfer line breach and subsequent ignition? Could a breach of the transfer line cause brittle fracture impacts to a docked LNG tanker or could the subsequent ignition in such a release scenario result in

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

damage to a docked tanker? How would this larger dispersion zone affect users of the Columbia River, the railroad tracks through the project site and other resources on and surrounding the project site? How would such an event affect the LNG storage tanks?

The fact that FERC released the DEIS without having NorthernStar's design calculations that supported that its trough feeding the impoundment pumps would handle a 10 minute transfer line spill is yet another sign that in FERC's rush to issue the DEIS it lacked basic information about the facility that is needed to characterize its impacts.

Question: What size design spills has FERC used to evaluate vapor dispersion and thermal radiation zones in its review of other LNG proposals, such as the Trunkline LNG terminal? How does the methodology FERC has used for other LNG terminals differ from the methodology it is applying to the current proposal for the purpose of identifying vapor dispersion and thermal radiation zones?

The modeling used improperly assumes no air/methane mixture in any spill impoundment in the event of a breach of the onshore LNG tanks or inlet or outlet lines thereto

The DEIS modeling of the LNG terminal risks also improperly assumes that should the integrity of the on shore LNG tanks or inlet or outlet lines thereto be compromised that gaseous vapors from the spilled LNG would not mix with air thus reducing the vapor dispersion distance. This assumption, however, is inconsistent with relevant field studies of the issue, such as the Gas Research Institute's Falcon Series Data Report on the 1987 LNG Vapor Barrier Verification Field Trials which is attached. It is also inconsistent with FERC's own acknowledgments in the Weavers Cove EIS. This flawed assumption is discussed in greater detail in the attached paper by Dr. Jerry Havens and Dr. Spicer entitled "Error in FERC environmental impact statement determinations of LNG vapor cloud exclusion zones: failure to account for air mixing in vapor impoundments."

Question: Does FERC acknowledge that it is not realistic to assume no mixing of air with gas vapors in modeling vapor dispersion distances? What is the proper vapor dispersion distance if the unrealistic assumption that there will not be a mixture of LNG vapors with air above a containment tank in the event of a tank breach?

The DEIS assumption that outer tank wall would effectively contain LNG lacks a reasonable basis in fact

The DEIS fails to properly consider or disclose the actual affects that an LNG vapor fire at the facility would have on Columbia River users adjacent to the facility or to residents of nearby Puget Island. The effects of vapor dispersion and a subsequent ignition based on realistic spill scenarios is similarly lacking. The DEIS, for example, presumes that in the event that the on shore storage tanks were compromised and that an LNG fire ignited on top of the LNG storage tanks that the out concrete tank shells themselves would not fail. Given the intense heat of an LNG fire, the intense cold of direct LNG contact with the concrete and the combination of the two extremes FERC should have very specific evidence to support an assumption that these outer tanks would not fail.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Question: If an LNG vapor fire ignited on a roofless LNG storage tank, as appears to be presumed in the DEIS, how long would such a fire burn? What evidence does FERC have to support that the concrete outer tank would not structurally fail in face of what could only be presumed to be many hours of exposure to intense heat? What would be the effect if the outer tank did fail? How would Puget Island be affected by either vapor dispersion? How would such a failure affect a docked LNG tanker and one what evidence is this evaluation based?

Geologic risks at site were not adequately considered

The geologic risks at the proposed site have not been fully or adequately considered or evaluated in the proposed EIS as is supported in comments submitted by the State of Oregon and others. The DEIS failed to adequately consider the risks of landslides at the site, the effects of earthquakes including the effects of liquefaction, the potential tsunami risks (both ocean caused and from a cross river landslide). The fact that the superficial analysis contained in the DEIS did not find any evidence, either through written reports or from photographic evaluation, of the landslide-triggered tsunami that did affect the area despite the clear records of this event in local newspapers highlights the need for a much more in-depth geologic evaluation of the risks posed by this high hazard site.

We believe that the concerns addressed by the State of Oregon DOGAMI in regards to inadequate geologic evaluation at the site need to be fully addressed in a supplemental DEIS.

While the DEIS notes the risks of liquefaction it wholly fails to reasonably describe the risks of liquefaction that would remain even after the loosely proposed and vaguely described mitigation measures. For example, while the proposed LNG tanks would be put on "deep" foundations, how would liquefaction affect the other key components of the facility such as the transfer pipes, dock, vaporizers etc.? As with so many other parts of this rushed DEIS any potential to even reasonably evaluate the effects of the proposed project is undermined by the lack of even final design specifications that would allow the public or other agencies to actually evaluate the geologic risks of the project and understand the likely effectiveness of mitigation measures. The DEIS states, for example, that "While the final engineering design for the LNG terminal would incorporate detailed seismic specifications and other measures to mitigate the impacts of seismic hazards." DEIS at 4-12. Deferring the design specifics of the facility, however, and the mitigation measures it may include is fundamentally at odds with NEPA and eliminates the ability of the public and others to understand and evaluate what the effects of the proposed mitigation measures may be and what the remaining impacts would be.

Similarly, throughout the DEIS the proposed mitigation measures lack a degree of specificity that would allow a reader to understand with any degree of certainty what the final effects of the proposed project would be. There is typically no detail about how the mitigation measures would be required and if they are not required what basis FERC relies on to assume that they would actually be implemented. FERC's "recommendations" to NorthernStar hardly constitute assurances that the suggested mitigation measures would be implemented.

Page 127 of 151

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

These recommendations on information that NorthernStar should provide such as "Details of the liquefaction mitigation methods, procedures, plan extent and verification methods..." are exactly the type of thing that FERC should have required be produced before the DEIS was released. In FERC's rush to issue the DEIS, however, it has undermined the public's ability to evaluate and comment on these specifics and as a result FERC needs to re-issue a supplemental DEIS that the public would have a chance to review and comment on.

The DEIS statement that the shoreline along the project site "appears to be moderately resistant to erosion" is without support or relevance since the shoreline has not been subject to the type of high intensity wave action that will result from the proposed port facility. The photos to the right shown an example of wave action on the lower Columbia River just up-river of the proposed project site that was generated from a ship far smaller than the proposed LNG tankers. These impacts are import, but largely ignored in the DEIS, in the context of both shoreline erosion as well as impacts on salmon stranding which is common as a result of ship wake. Again the DEIS's failure to consider the erosion related effects of the larger 200,000 cubic meter capacity ships that the terminal is being planned for undermines the accuracy of the EIS evaluation.

While the DEIS generally ignores or unrealistically downplays the impacts of wave action on erosion and salmon stranding outside the terminal area, its treatment of these issues inside the terminal area is similarly inadequate. It is wishful thinking, for example, to assume that "in general, tugboats would be operating within the proposed turning basin with their sterns directed away from the nearshore banks" and therefore would not impact shoreline erosion. This is plainly ridiculous as tugboats would clearly have to move around the site before, during and after the arrival of an LNG tanker and assuming that they would be pointed away from the shoreline is just another example where the EIS preparers intentionally blindfold themselves to the impacts of this project.

The DEIS notes that NorthernStar would deposit dredge material on the site to raise the final site elevation above the 100-year flood level. The DEIS, however, fails to consider how this dredge material would withstand the flood action of a 100 year flood and the risks to the whole site that would result from using highly erosive dredged fill for both the site foundation and for the earthen berm around the LNG storage tanks.

Question: How would the use of dredged spoils for what would essentially be the site foundation and for the containment berms affect the ability of the site to withstand high flood events, that are predicted to increase in coming decades with global warming, as well as other similar events ranging from liquefaction to tsunamis?

Page 128 of 151

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Question: The DEIS provides not information about the effectiveness of vibrocompaction and no information about the effectiveness of the proposed deep foundations planned for the LNG storage tanks. What would the remaining geological risks be assuming even that these mitigation measures are used?

The geologic analysis used in the EIS assumed that only the upper 85 feet of the soils below the project site were likely to experience liquefaction, but the DEIS also admits that there is at least 100 feet of sand, silt and clay alluvium under the site, and there is every reason to believe this entire soil structure is likely to liquefy in the event of a large enough earthquake. What justification does FERC rely on in its assumption that soils deeper than 85 feet would not liquefy?

Poor site selection for and LNG port

The DEIS fails to discuss the fact that the proposed terminal location is a poor site for an LNG terminal for multiple reasons. The DEIS ignores that the fact that the project is likely one of the highest risk sites in the United States being currently proposed given its location 38 miles up a narrow river channel which would make the proposed safety and exclusion zone meaningless for much of the tanker trip up the river since the shoreline would be well within the 1500 foot exclusion zone along the sides of LNG tankers.

The DEIS also ignores the fact that the project is located on a curve in the river and would located barely one LNG tanker's length from the Columbia River shipping channel. This is inconsistent with SIGTTO standards for terminal location siting and this fact should be disclosed and evaluated in the DEIS. Site Selection and Design for LNG Ports and Jetties Information Paper No. 14.

The DEIS also fails to adequately consider the effects on shipping and other river users, such as commercial and sport fishermen and recreational boaters who heavily use the area in and around the project site.

LNG pipelines

The DEIS's evaluation of the safety threats of the proposed pipeline which would run through Columbia and Cowlitz Counties is wholly inadequate and reflects an extreme callousness towards the people who be affected by this misguided scheme to generate revenue for New York energy speculators. FERC's almost laughable decision to segment analysis of the Palomar pipeline similarly violates NEPA and its implementing regulations.

These high pressure un-odorized gas pipelines have a blast zone of over 1,400 feet and hundreds of homes, businesses, farms and other sensitive facilities would be placed within the blast zone if the proposed project is approved. The Palomar line would result in over 33,000 acres of new blast zone being created in Oregon and thousands of acres of blast zone would similarly be created along the Cowlitz County line.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

While the DEIS completely fails to address the risks of the Palomar line it does only slightly better in terms of the proposed line through Cowlitz County. While the DEIS does a cursory review that acknowledges that the line crosses over 31 "potential" landslide areas it admits that it lacks significant information about these areas thereby undermining any ability of the public or decision makers to actually evaluate the risks of the proposed project on pipeline integrity. A similarly limited review of earthquake faults undermines any reasonable evaluation of the risks of the proposed pipelines.

FERC's recommendation that NorthernStar should "conduct additional field mapping and subsurface investigations as needed to develop a Final Pipeline Design Geotechnical Report" is exactly the type of advice that FERC should have given before putting out a DEIS that was based on cursory reviews and a lack of the type of site-specific data that NEPA requires for agencies charged with taking a "hard-look" at the impacts of a given project. DEIS at 4-20.

The threats of the proposed pipelines would loom over every property and its owners that are along the pipeline regardless of whether an accident ever did occur and this impact on people's daily lives, as well as the reduced property values that would result, needs to be carefully considered. The EIS makes no mention of the impact that having a three foot diameter high pressure high volume pipeline running through your property would have on the psychological health of those who live along the pipeline. While the DEIS attempts to downplay any actual risk to landowners in the DEIS a revised DEIS should specifically evaluate the social effects of how the proposed project would affect landowners along the pipeline. This should include the serious social impacts of experiencing a condemnation proceeding. If FERC is going to recklessly wield its condemnation power for the benefit of a private for profit corporation than it should at least have the decency to acknowledge the serious impacts that this have on those it wishes to impose it on and the proper place for that evaluation is in the DEIS.

Question: How many condemnation actions does FERC expect on both the proposed northern pipeline and on the Palomar pipeline? What is the projected total loss in property value that the proposed pipeline right of way would cause a result of loss of currently allowed uses along the pipeline?

Additionally, the potential for a catastrophic accident along the pipeline route will and in some cases already has significantly lowered property values along the proposed route. This should be specifically considered by having a trained and qualified real estate appraiser familiar with the local real estate market make actual market determinations about how playing host to a massive un-odorized pipeline would decrease individual property values for residents and business owners along the pipeline route.

The DEIS also generally ignores the fact that the proposed gas pipelines will lack the most basic safety feature that has been used for gas safety for many decades: odorization.

Question: Why would the proposed gas line not be odorized? What would the costs of adding odor to the line be? How would the unodorized gas decrease detection of gas leaks along the Williams pipeline that the proposed northern pipeline would connect to? What could the effects of this lack of such a basic safety provision be?

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

The proposed northern pipeline appears to be a dummy pipeline that is potentially not actually even intended as a route through which gas from the Bradwood project would reach the market. The most obvious fact support this contention is that the Williams pipeline lacks the capacity for the 1.3 bcf/day of gas that the Bradwood terminal is planned for. Knows Where the Gas Will Go?" Cassandra Profita. The Daily Astorian. Nov 27, 2007. Instead, there are good reasons to believe that Palomar pipeline would send the Bradwood gas to market and that the northern line maybe intended to transport gas to geologic formations underneath the hills in Cowlitz County for storage. Veneco and others are currently drilling exploratory wells looking for such storage areas in Cowlitz County, yet this was not disclosed in the DEIS and should be since such an action would be both a connected action and one that would have cumulative effects to the proposed project.

FERC should consider the collection of news articles and other documents related to the Palomar pipeline labeled as "Collection of Palomar pipeline docs" and then stop the proposed process until such time as a DEIS can be re-issued that considers the effects of the Palomar pipeline. FERC should also incorporate all documents, including maps and aerial photo overlays, that it has as a part of its file for the Palomar and Oregon LNG projects and include such documents in the record for the Bradwood terminal. This includes the attached transcripts from two of the Palomar scoping meetings which are attached as well as the transcripts from all additional Palomar scoping meetings.

Question: What does FERC know about the potential consideration to develop a gas storage site in Cowlitz County or anywhere in the surrounding area? How would this project be related to the proposed Bradwood project? How would this affect use and purpose of the northern pipeline route? What would the effects of this type of gas storage project be on humans, fish, wildlife, public safety and the broad range of sensitive resources that should be considered in a DEIS?

Question: On what basis can FERC accept the incredulous assertions of NorthernStar that it intends to use the northern pipeline route to send gas to the Williams line when the Williams line lacks capacity to accept the gas? What is the current maximum capacity of the Williams line and how much excess capacity in the line is there? Without adequate capacity in the Williams line how can FERC find that the northern pipeline route constitutes a viable distribution line for the gas? Does FERC acknowledge that the lack of capacity in the Williams lines supports the notion that the Palomar pipeline is a necessary part of the proposed project?

The Revised DEIR Fails to Analyze the Potential Risks of Onshore Leaks due to Chemical Composition of the Natural Gas from the Proposed Project

Between 2003 and 2005, Washington Gas, Inc., a natural gas distributor in the State of Maryland, experienced an unusually high number of dangerous gas leaks in certain areas of its suburban gas distribution network. Washington Gas contracted scientific analysis to determine the cause of the leaks. In a detailed report, the analysts concluded that the chemical composition of natural gas delivered by Washington Gas from the Cove Point LNG terminal to consumers in the high-leak areas contributed to degradation of seal quality in the gas pipeline network and the unusual number of gas leaks discovered

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

among Washington Gas customers. FERC is in possession of this document from the proceedings on the Cove Point LNG terminal and should include it in the record for the instant project.

Several findings from the Washington Gas report pertain directly to the environmental impact review for the Bradwood project. The DEIS fails to include these considerations, despite the grave implications for the safety of potential consumers of Bradwood's vaporized LNG.

Among the important findings, the report states:

- *The process of natural gas liquefaction and re-vaporization results in a lower C5+ [gaseous hydrocarbons with molecular weight equal to or greater than pentane] content (mostly pentanes and hexanes) in the revaporized LNG than that of the pipeline [domestic] gas. The gases used in our experiments demonstrated this difference: concentrations of C5+ hydrocarbons were 1053 ppm in the Shenandoah pipeline gas versus 105 ppm in the Cove Point gas.*

- *The elastomer in the seals can adsorb and desorb pentane, hexane, and other higher hydrocarbons with molecular weight equal to or greater than pentane] content (mostly pentanes and hexanes) in the revaporized LNG than that of the pipeline [domestic] gas. The gases used in our experiments demonstrated this difference: concentrations of C5+ hydrocarbons were 1053 ppm in the Shenandoah pipeline gas versus 105 ppm in the Cove Point gas.*

- *The change to [Cove Point LNG] gas that has a lower concentration of pentane and higher molecular-weight (C5+) compounds, caused a slight shrinkage in some seals due to de-sorption of previously adsorbed C5+ compounds. 87*

According to Washington Gas officials, the low C5+ compound concentrations in the Cove Point LNG was "a key contributing factor" in the deterioration and leakage of more than 1,400 gas seals, requiring a \$144 million project to replace gas lines and equipment. Illustrating the danger of the leaks, a high energy explosion that razed a four bedroom Maryland home (fortunately, uninhabited) was implicated in the shrunken seal leaks. See Baltimore Sun, *Officials look for cause at Cove Point for leaks in Pr. George's houses; Dominion blames equipment.* July 8, 2005.

Question: How would the composition of the gas imported to Bradwood potentially affect seals and other gas line and gas combustion equipment used by gas customers and in the transport of LNG derived gas? What would the composition of the gas that would be imported to Bradwood likely be based on the most likely suppliers?

This issue and many others relating to inherent problems and risks associated with LNG are thoroughly addressed in comments on the Cabrillo Port LNG project that were prepared by the Santa Barbara Environmental Defense Center. We attach these comments here and incorporate the concerns, questions and issues raised in these comments into our own comments as such concerns apply to the Bradwood Project. If FERC is unable to easily obtain any of the documents referenced in the EDC's comments please contact us and we will provide these documents to you for inclusion in the record.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Pipeline construction and operation

Along with the ecologic, economic and safety impacts of the tankers and terminal, Bradwood proposes to construct a 36-mile high-pressure natural gas pipeline, which would traverse multiple rivers and streams in Oregon and Washington. The pipeline requires a 100 to 120 foot construction easement, which will clear vegetation and disturb soils and natural resource industries (forestry, fishing, farming) in a long linear swath. This disturbance is permanent.

The physical, chemical, biological, and economic impacts of the pipeline are discussed below. These comments focus on the 36-mile pipeline proposed by Bradwood. However, as demonstrated in the alternatives analysis section, FERC must also consider the proposed Palomar pipeline, which is a necessary component of the Bradwood project. The Palomar pipeline is a 220-mile pipeline that will cross hundreds of streams and cause dramatic water quality issues. FERC must consider the impacts of the Palomar project and must require Bradwood to submit aquatic resource data on Palomar.

Physical and chemical impacts

The DEIS fails to consider that the pipeline will adversely affect the physical and chemical characteristics of the project area.

Bradwood proposes a very large, high pressure pipeline in an area with highly unstable soils. An incredible 51% of the soils along the proposed pipeline route are designed "Highly Erodible Land" or "Potentially Highly Erodible Land." FERC must analyze the effect of these unstable and erodible soils on pipeline stability and safety. In addition, the ground disturbing activity will increase the erosion of these already highly erodible soils. Erosion is especially problematic at waterway crossings and steep slopes, both of which are common along the pipeline route. Pipeline construction and maintenance will increase the turbidity, temperature, and oxygen demand in each stream along its route.

Digging pipeline trenches and HDD bore sites on steep, unstable slopes will increase the landslide risk. The pipeline will pass through high landslide hazard areas. As stated above, landslides are so common in Cowlitz County, that "Landslide Debris" is a stratigraphic unit into which the pipeline trench will bore. In fact, recent landslides in Cowlitz County have severed natural gas lines and caused large fires. Just this month, a landslide west of Clatskanie, Oregon occurred approximately 1 mile from the proposed pipeline route.¹⁶⁴ This large landslide ruptured a smaller existing natural gas line. The DEIS does not adequately address the danger of clearly foreseeable landslides to the pipeline or the increase of landslide risk due to pipeline construction.

In addition, all of the geologic hazards discussed above regarding the terminal are applicable to the pipeline. The DEIS fails to consider the impact of the geologic hazards on the pipeline and alternative pipeline designs or routes that minimize environmental and social risks.

¹⁶⁴ See Oregonian, "Landslide" December 12, 2007.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

We attach and incorporate the comments of Dan McShane, registered geologist, on the DEIS. Based on his long history working in Cowlitz County and his experience with natural gas pipelines, Mr. McShane discusses multiple errors and omissions in the DEIS.

Biological impacts

The DEIS fails to consider how the Bradwood pipeline will adversely affect biological resources. The primary impact will occur at stream crossings. First, riparian vegetation will be removed across a wide construction easement and permanently destroyed in the maintenance zone. The loss of riparian vegetation will decrease habitat for riparian mammals, amphibians, reptiles, birds, and macroinvertebrates. This will also destroy fish habitat that depends on healthy riparian areas for bank stability, shade, physical complexity, the input of coarse woody debris, and detritus from vegetation. In addition, removing riparian vegetation will increase water temperature by decreasing shade. The beneficial filtering and buffering by the riparian area will also be degraded. This destruction will decrease water quality and harm fish. DEQ stated, "There are 94 stream crossings and 24 wetland area crossings proposed to accommodate 30 miles of new pipeline. Associated with these disturbances to the streams and wetlands themselves, are **significant impacts to riparian and wetland vegetation**." Oregon Preliminary Comments at 12 (emphasis added).

Second, the pipeline construction will disturb soils, stream banks, and stream beds, which will harm aquatic life. Pipeline construction will necessarily involve heavy equipment in sensitive riparian habitat. The pipeline construction will remove and destroy topsoil adjacent to streams and remove the streambed substrate when trenching across the stream. Some of these sites are salmon spawning streams, so spawning gravels could be removed and harmed by the turbidity plume. The construction will generate tremendous turbidity and suspended solids and deliver sediments to downstream habitat, including downstream salmon habitat. Downstream sediment delivery will occur in habitat utilized by ESA-listed salmon and EFH. In some circumstances, bank hardening may be required, which will further degrade aquatic habitat. In addition, multiple roads will be created to access the pipeline route. The vehicles will compact and disturb soils. Further, Bradwood will construct multiple structures associated with the pipeline, which will disturb soil, vegetation, and water quality.

Third, the pipeline construction will disrupt fish passage by damming the streams during the trenching and pipeline placement. It is unclear how long fish passage would be interrupted. The mitigation of capturing and removing fish behind the dams is historically not effective, and will result in the take of threatened salmonids.

Fourth, any pipeline boring, including the multiple proposed HDD, risk frac out and the introduction of bentonite to the waterway. Bentonite smothers fish habitat and fouls streams. A recent pipeline through similar topography in southern Oregon experienced multiple problems with frac out and the introduction of drilling mud into the waterway. FERC must analyze the tremendous impact of the introduction of very large amounts of fine sediment on the Columbia River or salmon-bearing tributaries. The following photos show stream degradation from Coos County natural gas pipeline construction.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

Fifth, the lateral pipelines and other associated features (including power lines) will impact water quality. FERC must consider the impact of lateral pipelines – the DEIS failed to assess these impacts. Sixth, the pipelines will result in habitat fragmentation in important riparian habitats and associated uplands. Seventh, the pipeline will adversely affect rare plants. As the USFWS noted, the surveys and impact assessments for checker mallow, water howelia, and other rare plants must extend to all areas that will be impacted by the permanent and temporary right of way for the Bradwood pipeline. Additionally, the DEIS does not incorporate an assessment of how potential serious failures in unstable slopes and erosion throughout the area will impact habitat of sensitive plant species along the pipeline.

Cumulative Impacts

40 C.F.R. § 1508.25 requires FERC to consider the cumulative impacts of the proposal. This includes the cumulative effects of conservation, economics, aesthetics, general environmental concerns, wetlands, historic properties, fish and wildlife values, flood hazards, floodplain values, land use, navigation, shore erosion and accretion, recreation, water supply and conservation, water quality, energy needs, safety, property ownership and the needs and welfare of the people. FERC's analysis, therefore, is not limited to the region directly adjacent to Bradwood. Nor is the review limited to short-term impacts, but it must consider the long term impacts on the estuary and the entire length of the pipeline. Further, EIS must analyze connected actions and similar actions, as defined in the regulations.

The DEIS fails to include a cumulative impacts analysis of proposed Palomar Pipeline, which, as explained in the alternative section above, is directly connected to the Bradwood LNG terminal. Because detailed Palomar Pipeline maps are not available to the public or FERC at this time, it is difficult to assess the impacts and impossible to say which practicable alternatives exist related to pipeline route. However, due to the massive size and scope of the Palomar Pipeline, the adverse environmental, social, and economic impacts are extreme. The DEIS fails to analyze the cumulative impact of the Bradwood terminal, along with the two proposed pipelines, will of which have a tremendous adverse impact on each of the factors listed above.

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

The DEIS does not even attempt to acknowledge important past, ongoing, and future actions that will continue to hamper recovery of sensitive wildlife, fish, and their habitats. The cumulative impacts analysis also omits the obvious impact that industrialization and hydropower development have had on the Columbia River – developments which harm the estuary and the Lower Columbia's critical salmon nursery. The Columbia River Channel deepening project, which will also occur in the immediate project area, will impact fisheries and should be incorporated into a consideration of how the Bradwood area will function as even more important migration and refuge habitat during and in the wake of this project.

As part of the cumulative effects analysis, FERC must also consider Bradwood's degradation of fish habitat in light of the already tenuous state of salmon, sturgeon and groundfish in the Pacific Northwest. First, the wetland and shallow water habitat in the Columbia River has been significantly degraded over the last century. The remaining habitat at Bradwood, therefore, takes on added importance. The Columbia River dams degrade water quality by increasing temperature, decreasing dissolved oxygen and flow, all of which harms salmon.¹⁶⁷ The dams also decrease the amount of habitat available to salmon. In addition, other upstream uses, such as pollution from agriculture, forestry, and industry contribute to salmonid population declines. In addition, the Columbia River channel deepening project is ongoing. This large dredging project will seriously degrade water quality directly adjacent to the Bradwood site, and all along the lower Columbia River. Threatened salmon and other species will be harmed by the pollutants, disruption, and loss of habitat due to channel deepening dredging. Further, fish hatcheries degrade the survival of protected, native salmon. Due to the dams, other upstream impacts, habitat loss in the estuary and current dredging, 13 ESUs of salmon are on the brink of extinction.¹⁶⁸ The Bradwood LNG terminal's impact on salmon must be evaluated in light of the cumulative ecological stress that salmon already face. The DEIS has failed to consider adequately these cumulative effects.

In addition, global warming is reducing snow pack and increasing temperatures, which will adversely affect water temperature and flows. FERC must consider each of these cumulative effects on salmon and other aquatic life, and wildlife. As part of this analysis, FERC must consider the indirect effects of increasing the fossil fuel supply in the Pacific Northwest, which will lead to greater carbon emissions and accelerate global warming. The DEIS also failed to analyze the indirect effect of LNG creating additional gas-fueled power plants, which will decrease the demand for renewable energy, thereby hindering efforts to combat global warming and hindering the economic opportunities that renewable energy has brought to the Pacific Northwest, such as investments in wind, wave, and solar energy.

In addition, the DEIS has failed to consider the cumulative economic effect of Bradwood on the fishing industry and communities dependent upon the fishing economy. The direct harm to fish will harm the fishing industry, as will the lack of access to traditional fishing areas.

Mitigation is inadequate

¹⁶⁷ Ninth Circuit FCRPS Opinion

¹⁶⁸ *Id.*

20071222-5001 PERC PDF (Unofficial) 12/22/2007 12:24:56 AM

The proposed mitigation projects do not offset the tremendous damage that the LNG terminal and pipeline would cause. First, the mitigation violates the fundamental tenant of EPA wetland mitigation sequencing by failing to avoid adverse impacts. As described in these comments and by NMFS and Oregon, there are practicable alternatives to the Bradwood location with less adverse impact.

EPA describes the mitigation sequencing as follows:

In 1990, the Environmental Protection Agency (EPA) and the Department of Army entered into a Memorandum of Agreement (MOA) to clarify the type and level of mitigation required under Section 404 regulations. The agencies established a three-part process, known as mitigation sequencing to help guide mitigation decisions:

1. Avoid - Adverse impacts are to be avoided and no discharge shall be permitted if there is a practicable alternative with less adverse impact.
2. Minimize - If impacts cannot be avoided, appropriate and practicable steps to minimize adverse impacts must be taken.
3. Compensate - Appropriate and practicable compensatory mitigation is required for unavoidable adverse impacts which remain.¹⁶⁷

The MOA describes the requirement of the law:

Avoidance. Section 230.10(a) allows permit issuance for only the least environmentally damaging practicable alternative. The thrust of this section on alternatives is avoidance of impacts. Section 230.10(a) requires that **no discharge shall be permitted if there is a practicable alternative** to the proposed discharge which would have less adverse impact to the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences. In addition, Section **230.10(a)(3) sets forth rebuttable presumptions** that 1) alternatives for non-water dependent activities that do not involve special aquatic sites are available and 2) alternatives that do not involve special aquatic sites have less adverse impact on the aquatic environment. **Compensatory mitigation may not be used as a method to reduce environmental impacts** in the evaluation of the least environmentally damaging practicable alternatives for the purposes of requirements under Section 230.10(a).¹⁶⁸

Bradwood flips this sequence on its head by siting the terminal where it will have tremendous adverse impacts, but then attempting to mitigate those impacts. As the MAO states, compensatory mitigation may not be used as a method to reduce environmental impacts. The DEIS fails to raise the legal requirements of mitigation sequencing, fails to assess the adverse

¹⁶⁷ <http://www.epa.gov/owow/wetlands/pdf/CMitigation.pdf>.

¹⁶⁸ Memorandum Of Agreement Between The Department of the Army and The Environmental Protection Agency. 1990 (emphasis added).

20071222-5001 PERC PDF (Unofficial) 12/22/2007 12:24:56 AM

effects of Bradwood's proposal to operate out of sequence, and fails to assess alternative design, operation and mitigation options that have less impacts.

Second, even if Bradwood had properly avoiding adverse impacts, the mitigation does not adequately compensate for the damage. The destruction of 58 acres of prime estuarine salmon habitat is irreplaceable. In addition, adequate mitigation must replace habitat values with "in-kind" and "in-place" habitat. The MAO states:

Generally, in-kind compensatory mitigation is preferable to out-of-kind. There is continued uncertainty regarding the success of wetland creation or other habitat development. Therefore, in determining the nature and extent of habitat development of this type, careful consideration should be given to its likelihood of success.¹⁶⁹

Here, much of the proposed mitigation is not "in-kind" or "in-place", as NMFS noted in its May 11 letter. The construction and operation of the terminal will cause immediate, severe, deleterious impacts to salmon, critical habitat, and essential fish habitat. Bradwood asserts that salmon habitat will receive a net benefit from the project, but provides no scientific basis for this questionable statement. Bradwood has understated the extent and severity of impacts that will need to be mitigated, and so the analysis of how mitigation will offset these problems is thus inherently flawed. Most importantly, the mitigation measures put forth by Bradwood do not necessarily offset the types of habitat being destroyed by dredging, filling the log pond, and damaging wetlands, streams, and riparian areas at the terminal and along the alignment of the pipeline. NMFS has raised these issues as well as the problem that the effects of the mitigation will take hold at best several years after damage occurs along the pipeline and at the site. The DEIS must describe more thoroughly how proposed mitigation efforts will address this problem during construction and early operation of the terminal and pipeline.

Specifically, the DEIS does not adequately describe how it is mitigating impacts of dredging. The Svensen Island mitigation site is being used to offset the filling of the log pond and other tidal wetlands on the site. Lower Svensen Island and Hunt Creek do not represent a significant creation of new habitat, while dredging will directly degrade 58 acres of habitat (pg. 9-2). While Bradwood intends to improve and/or maintain habitat at its mitigation sites, they fails to show how this restoration will directly result in a positive gain in salmon habitat lost from the area dredged in the Columbia River and the filled log pond, an acreage which exceeds the amount of new habitat created at Svensen Island. The mitigation efforts are, by themselves, inadequate, but they also occur out of step with the impacts of the project itself, which are severe. The mitigation efforts for creating new habitat are downstream, and the mitigation plan is unclear as to the timeline for when new created habitat will provide offsetting benefits for damage done at the site. The mitigation plan does not demonstrate how habitat of similar importance and function will be created in other areas to account for the in-stream habitat, in particular. In addition, Bradwood fails to mitigate damage from the pipeline. The mitigation site at Delameter Creek is decided as inappropriate for mitigation of the pipeline impacts. Despite all of these shortcomings, the DEIS does not analyze the inadequacies of the mitigation plan or

¹⁶⁹ *Id.*

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

analyze the impacts to aquatic resources under the plan. The DEIS also fails to analyze alternatives to mitigation and alternative mitigation plans.

Expert agencies have roundly criticize the Bradwood mitigation plan. ODFW summed up the problem concisely: *“Significant fish habitat will be lost and mitigation is not adequate.”* Oregon Preliminary Comments at 4.

NMFS stated:

The mitigation plan included in the DEIS appears **inadequate and incomplete**. The preferred alternative **does not contain any mitigation for several adverse impacts on NMFS’ trust resources, including listed species under the ESA**. Sediment sequestration and wake stranding of juvenile salmonids are areas of particular concern. Where mitigation is proposed at Svensen Island, the description of the action has changed and is inadequate for assessment of beneficial effects to NMFS’ trust resources that are impacted by the proposed project. For example, not all of the island is currently within the applicant’s ownership or subject to the applicant’s right to make modifications. In addition, FERC needs to clearly articulate how the benefits provided at Svensen Island for salmonids adequately compensate for the decrease in habitat and habitat quality 14 river miles upstream and for on-going operational impacts that affect the viability of the affected populations. Furthermore, because the terminal would be operated for 40 years, a monitoring and adaptive management plan needs to be developed by the applicant, in consultation with NMFS that assures continued benefit to the target species over the lifetime of the project, and beyond if the affected habitat is not restored.

NMFS DEIS comments at 3-4.

When the state and federal agencies in charge of salmon both expressly state that the mitigation is inadequate, FERC must carefully assess the efficacy of the plan.

Bradwood’s claims that this project will enhance salmon habitat are completely unfounded. The agencies state that the proposed mitigation plan will not compensate for the dramatic loss of habitat. In fact, the agencies note that Bradwood’s proposed mitigation sites are already healthy habitat:

“All mitigation proposed would preserve and enhance existing areas **which already provide functional water quality and habitat benefits.”** Oregon Preliminary Comments at 12 (DEQ).

“If the Hunt Creek/Clifton Channel [mitigation] site is just going to be preserved, but already functioning, how are the waters impacts being mitigated for?” Oregon Preliminary Comments at 34 (Department of Land Conservation and Development)

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

“Although the targeted areas may function better if mitigation actions are successful, **the project will still result in a permanent loss of 33 acres of wetland and 58 acres of in-stream areas, as well as temporal losses from an additional 98 acres of temporary wetland impacts**. Not only is this **contrary** to both the intent and requirements for mitigation to fulfill permit requirements under the Clean Water Act, but it is of additional significance under the recent EPA elevation of the Columbia River to a national priority.” Oregon Preliminary Comments at 8.

In addition, Bradwood has touted its Salmon Enhancement Initiative (“SEI”) to the agencies and the public, but few have been impressed. Descriptions of SEI activities are far too vague to add mitigation value to Bradwood’s project. ODFW stated, “Bradwood has proposed to implement a Salmon Enhancement Initiative that would be entirely voluntary ... Because the plan is voluntary and not regulatory, questions persist about it. [There are] **no details about specific projects** so it is extremely difficult to assess benefits or project impacts.” Oregon Preliminary Comments at 55. The DEIS does not adequately describe the nature and effectiveness of the SEI, or alternatives to the SEI, such as requiring that the voluntary money be a mandatory component of compensatory mitigation.

Furthermore, the benefits and funding for the SEI depend on the ability of Bradwood to operate the LNG terminal consistently for 35 years. With persistent uncertainty in the global and Pacific Rim LNG markets, the Bradwood proposal cannot be expected to operate consistently and without interruption in funding for 35 years.

The DEIS proposes that Bradwood will employ noxious weed control as a form of mitigation. But, the DEIS does not adequately describe how controlling noxious weeds will directly benefit salmon and offset the type of impacts the project will have at the site, where terminal construction and dredging will destroy dozens of acres of critical habitat. Furthermore, as NMFS has noted, the methods of noxious weed control are important. If Bradwood intends to use chemical control measures, the impacts of these control measures must be assessed on salmon that may use the restored areas. The DEIS fails to analyze the efficacy of noxious weed control as mitigation, the extent of the control, the positive and negative attributes, and alternative means of control. In addition, the DEIS fails to discuss the proposed mitigation for construction, stormwater, and operational mitigation.

The proposed project will adversely affect water quality for the Columbia River and contribute to violations of Oregon’s and Washington’s Water Quality Standards.

The DEIS fails to consider the impact on water quality and the fact the proposed dredging, filling, and pipeline construction will cause violations of both Oregon’s and Washington’s numeric and narrative water quality standards, including harming designated uses.

Bradwood will cause or contribute to violations of Oregon’s water quality standards

FERC must assess whether the project will conflict with state policies. 40 C.F.R § 1502.16(c). Here, the DEIS failed to discuss the conflict between the project and state water quality standards. In reviewing the Bradwood proposal, DEQ made clear that project would

20071222-5001 PERC PDF (Unofficial) 12/22/2007 12:24:56 AM

likely violate water quality standards. For example, DEQ stated, “the hydrodynamic geomorphic changes in the river ... may contribute to **unacceptable levels of erosion ..., introduction of toxics to the waterway, habitat loss, and wetlands loss – all of which reduce water quality.**” Oregon Preliminary Comments at 11. In addition, “**potentially debilitating impacts to these [threatened] species include noise, continuous light, suspension of sediment, turbidity, loss of salmonid habitat** and ability to rest or avoid predation, and potential attractant for sturgeon to a dangerous construction zone.” *Id.* ODFW agreed, stating, “**Significant fish habitat will be lost and mitigation is not adequate.**” *Id.* at 4. DEQ expressly noted that the impacts of the pipeline are contrary to state law: “**Loss of riparian vegetation in these areas is directly contradictory to the applicable Water Quality Management Plan ...** which requires preservation and restoration of riparian areas in tributaries to address temperature and other water quality parameters.” *Id.* at 12. DEQ also stated that the impacts of the pipeline are contrary to state law: “Loss of riparian vegetation in these areas is directly contradictory to the applicable Water Quality Management Plan ... which requires preservation and restoration of riparian areas in tributaries to address temperature and other water quality parameters.” *Id.* Oregon’s review indicates that the project does not comply with Oregon’s water quality standards.

Specifically, Bradwood will cause or contribute to violations of the following water quality standards, all of which the DEIS fails to discuss:

Protection of the designated use of aquatic life, OAR 340-041-0101

The LNG terminal and pipeline fail to protect the designated use of aquatic life, including threatened salmonids and the North American green sturgeon. As described in detail above, the expansive acreage of dredging and filling in critical salmon habitat fails to protect salmon. The construction and operation of the terminal and pipeline, including removing riparian vegetation, tanker traffic, wastewater discharge, ballast water intake, pipeline stream crossings, and the risk of catastrophic damage due to a gas fire combine to create unacceptable harm to aquatic life. The fact that some of the aquatic life, including 13 ESUs of salmon and the North American green sturgeon, are on the brink of extinction makes the project less acceptable.

The LNG terminal also fails to protect the designated use of fishing because the terminal and tankers degrade the struggling fishery and block or delay access to traditional fishing grounds, as described in detail above.

Narrative criteria, OAR 340-041-0007

OAR 340-041-0007 prohibits “the creation of ... toxic or other conditions that are deleterious to fish or other aquatic life” Bradwood’s 58 acres of dredging and expansive wetland fill is clearly a condition deleterious to fish due to permanent loss of habitat. In addition, NMFS and DEQ raised as a major concern that LNG tankers will impinge and entrain juvenile salmon and other fish when the tankers take 6,000,000,000 gallons of ballast water each year. Additional deleterious conditions include: modification of river flow and hydrology at mouth of Clifton Channel, wake stranding of juvenile fish, discharge of warm engine cooling

20071222-5001 PERC PDF (Unofficial) 12/22/2007 12:24:56 AM

water, long-term piling driving and dredging, and destruction of riparian and upland habitat along entire pipeline.

Biocriteria, OAR 340-041-0011

Waters of the State must be of sufficient quality to support aquatic species without detrimental changes in the resident biological communities. As described above, the LNG terminal will degrade resident biological communities due to habitat destruction, wake stranding of juvenile fish, toxic discharges, increase temperature and turbidity, and removal of riparian vegetation, among other impacts.

Dissolved Oxygen, OAR 340-041-0016

Dredging and lengthy in-water work will reduce the dissolved oxygen in the Columbia River to levels that violate the water quality standard. The Columbia River is water quality limited for dissolved oxygen so any additional oxygen demand from Bradwood’s dredging or terminal construction and operation will certainly cause or contribute to violations of the water quality standards.

Temperature, OAR 340-041-0028

Bradwood’s dredging, vegetation clearing, and wastewater discharge will contribute to the exceedance of the temperature water quality standard of 68 degrees F for salmon rearing and migration. Bradwood’s proposed summertime discharges of firewater system testing of 74 degrees F and hydrostatic testing water of 75 degrees F will violate the temperature criterion. Because the lower Columbia River is already water quality limited, any contribution of heat from Bradwood above the ambient river temperature causes or contributes to a violation of the temperature water quality standard. The Ninth Circuit has recently made clear that new dischargers may not add a pollutant into a water body that is water quality limited. *Friends of Pinto Creek v. United States Environmental Protection Agency*, No. 05-70785, (9th Cir. Oct. 4, 2007).

Toxic substances, OAR 340-041-0033

Toxic substances may not be introduced above natural background levels in concentrations that may be harmful to aquatic life. Bradwood will discharge chromium, silver, and other toxic pollutants from the SCVs at concentrations harmful to aquatic life. In addition, DEQ and NMFS raised concerns about toxic pollutants, including phytosterols, mobilized from dredging or erosion of former industrial site.

Bradwood’s wastewater will contain the toxic pollutant silver at levels 14,900% greater than EPA considers safe for fish. Bradwood will discharge at 0.018 mg/L when the safe level is 0.00012 mg/L.¹⁷⁰ In addition, Bradwood’s discharge of the highly toxic chromium III and chromium VI are 119% and 2,354% greater than Oregon’s chronic water quality criteria,

¹⁷⁰ Technical Memorandum: Mixing Zone Analysis for Bradwood Landing Point Source Discharges, July 27, 2007 at 3, 5.

20071222-5001 PERC PDF (Unofficial) 12/22/2007 12:24:56 AM

respectively.¹⁷¹ This discharge violates both the numeric and narrative water quality standards. Bradwood's solution for their toxic discharges is to create a giant toxic mixing zone, in which the "silver concentrations determine the size of the chronic mixing zone."¹⁷² This backwards approach – building a big enough toxic mixing zone to accommodate any amount of pollution – is contrary to the CWA. DEQ cannot issue a permit that contains this toxic mixing zone. The DEIS failed to discuss the conflict between DEQ regulations and this project.

Turbidity, OAR 340-041-0036

Bradwood's long-term dredging will violate the standard of no more than a ten percent increase above background levels. The turbidity from the dredging is likely much worse than presented by FERC because the DEIS failed to consider dredging through organic matter and packed sand, and it failed to consider the necessity of blasting, clamshell dredging, and other methods that create more turbidity.

The turbidity standard has an exception for "limited duration activities necessary to address an emergency or to accommodate essential dredging." The 24-hour, 7-day dredging over 3 months is not limited in duration and not essential.

Antidegradation, 340-041-0004(7)

Oregon rules state that "water quality limited waters may not be further degraded . . ." OAR 340-041-0004(7). The Columbia River is water quality limited for temperature, dissolved oxygen, and other pollutants. Therefore, Oregon cannot allow Bradwood's new, additional discharge of these pollutants into the already degraded Columbia River. OAR 340-041-0004(7) says Oregon may grant narrow exceptions, but only if the "benefits of the lowered water quality outweigh the environmental costs of the reduced water quality" and the discharge will not harm endangered species. The environmental costs of this project are tremendous and the discharge will certainly harm endangered species by permanently destroying critical habitat, including the designated critical habitat of the Snake River sockeye.

Bradwood will cause or contribute to violations of Washington's water quality standards

The DEIS must assess the entire project's compliance with Washington's standards, not just the pipeline, because the terminal construction and operation will affect Washington's waters in the Columbia River. The DEIS fails to discuss compliance with Washington's standards at all. As described above, the LNG terminal and pipeline do not protect the Washington designated use of aquatic life, including threatened salmonids and the North American green sturgeon, due to expansive acreage of dredging and filling in critical salmon habitat.

¹⁷¹ *Id.*

¹⁷² *Id.*

20071222-5001 PERC PDF (Unofficial) 12/22/2007 12:24:56 AM

The LNG terminal also fails to protect the designated use of fishing, WAC 173-201A-010, because the terminal and tankers degrade the struggling fishery and block or delay access to traditional fishing grounds. The pipeline crossings will degrade fishing access and fish habitat.

Bradwood's dredging and pipeline construction will violate the one-day maximum turbidity criterion. Multiple streams that the pipeline would cross, including Cameron Creek, Abernathy Creek, Germany Creek, Tributary 5 to Coal Creek, Coal Creek, Ostrander Creek, and others are designated salmon spawning streams. The turbidity criterion is 5 NTU over background when the background is 50 NTU or less, or a 10% increase in turbidity when the background turbidity is more than 50 NTU. WAC 173-201A-200(e). FERC and the public cannot adequately assess the impact to salmon because the application materials do not discuss which streams contain salmon. For the streams that do not contain salmon, the criterion is 10 NTU over background when the background is 50 NTU or less, or a 20% increase in turbidity when the background turbidity is more than 50 NTU. *Id.* The dredging will greatly exceed this standard. The pipeline construction will also exceed the standard for trenching, and has the possibility of exceeding the standard for HDD and bore due to the potential for frac out, which causes bentonite clay or drilling mud to foul the streams.

The turbidity criteria allows a temporary mixing zone for in-water construction, but dredging and pipeline trenching will even violate the mixing zones in WAC 173-201A-200(e)(i). In addition, the mixing zone is not allowed here because it will substantially interfere with the salmon using the waterbody and damage the ecosystem as prohibited by WAC 173-201A-200(e) and WAC 173-201A-400(4).

The LNG terminal and pipeline will also violate Washington's temperature, WAC 173-201A-200(c), and dissolved oxygen, WAC 173-201A-200(d), water quality standards due to removal of riparian vegetation and increased siltation, and turbidity, as described in detail above. In addition, Cameron, Abernathy, Germany, Tributary 5 to Coal Creek, Coal Creek, and Ostrander Creek are listed on 303(d) list for temperature. The proposed pipeline will cause an increase in temperature in these streams during construction, which is prohibited by the CWA. Also, the long-term removal of riparian vegetation will increase temperature, which will further degrade the listed streams, in violation of the CWA.

The project will also violate Washington's antidegradation policy, WAC 173-201A-300, the purpose of which is to restore and maintain the highest possible quality of surface waters in Washington. The project fails to protect Tier I streams, including those on the 303(d) list, which "must be maintained and protected." WAC 173-201A-310(1). No degradation is allowed. *Id.* The pipeline construction would certainly degrade these Tier I streams. In addition, the pipeline will cross multiple Tier II streams, in which new activities are prohibited unless the lowering of water quality is necessary and in the overriding public interest. WAC 173-201A-320. Bradwood could redesign the pipeline route or crossing procedures, so the lowering of water quality is not necessary. Also, the pipeline route is not in the overriding public interest.

Overall, the DEIS fails to disclose and discuss the fact that the project will violate Oregon's and Washington's water quality standards, and the DEIS fails to discuss any alternatives that can eliminate or minimize this conflict.

The DEIS fails to adequately consider cultural resources and environmental justice

The DEIS fails to analyze the cumulative, direct, and indirect impact to cultural resources and environmental justice.

Lack of current data for analysis

On page 4-334 and 4-335 are located three tables (4.8.1-6, 4.8.1-7 and 4.8.2-1) which demonstrate income distribution and ethnicity in areas affected by the project. Two of these tables are derived from U.S. Census Bureau Census of 2000, while one of them (4.8.2-1) includes information from the U.S. Census Bureau Census of 2006. This raises concern regarding the use of outdated statistics. If the 2006 Census has been made available, then the EIS should include and analyze data from those graphs. A considerable change in ethnic composition and income distribution for the affected areas could easily occur within that 6 year gap. If data from 2006 was available at the time of data analysis for this DEIS, then why is it not included here? This should be remedied prior to an EIS being published so as to provide accurate information and appropriate analysis of affected populations.

Non-compliance with section 106 of the NHPA

On page 5-13 it is stated that "We have not yet completed the process of complying with section 106 of the NHPA. Cultural resource surveys are needed for about 11 miles total of the pipeline route." This analysis must be completed for any accurate statements to be made regarding impact on disenfranchised or minority populations. This should be remedied prior to an EIS being published.

No consideration for other disenfranchised communities, especially senior citizens and the physically disabled

Residents living along the pipeline route who are elderly or have physical disabilities are at a great disadvantage in participating in the FERC/NEPA process. With informational meetings being held at night and at various locations the participation of affected citizens with disabilities or frailties due to age becomes very difficult. Analysis should be done on these affected communities and information should be made available to them in an accessible format (such as large print and daytime meetings in all the affected communities -- not just a central location that people are expected to drive long distances to attend).

Questionable conclusions made by analysis of minority populations which result in a lack of information being made available to the public

In analyzing data regarding ethnic make-up and income distribution in areas that are affected by the project (terminal, marine traffic and pipeline) it appears that erroneous conclusions have been drawn. In the community of Navy Heights in Astoria the population is 22.9% Hispanic (table 4.8.1-6, which relies on the outdated 2000 census), but the conclusion drawn in the DEIS is that "there are no predominantly minority communities within the Zones of

Concern." (page 4-333) Additionally, table 4.8.1-7 shows that over 25% of the population of Navy Heights lives below the poverty level. What percentage of the population would have to be non-white and/or impoverished for it to be considered a "predominantly minority community?"

Furthermore, within section 4.8.1.9 on environmental justice it is stated that "each federal agency must ensure that public documents, notices, and hearings are readily available to the public." The DEIS claims that this is achieved through making notices available through "local government representatives, local libraries and newspapers, and local environmental groups." (page 4-333) Were notices written in Spanish and submitted to Latino-based newspapers that circulate in areas like Navy Heights? Were meetings held with translators in an effort to inform the quarter of the population of that area that is Hispanic and potentially non-English speaking? Were notices to Hispanic property owners provided in Spanish? And was this done in other areas where Hispanic population makes up a lower percentage of the overall population (such as Clatsop County where 4.5 % [1,603 actual residents] were Hispanic at the time of the 2000 census)?

With regard to the impoverished peoples living in the zones of concern, it appears that in most areas there are typically well over 10% of the population living below the poverty line (tables 4.8.2-10, 4.8.1-7 and 4.8.3-6). And yet he conclusion is repeatedly drawn that "there are no predominantly low-income or minority communities" in the zones of concern. Again, the question must be raised- what percentage of impoverished and/or minority groups would be relevant for a consideration to be made on the impact on those communities?

Further consideration of historic sites such as the LCNHT, Hunt Lumber Mill, historic shipwrecks and site 35CO16

In section 5.1.9 the conclusions and recommendations of cultural resources indicate that more work must be done on the part of the applicant to verify that historic cultural sites will not be adversely affected by the project (marine traffic, terminal and pipeline). Of primary concern are the Lewis and Clark National Historic Trail, the Hunt Lumber Mill and site 35CO16. These analyses and mitigation plans should be addressed before publishing an EIS. Additionally further analysis should be made regarding the impact of a low-probability high-impact event on the 37 shipwrecks that are identified outside of the navigation channel. Mitigations should be considered that would protect historic sites potentially impacted by a disaster that may cause damage to outlying areas surrounding the project.

The DEIS fails to discuss conflicts between the project and federal, state, and local plans, policies and controls

The DEIS fails to include discussion of the project's conflict with federal, state, and local plans, policies and controls. The project is inconsistent with multiple regulations and policies to protect the estuary. First, the project is inconsistent with Clatsop County's Comprehensive Plan and land use development ordinances. Bradwood has asked for over 20 amendments to the Clatsop County land use plans, including radically modifying the Comprehensive Plan's designation portions of the project site from "Natural" to "Industrial" and from "Conservation"

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

to "Development."¹⁷³ The DEIS must discuss the conflicts with County land use plans, as described in: the June 28, 2007 Clatsop County Staff Report from Mitch Robse to the Planning Commission; the July 10, 2007 letter from the Coalition to the Clatsop County Planning Commission; and the July 20, July 24, July 31, and August 8, 2007 letters from Columbia Riverkeeper to Clatsop County Planning Commission, all of which are attached. The DEIS fails to explain the existence and importance of this conflict. Even if Clatsop County modifies its land use plans, which it has not done, FERC must still address the conflict between the project and the land use plans. If Clatsop County amends its land use plans specifically to accommodate this project, the EIS must discuss the all direct, indirect, and cumulative effects of this land use amendment, including the environmental, economic, and social impacts of amending these plans and laws, and any alternatives to amending the plan that would avoid or minimize the adverse impacts.

The DEIS fails to include a discussion about conflicts between the Bradwood pipeline and Cowlitz County laws that protect natural resources, economics, and public safety. For example, the pipeline will violate the Cowlitz County Comprehensive Plan, zoning ordinances, development ordinances, Critical Areas Ordinances ("CAO") and Shorelines Management Plans. The DEIS fails to discuss the direct, indirect, and cumulative effects of violating these laws, including the environmental, economic, and social impacts. The DEIS also fails to discuss any alternatives to violating the laws that would avoid or minimize the adverse impacts.

The DEIS fails to discuss the conflicts between the Bradwood project and Oregon law and policies. First, the DEIS fails to disclose and discuss that the project may violate Statewide Planning Goal 16, attached, which requires the protection of Oregon's estuarine resources, including the economic, social, and environmental values in the estuary. The DEIS fails to discuss the impact of disregarding or taking an exception to Goal 16. Second, the DEIS fails to discuss the project's noncompliance with Oregon's implementation of the CWA's wastewater permitting program under CWA section 402. Oregon cannot issue an NPDES permit to Bradwood because the Columbia River is water quality limited for temperature and dissolved oxygen. Also, the proposed discharge violates the toxic pollutant criteria. Third, the DEIS fails to discuss the project's conflict with Oregon's obligation to certify a project as consistent with water quality standards under CWA section 401. Bradwood does not comply with water quality standards, and Oregon cannot issue the permit, because the project does not protect designated uses and does not comply with narrative and numeric criteria for temperature, turbidity, dissolved oxygen, chromium, silver, and other pollutants. Fourth, the DEIS fails to discuss the project's conflict with Oregon's duty to evaluate whether a water appropriation should be granted by the Water Resources Department. Oregon's evaluation must consider the public interest, and should consider the 6,000,000,000 gallons of ballast water used each year. The DEIS failed to consider project's conflict with the public interest assessment. Fifth, the DEIS failed to discuss the project's conflict with Oregon's duty to protect the public interest when leasing state land. The DEIS failed to distinguish which land is State-owned and which land is private at the facility site. This distinction is critical because the project conflicts with Oregon's

¹⁷³ Bradwood Landing LLC Narrative in Support of Applications for Local Approval of the Bradwood Landing LNG terminal and Associated Facilities; Comprehensive Plan and Zoning Ordinance Text Amendment application; NorthernStar Natural Gas Narrative in Support of Applications for Local Approval of Natural Gas Pipeline.

20071222-5001 FERC PDF (Unofficial) 12/22/2007 12:24:56 AM

fiduciary duties to protect State land in the public trust. A conflict exists because Oregon may not be able to lease the land to Bradwood. The EIS must look at alternatives to Oregon abdicating the public trust. In addition, Oregon has a duty to evaluate the public trust when issuing a dredge and fill permit. The DEIS fails to discuss the direct, indirect, and cumulative effects of not complying with these laws, including the environmental, economic, and social impacts of noncompliance, and any alternatives to noncompliance that would avoid or minimize the adverse impacts.

In addition to state law, the DEIS fails to discuss the conflict with federal laws, as required by the NEPA regulations. The DEIS fails to discuss the project's conflict with the CWA section 404 dredge and fill permit, as described in detail in the Coalition's December 18, 2007 letter to the Corps. In addition, the DEIS fails to discuss the project's conflict with the Endangered Species Act of 1973. As discussed in detail above, the dredging and filling of over 70 acres of prime estuarine habitat will jeopardize the struggling populations of 13 threatened ESUs of salmonids and the threatened North American green sturgeon. In addition, the proposal will increase in deep draft ship traffic by 25%, which will increase wake stranding of juvenile fish and increase vessel strikes and other harassment of endangered and threatened marine mammals, including several whale species and steller sea lion. The conflict exists because FERC cannot issue a cite certification in violation of the ESA. The DEIS fails to discuss the direct, indirect, and cumulative effects not complying with these federal laws, including the environmental, economic, and social impacts of noncompliance, and any alternatives to noncompliance that would avoid or minimize the adverse impacts.

The DEIS fails to integrate the environmental analysis with other agencies

40 C.F.R. § 1502.25 states, "to the fullest extent possible, agencies shall prepare [DEISs] concurrently with and integrated with environmental impact analysis and related surveys required by the Fish and Wildlife Coordination Act, the National Historic Preservation Act of 1966, the [ESA], and other environmental review laws and executive orders." FERC violated this requirement by proceeding with the DEIS without acting concurrently with the review required by each of these laws. For example, FERC produced the DEIS long before the ESA section 7 consultation has been completed. In fact, Bradwood does not even have a current Biological Assessment submitted the NMFS and USFWS, yet FERC blindly moves forward without the assistance of the expert analysis at NMFS and USFWS. In fact, NMFS submitted critical comments that the DEIS is inadequate and too vague to conduct a reasonable evaluation. An integrated analysis would reduce this problem. The failure to comply with 40 C.F.R. § 1502.25 also harms public review because the public, like FERC, cannot take advantage of the insight of the expert agencies.

The DEIS information is inadequate and inconsistent with the CWA section 404 application

The DEIS is inconsistent with other documents submitted by Bradwood, including the 404 application. The 404 application states that the "impact area in acres" is "45.87 (temporary and permanent)." This differs greatly from the DEIS, which show the impact area is over 100 acres. Both the DEIS and the 404 application simply do not contain adequate information to

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

assess the impact on aquatic resources and to conduct an alternatives analysis. The application materials contain inadequate information on the site of stream crossings due in part to the fact that the applicant has not visited many of the locations in which they plan to conduct major work. How can FERC assess the impact on aquatic resources if no one has conducted a field assessment of the specific site?

The DEIS states that the facility will contain two storage tanks, DEIS ES-1; 2-20. To the contrary, the 404 application states, "the Terminal would be designed with three LNG storage tanks." This is a major difference that affects the aquatic resources at the site, the number of tankers arriving per year, and the entire alternatives analysis. For example, NMFS stated that "Originally, during conversations with the applicant, it was stated that the addition of a third tank would likely correspond with an approximate 50 percent increase in LNG vessel traffic." NMFS DEIS comments at 4. It is unclear whether the applicant has backtracked on that statement, or how the third tank would influence vessel. The number of tanks is a prominent issue, but not the only discrepancy between the 404 application and the DEIS. FERC must circulate a new DEIS that contains accurate information about the design and operation of the facility.

The project has dramatically changed since the application was submitted. FERC must request a new application to reflect these changes. If FERC issued the permit now, it would be unclear which project FERC is approving. NMFS stated, "the applicant's proposed action has changed significantly since the DEIS was issued and aspects of the proposed action remain poorly defined." NMFS DEIS comments at 3.

In addition, the DEIS defers many design specifications to later in the process. This is inappropriate for LNG. When dealing with a project that can cause explosions and fires, and that would be located in an area known for high seismic activity and severe wind and river conditions, it is critical that the applicant submit complete information so that the DEIS can thoroughly and adequately assess the safety implications of the Project. Deferring the analysis to staff review after Project approval does not provide the public and decision-makers with complete information *before* the Project is approved, in accordance with the mandates of NEPA.

In addition, FERC cannot evaluate the environmental impacts and alternatives of this project without evaluating the proposed Palomar Pipeline. As described in great detail in the alternatives analysis section of this comments letter, the Palomar Pipeline would directly connect to the Bradwood terminal. NMFS stated, "extension of the [Palomar] pipeline to Bradwood Landing would have no utility independent of the proposed action." NMFS DEIS comments at 5. In fact, the Bradwood terminal is fully dependent on the proposed Palomar Pipeline for gas distribution. FERC cannot let Bradwood and Palomar attempt to obtain approval of this large project in a piecemeal fashion.

Incorporation by reference

These comments include all the documents referenced herein and the documents attached hereto and all documents we submitted to FERC. We request that all of these documents be part of the record before FERC for this matter. The Coalition's comments also adopt and incorporate by reference the comments submitted by the Columbia River Intertribal Fish Commission

20071222-5001 PERC PDP (Unofficial) 12/22/2007 12:24:56 AM

("CRITFC"), Gloria McKenzie, Duncan McKenzie, Marjie Castle, Frans Eykel, Carolyn Eady, George Exum, Irene Martin, James Reed, and Rick Beck. In addition, we request FERC to pay particular attention to the critical comments submitted by NMFS, U.S. Environmental Protection Agency, the State of Oregon, Cowlitz County, Clatsop County, and the City of Astoria.

Conclusion

For the reasons stated above, the DEIS is wholly inadequate for public review and does not satisfy the requirements of NEPA. The Coalition urges FERC to reissue a supplemental EIS permit for this misguided project.

Sincerely,
/s/ Brett VandenHeuvel
Staff Attorney
Columbia Riverkeeper

CERTIFICATE OF SERVICE

I certify that on the 21st day of December, 2007, I electronically filed the original document, **Comments on Draft Environmental Impact Statement, Bradwood Landing Project, FERC/EIS-0214D, Docket Nos. CP06-365-000, CP06-366-000** plus the exhibit attachments listed at the end of that document on behalf of Intervenor Columbia Riverkeeper et al with:

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E., Room 1A
Washington, DC 20426

I further certify that on the 21st day of December, 2007, I served one copy of **Comments on Draft Environmental Impact Statement, Bradwood Landing Project, FERC/EIS-0214D, Docket Nos. CP06-365-000, CP06-366-000** on behalf of Intervenor Columbia Riverkeeper et al via electronic mail on all parties listed on the office service list compiled by the Secretary in this proceeding. I served the exhibit attachments on a CD to all parties via first class mail. For those parties for which service is not specified at an electronic address, I served one copy of **Comments on Draft Environmental Impact Statement, Bradwood Landing Project, FERC/EIS-0214D, Docket Nos. CP06-365-000, CP06-366-000** and the exhibit attachments on a CD via first class mail.

DATED this 21st day of July 2007.

Brett VandenHeuvel
for
R. Scott Jerger
Of Attorneys for Intervenor

RE: Bradwood Landing Draft Environment Impact Statement Review
Docket No. CP06-365-000; CP06-366-000

Dear Secretary Bose:

The Rainland Fly Casters club, of Astoria, Oregon would like to submit the following input regarding the proposed Bradwood Landing LNG plant on the lower Columbia River. Our club, located in the lower Columbia River region and comprised of over 50 members, is dedicated the sport of fly fishing, but also to the conservation of fisheries resources and the education of people about these resources and the associated stream health issues which support our fisheries resource. Listed below are some of the questions and concerns we have, from a fisheries conservation viewpoint, about the proposed LNG plant and associated gas pipelines:

- CO12-1 • The LNG company claims that our region would gain 60 jobs from the operation of this plant. The document should estimate how many jobs might be impacted by a major spill of fuel oil from one of the transport ships as well as disruption with boat anglers and other users in the minimum 500 yard moving safety/security zone around all LNG transport ships. Much of our lower Columbia's economy is dependent on commercial fishing, recreational fishing, crabbing and tourism
- CO12-2 • The liability issue for a major fuel oil pollution incident caused by an LNG ship board accident or incident needs clarification. In the possible event of a major pollution incident, there should be a requirement for sufficient bonding and insurance for clean-up and damage compensation by both the shipper and facility operator.
- CO12-3 • Northern Star has advertised its commitment to a \$50 million Salmon Enhancement Project for the lower Columbia. This commitment is entirely voluntary, with no contractual obligation for Northern Star or its successors to actually spend funds for salmon enhancement. Therefore, we have serious doubts as to whether any salmon enhancement will actually take place. We recommend this funding be clearly obligated for mitigation that still need to be identified for major biological problems on the river, forest and tributary streams.
- CO12-4 • Other concerns include dredging the river bottom to create ship berthing and maneuvering areas at the plant. The accompanying overland pipeline from the LNG

Companies and Organizations 12

CO12-1 We do not believe that any jobs would be lost as a result of an unlikely spill of oil or fuel from LNG carriers in transit in the waterway to the proposed Bradwood Landing LNG terminal. As discussed in the revised section 4.3.2.2, fuel on each carrier is protected by the vessel's double hull. Furthermore, each LNG carrier would maintain a SOPEP as required by international convention. The SOPEP would comply with MARPOL [marine pollution] 73/78 Consolidated Edition 2002 Annex 1 Regulation 26, which requires every oil tanker of 150 tons gross and above, and every vessel of 400 tons gross and above to carry an approved SOPEP. All LNG carriers would also be required to comply with state spill prevention and contingency plans, including the applicable requirements in Chapter 317-40 of the Washington Administrative Code – Bunkering Operations. As discussed in section 4.7.1.4, the project should not have significant impacts on commercial or recreational fishing or tourism.

CO12-2 See our response to comment FA2-35.

CO12-3 See our response to comment FA4-12.

CO12-4 Potential impacts on aquatic resources (including salmonids) due to dredging are discussed in section 4.5.2.1. Potential impacts on aquatic resources (including salmonids) due to construction of the pipeline waterbody crossings and unstable slopes are discussed in sections 4.5.3.1. In addition, NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan provides a detailed description of construction methods, potential impacts on aquatic species and habitat, mitigation, and monitoring. This plan was filed with the FERC on December 21, 2007 and is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e. CP06-365), and putting in the proper date range.

The adequacy of compensatory mitigation for project impacts is addressed in the response to comment FA2-10.

K-756

CO12-4
cont'd

plant toward gas markets will also have impacts on fish spawning and rearing areas in the major streams the pipeline will cross. These detrimental effects on stream crossings and landslide areas need to be identified, fully mitigated and closely monitored for this project to pass any kind of environmental muster.

CO12-5

In closing, The Rainland Fly Casters feel that the proposed project can cause detrimental effects on our local fisheries resources beyond those identified in the document and feel that these potential effects should be thoroughly identified and mitigated. We recommend exploring alternative LNG facility sites that are more compatible with the Columbia estuary. Receiving facilities for LNG ships are perhaps best located off-shore where major accidents or incidents cannot damage the extremely valuable estuary. Pipeline routes used by the project should be located where they best protect the forest and streams. We believe a better job can be done in finding a site for these facilities.

Thank you for the opportunity to comment.

Sincerely,

Tom Scoggins

The National Grange

Of the Order of Patrons of Husbandry

Building Communities

December 19, 2007

Magalie Roman Salas, Secretary
Federal Energy Regulatory Commission
888 First Street NE
Washington, DC 20426

Re: Docket Nos. CP06-365-000; CP06-366-000; CP06-376-000; CP06-377-000
Northern Star Energy LLC, Bradwood Landing LLC, Natural Gas Import terminal
facilities and associated facilities in Bradwood, Clatsop County, Oregon

Dear Secretary Salas,

CO13-1 The National Grange urges the Federal Energy Regulatory Commission (FERC) to develop and strengthen regulations regarding the siting of Liquefied Natural Gas (LNG) terminals and to consider the overall economic impact on any region being considered before any LNG site is approved. This policy is also supported by the Washington State Grange, which adopted similar statewide policy urging FERC to deny the Northern Star Natural Gas application to construct an LNG terminal at Bradwood Landing and an associated 34 mile high-pressure pipeline through a portion of Washington State.

The National Grange of the Order of Patrons of Husbandry (National Grange) is the oldest general farm and rural public interest organization in the United States of America. Founded in 1867, the National Grange has been representing the interests of family farmers and rural citizens of the United States for 140 years. Today the National Grange represents individual farmers and rural Americans affiliated with more than 3000 local, county and state Grange chapters in rural communities across the United States including chapters in the states of Washington and Oregon.

CO13-2 The primary concern of the Washington State Grange and the National Grange with the Bradwood Landing option is the danger associated with the movement of large LNG vessels through the bar at the mouth of the Columbia River and the narrow channels upstream to the site. The potential hazards and disruption caused by this traffic to other shipping on the river are great, particularly the movement of agricultural commodities from existing facilities further upstream.

CO13-3 Additionally, the proposed terminal and pipeline threatens public safety and security in the Lower Columbia River area for local citizens. Finally the proposed terminal creates a threat to the critical salmon habitat in the Columbia River Estuary.

CO13-4

CO13-5 The National Grange urges the FERC to carefully weigh safety issues, river traffic concerns, potential pollution, habitat impacts, and the comments and recommendations of the Coast Guard about the potential problems associated with the additional traffic when siting any LNG terminal facilities. Until FERC takes positive action to strengthen regulations regarding the siting of Liquefied Natural Gas (LNG) terminals and to consider the overall economic impact on any region being considered before any LNG site is approved, we urge you to disapprove the

Companies and Organizations 13

- CO13-1 The FERC considers the current regulatory framework for reviewing applications for LNG facilities to be sound. Our regulations at 18 CFR 380.12(h) require a report on socioeconomic impacts to be filed by proponents of LNG facilities. The EIS includes an analysis of socioeconomic impacts in section 4.8. The Commission's Order will contain a more fully developed discussion of economics and need for this project.
- CO13-2 Section 4.11.5 includes discussions of shipping safety. This section includes discussions of the potential hazards and disruption that could occur on the other shipping activities on the river. As discussed in section 4.8.1.7, we believe that the Bradwood Landing would not have significant adverse impacts on other commercial shipping traffic on the lower Columbia River.
- CO13-3 See our response to comment PM6-20. Safety is addressed in section 4.11.
- CO13-4 Sections 4.5 and 4.6 address impacts on designated critical habitat for salmon within the Columbia River. As stated in section 4.6.3, the FERC would not allow construction to begin until after we have concluded formal consultation with the FWS and NMFS.
- CO13-5 The EIS address safety, river traffic, air quality, and impacts on habitats. The Coast Guard is a cooperating agency in the production of the EIS.

RE: Comments Regarding Significant New Environmental Issues for Bradwood LNG Proposal, Docket Nos. CPO6-365-000 and CPO6-366-000.

Ms Bose,

We submit these comments on the Draft Environmental Impact Statement ("DEIS") Badwood Landing Project ("Bradwood"), FERC/EIS-0214D, Docket Nos. CP06-365-000, CP06-366-000, on behalf of the following organizations: Columbia Riverkeeper; Columbia River Business Association; Rivervision; Wahkiakum Friends of the River; Landowners and Citizens for a Safe Community; Oregon Chapter Sierra Club; Willapa Hills Audubon Society; Oregon Citizens Against the Pipeline; Friends of Living Oregon Waters; Coalition; Northwest Environmental Defense Center; Willamette Riverkeeper; Rosemere Neighborhood Association; Audubon Society of Portland; Oregon Council Trout Unlimited; Native Fish Society; Citizens for a Clean Columbia Wenatchee; Columbia River Fishermen's Protective Union; Northwest Guides and Anglers; Oregon Wild; and Energy Options (collectively, "the Coalition"). The Coalition includes a broad, local and regional spectrum of business, environmental, safety, and property interests. Each organization has members who would be harmed by LNG terminal.

These comments are timely and in response to new information that has been issued by FERC and the applicant since the completion of the DEIS and the closure of the public comment period on that document. Significant new information has been submitted to FERC by NorthernStar that significantly changes the nature of the environmental impacts of the project. We request that FERC consider the following comments in light of this new information that was not included in the DEIS.

I. FERC must circulate a new DEIS

CO15-1 First and foremost, we reiterate our request that FERC issue a supplemental DEIS for public comment because the current DEIS is wholly inadequate in evaluating the impacts of the project. Our previous comments have described how the DEIS contains major factual errors, fails to address substantial changes to the project, fails to address reasonable alternatives, ignores the Palomar Pipeline as a connected action, and fails to evaluate significant economic, social, and environmental consequences. Recently, information has been released that clearly indicates

CO15-1 We disagree. The draft EIS complied with the requirements of the NEPA; therefore, it will not be reissued. Although minor modifications have been made to the proposed action since the issuance of the draft EIS, the project itself has not substantially changed.

K-763

CO15-1
cont'd

changes in the project design—changes that neither FERC nor the applicant have evaluated and that fundamentally alter the nature of the project's environmental impacts. FERC's regulations require FERC to supplement the inadequate DEIS, and circulate the supplement draft for public comment. 40 C.F.R. § 1502.9(c).

Since the completion of the Bradwood LNG Draft Environmental Impact Statement, significant new information has been released regarding the potential design and impacts of the Bradwood LNG terminal and the Bradwood pipeline. Bradwood is reworking its project and seeking changes in discussions with FERC and other agencies. Bradwood plans to change these major project components¹:

- Incoming LNG tankers will no longer be likely to use screened ballast and cooling water intakes. Hence, tankers will take in 20-50 million gallons of Columbia River water with each visit, also drawing in threatened and endangered salmon.²
- The pipeline route is expected to change. NorthernStar has, itself, acknowledged many alterations of the route are underway. These changes could significantly alter the nature of the environmental, public safety, and economic impacts of the project.
- Dredge spoils will now be placed entirely on the Bradwood site – it appears that deposition at Wahkiakum County will not occur.
- The regasification scheme may be altered to allow open-loop regasification. This system will draw in up to 190 million gallons each day, again threatening harm to Columbia River salmon. It will also greatly increase the amount of effluent from the site treated with anti-biofouling chemicals.

These changes raise public safety, economic, and environmental issues that require an opportunity for public review and comment. Bradwood clearly intends to defer announcement of some alterations to the project and its impacts until after the Final EIS, according to new information since the DEIS comment period closed.³ Additionally, recent public statements by Bradwood fail to acknowledge these changes, causing confusion among affected community members, other agencies, and intervenors. FERC cannot allow Bradwood to significantly alter its project after the closure of the DEIS comment period, undermining the public's ability to understand and raise pertinent issues. Because it is not appropriate to move forward until the project is clearly described, and because the public has been misled regarding the nature and impacts of the project, it is now necessary for FERC to re-issue the DEIS or provide a supplemental EIS and provide an opportunity for public comment on new information.

A supplemental EIS is required when new information significantly transforms the nature of environmental issues. Changes to the design and new information about the impacts of the project raise serious issues that could increase drastically the magnitude of impacts on water quality, salmon and salmon habitat, and other environmental and economic resources. Project changes – particularly the combination of introducing open-loop regasification, cooling water

CO15-1 discharge, and unscreened ballast/cooling water intake – must be reviewed in a thorough, transparent public process with adequate opportunity for public input.
cont'd

II. Ballast and Cooling Water Withdrawals and Discharges Threaten Harm to Listed Salmon

CO15-2 FERC has not analyzed the potential impact of unscreened ballast water withdrawals.

The DEIS prepared by FERC for the Bradwood proposal currently assumes that all incoming LNG tankers will use screened ballast and cooling water intakes. FERC staff make this recommendation for avoiding and minimizing impacts from ballast and cooling water intake and discharge:

Prior to beginning initial site preparation at the LNG terminal, NorthernStar shall prepare a plan, for review and written approval of the Director of OEP, which outlines how NorthernStar would ensure that only LNG ships that are retrofitted to use the screened water supply at the berth are allowed to unload cargo at the Bradwood Landing LNG terminal. The plan shall include a method for notifying FERC in advance of an LNG ship's initial call to the terminal and verify that it has been retrofitted to utilize NorthernStar's screened water intake system for taking on water from the Columbia River for ballast and engine cooling.⁴

CRK and others questioned whether NorthernStar truly intended to abide by this provision, despite their claims that the above measure was practicable and would be included in their plans for terminal operation. Because mitigation measures must be reasonably likely to occur, and because NEPA requires a rational analysis of the likelihood for success of these measures, CRK and others challenged FERC to give further analysis of the ballast water issue and consider the potential for unscreened water withdrawals. The DEIS failed to do so, and CRK and others are unable to raise all pertinent issues about the impacts of ballast and cooling water withdrawals because the DEIS has not fully disclosed how – if ever – the screened intake system would be used and how it would impact salmon. NorthernStar's requested changes in its April 8 letter to FERC only exacerbate this problem and leave both FERC and the public unsure about the likelihood of the screened intake system being used and having any efficacy whatsoever.

The January 24th Conference Call between NMFS and FERC highlights a persistent problem with the Bradwood project: the design and expected impacts of the project are continually shifting. Because of this, multiple State and local agencies dealing with the project are operating under false assumptions regarding the project's design and impacts. Notes from the January 24 Conference Call between NMFS and FERC clearly indicate that ballast and cooling water withdrawals may go unscreened, introducing the likelihood that 20 to 50 million gallons per ship would be withdrawn, thus entraining and impinging threatened and endangered salmon:

"NorthernStar stated that due to changes in market conditions, it may be necessary to revise the proposed method of water intake for ballast and engine cooling water, if revisions to the proposed water intakes for ballast and engine cooling are formally filed, the effects analysis portion of the BA will be revised accordingly. NorthernStar stated that they will continue to offer incentive based contractual agreements for vessels to use

⁴ DEIS, p. 4-145.

CO15-2 After our issuance of the draft EIS, NorthernStar indicated that not all LNG carriers may be retrofitted to connect to the proposed ballast and cooling water supply system. Therefore, our analysis and discussion of potential impacts on water quality and aquatic resources (which includes salmonids) in sections 4.3.2.2 and 4.5.2.1 has been revised. We conducted additional analysis of entrainment and water quality impacts at the wharf without the use of the filtered water supply system and NMFS-approved screens. Due to the potential impacts on sensitive aquatic resources at the terminal, we are recommending that the Commission Order include a condition to require that NorthernStar develop a plan to deliver screened water to LNG carriers at the terminal. We are also recommending that NorthernStar conduct post-installation tests of all intake screens at the terminal, and develop a monitoring and reporting program to assess the efficacy of the screened water supply system at minimizing entrainment and impingement. In addition, we are recommending that NorthernStar develop performance standards for water quality impacts associated with LNG carrier discharges of cooling water at the wharf. We will conduct additional detailed analyses of the screened water supply system and the performance standards in our revised BA and EFH Assessment.

CO15-2
cont'd

the screened water intakes for ballast and engine cooling; however, they are not confident all vessels will be retrofitted to do so. Thus, NorthernStar is developing quantitative performance-based measures that are to be met for entrainment and impingement of juvenile salmonids as well as temperature impacts. The NMFS asked whether NorthernStar still planned to provide an incentive for vessels to accommodate the screened ballast/engine cooling water system. NorthernStar said it would still offer incentives, and would offer quantitative performance measures to be met regarding entrainment and temperature impacts. Because the pumps would potentially not be continually operating for either the re-vaporization process or to provide ballast/cooling water, the NMFS asked whether additional operation and maintenance measures would be required (e.g., run pump and discharge water periodically, physically clean screens periodically). NorthernStar indicated they would have to look into it further, but would include operational and maintenance practices in the proposed action and effects analysis.⁵ (emphasis added)

NorthernStar details its lack of confidence regarding incoming vessels' willingness to use screened ballast water intakes in a response letter to the DEIS dated April 8, 2008. It would be reasonable for FERC to conclude, based on that letter, that ballast and cooling water withdrawals will occur entirely without use of the screened system. NorthernStar admits in an April 16 letter that contract incentives may be inadequate for securing retrofitted tankers able to use the new system and asks FERC to allow unscreened ballast water intake. In that letter, NorthernStar argues that it is not reasonable to assume that incoming LNG tankers will use exclusively the screened intake system, even after five years. The April 16 letter states, "the spot LNG Carriers and the substitute LNG Carriers would not be modified to receive the filtered water, even after five years."⁶

The problem NorthernStar describes is only likely to grow worse as the LNG market becomes more high-priced and volatile in the coming years.⁷ Spot cargoes are likely to increase, limiting or even eliminating the potential for tankers to use the screened ballast water intake. The high price of LNG globally will make it even more unlikely that incoming LNG tankers will specifically retrofit to serve the Bradwood site. If FERC does not require screened ballast intakes, it is highly unlikely that market conditions will shift so that incoming tankers used the designed intake system.⁸ With global prices topping \$20/mmBtu, Bradwood's ability to attract any cargoes will be diminished—not to mention cargoes with special retrofitted ballast water intakes—and its project will not likely use the screened intake system at all. As a result, and as we noted in our initial DEIS comments submitted in December 2007, FERC must analyze impacts from ballast and cooling water withdrawals in the very likely case that incoming ships do not use NorthernStar's intake system.

Although FERC is required to take a "hard look" at the environmental impacts of the project, FERC's DEIS does not evaluate the impact on listed fish species of 125-plus LNG vessel calls per year, each withdrawing up to 50 million gallons of ballast and cooling water. The project could cause severe harm to fish from entrainment and impingement as well as with heated cooling water discharges. On page 4-145, 4-209 (Table 4.6.2.1) and elsewhere

CO15-2
cont'd

throughout the DEIS, FERC's assessment of the project's impacts hinges on incoming LNG tankers using the screened intake system. As we noted in our comments, the impacts of the screened intakes are not clearly described, and the fish screen design for ballast and cooling intake is inadequately detailed. The potential for this system to be bypassed by every incoming LNG tanker adds to the inadequacy of the DEIS analysis and precludes FERC and the public from making a reasoned judgment about the impacts of the project on federally listed salmon.

In its April 8 letter to FERC, NorthernStar states that it is not asking FERC to abdicate its responsibilities under NEPA, but that is precisely what FERC would be doing by allowing the project to move forward without circulating a new DEIS or supplemental DEIS. FERC has no basis for allowing Bradwood to go forward with the project under Bradwood's suggested new language for Mitigation Measure 24. The DEIS simply does not disclose impacts on salmon from billions of gallons of ballast water intake each year.

FERC Should Not Delay Consideration Of Ballast and Cooling Water Impacts to Salmon

In both its April 8 letter to FERC requesting that its ballast water mitigation requirement be re-written and in its April 16 response to DEIS comments, NorthernStar suggests that it would be appropriate for FERC to defer detailed consideration of the impacts of the Bradwood project until after NOAA issues a BA. NorthernStar argues that, "The biological assessment will take a more detailed and in depth look at the impacts of the project to salmonids and other endangered species. This detail is more properly presented in the BA rather than the FEIS."⁹ By following NorthernStar's logic, FERC would willfully ignore a huge potential impact to salmon from ballast and cooling water withdrawal and cooling water discharge. The DEIS is required to present the best available science regarding impacts to salmon, and up until these recent submissions by Bradwood, FERC has largely accepted the argument that mitigation measures would significantly reduce or eliminate entrainment and impingement of fish.

Regardless of what NOAA concludes, FERC has a responsibility to present the public with a thorough, reasonable analysis of the project's impacts. The current DEIS simply does not consider the impacts of billions of gallons of unscreened water withdrawals at Bradwood. FERC cannot defer its analysis to the BA. NorthernStar's own inability to produce a consistent project description has stalled NOAA's review of the project, and the DEIS should be re-issued so that both FERC and NOAA are reviewing projects that either use or do not use screened ballast and cooling water intakes. The "informal consultation" with NOAA requested by NorthernStar on the ballast and cooling water issue would not preclude FERC's responsibility to fully address all environmental impacts of the project.

Based on extensive public and agency comment casting doubt on the efficacy on NorthernStar's ballast water screening system, FERC was well aware that the system was dubious. Yet, FERC's DEIS, which assumed the ballast screening system would function as promised, did not analyze impacts of unscreened ballast water. FERC's assumption was wrong. FERC now has two choices: one, continue to require screened ballast water for all ships, as described in the DEIS; or, two, release a new DEIS that describes the impact on aquatic species without any ballast intake mitigation.

⁹ April 16 letter responding to DEIS comments. Applicants Responses to Comments on the DEIS regarding Marine Matters. Page 1, responding to USDI comment.

CO15-2 Bradwood's Proposal Does Not Protect Salmon

cont'd

Bradwood claims in its April 8 letter that the "proposed on-site water system coupled with the performance standards are protective of listed salmon." This is a baseless assertion, one completely unsupported by analysis in the DEIS. Bradwood now proposes "performance-based measures" that do not appear in the DEIS. This fundamental alteration of the proposed terminal operations requires a fresh analysis, a new opportunity for public comment, and a new DEIS from FERC. Ballast water withdrawals using the screened system are clearly not "reasonably certain to occur", by Bradwood's own admission. The performance standards do not appear to have any guarantee of actually protecting salmon, and Bradwood has provided no analysis to FERC that supports the conclusion that unscreened ballast and cooling water withdrawals would do anything other than harm listed salmon.

Bradwood's April 8 letter to FERC cites the Ninth Circuit's decision to remand NMFS' biological opinion and absurdly asserts that the project would be consistent with that decision. The re-written condition provides no assurance that any screened intakes would occur and calls for the Applicant to consult "informally, as appropriate" with NOAA in development of proposed mitigation measures. The result of "informal" consultation with NOAA would be Bradwood submitting a plan *after* issuance of a Biological Opinion and FERC FEIS and Decision. Bradwood is essentially asking both agencies and the public to trust Bradwood to develop a plan that will encourage use of the screened water intake system. However, as Bradwood itself notes in its April 8 letter and notes from the January 24 conference call, contract incentives may be inadequate for promoting use of the system. Bradwood's April 16 response to DEIS comments goes even further, and states that even after five years of operation, the facility may not have incoming LNG tankers capable of using the screened intake system.¹⁰

Again, FERC's DEIS does not even ponder the issue of massive unscreened withdrawals for ballast and cooling water, much less give thorough consideration of these altered avoidance and mitigation "performance measures." The project now poses an even more severe threat to listed salmon species, and without re-issuing the DEIS, any FERC decision on this issue would be arbitrary and capricious. FERC cannot delay consideration of this issue and accept Bradwood's false assertion that the new measures would be protective of listed salmon. To do so would go far beyond "reasoned deference" to NOAA and instead constitute blatant disregard for NEPA and FERC's responsibility to disclose the project's design and impacts. Under NEPA, the DEIS must fully disclose potential direct, indirect, and cumulative impacts to listed species.

FERC must refuse the Applicant's request that FERC issue a site certificate for the facility without a full understanding of this issue. Neither NorthernStar nor FERC has provided any assurance that the project will be protective of salmon, with or without screened water intakes. The unwillingness of incoming LNG tankers to use the screened system only increases harm to salmon, and there is no assurance that future planning will significantly increase the likelihood of tankers' using screened intakes. Bradwood's proposed alteration to the ballast mitigation measure would leave no opportunity for the public to respond to the impacts of the project and make the ballast water screening requirement ineffective. As a result, Bradwood's April 8 letter and requested changes

¹⁰ April 16 letter responding to DEIS comments. Applicants Responses to Comments on the DEIS regarding Marine Matters. Page 2, responding to EPA comment.

CO15-2
cont'd

fundamentally alter the nature of the project's impacts. FERC must re-issue the DEIS with a thorough analysis of the ballast water issue assuming that all ballast and cooling water will be withdrawn without the screened system, a distinctly real possibility according to Bradwood's April letter.

Additionally, FERC should re-iterate and clarify that all incoming LNG tankers must use the screened system. Otherwise, the mitigation measure will have no realistic value in preventing harm to salmon. It is reasonable and prudent for FERC to recommend measures that are protective of listed salmon. While we question whether the ballast water screens would be as effective as NorthernStar and FERC has claimed, they will be completely ineffective if, as NorthernStar suggests, LNG tankers are unwilling to use them. Without using screened intake, the potential for entrainment is enormous and not avoided in any way. In fact, the synergistic effect of potentially releasing cooled water from open-loop regasification in the immediate proximity of the unscreened ballast and cooling water intake on LNG vessels could enhance the likelihood of entrainment. FERC does not have to wait for NOAA; rather, it can use its site certification process to require that NorthernStar use the screened intake system that the company led everyone to believe would be effective, practical, and used by all incoming tankers.

Bradwood Has Recently Stated that Ballast Water Intake Would Be Screened

While Bradwood has attempted to characterize the current DEIS language requiring use of screened ballast and cooling water intake as a "misunderstanding" with FERC, recent NorthernStar statements have represented that its screened intake system would be used by all incoming tankers. Bradwood stated in Mid-March: "Ballast water withdrawal *will be done* through screened intakes to avoid entrapping fish and other mid-water column organisms"¹¹ (emphasis added). The above statement, written by Bradwood itself, indicates that FERC and the public have not misinterpreted Bradwood's previous project descriptions, and that screened ballast water intake has been represented by Bradwood as an expected, uniform practice by all incoming LNG tankers. In the statement above, Bradwood states that the intake "*will be done*" – rather than *could* be done – through screened intakes. Over the past year, Bradwood has repeatedly characterized its ballast water system as likely to be used by incoming LNG tankers. Clearly this is no longer the case.

Columbia Riverkeeper and others questioned this assumption at the outset of local, state, and the FERC application process, but NorthernStar continually asserted that its ships would use the screened ballast water intake system. Furthermore, many documents submitted by NorthernStar – including the original Biological Assessment, Resource Reports, and multiple State and local applications, indicate that Bradwood, "changed project design to provide screened water to ships at dock for cooling engines and filling ballast tanks, thus avoiding entrainment impacts to juvenile fish (including listed salmon)."¹² Again, NorthernStar bases the impact assessment of its project on salmonids on the huge, and now invalid, assumption that entrainment impacts will be "avoided."¹³ FERC has similarly assumed in the DEIS that fish would be protected from impingement and entrainment and has not fully assessed the impact of unscreened ballast water intakes. By implying in recent statements that its project is avoiding

¹¹ Land Use Application Findings submitted to Clatsop County by Bradwood. March 14, 2008. page 38.

¹² Ibid, page 42.

¹³ CZMA Certification application submitted by NorthernStar. October 2007.

Companies and Organizations 15

CO15-2
cont'd

entrainment impacts, Bradwood is fostering the impression that all incoming tankers will use its screened intake at the very time that it is requesting FERC to allow incoming tankers to bypass the screened water intake system.

Finally, the screened ballast and cooling water intake is integral to the design and impact assessment for the Bradwood project—not only to avoid screened ballast water intake, but also to avoid the discharge of cooling water by combining ballast and cooling water systems. CRK and others questioned the plausibility of this scheme, but statements from Bradwood within the past several weeks clearly indicate that the screened intake system constituted a major assumption informing the impact assessment on water quality and salmon:

Bradwood Landing's proposal to **supply screened ballast and cooling water** to LNG carriers berthed at the facility will eliminate or nearly eliminate the need for the carriers to discharge cooling water while berthed at the terminal. A carrier will first use the water that it receives from the terminal in its cooling system and then will discharge the water to its ballast tanks. If the ballast tanks fill before the carrier leaves the berth, the water in the ballast tanks will be recirculated through the cooling system to avoid the need to discharge cooling water to the river.¹⁴

Table 4.3.1-1 on page 4-53 of the DEIS represents a similar understanding of the impacts of the project, and omits consideration of significant cooling water discharges. NorthernStar continues to reinforce the notion that both water withdrawals and discharges will be modified by the screened water system, and that tankers will be re-circulating cooling water for ballast. In light of information released in recent memos and NorthernStar's April 8 response letter to FERC, these recent public statements by NorthernStar appear to be inaccurate and deliberately misleading. The public, FERC, and other agencies have no assurance that any ballast water withdrawals will occur using the screened system and with re-circulating ballast.

By altering ballast and cooling water intake plans, Bradwood significantly transforms the nature and scope of impacts to salmon and their habitat in the Columbia River. Bradwood continues to allow other agencies to operate under the assumption that ballast will be fully screened, capitalizing on the confusion of its ever-changing project design. FERC must comply with NEPA by giving a clear project description and fully disclosing the environmental impacts of the project. FERC and local and State agencies accurately interpreted Bradwood's previous project description, and Bradwood's recent statements correspond to FERC's original understanding of the project design—that *all* tankers would use screened ballast intakes as indicated in Mitigation Measure 24 as currently written.

III. Pipeline Route To Be Significantly Altered Since DEIS

CO15-3

NorthernStar is not only altering plans for terminal operations, but it continues to make changes to its proposed sendout pipeline. According to a recent Willamette Week article,

"Charles Deister, a spokesman for NorthStar (sic), sighed deeply when he heard about WW's post. 'There's much more to it than that,' he says. Deister explains that the current map of the pipeline route is still temporary—already undergoing nearly

¹⁴ Ibid, page 278.

CO15-3 The pipeline route has not changed since the release of the draft EIS.

Companies and Organizations 15

20080425-5008 FERC PDF (Unofficial) 4/24/2008 5:04:52 PM

CO15-3
cont'd

60 adjustments based on individual properties. "We are taking in local input," he says.¹⁵

While it is appropriate for NorthernStar to take in local input, the public has not had a sufficient opportunity to review NorthernStar's route, and NorthernStar continues to provide potentially affected landowners with contradictory statements and information regarding the routing of the pipeline. Publicly, NorthernStar has both stated that its route is unchanged, and (above) that many route alterations are already underway.

Specifically, subsequent to November FERC hearings on the DEIS, NorthernStar has provided landowners with contradictory information regarding the route of the pipeline and location of the Columbia River HDD and drill sites on both sides of the Columbia River. Verbal conversations and email communications between Gary Coppedge and members of the Mill Falls Estates Homeowners Association in Cowlitz County have indicated that the pipeline route is not determined. Verbal and email communications regarding the Columbia River HDD indicate that NorthernStar may alter its plans, but like its proposed changes to the regasification scheme, NorthernStar intends to wait until after issuance of an FEIS to make accurate route information available.¹⁶ Coppedge personally told several Mill Creek area landowners that the pipeline route and drill site were uncertain, even since the issuance of the DEIS.

In contrast to its statements to potentially affected landowners, NorthernStar's April 16 letter to FERC states that the drill site and pipeline route have not changed since submission of its Resource Report 1 and FERC application. Testimony submitted by members of the public indicates that Coppedge has repeatedly stated that the pipeline route in the vicinity of the Columbia River HDD may be changing. As a result, NorthernStar's recent public statements and personal communications with landowners are contradictory, to say the least. The NEPA process requires a clear description of the project and its impacts, and the DEIS does not achieve this task, as CRK and others noted in their comments. Given NorthernStar's intention to alter the project's design and route, NorthernStar's problem of providing inadequate and inconsistent information regarding the route and impacts of its pipeline has only worsened since issuance of the DEIS and closure of the comment period.

Additionally, NorthernStar continues to fail to provide added geotechnical information required to determine the realistic environmental impact of its project. The revised Geohazards report identifies the Columbia River HDD and other areas as potentially problematic, and any change (even a change that NorthernStar might characterize as "minor") could significantly alter the environmental impacts of the project.

IV. Dredge Disposal Plans Are Altered and Unclear:

CO15-4

Bradwood now proposes to deposit all 700,000 cubic yards of dredged material on the Bradwood site. The impact analyses on which the Bradwood application rests – particularly the Bradwood BA and the Army Corps Alternatives analysis – do not fully evaluate the potential impact of placing all 700,000 cubic yards on a site with only 420,000 cubic yards capacity. According to pages 1-2 from the notes of the January 24 Conference Call between NMFS and FERC,

¹⁵ (Willamette Week. "Clatsop County preps for referendum on gas pipeline." March 24, 2008.)

¹⁶ Email communication from Gary Coppedge to landowner in Mill Falls Estates.

CO15-4 Section 3.1.9.2 of the draft EIS acknowledged that one upland placement alternative for dredged material would be to use the Bradwood Landing LNG terminal site for the entire 700,000 cubic yards of dredged material. We further discuss this and analyze the potential impacts of that action in the final EIS.

CO15-4
cont'd

"Because capacity at the Wahkiakum County Sand Pit cannot be assured, NorthernStar is proposing to place all dredged materials at the LNG terminal site...NorthernStar has not proposed the location(s) for placement of materials from maintenance dredging, but stated that the LNG terminal site would not be used."¹⁷

The notes from this call indicate that NMFS has expressed significant questions and concerns with potential changes in the project's impacts to the Estuary from placing 700,000 cubic yards on the site. Currently, the supporting impact analysis do not evaluate the following issues according to NMFS:

"NMFS reminded NorthernStar that revising their proposed action would require them to revise their effects analysis, and posed several examples for NorthernStar's consideration. What effect would increasing the berm height have on vegetation management around the perimeter? Would increasing the overburden on site increase contaminant migration risk? Would increased soil stabilization require an increase in water withdrawals for vibroflotation?"¹⁸

The DEIS is inadequate in evaluating the impacts of dredge disposal, and the lack of clarity on this issue prevents the public from commenting meaningfully on the impacts of the project. FERC must resolve this issue, provide a clear project description, and provide the public with an opportunity to comment on the impacts of the project.

Even as it intends to dump all 700,000 cubic yards on the Bradwood site, NorthernStar has made recent statements that indicate that the Bradwood site's capacity is limited to 420,000 cubic yards, that Wahkiakum County is still a viable disposal site, and that Bradwood has plans for maintenance dredging disposal sites.

The volume of dredge material identified for Bradwood in the CREST plan is 420,000 cubic yards. This volume will be exceeded on the site. The remainder of the material will either be disposed of on site or, as some federal agencies have indicated they would prefer, disposed of in water. Maintenance dredging disposal sites have been identified.¹⁹

Bradwood's statements are contradictory, and NOAA raises significant issues that are not addressed in the DEIS. Bradwood continues to make statements in other permit processes that indicate that Wahkiakum County may be used for dredge disposal for both turning basin and maintenance dredge operations.²⁰ Yet, recent statements to FERC indicate that the dredge disposal issue is completely unresolved. These issues significantly change the nature of the project's environmental impacts, and the DEIS must be revised and re-issued to reflect Bradwood's true intentions for dredge disposal. The DEIS does not currently include adequate information to address issues raised by NOAA, Wahkiakum County residents, and other local and state agencies who are being actively misled by Bradwood to believe that Wahkiakum County is a viable disposal site.

CO15-4 and that Bradwood has adequate capacity to potentially receive all 700,000 cubic yards of dredging for the turning basin.
cont'd

V. Project May Be Altered to Incorporate Open-Loop Regasification:

CO15-5 NorthernStar has recently proposed for the first time to use an open-loop gasification system. On average, an open-loop system will withdraw between 75 and 195 million gallons per day.²¹ This huge and potentially destructive change to the project design would require the withdrawal of additional billions of gallons of water per year for terminal operations. Furthermore, Bradwood intends to wait until after FERC issues its FEIS to make this significant change to its terminal design. Yet, Bradwood is already planning to build screens for water intakes that will be twice their original size in order to facilitate open-loop regasification.

"NorthernStar clarified that the screen design accommodates 10,000 gpm (previously 5,500 gpm) to allow for the SCV design to be supplemented by an open-loop revaporization process. This modification to the revaporization process was originally introduced to the NMFS during the December 12, 2007 conference call. NorthernStar confirmed that during a January 23, 2008 meeting with the NMFS that it intends to delay a request for a modified revaporization design until after FERC certification of the current proposal. NMFS asked if they still planned to install screens sized for the open-loop system. NorthernStar said they would."²²

Hence, the use of open-loop regasification is reasonably foreseeable because the applicant is designing the intake pipes to accommodate the open-loop design. The impacts of open-loop should have been analyzed as an alternative design for the project. It is inappropriate for FERC to allow NorthernStar to defer consideration of a change of this magnitude until after issuance of the FEIS, even as Bradwood begins to design its project around use of an open-loop system.

The DEIS omits any consideration of this potentially massive water withdrawal. Table 4.3.1-1 on Page 4-53 of the DEIS provides a summary of water withdrawals and discharges, and it includes no information about the potential for open-loop regasification. FERC must take a "hard look" at the environmental impacts of the project and thoroughly disclose the project's design and impacts. Issuance of an FEIS would be extremely inappropriate without clarifying the design and impacts of an open-loop design. There is currently no mention of open-loop design in Resource Reports, the application, or the DEIS – yet NorthernStar is considering using this type of regasification scheme and re-sizing intake screens to fit this open-loop configuration.

The potential use of an open-loop system is an extremely significant change to the project design, akin to the abandonment of required screened ballast water withdrawals in its significantly deleterious impacts to salmon. Use of an open-loop regasification in combination with unscreened ballast and cooling water intakes on the part of LNG tankers will create a new, significant hazard to salmon and salmon habitat. Open-loop systems present a huge hazard to juvenile fish as well as any eggs or larvae in the

²¹ Presentation by Jeff Rester, Gulf States Marine Fisheries Commission. "LNG in the Gulf of Mexico". 2007.

²² Notes from Jan. 24 Conference Call between FERC, NOAA, and NorthernStar. Page 2.

CO15-5 The vaporization system has not changed since the release of the draft EIS. NorthernStar currently proposes to use SCVs, not open racks, to gasify the LNG. Therefore, discussion of the potential impacts associated with using open rack technology is not included in the final EIS.

CO15-5
cont'd

immediate area of the project. Even if Bradwood only uses an open-loop regasification system for 20 percent of its regasification, the new project would involve between 5.5 and 14 billion gallons per year of additional water withdrawals over the current SCV design.

All of the water circulated through the open-loop system could potentially be chemically treated to prevent damage to equipment. In other open-loop designs, sodium hypochlorite has been used.²³ The DEIS does not consider the impact to the Columbia River estuary and federally protected salmon species of the terminal discharging up to 14 billion gallons of chemically treated water. The DEIS repeatedly discusses the use of submerged combustion vaporizers (SCVs) for regasifying LNG with no discussion whatsoever of the potential for open-loop design. It would be a complete abrogation of its NEPA responsibilities for FERC to allow NorthernStar to move forward with its project while it re-sizes project elements such as intake screens and fails to assess the chemically treated discharges from open-loop regasification.

Open-loop regasification, even if only employed partially or during certain times of the year, would substantially change the project's expected impacts. FERC is required to disclose fully impacts to the environment from the Bradwood project, and clearly has failed to do so. Most importantly, the DEIS fails to consider the synergistic effects of open-loop regasification and unscreened ballast water withdrawal. Because open-loop designs produce cold water discharges, the open-loop design risks creating attractive cold water refugia in the immediate proximity of ballast and cooling water intakes that could be lethal to juvenile salmonids. Bradwood is asking FERC to allow LNG tankers to bypass its screened water intakes even as it considers creating cold-water habitat in the same area. FERC's DEIS does not evaluate this combination of effects that could occur from proposed changes to the project's design, and FERC cannot issue an FEIS without first allowing the public to review the project's design and its environmental impacts in a new public comment period. Additionally, as we noted above, discharge from the water-intensive open-loop system could be attractively cold but still laden with chemicals that would further harm threatened and endangered fish species and Columbia River water quality. FERC cannot ignore these issues in the DEIS and must consider these potential impacts of the project.

FERC cannot move forward with permitting the project without first understanding the nature and impact of the modification to allow for open-loop regasification of LNG and giving the public a meaningful opportunity for comment on this matter. Bradwood should not be allowed to move forward with one site design while clearly intending to amend this design later in the FERC process. This "bait and switch" tactic will leave the public and other state and local agencies unable to fully evaluate the project as a whole for compliance with all pertinent laws.

VI. Conclusion:

FERC should consider these issues as critical pertinent new information in the issue of the Bradwood LNG terminal. Bradwood has repeatedly hidden from the public its true intentions regarding the final design of its project, and the applicant must be forced to be completely transparent about its project design before any agency can even

²³ Ibid, p.10.

Companies and Organizations 15

20080425-5008 FERC PDF (Unofficial)-4/24/2008 5:04:52 PM

begin to evaluate the direct, indirect, and cumulative impacts of the project as a whole. Other state and local agencies are blindly moving forward when new information submitted to FERC (but not to other agencies) very clearly shows that the project description they have reviewed is no longer relevant, and that the applicant intends to wait until after FERC approval to make major changes to the design of its project.

FERC, as the lead permitting agency, has a responsibility to provide a clear project description and impact analysis. The public and other agencies cannot make reasonable judgments about the project's consistency with applicable law until the applicant clarifies key issues such as impacts to salmon from unscreened ballast and cooling water intake, pipeline route alterations, open-loop regasification, and altered dredge disposal plans. Columbia Riverkeeper and others cannot meaningfully comment on the project if the design continually changes. Currently, the DEIS comment period has closed and did not afford CRK and other parties an adequate opportunity to comment on key impacts of the project. Indeed, CRK, state and local agencies, and other members of the public cannot comment on a project that they do not understand. FERC must re-issue the DEIS or produce a supplemental DEIS that clarifies these issues and augments the analysis of social, environmental, economic, and public safety impacts from the project's revised terminal and pipeline design.

Re Docket No: CP06-365-000

The following is being submitted with attachments through efile as previously procedurally recommended by Mark Hershfield with regard to the Bradwood Landing LNG Terminal Project, Docket No. CP06-365:

Mark Hershfield
Special Assistant/Counsel
Office of External Affairs
Federal Energy Regulatory Commission
(202) 502-8597

IND1-1

After review of the Docket No CP06-365 impact statement Section 4 – Environmental Analysis, and Section 5 - Conclusions and Recommendations, we do not see consideration in those sections for potential shoreline reduction risk (sea level rise) from climate change as it could potentially impact the project this century. (The exact words "sea level rise", "climate change", and "shoreline reduction" were not found in a search of those specific sections, only the words "shoreline erosion" was found as it relates to the impact of increased vessel traffic on such erosion, which is not a climate change risk); accordingly (and from this impact statement review only), it would not appear that potential climate change driven sea level rise risk environmental factors were considered by staff in this approval recommendation to the FERC Commissioners.

However, it was noted in the impact statement in Section 4.1.1 that "elevations from the Coast Range extend from sea level...", confirming our mapping that follows of some areas with elevations from 0 to 3 feet that are potentially at risk from shoreline reduction from climate change this century (in addition, we have mapped potential sea level rise risk to areas around Bradwood that indicate that certain surrounding areas and their transportation infra-structure to/from Bradwood are at risk – for example the Burlington Northern Santa Fe Railroad line which runs along the Columbia River, which may also be a factor in this project, and if so should be considered as to its potential environmental impact from the project).

IND1-2

We did not observe any analysis of major "storm surge" risk in Section 4 (such as is referenced in the Report to the Oregon Department of Land Conservation and Development, June 2000, using the terminology "extreme waves" and "extreme tides" with possible unidentified "climate factors"- http://www.oregon.gov/LCD/OCMP/docs/Publications/Extreme_WavesTide_rpt.pdf); however, to the extent that some storm surge impact appears possible in this area of the Columbia River ("the projected 100 year wave heights now range from 14.1 meters for the Columbia River buoy" – the buoy is offshore from the Columbia River according to the report), this impact appears to not have been considered or analyzed in this case, nor in the context of its compounded effect with any potential sea level rise risk (those words do not appear in this section).

Given the above points, it is unclear that potential impacts from climate change driven shoreline reduction, and any compounded effect from extreme tides driven by storm surge, may not potentially cause material environmental consequences from this project.

Individuals

1

IND1-1

The lifetime of the project is 40 years. Climate change, including associated sea level rise, over that period is not expected to have a significant impact on the project. As described in section 2.4.1.1, the LNG terminal would be at an elevation of 20 feet above mean sea level. The PWRR tracks that currently pass through the LNG terminal site may be used for transporting materials during construction of the project and a portion would be realigned to accommodate the terminal. The railroad would not otherwise be associated with the project.

IND1-2

An assessment of risks from flooding, tsunamis, and seiches is discussed in section 4.1.3.3 for the LNG terminal and in 4.1.4.3 for the pipeline. The extreme waves and tides along the coast as discussed in the referenced paper would not have an adverse impact on the LNG terminal site located at CRM 38 or on the pipeline facilities.

Re: Docket # CP06-365-000
Bradwood Landing LNG Receiving Terminal

FERC:

IND2-1

The proposed Bradwood Landing LNG Receiving Terminal will provide immeasurable benefits to the region and country and should be approved. The project meets all federal and local regulatory requirements. It will provide an essential, efficient, non-polluting source of energy.

The facility will create needed competition in the energy market which will help stabilize energy costs and provide economic relief for industrial and residential consumers. Energy costs in the region have been driven up by inadequate supply and have resulted in increased production costs in the region's key aircraft, steel, natural resource and other industries.

The project meets all environmental standards and will provide energy in a manner that creates far less CO₂ and other greenhouse gasses than other energy alternatives.

I urge you to approve this project.

Sincerely,

Bob Speaker
2960 NW Marshall Dr.
Corvallis, OR 97330

jnreed48@hotmail.com

I attempted to submit this material electronically but the FERC website could not confirm my user address.

SUMMARY OF SITE SUITABILITY

In my judgment, the apparent overall unsuitability of the Bradwood Landing site for LNG operations should suggest that FERC perform a broader and more comprehensive analysis of the proposal to assure itself that FERC has made a good faith effort to uncover all unintended consequences of the NorthernStar proposed LNG terminal at Bradwood Landing, which appears to be an implicit charge in the introduction in Section 3 of the draft Environmental Impact Statement. The site unsuitability is not limited to issues on the environmental impact but also on the operational suitability of the site. The lack of nearby response infrastructure, operational support and the narrow response lanes make safety and operability more problematic. These issues may be exacerbated by technical and financial limitations of the operator. It is well to remember that the fine operational and safety record of the LNG industry was achieved in settings significantly different from that of the Bradwood Landing site.

OVERVIEW OF FERC DRAFT ENVIRONMENTAL IMPACT STATEMENT

As a general comment, the Draft Environmental Impact Statement prepared by FERC, et al is a reasonably comprehensive document designed to serve as a first draft of a roadmap to advance the Bradwood Landing proposal through the regulatory process. It consists of a checklist of issues and proposed mitigations rather than being an overall evaluation of whether the Bradwood site is, in sum, a

Individuals

3

K-779

K-780

positive addition to the Pacific Northwest and the specific impacts that it will effect. It does not rise, in my opinion to the level of an "Environmental Impact Statement", as intended in national and international legislation. Perhaps this is an over-reliance on a narrow interpretation of the word "environmental" in the designation of the report. Nevertheless, acknowledging this limitation and the need for comments for procedural integrity, several additional investigations are warranted by omissions or insufficient investigations in the document. An action list is provided, for your convenience, at the end of these comments, my first submission from my first review of the draft EIS. I may make additional submissions as I continue to review the document.

IND3-1 While I have no particular expertise regarding specific Columbia River conditions, it strikes me that this report is deficient in identifying specific environmental impacts. Try as I may, I cannot find an actual assessment of the environmental impact of the use, for example, of salmonoid exclusion screens (e.g., what percentage of salmonoids are actually killed by use of these screens when drawing in the projected volumes of river water). The Bonneville Dam, for example, has determined that 85% of salmonoids can survive passage through their turbines at their operating rates. Why NorthernStar or its consultants cannot determine an actual kill rate and environmental impact for this issue (and many others) baffles me. The draft EIS mentions several mitigation techniques but does not opine on such techniques' efficacy. This omission would not be acceptable for submission to authorities in the United Kingdom or in Russia. I cannot understand why an EIS with these deficiencies would be acceptable in the United States.

Personal Observation

IND3-2 One section I have never seen in an Environmental Impact Statement and I've always had a nagging question of why, is: "how many people will die during the construction of this project?" During a meeting of senior managers for the beginning of a platform development in the U.K. North Sea, the construction manager observed that one third of the managers sitting around the table (9) would be dead by the time the platform was commissioned. As it turned out, 2 died and one had a heart attack that resulted in his leaving the project. I would think that industrial OSHA statistics are sufficiently advanced to answer this question and any questions regarding expected lost time accidents over the operating life of a project. This has always seemed to me to be an "impact."

Note: Various sections of the draft EIS do not always contain all of the information provided within the titled section of the subject relevant to its conclusions. Pertinent information may be contained in other sections of the document. When this information was not readily accessible or uncovered, it is possible that the following comments might make one or more unwarranted

Individuals

3

IND3-1 The use of a NMFS-approved screen (e.g., those meeting the screening design criteria including size, bar spacing, sweeping velocities) is not expected to result in any entrainment or impingement of salmonids; however, it is possible that some entrainment and impingement may occur. The degree to which entrainment and impingement occurs is both site- and situationally specific and will be addressed through formal consultation with the NMFS.

IND3-2 NorthernStar has committed to construct and operate the project in accordance with OSHA and other health and safety standards. As such, work-related deaths or serious accidents are very unlikely to occur.

assertions as to fact or completeness. It should also be noted that while I agree with many statements in the draft EIS, a failure to make a comment does not imply that I agree with them or do not believe that further study is necessary. An example is offshore loading under "Alternatives". While I agree with the conclusions, there are details in the draft EIS that are not warranted based on the state of the industry technology.

SPECIFIC COMMENTS BY SECTION

Section 2.8.2.1 Corrosion Protection and Detection System

Pipeline Monitoring

IND3-3

The draft Environmental Impact Statement makes a passing reference to "The interior of the pipe would be periodically monitored for corrosion using internal in-line pigging technology." This is much too vague a statement. I assume that FERC anticipates the use of "intelligent pigs" to monitor wall thickness. If so, FERC should state so plus their frequency. The mitigation provided by the use of intelligent pigs is significantly different for pig runs every 100 years as opposed to every 5 years. This is not a detail left to future operational discussions. Landowners along the pipeline right-of-way need to have a definitive schedule requirement for their own right-of-way agreements to safeguard their own interests. FERC should also require that any wall thickness reduction that results in an operating pressure below the most stringent construction classification anywhere along the pipeline route (presumably Class 3) be repaired within one year or the gas deliveries be ceased. If not, then FERC should be required to investigate the environmental effects of catastrophic pipeline failure (since pipelines leak). This is not a description of the flame; it is a description of the consequences of the flame (a metaphor).

Section 3.1 FERC Alternatives

Economic Feasibility

IND3-4

Section 3 is the only section I could find that attempted to address the overall feasibility of the NorthernStar proposal, albeit indirectly, and FERC's responsibility therefor. In addressing other locations or facilities which might be "technically and economically feasible, reasonable, and practical", FERC implicitly admits that these criteria should be considered in the approval of the NorthernStar proposal. Unfortunately, the bulk of the draft EIS in other sections addresses mitigation techniques associated with a narrow range of technical issues that are only one consideration in the project's feasibility. It does not address the overall feasibility of the project, which is of paramount importance in the approval process. I can

Individuals

3

IND3-3

As discussed in section 4.11.9.1, 49 CFR Part 192 addresses natural gas pipeline safety issues, including requirements for the frequency of pipeline inspections.

IND3-4

The FERC staff did analyze the feasibility of the proposed Bradwood Landing Project. This is mostly reflected in section 4.11 (Safety and Reliability) which discusses our review of the engineering design for the facility. Project need is briefly summarized in section 1.1. The Commission will more fully consider need in its Order for this project. Under section 3 of the NGA, NorthernStar does not have to reveal economic data such as the sources of its LNG from overseas producers, or its potential customers. NorthernStar is at total financial risk for this project. It is the policy of the FERC to allow the market to decide which authorized LNG terminals are built and put into service. (See also our responses to comments PM2-29, PM2-39, and FA3-14).

K-781

K-782

IND3-4
cont'd

assure you that neither FERC nor the public is well served by a marginal or uneconomic facility being placed on the Columbia River. Besides the questionable abilities of NorthernStar to deliver on the project due to internal financial and technical limitations, the project appears flawed on the basis of international LNG commercial experience and on the basis of the flawed assumption of energy interchange

International LNG Commercial Conditions

IND3-5

Except for instances of published technical studies or accidents described in the literature, the overall draft EIS is unusually United States-centric, omitting much of the operational, commercial and environmental experience in the Pacific Rim where the bulk of the LNG trade actually takes place and from where NorthernStar intends to access its LNG. The international references to U.S. experience are generally limited to the Atlantic LNG trade which is a different trade than that of the Pacific Rim. There are profound differences in the economic availability and contractual terms between the Atlantic and Pacific trades. It is problematic whether NorthernStar LLC in its current configuration could attract continuous shipments of LNG in the volumes proposed inasmuch as Pacific Rim LNG projects sell on a long-term take-or-pay basis. It is the Atlantic trade (augmented very rarely from Australia) which is opening up to merchant suppliers and buyers, and which will have the surplus tankers needed to service a spot market. This would suggest that Bradwood Landing could be an underutilized LNG terminal; a condition that (i) any FERC inspections of the maintenance of U.S. terminals in past years would suggest is undesirable and (ii) does not justify the large footprint and impact of the LNG terminal. The question then arises whether this terminal should be approved if commercial conditions resulted in annual LNG deliveries of 1 to 2 million tonnes or less. It is axiomatic that marginally economic or uneconomic facilities receive the lowest level of maintenance expenditures. This is true even in economic developments if they are experiencing economic decline. One only needs to reflect on the pipeline operations of British Petroleum on the North Slope of Alaska to confirm this self-evident behavior.

Financial Capability

IND3-6

If one examines the supply arrangements in the Pacific Rim currently in place and being negotiated, long-term commitments to financially secure buyers are required. The type of financial strength required to secure a 1 BCF/d stream of gas requires something in the order of \$40 billion over 20 years (fixed). In none of NorthernStar SEC filings can I detect the plan to establish this level of financial stability.

Individuals

3

IND3-5 A discussion of international LNG commerce is outside of the scope of this EIS, which is focused on the specific environmental impacts associated with the proposed Bradwood Landing Project. The purpose of this EIS is to address U.S. laws (like the NEPA) and regulations. All of the existing LNG import terminals in the United States have periods when their capacities are not fully utilized and yet they remain economically viable. We do not consider the footprint of the Bradwood Landing LNG terminal to be large. In fact, it is smaller in size than many operating or proposed LNG terminals in the United States. In section 3.1.6 we considered alternative LNG terminal designs and layouts, and found that the current footprint made sense considering the economic and engineering objectives of NorthernStar. The Commission will consider need, engineering design, and feasibility in its project Order. See also our response to comment IND3-4.

IND3-6 See our responses to comments IND3-4 and IND3-5.

K-783

Tanker Suitability

IND3-7 Should NorthernStar be able to attract a spot market delivery, FERC should be able to address the availability and suitability of the LNG tankers that would be available for that trade. Generally speaking, I would expect that these would be much older tankers released from former commitments under contracts with Alaska, Indonesia Arun and other older projects. These are likely the tankers currently not deemed suitable for trade into Osaka or Tokyo Bays.

Terminal Sharing Agreements

IND3-8 The recent experience of multiple users negotiating TSRs or terminal sharing agreements (also known as TUAs or terminal use agreements) demonstrates the high probability of the need for a third storage tank at the Bradwood Landing site, especially if there is a mixture of long-term and spot deliveries and if NorthernStar could attract the level of LNG deliveries proposed. Besides the need for flexibility under the terms of different sales and purchase agreements, different compositions of LNG from different sources exacerbates the gas quality question. The ultimate approval of the permit should be based on a three-tank configuration.

International LNG Experience of Energy Interchange

IND3-9 The size of international LNG projects has led virtually all projects of the magnitude of the Bradwood Landing project to be between dedicated suppliers and users. LNG gas is not interchangeable with regular sources and regular uses of natural gas without, at minimum, mixing to obtain a suitable properties such as the Wobbe Index. The pricing and contractual terms of LNG source gas in the Pacific Rim are not the same as conventional sources of natural gas in the United States. Pacific Rim LNG contracts are generally based on an "S" curve of crude cocktails (imported to the purchasing country) with floor and ceiling thresholds. These curves have always averaged well in excess of U.S. gas prices. To compete for resources from the Pacific Rim, therefore, the most likely result is that Bradwood LNG-source gas will be more expensive than domestic U.S. supplies of gas for two reasons. First, a long-term U.S. contract will likely need to be competitive with other long-term Pacific Rim contracts and by that fact alone long-term gas prices will be higher than U.S. domestic gas. LNG-sourced gas will operate like a monopolistic niche within the gas usage of the Pacific Northwest that is opened to LNG. Pricing of new sources of domestic supply will also likely be influenced (upwardly) in the presence of a LNG gas floor price in the market. Other supplies of LNG-sourced gas, not subject to long-term commitments (i.e., spot cargoes), would normally be a minor component. Historical spot prices, however,

Individuals

3

IND3-7 See our responses to comments CO12-1, IND3-4, and IND3-5.

IND3-8 NorthernStar's current proposal is for two LNG storage tanks. However, we acknowledge that there may be a future need to expand the terminal by adding a third storage tank, and discuss this in section 3.1.6.2. See our response to comment IND3-26.

IND3-9 NorthernStar believes its project can offer a new source of natural gas through imported LNG that could be competitive with domestic supplies. See our responses to comments IND3-4 and IND3-5.

IND3-9
cont'd

have generally been higher than regular supplies for a number of structural reasons within the market.

Experience of the international Pacific Rim trade would suggest that Bradwood Landing is introducing a permanent non-competitive supply of gas to the Pacific Northwest, which would more likely be an energy price-driver (upward, as experienced in Japan, Korea, and Taiwan), leading to an overall more expensive slate of most other energy supplies. LNG might be beneficial for a relatively restricted group of high volume gas users isolated from the local energy market, but not as a general supplier of energy to the broad Pacific Northwest market. This happens to be an attractive but not yet compelling aspect of the Port Westward proposal.

Section 3.1.3 Alternatives (Proposed West Coast Alternatives LNG Import Terminals)

Port Westward

IND3-10

While not personally convinced of the suitability of an LNG terminal located so far upriver for operational reasons, Port Westward appears, by FERC's own discussion in this section (their contradictory conclusion on page 5-18 notwithstanding), to contain the elements of a superior siting for an LNG terminal by virtue of its positive improvements in the environment (water temperature) and a uniquely defined set of users (which negates the economic disadvantages of generalized use of LNG). This assessment is in contrast to FERC's assessment that Bradwood Landing's negative impact, which can only be mitigated to the degree it can be brought under legally acceptable levels of distress. It is difficult to understand how FERC, which has now taken on the much wider responsibility of representing all stakeholders in the permitting decision, could not favor Port Westward and would not demand that preference be given to advancing the Port Westward site unless a study demonstrates that two LNG terminals is optimum for the Columbia River or that Bradwood Landing is a superior site.

Section 3.1.5 Alternatives (Regional LNG Import Terminal Site Alternatives)

International LNG Technical Experience

IND3-11

It is surprising that very little discussion exists with respect to international siting of LNG terminals regarding whether Bradwood Landing is "technically ... feasible, reasonable, and practical." It would seem that the use of "proven technology" includes proven site selection criteria that addresses the optimum feasibility of the project. An examination of operations at a range of international LNG terminals would identify strengths and weaknesses of site selections. Instead, the bulk of the

Individuals

3

IND3-10

As indicated in section 3.1.3.4, the Port Westward alternative LNG terminal location does have some environmental advantages. However, it also has some disadvantages, and is not clearly environmentally superior to the Bradwood Landing Project. (See our response to LA3-14.) No project sponsor has come forward to submit an application to the FERC for an LNG import terminal at Port Westward. The FERC assesses each proposed LNG terminal site independently based on environmental factors. We do not choose between locations, and independently review each proposal on its own merits. See also our responses to comments PM2-29 and FA3-14.

IND3-11

We do not agree that including international LNG import terminals in our discussion of regional site alternatives is appropriate. Other LNG terminals in the United States have capacities similar to the Bradwood Landing Project. For example: Freeport 6.7 billions of cubic feet equivalent (Bcfe) storage, 1.5 Bcfd sendout; Cheniere Sabine Pass 10.1 Bcfe storage, 2.6 Bcfd sendout; Lake Charles 9.0 Bcfe storage, 1.8 Bcfd sendout; Elba Island 7.3 Bcfe storage, 1.2 Bcfd sendout; Cove Point 7.8 Bcfe storage, 1.0 Bcfd sendout; Distrigas – Everett terminal 3.4 Bcfe storage, 715 MMcfd sendout. The FERC has considerable experience in the review of onshore LNG import terminals. A number of LNG import terminals have been operating in the United States since the 1970s. See also our responses to comments SA1-15, IND3-4, and IND3-5.

K-785

IND3-11
cont'd

analysis appears to be concentrated on the sparse experience of U.S. LNG terminals in very limited operations. U.S. terminals have not experienced the problems and limitations they will face when stretched to their operating limits, the time when design and siting decisions reveal their consequences. NorthernStar LLC is proposing a significant nameplate capacity for its Bradwood Landing facility, an actual operational rate not experienced in the United States. One should not assume that Bradwood Landing can achieve the levels of safety and efficiency experienced in the LNG industry if site decisions are significantly different than those upon which the industry safety experience is based.

Puget Sound Suitability

IND3-12

The lessons learned from international operations should be deeply intertwined in the discussion of alternative sites for LNG terminals in the Pacific Northwest. If one were looking at models of efficient and safe operations, for example, Puget Sound would obviously be one consideration by virtue of its similarity to the LNG terminals that exhibit the high levels of safety and efficiency achieved in the industry. The discussion of Puget Sound is the only one within the draft EIS that I feel is duplicitous (as opposed to merely "sloppy" or vague). The draft EIS disposes of Puget Sound by setting up the "straw men" of Cherry Point and Port Angeles, disposing of them with references to local government restrictions, and writing off the entire Puget Sound area as a result. This is not sound analysis. An examination of large LNG terminals in Japan or Korea, which offer the most robust operating footprint, would be more useful in examining sites within Puget Sound. The FERC draft EIS is wholly deficient in this portion of its analysis.

Section 4.1.3 Geology (LNG Terminal)

Shoreline Erosion

IND3-13

Shoreline erosion is discussed on pages 4-15 and 4-16. It is a curious mix of discussions of the erosion effects on the shoreline of the LNG terminal and on the nearby islands, most notably Puget Island. Unless due merely to awkward drafting, it appears from the study data supplied that Puget Island faces a potentially severe erosion problem notwithstanding the summary conclusion that no general erosion problem exists. If one takes the statements at face value, tugboats may be, during turning operations, within 1000 feet of Puget Island with their screws directly facing the island, a condition characterized as the most severe erosion situation. This conclusion is dodged (or missed) within the draft EIS by changing the subject indicating that the LNG terminal on the opposite shore will not be at risk of erosion during this situation. Erosion along the southwestern stretch of Puget Island is well known and documented by the Army Corp

Individuals

3

IND3-12 The purpose of assessing sites in Puget Sound was to look at some potential LNG import terminal alternatives in the Pacific Northwest. Our analysis in section 3.1.5.3 outlined constraints at Cherry Point and Port Angeles, and explained our reasons for not evaluating them further. Alternative terminals in Japan or Korea could obviously not meet the objectives of the Bradwood Landing Project.

IND3-13 See our response to comment PM3-18.

K-786

IND3-13
cont'd

of Engineers. The large bar on the northwestern point of the island could likely be altered by its proximity to the turning basin. The effects on the shoreline of Puget Island require addressing, particularly as *the entire island is protected by dikes*. As you are, no doubt, aware, the Wahkiakum County Commissioners recently decreed an emergency for the repair of the Steamboat Slough dike, just downstream of the proposed Bradwood Landing LNG terminal. Presumably, dike conditions will require investigation all around the vicinity of Bradwood Landing.

Cathodic Protection

IND3-14

In the soil analysis section (pg. 4-17), it is asserted, "Mitigation measures for corrosion protection will not be required for this site" while, at the same time, cathodic protection is contemplated for the pipeline (Section 4.1.4). Besides the apparent conflict of those statements, the pipeline proposal might affect the LNG facility. There are a number of locations worldwide where the imposition of an impressed cathodic protection system for a pipeline has resulted in nearby facilities becoming sacrificial anodes to the pipeline. In my most recent operations experience, this occurred in Tunisia in the vicinity of the Transmediterranean Gas Pipeline from North Africa to Italy. While some provision for facility cathodic protection may be contained elsewhere in the draft EIS, it is not provided for within the most obvious sections. Nor can I find the effects of an impressed current on the number of water wells along the pipeline route.

Section 4.3.2 Water Resources

Discharge Water Composition

IND3-15

There is a discussion of the requirement for neutralization of condensate water on page 4-77. The separation of the waters from the SCV baths (displaced by makeup water) and the condensate water is unclear and suggests that the two are mixed and discharged into the Columbia River after neutralization from a pH of 5.7. Presumably, the process is a neutralization of carbonic acid (introduced from the combustion vapours). With the process uncertain, I cannot determine whether neutralization is to be performed by the addition of alkaline chemicals, which would presumably add an identifiable component to the discharge water. Since critical pipe metals are submerged in the SCV bath (upon which the presence of oxygen would act as a corrosion accelerator), it is unclear whether Northern Star plans to address oxygen removal by deaeration, reliance on alkaline chemicals or by addition of oxygen scavengers (such as sodium sulfite) or all three. The latter two would, of course, add another component to the discharge water. Northern Star or FERC should be able to identify a discharge stream volume and its components beyond a vague identification of a total dissolved solids number. Note: in the

Individuals

3

IND3-14 As indicated in section 4.11.9.2, a cathodic protection system has been required on all pipelines installed after July 1971, regardless of soil type. See also our response to CO7-3.

IND3-15 As described in section 2.1.3.5, during normal operations, the SCVs would generate about 160 gpm of condensate water. Excess water produced by the SCVs would pass to an overflow effluent pit where the pH of the water would be neutralized with alkaline chemicals. Table 4.3.2-4, which shows dissolved metals and other constituents in the SCV discharge from two existing LNG facilities, has been added to the final EIS.

IND3-15 | Clatsop County submission, Northern Star indicated that the TDS would
cont'd | be about 10 times that of the Columbia River water.

Section 4.8.2 Socioeconomics

Property Values

IND3-16 | While not a compelling argument for or against the siting of an LNG
terminal at Bradwood Landing, the analysis of property values performed
in the draft EIS is laughable. I would characterize this section as merely
"sloppy." Using a generic 1993 study from Argonne or a review of housing
values surrounding the Portland LNG peak-shaving facility is so flawed as
to raise the question whether other sections received equally rigorous
attention. FERC does not provide the source of the data on housing
prices but there are a number of professional real estate consultants that
can assess the effects on property values from the site-specific conditions,
including the replacement of a rural pristine view within one mile by an
industrial facility emitting light and noise. NorthernStar's previous effort to
characterize the effects of past dredging efforts (in effect, the formation of
a beach) as equivalent to a large industrial facility, as regards nearby
property values, is equally laughable. Based on cursory examinations of
the volatility of real estate markets, it would not be surprising to find
negative effects of 25% or more. It would be preferable to not even
address property values than to introduce such defective speculation to
this document.

Section 4.10.2 Air Quality and Noise

Noise Data

IND3-17 | The table (pg.4-392) listing the noise levels of various items of equipment
is deficient by its omission of the noise level frequency distribution of SCV
(submerged combustion vaporizers). Instead, a one-meter value of 118
dBA was used "somehow" in the study. Without knowing the boundary
conditions used in the Scantech software, it is impossible to know whether
the calculation for noise propagation is even technically sound. I would
assume, at minimum, that the calculation will use transmission across
water with wind aid. This calculation methodology is still unacceptable for
two reasons. One, it uses sound levels determined during ideal running
conditions and does not consider transient conditions (which are generally
where maximum noise levels are experienced). Two, it is within FERC's
capability to simply go out and measure sound levels from these burners
already in place (when in use and when not in use) to validate the
methodology. High fuel rate fired vessels are normally quite noisy within
the sensitive frequency ranges. Data missing from the draft EIS should be
re-evaluated and corrected.

Individuals

3

IND3-16 | The 1993 study, by independent scholars, published in a juried learned
professional journal, provides the most appropriate analysis of the potential
effects on property values of facilities similar to the one proposed by
NorthernStar. The impact that an industrial facility may have on the value
of a tract of land depends on many factors, including the size of the tract,
the values of adjacent properties, the presence of other utilities, the current
value of the land, and the current land use. Each potential purchaser has
different criteria and differing capabilities to purchase land.

IND3-17 | The noise modeling was completed utilizing a conservative methodology
where all equipment is operating at the same time. In practice, the overall
noise contribution to the environment should be less than what was
predicted. The transmission of noise across the water was set up in the
model to be a perfectly reflective surface with no noise attenuation.

K-788

Empirical Noise Data and Site Conditions

IND3-18 I am generally surprised by the lack of empirical information on noise in the draft EIS. As stated, it should be fairly easy to take noise measurements from various operational procedures at one or more LNG terminals (and peak shaving facilities) and then made adjustments for mechanical differences between terminal designs. Noise mitigation using empirical data was utilized by Sempra/Shell to validate their designs for Baja California and it is inexplicable why the same techniques cannot be used for Bradwood Landing by FERC.

It is also surprising that FERC does not appear to correct the misinformation provided in earlier NorthernStar submissions where they state no special conditions exist for the propagation of noise. A cursory examination of the site would demonstrate that Bradwood Landing is being proposed in an amphitheatre-like setting facing a high transmission plain. Transmission of noise northeast across the water directly towards the residences on Puget Island must be a special concern, especially from sources generating 118 dBA or more.

Section 4.11.5 Hazards

Exclusion Zones and Pool Propagation

IND3-19 The use of the Scandia study is probably justified by the actual experience of the terrorist attack on the U.S.S. Cole, which would be a reasonable assessment of risk within the small exclusion zones proposed by the Coast Guard. It would be interesting to have the Coast Guard confirm whether the U.S. Navy agrees with the Coast Guard as to the safe exclusion zone of the U.S.S. Cole for purposes of evaluating the risk level (even though the specific response from the Navy may be confidential). It is acknowledged in the draft EIS that a pool fire would have significant thermal effects within a radius of 1640 feet (Zone 1), as discussed on page 4-426. The calculation of this radius does not seem to take into account the current on the Columbia River, which might make containment of the pool fire within this single radial dimension more problematic. It seems more likely that any pool fire on the Columbia River would string out and become more elongated along the Oregon shoreline. Under these conditions, the proximity of a large fuel source, in the form of woodlands, exacerbates the hazard to the area. The ignition of the shoreline forest under various wind conditions should be evaluated before this new ignition source is added to the lower Columbia River. The spread of a forest fire is also an environmental impact apparently not addressed in this draft.

Individuals

3

IND3-18 The LNG facility should not provide any reflective sound from the south rock cliff due to the facility location being shielded from the rock cliff. In addition, the sloping hills behind the proposed LNG terminal are not vertical rock cliffs, are foliated and would tend to absorb noise, potentially reflect noise upward and not reflect the noise laterally east across the open water.

IND3-19 Currents could potentially transport the pool farther away from the spill. However, it would also be more likely that the waves would break up the pool into multiple, irregular shaped pools. If a pool fire were to be elongated along the Oregon shoreline, the distance to the thermal hazard levels with respect to the shoreline would be decreased. Although there are no models that currently account for spread action due to waves or currents, FERC staff believes that the methods used for determining thermal radiation and vapor dispersion zones uses the best available methods and in the areas of uncertainty, uses conservative assumptions.

K-789

ACTION ITEMS

- | | |
|---------|---|
| IND3-20 | 1. Determine a required frequency for the use of "intelligent pigs" to monitor pipeline wall thickness. |
| IND3-21 | 2. Perform a feasibility study on NorthernStar's ability to obtain LNG sufficient to supply 1 BCF/d from the Pacific Rim: such study to consider how much LNG would be available from current suppliers or those suppliers with approved Plans of Development under spot market conditions and under traditional take-or-pay arrangements. |
| IND3-22 | 3. Perform a feasibility study to determine whether NorthernStar has the financial resources to contract for proposed volumes of LNG and to post necessary construction bonds and other obligations. |
| IND3-23 | 4. Determine whether NorthernStar can economically sustain its obligations if deliveries do not live up to their expectations and instead fall in the order of 1 to 2 million tonnes of LNG per annum. |
| IND3-24 | 5. Determine whether NorthernStar has sufficient inhouse technical capability to direct EPC contractors (engineering, procurement and construction). |
| IND3-25 | 6. Determine the availability of surplus tankers and their age/design criteria for suitability of use in Columbia River traffic. |
| IND3-26 | 7. Determine the effect of a third storage tank on site at Bradwood Landing. |
| IND3-27 | 8. Perform an economic analysis on the effect of LNG importation on the price of competing energy supplies; such study to include the contractual differences between energy sources of supply and the distortions created by the contractual conditions of Pacific Rim LNG SPAs (sale and purchase contracts) from which the LNG would be obtained. |
| IND3-28 | 9. Perform a study comparing the benefits of an LNG terminal at Port Westward with those benefits of an LNG terminal at Bradwood Landing; such study should also determine the effect of two LNG terminals on the Columbia River (if Port Westward would go forward) or conversely, one LNG terminal twice the size of the currently proposed Bradwood Landing (if the import rates of both Bradwood and Port Westward were justified). |
| IND3-29 | 10. Perform a study of resource requirements and general impacts for LNG terminals located in Tokyo Bay or Osaka, Japan. Review the operation of a similarly sized LNG terminal in Niigata, Japan. |
| IND3-30 | 11. Perform a study of the siting of an LNG terminal in Puget Sound, Washington. |
| IND3-31 | 12. The Army Corp of Engineers should perform a study of the condition of dikes on or around Puget Island and also perform a study of the erosion of shoreline along Puget Island directly or indirectly (e.g., changes in passage clearance assumed by marine traffic while an LNG tanker is berthed) associated with marine activities of the proposed Bradwood Landing LNG terminal. |
| IND3-32 | 13. Perform a cathodic protection study for the Bradwood Landing site assuming cathodic protection of the pipeline. |

Individuals

Washington, DC 20426

Re: Docket CP06-365-000 Bradwood Landing

Dear Commissioners,

I wanted to write and let you know of my complete support of Bradwood Landing and to encourage you to vote in favor of their project on the Columbia River.

IND4-1 The company will be creating more areas for environmental enhancement to make up for the space they'll be using along the river. They have pledged to do whatever they can to ensure minimal impacts to the river and wilderness area surrounding the facility.

Since that area is already zoned marine industrial, it is an ideal place for an LNG facility, much more appropriate than Warrenton.

I hope that once you have heard all of the testimony and looked at the facts, you will realize that there is no reason NOT to approve Bradwood Landing.

Thank you,

Anita Amick

Re: Docket CP06-365-000

Dear Commissioners,

IND5-1

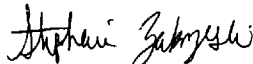

I support our environment and I support the Bradwood Landing LNG project. I believe you should too because it will help move our state away from dependence on coal (we use over 40% for electricity) and it will help power local companies with a fuel that is much cleaner. Additionally, as someone who supports 'green' energy, new natural gas will act as a good backup for these new energy sources such as wind or wave power. If the wind stops, then Clatsop County's natural gas can help power industry around the state.

Many people are using NIMBY arguments against this plant, yet they have no solutions to our state's energy needs. LNG is a popular solution globally and one that has a safe track record. Additionally, the site of this plant, at the location of an old timber mill, will keep a tradition of industry going in Clatsop County. New and clean energy, plus new jobs, equals a good solution for Clatsop County. This plant will also help make Clatsop County a leader in solving this state's energy issues.

I know you will make the right choice, and vote to approve the Bradwood Landing LNG project.

Thank you for your time.

Sincerely,

Stephanie Zakrzewski

Re: Docket CP06-365-000 Bradwood Landing

Dear Commissioners,

I am writing today to express my support for the Bradwood Landing terminal. I believe that this project would benefit our region in many ways, not only in jobs and tax revenue, but with an ongoing steady supply of natural gas for consumers and local industries.

You will be reviewing information and hearing testimony from many people in November, and we all appreciate the time and thoroughness of that your commission is devoting to getting the facts and hearing the people. Many of those that will come to speak will be opposed to the project and will tell you horror stories, most of which I'm sure you are used to hearing. The majority of their claims are based on misinformation and emotion, and I am certain that you will be able to look past those claims.

The area of Bradwood is already zoned for industrial use, and wouldn't be suitable for anything else because it is primarily dredge spoils from decades ago. The plant itself is not unattractive, and the company has pledged to do everything possible to minimize noise and light, so as not to disrupt the peaceful way of life for Puget Island residents.

I hope that once you have reviewed the information and heard testimony in November, you will approve their permit. We need this industry in the Pacific Northwest, and I can think of no better location for it.

Thank you for your time,

Re: Docket CP06-365-000

Dear Commissioners,

IND7-1

Please accept this letter of support for the Bradwood Landing facility. As long time residents of Svensen, we understand the need for securing a steady supply of natural gas for our future, and having investigated this industry, are comfortable with the excellent safety record worldwide.

There are many issues involved, but the company has pledged to make the impacts to the land and river as minor as possible - and when called for, they plan to do even more than would be required to compensate.

There is nothing more suitable to that location than an industrial facility. We've seen people comment that it would be beautiful place for a resort - and yes, that is a beautiful part of the river. Considering, however, that the usable portion of property is old dredge spoils, obviously it wouldn't be feasible to use it for anything recreational.

Please look at both sides, and consider the facts rather than the emotional arguments that some people will throw out there. When the facts are presented, we are confident that you will agree unanimously in favor of Bradwood Landing.

Thank you for your time,

John & Christine Hulon

Re: Docket CP06-365-000 Bradwood Landing

Dear Commissioners,

Please accept this letter of testimony in support of the proposed Bradwood Landing LNG facility on the Columbia River in Clatsop County, Oregon. As a contractor with over 25 years of experience in the heating & cooling industry, I feel that my opinion of any industrial project carries the weight of my experience.

IND8-1

Please approve this facility and related pipeline. Like any utility that has been put in place, this is a gas pipeline that will be constructed to strict industry standards, even going beyond industry standards with more welding than required and a state of the art "smart pig" monitoring system to ensure the pipeline once build will remain safe.

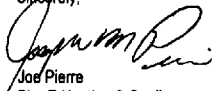

NW Natural will build the pipeline; they are the experts their field and have provided gas service to this area for many years, safely. The pipeline will serve Wauna Mill, and in doing so will keep the cost of the paper products they make affordable and the mill production sustainable. Other industries along the pipeline route, such as Longview Fibre and Georgia Pacific will also be able to purchase gas directly.

It has been shown that LNG is safe, and the industry has an enviable safety record over the last 50 years. Bradwood is the right place due to its remote location and its existing status as a marine industrial area. It will also provide dozens of family wage jobs, something that is much needed in our County, not only at the facility itself but in supporting business.

Lastly, the extensive environmental mitigation that will be done by the company during and after construction, even more than is required, should show that this company intends on protecting our fish and wildlife during and after construction.

Please carefully review the facts and once done, I'm sure you will find this project meets all requirements and just makes sense. I am certain that you will do the right thing and approve Bradwood Landing.

Sincerely,

Joe Pierre

Re: Docket CP06-365-000

Dear Ms. Bose and Commissioners,

Please accept this letter of testimony in support of the proposed Bradwood Landing LNG facility. Although I cannot attend the hearings in November, I wanted to make sure you were aware of my support.

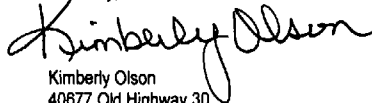

IND9-1

Our region, the Pacific NW, needs this company, not only for the stable energy supply they will provide, but for the tax revenues, jobs, and other services that will exist because they are here. They have shown that they will be a conscientious corporate entity in the region, and when comparing their project to the others, I can only say that I would support Bradwood Landing. The location is appropriate.

I hope you are not swayed by well meaning folks who say this project will ruin the Columbia River. Bradwood Landing has made fish protection and enhancement of wildlife habitat a part of their design. They are doing more to enhance the River than any other environmental group or government agency has been able to accomplish in years.

I know you will take time to carefully review all the facts, and having done that will determine this project is in the right place, for the right reasons. I encourage your approval of Bradwood Landing.

Sincerely,

Kimberly Olson
40877 Old Highway 30

IND9-1

The EIS documents the reasons behind our findings. Our conclusions are based on information provided by NorthernStar; analyses and site visits by Commission staff; and literature research and reviews of scientific and independent studies. NorthernStar has proposed, or we have required, measures that we believe would appropriately and reasonably avoid, minimize, or mitigate environmental impacts resulting from construction and operation of the proposed project.

Re: Docket CP06-365-000

Dear Commissioners,

Please accept this letter of testimony in support of the proposed Bradwood Landing LNG facility.

Although I will be unable to attend the hearings in November, I wanted to make sure you were aware of my support. Your approval of the Bradwood Landing is needed so that our region can be assured of a steady supply of natural gas for the future, and to help our state begin to wean itself from more harmful fuels.

Please don't be swayed by people wearing red shirts and their Anti-LNG slogans. They have killed enough trees with their pages of letters full of misinformation about LNG and the affect Bradwood Landing would have on the Columbia River. The Coast Guard, Bar Pilots, River Pilots and Commercial Fisherman have been all involved in the discussions on river safety and transit, to be sure everyone has input. Review the facts and discount the lies. LNG can safely transit the river while accommodating other river users.

Once you have reviewed all the facts, I'm certain you will determine that Bradwood Landing is the perfect location for the terminal, and will approve their project.

Thank you for your time.

Re: Docket CP06-365-000

Dear Secretary Bose and Commissioners:

I am writing in favor of the Bradwood Landing LNG Receiving terminal and pipeline that is proposed for the Columbia River near Astoria, Oregon.

IND11-1

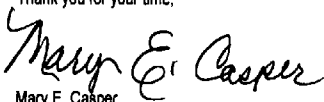

In looking at the various locations proposed around our region, the one at Bradwood is, in my opinion, the only logical place to have a receiving terminal. It is more remote, and would require a shorter pipeline than the other projects.

Additionally, it appears to me that the gas from the other projects will be slated for the California market, which is something many people are saying about Bradwood also but is not true. The gas that will come into Bradwood Landing will serve Oregon and Washington consumers as well as many industries. It seems to me that if we are importing gas to our state, it should be used in our state!

Please vote to approve this project. It is important to so many of us, to have this new industry that will give so much to the County over the years it will be here. It is a good thing, please don't let the nay-sayers affect your decision with the misinformation they will throw around.

I have faith that you will all do the right thing and allow the facts of the matter to help you make your decision.

Thank you for your time,

Mary E. Casper

Re: Docket CP06-365-000 Bradwood Landing

Dear Ms. Bose and Commissioners,

IND14-1

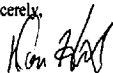

As a member of IBEW Local 48 in Oregon and a resident of Svensen, I would like to voice my support for the Bradwood Landing LNG terminal in Clatsop County. As a union electrician, construction projects like these are what keep our family wage jobs in our region. Livable wages means keeping food on our tables and allows us to buy homes in the area.

Not only that, the addition of LNG will help keep Northwest companies producing products for the world. These companies rely on affordable sources of energy and electricity to make their goods and to keep people employed. Adding new natural gas to the region will help my union brothers and sisters at forest products plants, aircraft parts factories, and in manufacturing jobs around the Northwest.

Lastly, the company has shown their dedication to work with the environmental impacts that will be created by their construction and operation, by designating protected wetland areas, as well as working with local fishermen to ensure their livelihoods will not be impacted.

Please approve the Bradwood Landing LNG terminal. Union workers bring a better quality of life to Clatsop County and the addition of LNG will help keep union workers on the job and encourage additional new and very valuable industry to our region.

Sincerely,

Don Hanseth

Re: Docket CP06-365-000

Dear Commissioners,

I have lived in Astoria most of my life and am a respected educator. I wanted to write and add my voice to those writing in support of Bradwood Landing.

Most of the reasons I hear in opposition to this facility are based on misinformation and fear. I realize it is fear of the unknown, but I really wish those people would bother to get the facts, and to look at those facts with maturity and an open mind.

IND15-1 | The purpose of this letter is not to bash the opposition, however, but is to encourage you to approve Bradwood Landing based on the our need for clean energy and its appropriate location.

I know that as a commission, you will review all the facts carefully, and I'm confident that once done, you will agree with your staffs recommendation to approve Bradwood Landing.

I know the opposition is very vocal, but I am certain that the majority of citizens support Bradwood Landing. I hope that you will not give in to the pressure from the vocal minority.

Thank you for your time,

Re: Docket CP06-365-000

Dear Commission,

I am a resident of Svensen, a small community east of Astoria, about 10 miles from the site where Bradwood Landing wishes to build a liquefied natural gas receiving terminal. I am strongly in favor of this project not only for the stable supply of energy it will provide our region, but because of the company itself.

The site where they would like to build this facility has historically been used for industrial use. I'm certain that if the lumber mill hadn't gone out of business and left, and if the timber industry was still booming, the town of Bradwood would still be there and the mill still in operation.

The company has consistently gone above and beyond in what has been a very lengthy permitting process, which shows that they are serious about causing as little impact as possible to the area, along with replacing the land they are using with 10 times the area in new wetlands and protected wildlife areas.

Please approve the Bradwood Landing LNG facility.

Sincerely,

Brian McCollister

Dear County Commissioners

FILED
OFFICE OF THE
SECRETARY
2007 OCT 24 P 2:35
FEDERAL ENERGY
REGULATORY COMMISSION

IND17-1

The future of Clatsop County's economic development is in your hands. Support economic development for Clatsop County, by approving Bradwood Landing.

1. Timber revenue is drying up
2. Hydro power is going up
3. No new industries, our children must live elsewhere to survive,
4. Our children are our future.

We cannot put our eggs in one basket, that being tourism. It does not make sense to look at our future without industry and an industry that will enforce a drug free workplace is a plus to our community. Bradwood Landing will have skilled workers who with families will add value to our community. The company is dedicated to provide necessary classes to people who wish to learn these skills, and even if enough locals don't wish to enhance their futures, new people with new jobs bring value added investment in our future.

Please approve Bradwood Landing, put it back to work. With Federal tax dollars from timber revenue ending soon, Bradwood Landing is the right project for the times. It also brings ancillary benefits to jobs such as more tug operators, Stevedore services, more fire, life and safety positions, and it opens the doors for the Clatsop Community College to develop more skilled labor programs on the West Coast. There are many, many related economic benefits to an industrial use. There are many local benefits for other businesses, not to mention the tax benefits, especially for the Knappa School District.

The benefits and balance of mitigation were designed to allow projects to be approved, and Bradwood Landing will be doing far more than required to offset any environmental impacts. Do your part to make our future the future for our children. Please approve Bradwood Landing.

Respectfully yours,

Re: Docket #CP06-365-000

Dear Commissioners:

IND18-1

Why would Northern Star Natural Gas want to site a liquefied natural gas terminal in Clatsop County? It's simple, because our region is growing!

That growth means industry, and where there's industry there are energy needs. Northern Star is proposing an import facility at Bradwood Landing, because it's close to the market it wants to serve, while still being remote.

The Bradwood site is close to existing pipelines and will require minimal building to connect to local suppliers. It makes good business sense to centralize distribution in a way that limits transit needs and helps you connect to your customers. Locating in Oregon, specifically Clatsop County, allows Northern Star to do exactly that.

In addition, I have been impressed with the extent to which Northern Star is mitigating any environmental impacts for the terminal or pipeline, even the river itself.

Please approve Bradwood Landing, they will make a huge positive difference in the future of our region, both environmentally and economically.

Sincerely,

Ken Reid

Re: "Comment on Filing", Reference Docket No. CP06-365-000, Bradwood Landing Project

Dear members of the FERC Committee:

It is with great disappointment and concern that I write this comment and rebuttal to the conclusions raised by the DEIS regarding the Bradwood Landing Project.

IND19-1

To me, it is a given that people who have deep roots in an area would know their area intimately. I believe the residents of the lower Columbia River when they say that the impact of an LNG depot would be significant to the land and river that they know so well on an everyday basis. Common sense alone decries an LNG project on the river. No salmon recovery program, for instance, could withstand the impact of the LNG industry (with its depot and tanker traffic) on the Columbia River. It just doesn't jibe with reason or reality. The LNG industry cannot be a "one size fits all" deal, especially in this case. This type of industry just doesn't fit on the Columbia River, quite literally. I believe that it is the responsibility of your agency to reassess the DEIS's conclusion that the impact would be minor, even with the so-called mitigations. In other words, how can you be so sure that the impacts would be minor? I do not possess a scientific degree but I know the river and the islands and the estuaries very well and I completely disagree with your findings that the impact would be limited. Again, can you be so sure of your findings that you can take that risk as well as allow the residents of the area to take an even greater risk? Please consider these comments in deliberating changes to the DEIS. Thank you.

IND19-1

As described in section 5.1, we have determined that construction and operation of the Bradwood Landing Project has the potential for limited significant environmental impacts. However, we have proposed measures to mitigate such impacts. Our conclusion is based on information provided by NorthernStar; analyses and site visits by Commission staff; literature research; alternatives analyses; comments from federal, state, and local agencies; and input from public groups and individual citizens. As part of our review, we developed measures that we believe would appropriately and reasonably avoid, minimize, or mitigate environmental impacts resulting from construction and operation of the proposed project. As such, we recommend that our mitigation measures be attached as conditions to any authorization issued by the Commission. Furthermore, the FERC would not allow construction to proceed until after we have concluded formal consultation with the FWS and NMFS.

Re: Docket CP06-365-000

Dear Commissioners,

We wish to advise you of our support of the Bradwood Landing project, and why you should vote for approval of their permit.

IND20-1

We need this industry here, and this particular project will not only help with our future energy needs as our supply of gas decreases from other areas, but it will ensure supply to local industries that depend on natural gas to operate without taking that gas away from homes.

The increase in County Tax revenue because of this project will make a huge difference to many agencies that depend on it, as well as helping to improve the Knappa School District. In addition, the navigational improvements will benefit every industry on the Columbia River. Lastly, the environmental mitigation that the company will undertake, will help the health of our Salmon and our river in general, by giving back 10 times what they are taking in the way of habitat.

We know you will carefully review and discuss every aspect of this project. Don't be swayed by the nay-sayers and NIMBYs. If that was the criteria of an approval, how could ANY industry ever be built? This project is a benefit to our community and should be approved.

Respectfully yours,

Patricia Whiteside

Re: Docket CP06-365-000

Dear Commission,

I wanted to let you know that I fully support the proposed Bradwood Landing LNG receiving terminal, and hope that you will approve their project.

IND21-1

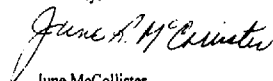

Bradwood has always been a Marine Industrial area, and the current zoning needs to be changed in order to accommodate larger ships. Also, since the land there is made up of primarily dredge spoils, there could be no possibility of it ever being anything BUT industrial.

In designing the facility, Bradwood Landing has gone through extensive design changes to minimize any impacts to the river and the land. They have shown that they are environmentally responsible and really DO care about our river and wildlife.

In other words, this company has jumped through hoops at every turn trying to satisfy everyone – most of the mitigation measures they will undertake are far and above what would be required, and that willingness to make things better should reflect positively. I have no doubt that they will continue to be a conscientious member of our community, both economically and environmentally.

I know that you will receive many comments from people stating that this facility will ruin the river and that we don't need the gas. Most of those statements will be false, fueled by emotion and from people against any kind of development. I am confident, however, that you as a committee will review the facts and not take every comment you see as the truth, and will ultimately approve this project.

Sincerely,

June McCollister

SUBJECT: Comments Regarding the Draft Environmental Impact Statement -
 Bradwood Landing (FERC Docket Nos. CP06-365-000 et al.)

FILED
 OFFICE OF THE
 SECRETARY

2007 OCT 30 P 2:54

FEDERAL ENERGY
 REGULATORY COMMISSION

This response to the Draft Environmental Impact Statement (DEIS) for the Proposed Bradwood LNG facility and pipeline is in three sections: 1) Air Quality; 2) Seismic Issues; and 3) Operational and Security Concerns. Having had a scientific background, I have tried to be objective in analyzing these data. Given the volume of material in the public record, I cannot be completely sure I have the latest version of every report and table. Nevertheless, I think the issues I raise are serious and deserving of your attention.

I. AIR QUALITY

I have reviewed Section 4.10 Air Quality and Noise in the Bradwood draft EIS. Specifically, I have tried to trace the data cited in several tables back to the original source document submitted by Northern Star (NS) to determine if the data reported in the DEIS is based on accurate assumptions and complete data. As a result of this process, I have several questions and concerns.

A. Data and Assumptions: I have tracked the emission data and assumptions used for LNG carriers, tugs and security vessels in DEIS Table 4.10.1-4 (p.4-370) with the corresponding data in Resource Report (RR) 9.

Assist Tugs: The data for the Assist tugs do not match anything I have been able to locate. (See Attachment A for the three different versions of tug emission data: DEIS Table 4.10.1-4, RR Table 9.1-11 and RR 9 Table 9A-17.) I am concerned about this because I believe the earlier RR tables seriously understated tug emissions. The RR 9 tables assumed 1) only one tug would accompany the LNG carrier up the river to the terminal¹, whereas, the Coast Guard requires two in good weather and three when extreme wind and weather require it (Waterway Suitability Report – WSR, 2/28/07, p. 3); 2) the tugs would only accompany the carrier for 1.3 or 2.5 hours, whereas, it will take the carrier 3.7 hours to go from the jetty to the berth (Note: On page 3, the WSR states that the tugs should join the vessel “as soon as it is safe to do so.”); 3) show zero emissions for the tugs while the carrier is unloading, even though the Coast

¹ Table 4.10.1-4 assumes 2 assist tugs, but the volume of emissions reported is only about 20% higher than the earlier Tables that assumed only 1 assist tug.

Individuals

IND22-1

IND22-1 See our responses to comments FA3-5 and FA3-6.

IND22-1
cont'd

Guard requires three tugs² to remain on standby to assist with emergency departure procedures³; and, finally, 4) show 18 hours for the hotelling process, even though all other references in this application refer to a 24 hour unloading period.⁴ I assume FERC will agree that when emissions are tallied for the assist tugs while the carrier is hotelling, *they should be tallied for the full 24 hour period.*

- Have the emissions for the tugs in Table 4.10.1-4 been corrected for each of the erroneous assumptions described above. If not, what assumptions did NS use in producing the data used for this Table?

IND22-2

LNG Carrier: Emissions reported for the carrier's generator during the hotelling period (RR 9 Table 9.1-10, Attachment B), are also based on an 18 hour unloading process with zero emissions for the other 6 hours. There were zero emissions reported for the main engine during the entire 24 hour period

- Why are the carrier emissions for the hotelling process only calculated for 18 hours? If the carrier is berthed for 24 hours, the engine must be running during that entire period, even if the unloading is completed sooner. (See below)

IND22-3

NS Report "Response to Staff Environmental Information Requests", 09/07/06, discusses at some length why it is impractical to cool-down and shut down the carrier's steam boilers while dockside for cargo unloading. It states:

Typically, one of two of the ship's boilers will remain on line in order to provide steam for the ship's turbogenerators (steam turbines operating as prime movers for the ship's generators) as well as maintain ready steam for the immediate engagement of the ship's main propulsion turbine, if needed. ...In addition, placing the LNG carrier in the position of conducting cargo transfer operations without reasonable access to propulsive power gives rise to potential safety issues by narrowing the LNG carrier's catalogue of response options and its ability to appropriately respond to emergent situations.(p. 20)

Clearly, the carrier main engine is running during the entire time it is dockside.

- Why are no emissions reported for the carrier's main engine during the hotelling process?

² Three tugs are required to remain on standby during unloading (WSA report, p. 3) not one as described by NS in the Initial Biological Assessment (p. 28).

³ A Coast Guard representative in Portland told me that, depending on the type of engine, the tug engines would be required to be idled or to be started regularly.

⁴ This assumption was carried over to the April 2006 modeling report, which states "24 hour emission rate is based on 18 hours of operation with 6 hours of no emissions." (Table 3, Footnote 4)

Individuals

22

IND22-2 See our responses to comments FA3-5 and FA3-6.

IND22-3 See our responses to comments FA3-5 and FA3-6.

IND22-4

Finally, I traced the SO₂ emissions for the carrier generator while hotelling that were used in the AAQS Dispersion modeling study, Table 1, April 12, 2006, p.2, to the SO₂ data reported in Resource Report 9 in Table 9.1-10. (Attachment C) The modeling study used a figure for SO₂ that is about one-half the value in Resource Report 9.

- What data or assumptions did NS use to generate the lower SO₂ number reported in the AAQS Report, Table 1?

Security Vessel: I am not aware of any source documents for the security vessel emissions cited in Table 4.10.1-4 (Attachment A)

- Are the source documents for security vessel emissions available to the public? What assumptions were used in estimating these emissions?

IND22-5

B. Concerns: After examining the emission data reported by NS for the proposed Bradwood LNG operation, I am very concerned that they did not give an accurate or complete picture of the volume of emissions that this operation will introduce into the lower Columbia River area:

- As described above, I lack confidence in the assumptions used by NS in compiling the emission data submitted to the various agencies and to the public. Likewise, I lack confidence that the modeling studies were based on correct data. With one or two exceptions, NS's assumptions underestimated the magnitude of the air pollution that will be caused by this operation.

For example, I find it ludicrous that they would assume that three tugs will be required by the Coast Guard for security reasons to be on standby for 24 hours in close proximity to the carrier while it is unloading, but not generate any emissions during the entire period. (It remains to be seen if any emissions were estimated for the security vessel.) In addition, why would NS use 18 hours when computing generator emissions during carrier hotelling and report no emissions for the main engine? I don't understand why they cut back on the number of hours the tugs will accompany the carrier up the river.

- Even if the emission data submitted by NS were accurate, complete and based on valid assumptions, I think the way the data are reported in the DEIS make it very difficult for the public to fully grasp the impact this operation will have on the quality of the air in this region, as well as the magnitude of greenhouse gases that will be emitted. I am also concerned that most of the public have no idea how fragmented and complex the state and federal regulations of emissions really are.

Individuals

22

IND22-4 See our responses to comments FA3-5 and FA3-6.

IND22-5 See our responses to comments FA3-5 and FA3-6.

IND22-6

For example, most people do not know that for every ton of CO emitted, there will be 100 tons of CO₂ emitted, a greenhouse gas that is a major contributor to global warming, but currently not a federally regulated pollutant. Even without any of the corrections I have suggested earlier in this memo, using the formula that one ton of CO equals 100 tons of CO₂, this project would create 69.7 tons of CO₂ per year. [Note: The Oregon Department of Energy has asked NS to voluntarily comply with the CO₂ standards for non-generating energy facilities. To date, NS has not indicated whether they will comply with the ODE request. (DEIS p. 4-382)]

IND22-7

I am also sure that most people do not realize that state and federal regulatory standards for emissions are quite different. For example, it is stated in Table 4.10.1-6 that the terminal will emit 122.6 tons/year (tpy) of NO; in RR 9 Table 9.1-10 it is stated that the ship generators will emit 130 tpy of NO while hotelling. Each value separately exceeds Oregon standards⁵, but not the federal standards. These two emissions were combined in a modeling study requested by ODEQ; no such requirement that they be combined exists at the federal level. I personally do not understand why these emissions are not combined: they are both part of the "terminal operation" while the ship is "hotelling", i.e. the carrier is no longer mobile; it is physically and electronically part of the terminal, transferring a hazardous substance from one part of the terminal to another under the control of terminal employees.⁶

- If the annual NO emissions for the carriers while hotelling and the terminal are combined, the total NO emissions would be over 250 tpy and the operation would be subject to the additional regulations and review of the federal Clean Air Act.

Conclusion: I believe the questions and issues I have raised above are important because both Oregon residents and Oregon agencies are entitled to a complete and accurate picture of the air pollution impact of the proposed Bradwood facility.

IND22-8

I assume if FERC finds that air emissions have been underreported, it will ensure that all affected tables are corrected and, if necessary, new modeling studies are completed.

⁵ NS will be required to obtain a Title V operating permit from Oregon because the Potential to Emit (PTE) will be greater than 100 tons per year for certain regulated air pollutants. (RR 9 Sec 3, p.14)

⁶ See Resource Report 1, p. 10 for discussion of the terminal control technology.

Individuals

22

IND22-6 See our response to comment PM5-1.

IND22-7 The Bradwood Landing project is required to comply with all applicable air quality regulations including applying for and obtaining necessary air permits/authorizations. Section 4.10.1 of the EIS documents these requirements.

IND22-8 Section 4.10.1 of the EIS has been updated, as needed, to reflect revised emissions estimates and air quality impacts for the project.

2. SEISMIC CONSIDERATIONS

Because of its proposed location, the Bradwood Landing facility will have a whole set of added risks and complexities that other LNG facilities do not have to cope with. While the DEIS rightfully acknowledges that the proposed terminal site is classified as a "High" hazard area relative to earthquake potential and soil liquefaction (DEIS p. 4-11), and numerous mitigation measures are proposed, I still have many concerns. Chief among them are the following:

A. Key statements in the DEIS reveal a lack of in-depth knowledge of this area:

- The DEIS statement (p. 4-11) about the "lack of historical seismicity in the Pacific Northwest with regard to Cascadian Subduction Zone events to assist in bracketing earthquake recurrence", reveals a glaring lack of knowledge⁷ of the geological research in the Northwest over the past 20 years and what it has revealed about the seismic history of this area

Many people in Clatsop County can tell you the exact date of the last subduction earthquake to hit this area – it was January 26, 1700 – 307 years ago. This was recorded in Japan as a result of a tsunami that hit their shores after this huge quake on the west coast of North America. This has been confirmed by the detailed studies that have been conducted since the early 90's of core samples in estuaries showing the subsidence and flooding by tsunamis and the measurement of the tree rings from trees that died in these events. (See Attachment D for a few articles that give more details.) Basically, we now know that huge subduction earthquakes are a regular event all along the west coast of North America; their approximate dates have been identified going back thousands of years. They occur on average every 300-500 years, but can happen within 100 years.

- "The likelihood of fire in the surrounding forests is unlikely given the amount of rain in the area."

While it is true this area does have a lot of rain, June through September is typically very dry. The Department of Forestry routinely imposes County-wide open burning bans during this period and requires that all logging operations follow strict safety precautions. As you may know, the Tillamook Forest fires that occurred in the 30's and 40's destroyed several hundred thousand acres of forestland; the Tillamook Forest has not fully recovered 70 years later.

⁷ Under Section 4.1, Regional Geological Setting (p. 4-2 etc.) I found no mention of the extensive, well-known earthquake history of this area.

Individuals

22

IND22-9

IND22-9

See our response to comment PM6-18.

IND22-10

IND22-10

Appropriate portions of the EIS have been revised. While we acknowledge that forest fires in the region have happened in the past, in this EIS we are analyzing whether the project could cause such a wild fire. We believe that with the mitigation measures to be implemented by NorthernStar, and the conditions of the Coast Guard WSR, a spill from an LNG carrier and resulting pool fire is highly unlikely.

IND22-11

B. Because the seismic history of the area has not been acknowledged, the DEIS understates the frequency and hence the risk of a subduction earthquake on the site and along the pipeline.

In a site-specific hazard analysis, URS (2006a) indicated a peak horizontal bedrock acceleration of 0.36 gravity with a 2% probability of exceedance in 50 years (i.e. a 2,475 year return period). (p.4-11) This does not seem to agree with recent geological research in the area documenting an average recurrence of every 300-500 years. Recalling that it has been 307 years since the last major subduction quake in Oregon, a local geologist estimates that there is a 15 to 20% chance of a major subduction earthquake occurring in the next 50 years, not the 2% chance stated in the DEIS. (p.4-11) (See Appendix E) Considering the consequences, a one in five chance of this type of quake during the next 50 years, I think the risk of an LNG facility at the Bradwood site is unacceptable.

IND22-12

C. The severe consequences of a serious failure at the terminal or along the pipeline are not acknowledged.

The fact that the facility and pipeline would be in a rural area, does not mean the damages would not be catastrophic in terms of life and property. Victims could include people in recreation or commercial vessels on the Columbia River, people in their homes⁸, or small communities like Westport⁹, people on nearby roads or working on their farms or employees of the Wauna mill. If there is a forest fire, the environmental and economic losses would also be devastating, especially after an earthquake, when normal firefighting resources would be unable to respond.

- A major forest fire caused by an unexpected event either at the terminal or along the pipeline, could wipe out the state and commercial forest industry in Clatsop County (currently worth billions of dollars in assets) that is considered one of the most productive places in the world for growing trees; it is the bedrock of the County's economy.

I recently heard an earthquake expert state that many of the deaths and damages associated with earthquakes occur *after* the earthquake due to pipeline

⁸ Eleven homes are within 50 feet of the pipeline right-of-way. (ES-4)

⁹ This would also include the County's current Westport boat ramp. (See Attachment F for a map showing the pipeline in relation to the boat ramp and the community of Westport.)

¹⁰ A recent document by NS in response to local concern about potential fires caused by the LNG operation stated: "We also know there is no credible event on our facility that could cause a forest fire." And "In the unlikely event of a forest fire, Bradwood will...call for assistance from mutual aid network and enlist the aid of state resources." (p.9-10)

Individuals

22

IND22-11

The recurrence interval refers to the peak horizontal bedrock acceleration that would occur at the site, not to the average recurrence interval of subduction zone earthquakes in the Pacific Northwest. Please see *Final Report, Seismic Hazard Analysis for LNG Import Terminal, Bradwood, Oregon* by URS Corporation, 2006, available on the FERC's eLibrary, for a detailed discussion of the seismic analysis for the Bradwood Landing LNG terminal. This document is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e., CP06-365), and putting in the proper date range. Additional details regarding the "design earthquakes" are presented in section 4.1.3.3.

IND22-12

Although there is a risk of a pipeline rupture due to various causes, the risk to any individual along the pipeline risk is minimal.

IND22-12

cont'd

ruptures and the subsequent fires. The devastating consequences of these ruptures are documented in a study prepared for the Gas Research Institute by C-FER Technologies, October 2000, entitled "A Model for Sizing High Consequence Areas Associated with Natural Gas Pipelines." The author devised a simple and defensible approach to sizing the ground area affected by a worst-case ignited rupture of a high pressure natural gas pipeline. The key variables are the pipeline diameter and its operating pressure. He tested his formula against the area affected in actual ruptures in North America. These are summarized in a Table 3.1 on page 14. (Attachment G) This Table describes each incident, the number of deaths and injury, the property damage, the maximum burn distance from the pipeline and the pipeline diameter and pressure.

- This report concluded that larger diameter lines operating under 600 to 1200 psi (as would be the case with the 36 inch Bradwood pipeline in Oregon) would have a hazard area¹¹ radius of over 1,100 feet. When one examines the proposed pipeline route, the consequences of one or more line failures during a massive earthquake becomes evident. This is magnified by the fact that the pipeline route will cross 31 potential landslide areas. (p. 4-20)

D. Often the data presented are confusing or not at all reassuring.

IND22-13

USGS (2006a) has indicated that the project is in an area likely to experience peak horizontal bedrock accelerations of between 0.4 and 0.5 gravity (g). The engineering firm hired by NS to do the seismic hazard analysis came up with 0.37 g and recommended that Safe Shutdown Earthquake (SSE) design with a peak bedrock acceleration of 0.4 g. (DEIS 4-11)

- How do you reconcile the difference in gravity levels between USGS and the URS firm? Is designing for a level 9 earthquake really conservative given the 9.2 level in Alaska in 1964 and 9.5 level in Chile in 1960?

IND22-14

When discussing the geological risks associated with the pipeline, the following statement was made:

- Southern California has not experienced a major pipeline rupture during the past 61 years. (p. 4-22):

¹¹ The author defines this as the area within which both the extent of property damage and the chance of serious or fatal injury would be expected to be significant. (p.9)

Individuals

22

IND22-13

The peak horizontal bedrock acceleration estimates from the USGS reference are based on regional maps while the URS values are based on a site-specific seismic hazard analysis. Given that consideration, the numbers agree reasonably well. The seismic analysis prepared for the Bradwood Landing LNG terminal was site-specific rather than being done for a facility located in Alaska or Chile.

IND22-14

The SoCal study was cited to illustrate the fact that pipelines are ductile in nature and not prone to failure during earthquakes. Southern California is a seismically active area with a large number of gas pipelines and so is an appropriate area for such a study.

IND22-14

I do not consider this statement at all reassuring. California has experienced strong Level 7 earthquakes during this period, but it has not experienced a massive level 9 earthquake. Since a Level 9 subduction earthquake is dozens of times stronger than a Level 7 earthquake, the above statement proves nothing.¹²

- A more reassuring statement would be that an LNG facility and/or high pressure 36" natural gas pipelines survived intact after a major subduction earthquake, such as Alaska's 1964 Level 9.2 earthquake or Peru's 1960 Level 9.5 earthquake. Lacking that reassurance, I think this area is being asked to bear an unacceptable level of risk.

IND22-15

The geological consultant, URS (2006a) estimated that,

- In the vicinity of the LNG terminal site, an earthquake with a magnitude of 7.0 or greater could cause the surface to rupture. As such, deep seated faults could potentially exist in the project area without showing visible signs of faulting or deformation at the ground surface." (p. 4-9)

Later it is stated that a reconnaissance of the site by URS revealed no evidence of ground rupture or faulting. They concluded, "The potential for ground rupture at the Bradwood Landing site is negligible." (p. 4-11) I find these statements confusing.

- Given the first statement above, what type of "reconnaissance" did URS do that allowed them to determine the potential for ground rupture was negligible?

IND22-16

I was most disturbed by the section on the pipeline and the descriptions of the multiple risks identified, including subsidence and liquefaction identified all along the Columbia River and the many streams and boughs it crosses, plus 31 potential landslide areas in Washington and 2 in Oregon. Many of these risks were dismissed with statements like, "They will monitor strain in the pipe and movement of the surrounding soil." *These strain gauges will not help if all the strain happens during 3-5 minutes of a major earthquake.*

Given the geological reality of this area, I found the following statements frightening:

¹² A scientist who has studied the earthquake history at Sasebo, stated that the 7.1 earthquake that hit San Francisco in October 1989 would "look like a friendly nudge," compared to the giant earthquakes experienced in the Northwest over the last several thousand years. It would pack 30 times the energy." (Daily Astorian, 3/20/90)

Individuals

22

IND22-15

As described in section 4.1.3.3, URS (2006a) found no evidence of active surface faults within 1 mile of the proposed LNG terminal site based on 1) review of relevant literature; 2) examination of aerial photographs; 3) review of boring logs and cross sections; and 4) site reconnaissance. Site reconnaissance would involve in-field observation for indications of lateral or vertical ground displacement.

IND22-16

Landslides may occur in areas that have certain conditions leading to unstable slopes. Earthquakes can trigger landslides in those areas. We have identified areas of potential landslides and potential mitigation measures in section 4.1.4.3. Also see the response to comment LA7-25.

IND22-16

cont'd

"Given that the proposed pipeline route does not cross any active faults, earthquakes and associated seismic risk are not anticipated to have a significant impact on the proposed pipeline." (DEIS p. 4-22)

General mass movement policy 2 (i.e. Clatsop County's) is not applicable because the pipeline is not within a mass movement hazard area. (NS's Pipeline Narrative in Support of the Application, p.81, 02/07)

Given the fact there are more than 31 potential landslide areas along the pipeline route, plus long stretches subject to subsidence and liquefaction, common sense tells me you don't need active faults to have serious risks from a massive earthquake. I found nothing in the report about the compounding effect of subduction earthquakes in areas already prone to slides.

Conclusion: If the Bradwood operation is approved, this installation will have profound implications on the life and security of area residents. It appears to me that this facility is being funded and engineered by people who do not live in or have an in-depth knowledge of this area. It is shocking to me that neither the NS reports or the DEIS report reference the last 20 years of geological research along the West Coast!

Given the extensive records of major subduction earthquakes in this area over the past two thousand years, we now know they strike on an average of every 300-500 years. Those of us who live in this beautiful area know that a quake like the one that hit Indonesia 2 years ago could strike here at any time. Because we live with this natural risk (while taking many precautions to minimize the damages and risks) does not mean we want to live with a huge man-made risk that could devastate those portions of the County not devastated by an earthquake and the ensuing tsunami along the coast.

It does not reassure me that FERC will require a high level of oversight of all aspects of the terminal design and construction. Unless FERC acknowledges recent geological research, your entire report lacks credibility.

A good beginning in restoring credibility would be if you would answer the following question:

Individuals

IND22-17

- Is there any LNG facility anywhere in the world that is operating this close to a subduction zone¹³ and with a high pressure 36" pipeline that will have major sections located in estuaries and in soils and terrains subject to landslides, liquefaction and subsidence? If so, have these sites actually experienced a subduction type earthquake? If so, what were the results? If not, does that mean Bradwood will be the first LNG facility with this combination of risks?

Even if world-class engineers have staked their reputation on the integrity of the storage tanks and other critical terminal structures in the event of a level 9 earthquake, are they equally sure that all connections can withstand violent earth movement for 3-5 minutes? Remember the Challenger rocket had a disastrous explosion due to the failure of a simple O-ring

3. OPERATIONAL AND SECURITY ISSUES

IND22-18

Filtered Water Supply System: FERC has recommended that NS explain how they will ensure that all LNG carriers that deliver to Bradwood will have the appropriate connections to use the filtered water system. These modifications will cost \$250,000 to \$850,000 per ship. (NS's Responses to Staff Environmental Info. Requests, 09/07/06, p.18) It is unclear to me whether the ships that are modified will still be able to deliver LNG to other facilities. With a supplier's market that exists today, it is also difficult to imagine what type of incentive it would take to convince an owner to make these changes. However, *the filtered water system is absolutely essential to prevent entrainment and impingement of endangered fish¹⁴ in the 20 – 50 millions of gallons of water that will be drawn from the Columbia River for each carrier. If only a small percentage of carriers actually make the necessary modifications, it will change the whole environmental impact of the project.*

- Given the importance of this issue, I urge FERC to do more than just "recommend" that NS explain how it would allow only modified carriers to deliver LNG to the facility. (ES-3) FERC should not approve the Bradwood application until it receives a satisfactory explanation of how the filtered water system will be fully implemented, utilized and monitored¹⁵.

Extreme Weather: According to an Oregon Department of Forestry document, there have been 5 major floods in western Oregon over the past 150 years:

¹³ Several scientists contend that the two plates are actually locked under the Coast Range in Oregon. This would mean more violent shaking in this area as well as in the Portland area. (Appendix D)

¹⁴ The Columbia Estuary is used as a migration corridor by all juvenile anadromous salmonids as they move from fresh to salt water.

¹⁵ Monitoring is especially important, since this system has never been tested.

Individuals

22

IND22-17

LNG facilities are operating in Indonesia, Japan, and Alaska. The Bradwood Landing LNG facility is designed for the tectonic setting in which it is located. Also see our response to comment SA1-4.

IND22-18

See our response to comment PM1-31.

- IND22-19 1861, 1890, 1948, 1964 and 1996. These usually happen in winter and may include heavy snow as occurred in 1964 and 1996. Attached are several clippings from The Daily Astorian (Attachment H) that describe the 1964 flood. Among the highlights were:
- Severe flooding along the Columbia River including Svenson and Brownsmead.
 - The Coast Guard's closing of the Columbia River for several days due to debris and navigational aides being knocked out; thirteen ships were held up along the Astoria waterfront.
 - Snow was reported at 32 inches atop the Clatskanie hill on Hwy. 30. Twelve inches fell at Bradley Park in 12 hours.
 - Two men drowned when the car in which they were riding plunged off Wooden Dike Road near Hwy. 30 into the Columbia River Slough.
- This weather history raises several concerns:
- Will the Bradwood facility be able to cope with a flood that includes large amounts of snow?
- IND22-20 • Will it be able to function safely for several days without road access for staff and supplies?
- IND22-21 • Will it have special equipment to promptly handle the hazards on Clifton Road that are associated with cold weather?
- IND22-22 • Have the engineers who are working on the pipeline fully taken into account the amount of weighting that must be done to prevent the pipeline floating up in flooded soils? Will weighted pipes be stronger or more brittle when subject to a violent earthquake?
- IND22-23 **Security in Remote Areas:** The proposed Bradwood facility would be located 38 miles upriver along a shipping channel that is often quite narrow and next to long stretches of uninhabited, remote land on one or both sides of the river. I know there will be a new camera system installed along the river, but I do not understand how this system will help with security along the shore. Most of these rural areas either have small police forces or none. Many stretches have no roads. If the County sheriff is expected to patrol these areas, a much expanded force will consume much of the increased taxes expected.

Individuals

22

- IND22-19 The Bradwood Landing LNG terminal would be well above the flood plain (see section 4.1) and its operation would not be adversely affected by snow.
- IND22-20 See our response to comment PM1-1. NorthernStar is currently in the process of developing an ERP which contains contingencies for weather-related events.
- IND22-21 Clatsop County would maintain Clifton Road.
- IND22-22 As discussed in section 4.3.1.4, the pipe would be coated with a minimum of 4 inches of concrete in areas of shallow groundwater to mitigate buoyancy. During an earthquake, the pipe itself would remain ductile, although the concrete might suffer cracking. This would not compromise the integrity of the pipe.
- IND22-23 The Coast Guard has determined that the Columbia River would be safe for LNG marine traffic with the conditions described in the WSR (see section 4.11.5.5 and Appendix H). Security details classified as SSI are not available to the public.

IND22-23

cont'd

- How can any police force or any combination of security forces provide security along the entire 38-mile shoreline of the Columbia River traversed by the LNG carrier?¹⁸

IND22-24

I also have not found any mention of the security issues associated with the Astoria Bridge that connects Oregon and Washington. Each carrier must pass under this busy link between the states.

IND22-25

- Do LNG carriers pass under any bridges in the East. How do they prevent terrorist's attacks from them? Have they ever been closed to the public during a higher security alert level?

Another area of concern is the uninhabited Tenasillahe Island, part of the Lewis and Clark National Wildlife Refuge, located just 0.7 mile north of the terminal; it is currently open to the public by boat 24 hours a day.

- Will security measures be taken to restrict public access to this island?

IND22-26

I am also concerned about the Clifton Channel, adjacent to the terminal that is heavily used by fisherman and recreationists.

- What is to prevent some seemingly harmless fishing boat from suddenly veering off and attacking a carrier while it is unloading? This is how the S.S. Cole was attacked in the far east.
- At the other extreme, what will prevent an overreaction by security personnel if these are just reckless teenagers "fooling around," or an innocent fisherman not paying attention?

Conclusion: One gets the impression that from NS's perspective, money is the answer to all problems. In the three issues outlined above, I do not think it is.

IND22-27

- I think NS will have a very difficult task of getting ship owners to modify their vessels for \$350,000 to \$850,000 so they can use the filtered water system at Bradwood, even with the best of incentives.

IND22-28

- Have they even begun to think of how to maintain a safe and secure operation in the face of the extreme weather I described?

IND22-29

- No amount of "sharing of increased security costs" or an increase in tax revenue will be enough to provide security along the remote and rugged 38 mile shoreline of the Columbia River.

¹⁸ In 2004, a Homeland Security official, Pamela Turner, wrote the following to U.S. Rep. Markey of Massachusetts: "There is no economically feasible engineering or design solution that could mitigate the consequences of a large scale LNG release on the vessel's hull."

Individuals

22

IND22-24 See our response to comment PM6-97.

IND22-25 Public access to Tenasillahe Island would not be restricted. The 200-yard safety and security zone around the LNG vessels while docked at the LNG terminal would not affect the river adjacent to Tenasillahe Island.

IND22-26 See our response to comment IND22-23.

IND22-27 See our response to comment PM1-31.

IND22-28 See our response to comment IND22-20.

IND22-29 See our response to comment IND22-23.

Recommendation: I am not trying to be an alarmist, but a realist. We all know that any facility as technically complex as an LNG facility will have many things go wrong during its 50 year life span. This facility, however, will have a whole additional layer of risks. Because of the unique characteristics of this area, I feel compelled to raise realistic scenarios and questions that people who do not know this area might never think of. To simply respond by saying, "the risk is very low," is not very comforting when you actually live here, *especially when you add up the variety, unusual nature and seriousness of these risks.*

Given the proposed location of the Bradwood facility in an area that is

- flood-prone,
- slide prone,
- environmentally sensitive,
- high risk for major category 9 earthquakes, and
- virtually impossible to defend from a terrorist attack,

there must be a better alternative!¹⁷ The people of the lower Columbia River are being asked to bear an unreasonable amount of risk and environmental degradation.

I appreciate the opportunity to comment on the proposed Bradwood facility and look forward to your response.

Sincerely,

Carolyn Eady

¹⁷ Have you really considered 1) the fact that Canada is stepping up its production capacity, including LNG terminals so as to retain its position as a major U.S. provider of natural gas; 2) California will soon be served by a new pipeline from Mexico, and 3) there have to be new initiatives to reduce fossil fuel consumption if we are to have any chance of reducing global warming?

Comment Form: FERC Bradwood Landing LNG DEIS

Please use this form to provide written comments on the FERC Bradwood Landing LNG Project Draft Environmental Impact Statement. Cowlitz County is collecting comments on the FERC Bradwood Landing LNG DEIS to add to its own review of the DEIS. As the Lead Agency for SEPA, Cowlitz County is carefully reviewing the DEIS to ensure it meets the needs of SEPA and represents the best environmental decision. To be most effective, comments should refer to specific sections, text or exhibits within the DEIS.

Name: DARWIN SMITH	Date: 10-25-07
Address: 125 Coalmine Rd Kelso, WA 98626	
1. What do you see as the major impacts of the Bradwood Landing LNG project and pipeline? HAZARD: TO FISH INDUSTRY & COMMUNITIES ALONG SHIP ROUTE SHIPPING DELAYS OF GOODS FROM ID, OR, WA, FAR INLAND. PIPELINE IN UNSTABLE FLOOD PLAIN ON W. SIDE - BORING UNDER COL. R. AND POSSIBLE BROOK OUT. TAKING OF PRIVATE PROPERTY THAT CAN BE USED AS THEY WISH. OWNER TO BE DICTATED TO AS TO THE USE OF THEIR OWN PROPERTY. STILL PAYING PROPERTY TAX. LARGE HIGH PRESSURE LNG GOING TO A SMALLER LINE THAT HAS FAILED AT LOW PRESSURE.	
2. Does the DEIS provide an accurate description of impacts? If not, what specifically should be changed or improved? ALL THIS WILL REQUIRE A NEW AND LARGER LINE TO BE INSTALLED ALONG THE PRESENT PIPELINE. (AN ISSUE THAT HASN'T BEEN BROUGHT UP BY THEM). ALL THIS FOR GAS HEADED FOR CALIFORNIA, A STATE THAT WOULDN'T ALLOW A TERMINAL ON THEIR COAST.	

~ OVER ~

Individuals

23

- IND23-1 The Coast Guard has determined that the Columbia River would be suitable for LNG marine traffic with the conditions described in the WSR (see section 4.11.5.5 and Appendix H). Hazards along the waterway for LNG marine traffic and mitigation are discussed in section 4.11.5.
- IND23-2 As discussed in section 4.8.1.7, no significant delays to shipping would occur as a result of the LNG marine traffic.
- IND23-3 As described in section 4.1.4.3, the pipeline would not be affected by flooding that occurs in floodplains because it would be buried at least 4 feet deep and concrete coating would be used to mitigate buoyancy. HDD methods would be used for crossing the Columbia River to avoid impacts on the river. While the potential exists for a frac-out to occur, a contingency plan would be in place to handle such an occurrence and the impacts would be temporary.
- IND23-4 NorthernStar would compensate the landowner for use of the land needed for the pipeline right-of-way, including damage to property during construction, loss of use during construction, and loss of renewable and nonrenewable or other resources (see section 4.8.3.3). See our response to comment PM2-4.
- IND23-5 The Bradwood Landing pipeline would transport natural gas, not LNG. The pipeline would be 36 inches in diameter up to the PGE Beaver Power Plant interconnect, at which point it would decrease to 30 inches because of the reduced volume of gas being carried after the Wauna Mill, Northwest Natural, and Beaver Power Plant interconnects. The 30-inch-diameter pipeline would interconnect with the 30-inch-diameter, high pressure Williams Northwest pipeline.
- IND23-6 The Bradwood Landing pipeline would be slightly more than 36 miles long from the terminal to an interconnection with the existing Williams Northwest system. This sendout pipeline is analyzed in the EIS.
- IND23-7 NorthernStar contends that the vast majority of the natural gas sent out from its terminal would be transported to markets in the Pacific Northwest, not California. See our response to comment PM1-23.

K-823

Comment Form: FERC Bradwood Landing LNG DEIS

3. What kind of mitigation do you think should be provided for the impacts of the project?

Stop The project!

4. Please provide any other comments here:

IND23-8

this gas is not for WA, or OR. it is headed for California - the most support for job is just a short period of time the hazards are forever.

IND23-9

few job will be for the overage person as they will bring in personal of their choice to run the terminal

~~ Thank You ~~

Name: LEO K KESLER JR	Date: 10-28-07
Address: 6607 HAZEL DELL RD CASTLE ROCK WA 98611	
IND24-1	1. What do you see as the major impacts of the Bradwood Landing LNG project and pipeline? DREDGING THAT MUCH OF OUR RIVER CAN NOT BE GOOD FROM THE FISH HABITAT. THE SAFETY OF OUR PEOPLE WOULD BE PUT AT HIGH RISK. STEELING THE LAND OF PRIVATE OWNERS FOR A PROJECT THAT IS BEING BUILT ON ANCHANT LAND SLODES, UNSTABLE LANDS, TERRORIST ATTACKS IMPORTING LNG FROM OTHER COUNTRIES IS GOING TO MAKE THEM RICH + US EXPLODE.
IND24-2	2. Does the DEIS provide an accurate description of impacts? If not, what specifically should be changed or improved? IF YOU GO UP ALLEN BRAS ROAD 1/4 MILE LOOK TO THE RIGHT THE KB LINE HAS BEEN BUILT ON UNSTABLE GROUND GARY ALLAN HAS HAD TO HAVE HIS HOUSE MOVED THE PIPE HAD TO BE INSTALLED ON TOP OF THE GROUND IF YOU LOOK AT IT NOW IT HAS SHIFTED & LOOKS LIKE A SNAKE IT IS GOING TO BREAK YOU MUST SEE IT. THE WILLIAMS LINE HAS FAILED ALREADY I WITNESSED IT. THESE LINES ARE ALREADY UNSAFE IF YOU PLUMB IN A BIGGER HIGH PRESSURE LINE YOU ARE JUST ASKING FOR TROUBLE. THIS COMMUNITY DOES NOT NEED OR WANT THIS PROBLEM. THIS IS NOT A SMALL PROJECT THIS IS A HUGE DREDGE 700,000 CUBIC YARDS THIS WOULD FILL 70,000 10 CUBIC YARD DUMP TRUCKS WHICH IF LINED UP WOULD STRETCH FROM LONGVIEW TO THE CALIFORNIA/OREGON BORDER
IND24-3	

~ OVER ~

- IND24-1 Impacts on fish habitat and mitigation associated with dredging of the maneuvering basin are discussed in sections 4.5 and 4.6. Risks to human safety posed by the project would be mitigated as described in section 4.11.
- IND24-2 Although the Bradwood Landing pipeline would be collocated with the KB pipeline where possible to minimize environmental impacts, NorthernStar would not install the Bradwood Landing pipeline in areas of unstable ground without adequate mitigation. Also see our response to comment LA7-25.
- IND24-3 We believe that the Bradwood Landing LNG terminal can take in all of the material dredged from the turning basin. That material would be conveyed by hydraulic dredge slurry pipeline, and not carried in trucks.

October 31, 2007

Federal Energy Regulatory Commission
Attn: Kimberly D. Bose, Secretary
888 First Street NE, Room 1A
Washington, DC 20426
Reference Docket #CP06-365-000

Dear Sirs:

I would like to offer my comments on the Bradwood Landing LNG project (Clatsop County Oregon). I have organized this submission under topics, beginning with a "Comment Summary".

Comment Summary

I have reviewed the Bradwood EIS submission and found nothing of major concern that could not be corrected or mitigated through value oriented engineering and well thought out site management policies. The Bradwood LNG project could bring significant economic value to Clatsop County and neighboring communities. In the long run Bradwood could stabilize our regional supply of natural gas. I share the concern of many opponents of the Bradwood project about the over reliance on carbon based fuels. However the carbon based fuel controversy is well outside of the Bradwood scope of work and should be addressed in another venue unrelated to the Bradwood project. If the Bradwood LNG project meets all established standards, I would like to see this project continue on a forward basis.

Public Process

It is my sincere hope that the Bradwood LNG public process be open, forthright, well thought out, and all in encompassing AND free of Nazi salutes, fabricated data, threats, 1960's Berkeley California protest street theatre, and selfish motivations. I have been greatly disturbed at the antics of the anti-LNG protesters. What truly good input that could have been provided by the anti-LNG faction was drowned out by the silly circus like atmosphere that they and their supporters instigated. A very disturbing observation is that some of the media outlets have taken Bradwood Landing and regulatory comments out of context to fuel scare headlines in the local and statewide media. Where the media could have helped balance out the public discussion, it turned into a propaganda organ of the anti-LNG faction and tainted the process.

I have asked some of the anti-LNG protesters the following question: "If you were addressing the graduating class of our local high schools, what career advice would you give the graduating seniors if they wanted to remain in our community, and be able to buy a home, attend college, obtain well paying employment with transferable skills, and have the good life just like you do? Then I quickly follow on with: What if these kids did not want to clean toilets, flip burgers, wait tables, be a probation officer or drug abuse counselor, or work the green chain at the local mill?" The response has been a classic case of anger management. In fact the anti-LNG group has no desire for any jobs, economic opportunity, or even a hint of opportunity. They already have their nest egg, many are retired, many have made their fortune elsewhere, and most of all, don't have

Individuals

IND25-1

cont'd

kids who would like to remain near their own families. Even though Clatsop County has experienced job growth in recent years, nearly all the job gains have been in the service sector. What our region needs is economic opportunity with upward mobility and transferable skills. The Bradwood LNG project could set this in motion. The associated LNG marine terminal and tugboat support personnel could have a far greater positive job impact than the actual LNG storage facility. The Bradwood project is a win-win for average person.

Marine Navigation and Shipping Impact

There has been quite a bit of controversy over the impact of shipping LNG on the Columbia River. The navigation and security regulations that are part of the Coast Guard rules are clear and concise as to how the vessel is to be operated on the Columbia River. Even though the cargo (LNG) has a bearing on security requirements, the size of the vessel determines the actual navigation and operation of the vessel. In the future as general cargo vessels become even larger, even stricter navigation rules and safety zones will apply to all vessels on the Columbia River. When the Navy Rose Festival Fleet parades up the Columbia River to Portland, wide safety zones are in effect similar to the proposed LNG tanker zones. Large ocean going passenger cruise ships that stop in Astoria or cruise up the river to Portland all have safety and security zones around these vessels as well. I don't see a problem with safety zones – they are in place for safety!

To fully understand safety zones on another level, I would like to cite these examples: The FAA has strict regulations relating to ground taxiing, flight path separation, and navigation of all aircraft. It is demanded that small private aircraft stay away from larger commercial aircraft that cannot safely change course or altitude. The aviation routing system keeps small private planes several miles away from jumbo jets for well defined safety reasons. Continuing on this thread: When you drive a car common sense dictates that you stay away from heavily burdened semi-trucks and you give way when they turn or change lanes. It would be absolutely absurd and stupid for a VW to challenge a loaded cement truck just like as it would be equally risky trying to land a small plane directly across the approach pattern of a 747, or a fisherman in a dingy "standing his ground" in mid channel with a tanker bearing down and unable to maneuver from the center of the navigation channel. Common sense and brains need to come into play when driving, flying or boating. In recent years it has become easier to protest and blame others than it is to use common sense.

Oregon has a private boat operator licensing and education program that requires boat operators to attend boating education classes and passing a final examination. In essence, if you operate a private watercraft in Oregon you need the boating safety card which indicates you know the USCG navigation rules and how to avoid collisions and accidents. The classroom instruction goes into quite a bit of detail about the marine Rules of the Road, safe boat handling, emergency situations, Notice to Mariners, and communicating with other vessels. If a person has no idea of how to safely and legally operate watercraft, maybe they don't belong on the water in the first place.

The Columbia River has been a traditional transportation corridor for every type of vessel and cargo combination for nearly 200 years. Why deny LNG carriers the right to use the Columbia River when there are barges of chlorine, ammonia, gasoline, and propane regularly transit the

Individuals

25

IND25-1
cont'd

same route? Directly adjacent to the river on the shoreline are rail lines that carry the same or similar cargoes through dozens of small towns and rural communities. U.S. Highway 30 parallels the Columbia River and there is significant traffic of hazardous chemicals and petroleum products. During WWII, the first atom bomb that was dropped on Japan was shipped out of a Navy munitions depot a short distance from Bradwood.

Land Use

Oregon has very stringent land use zoning laws to prevent urban sprawl and contain development. One factor in determining current land use zoning is prior use. If the land was used in past for industrial or commercial use, then in all likelihood this use can carry forward – even if the land has not been used in recent years. The Bradwood LNG terminal falls in this category. The land was used a lumber mill and marine terminal in past years. Near by is the Wauna Paper mill which is currently a heavy industrial pulp and paper processing facility with a cogeneration power plant and marine terminal. The history and nearby industrial use clearly indicate the appropriate use of the Bradwood site would extend to LNG.

A related land use issue is adding more property that is zoned for industrial use to the core Bradwood terminal site. Oregon land use regulations allow up or down zoning of adjacent or contiguous property. It is a rather simple procedure that Clatsop County and other local entities have done numerous times in recent years.

Transmission Line Right of Way

Rightfully there is concern about the proposed high pressure gas pipeline and the eminent domain powers of utilities. Oregon is crisscrossed with Bonneville Power Administration high voltage electrical transmission towers – some reaching nearly 100 feet in the air – going on for miles and miles – well beyond the horizon – with most of the right of claimed via eminent domain. The proposed underground gas pipeline from Bradwood will be out of sight and deeply buried. In Oregon it does not take long for trees and berry bushes to quickly cover any open space. The pipeline right of way could create an opportunity for local communities, conservation groups and willing property owners to add more open space and natural habitat adjacent to the right of way for local nature preserves.

Safety and Fire Fighting

Good emergency services are a critical part of any major industrial development project. Clatsop Community College has a fire fighting training program and shipboard firefighting simulator which could be used to train emergency workers. Clatsop Community College also offers a full curriculum of maritime training and related USCG license preparation classes. Training and safety should be no problem at Bradwood.

It is my sincere hope that the Bradwood Landing LNG terminal be approved.

Sincerely,

Jim Sargent

Re: Docket No. CP06-365-000 et al.

My name is Charlene Damitio. My husband, Rick, and I live on Puget Island. Our home is four-tenths of a mile across the Columbia River from Bradwood Landing. If you visit our home at 101 Ostervold Rd., have a seat on our deck and look across the river, you will realize why I am writing this letter. The picture will, indeed, be worth a thousand words.

IND26-1 | This half-mile proximity that I speak of between my and many of my neighbors' homes and the proposed facility is a shore-to-shore measurement. According to Northern Star's plans, their dock is going to be built 300 feet from shore. The dock itself will be 105 feet. Add the width of the beam of an average LNG tanker of 143 feet and that puts some of us another 548 feet closer to the liquid natural gas—at one of the riskiest times in the whole process of getting it from across the world to here; i.e., when the liquid gas is being transferred from the tanker to the storage tanks.

IND26-2 | Those of us living on the stretch of island directly across the river from Bradwood Landing will be most effected. We will suffer the lights, the noise from the combustion vaporizers, the pollution, and the inevitable erosion to our beaches from the powerful tugboats pushing the tankers into dock. We stand to not only lose our peace and tranquility, but our houses—literally—from the erosion.

IND26-3 | But I am not writing for just us folks on the front lines. I feel all of Puget Island is too close for comfort. Not to worry Northern Star tells us—LNG cannot explode. What they don't tell us is that a fire from an accidental leak would burn so hot and so fast that it would look like an explosion. We are finding it difficult to take comfort from the difference between a real explosion and a fire burning hot enough and fast enough to just look like an explosion. Which brings us to a question we have: Is there not a guideline of some kind as to just how close to a residential neighborhood an LNG facility can be built? There are a thousand or more people living on Puget Island, and that means families, children, churches, farms—all at risk in the event of an accident.

We realize that FERC has countless issues to consider in deciding whether or not to issue a permit to Northern Star—some very major issues regarding the environment, the estuary, and future energy needs. Our hope is

Individuals

26

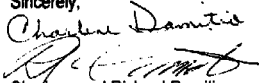

IND26-1 | Section 4.11.5.3 discusses the hazards associated with a spill from an LNG carrier, the zones of concern and their impacts, and what communities fall within each zone of concern.

IND26-2 | Visual impacts due to lighting at the terminal are discussed in section 4.7.2.7 and noise impacts are discussed in section 4.10.2.2. Air quality impacts from LNG vessels and the LNG terminal are discussed in section 4.10.1. See also our response to comment PM3-18.

IND26-3 | As discussed in section 4.11.4, LNG terminals must comply with the siting requirements of 49 CFR 193. Figures 4.11.4-1 and 4.11.4-2 show the thermal radiation zones and vapor dispersion zones calculated for the terminal.

that the concerns of the residents of Puget Island will be taken as seriously as the rest, and that in the end Northern Star's Bradwood Landing permit will be denied.

Sincerely,

Charlene and Richard Damitio

Ms. Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E., Room 1A
Washington, DC 20426

Re: Docket No. CP06-365-000 et. al.

Dear Ms. Bose,

IND27-1 In reference to the Technical Memorandum from Coast & Harbor Engineering regarding the "Mixing Zone Analysis for Bradwood Landing Point Source Discharge" for NorthernStar Natural Gas, I like to bring to your attention a minor error in Par. 2.4, page 3. Flow rate of 4,200 gallons/hr. Maximum flow rate of firewater system is 4,400 gallons/min. (GPM) as stated in several draft reports and the FERC DEIS.

IND27-2 My other comment regarding this memorandum is Par. 2.2 pages 2, 3, Hydrodynamic Conditions. The analysis of the mixing zone was intended for a worse case scenario ambient hydrodynamic conditions. The research recognize a reversal of flow during flood tide (up stream), which is very significant for a period of time. The memorandum however used a 0.0 ft/sec flow as the worse-case condition.

I disagree with the memorandum as the upstream flow condition will create double exposure to the ambient flow by the discharged effluent.

IND27-3 A major concern is the amount of CHROMIUM VI (Hexa-Chrom) created during the Submerged Combustion Vaporized (SCV) process of 190.55 lbs/yr. What's especially worrisome is the cumulative effect after several years of operation and following river maintenance dredging and shore-side disposal, this Chromium VI¹ and other pollutants will become airborne and a outright poison to the local population.

¹ LENNTECH Chromium (Cr) and Water.

Individuals

27

IND27-1 We address this study in the EIS.

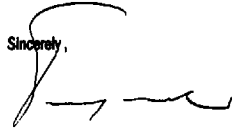

IND27-2 The worst case would be when there is no ambient current to assist with the mixing process. In theory it seems possible that since the river reverses flow that the worst-case scenario would be one in which part of the river is exposed to a double dose of the effluent, resulting in a stronger plume of discharge. However, in reality for several reasons, the worst-case scenario is the period during which the river's current is nearly zero (when the river is in the process of changing directions). For the effluent to double back onto itself it would first have to travel down/up river (depending on the river's initial direction of flow) and then undergo a change in direction and travel back to the exact location of the point of discharge. Given that the discharge point is located around many wharf pilings there is no straight line path that would go undisturbed by swirling eddies. At the same time the effected zone is a relatively small area (especially when considering the vertical direction), meaning that even if some of the effluent were to somehow flow back to the point of discharge it would likely be at a different depth as the original discharge. Instead, the worst-case scenario is one in which the river was assumed to be completely stagnant for an extended period of time, which is never the case. In actuality, eddies and currents in the river are constantly creating small zones of mixing and turbulence, meaning that as a whole the river may not be moving, but within it are pockets of water that are constantly circulating. Essentially, any type of movement within the water column, whether it be from eddies, or simply flow caused by differing densities (due to temperature differences), aids in the mixing of the effluent. Basically, any type of mixing results in diluting the effluent at a much faster rate.

IND27-3 Total chromium data from an existing LNG facility was used for the mixing zone analysis but was conservatively assumed to be chromium VI. Chromium VI was not specifically detected in the discharge at the existing LNG facility and may not be present in the SCV discharge at the Bradwood Landing site. Any chromium in the SCV discharge water would be dissolved and would not settle out into the sediment. The concentrations would be very low even prior to mixing with the river water and would meet ODEQ water quality standards within a mixing zone of 2 feet. There would be no effect on sediments from the dissolved chromium.

K-832

I will make the USACE aware of this condition as not to jeopardize any future dredge disposal sites,
due in part our beach is a "Beach nourishment site".

Sincerely,

Frans Eykel

FEDERAL ENERGY
REGULATORY COMMISSION

Magalie R Salas, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington DC 20426

RE: Docket #: CP06-365

Dear Magalie Salas,

I support Bradwood Landing, the proposed LNG terminal on the Columbia River. I support Bradwood for environmental reasons and I have listed them below:

- Methane, otherwise known as Natural Gas produces a much lower amount of CO2 than coal or coal gasification. We are going to need reliable energy supplies and Natural Gas produces less CO2.
- Many of the world's gas reserves historic "stranded" reserves. These reserves were discovered during oil explorations and capped. So much of the drilling and discovery has been completed. That alone lessens the environmental impact.
- Until recently oil wells burned their excess natural Gas, flared it off. They looked at methane as a useless byproduct in the exploration and development of oil wells. Now, that methane is being captured and sent to market. This again is a very positive environmental gain. The conservation of energy!
- Bradwood will have minimal impact along its pipeline route with directional drilling of the pipeline under rivers and sensitive wetlands. Only 36 miles of pipeline to get Bradwood Landings Natural Gas to the Northwest energy markets.
- Northern Star, Bradwood Landings developer has committed to restoring the Hunt Creek Estuary and Hunt Creek. A small project but we all know how positive Salmon enhancement on multiple projects adds up to Salmon restorations.

Northern Star is a responsible company developing a responsible project. Please join me in supporting Bradwood Landing.

Thank you

FEDERAL ENERGY
 REGULATORY COMMISSION

You have not heard from me before. What you are proposing is such an outrageous and horrible thing you want to do to my life that I could never quite fathom that it could really happen to me and my neighbors! So I have not spoken before, thinking the problem would go away. Not so!

IND29-1 I own 40 acres of hilly land in Cowlitz County in Washington, where you propose to permit a pipeline for LNG. The last plan I heard was to put this line right through the middle of my acreage, thereby destroying its value forever, along with my water supply, yard, garden, a 150-plant blueberry patch, tree farm, and my house. The property has been in the family since 1929, housing three generations and still counting. Our wonderful spring has served us faithfully for 75 plus years.

How could you or anyone believe that I would favor giving this up for any reason, let alone that a few strangers out there are looking for jobs??
 It is unthinkable!

Another of our group of opponents, Marjie Castle, has a similar situation, and her impassioned plea that your permits involve her life, her dreams, and her future, brought tears to my eyes, and that is my plea also! No way will I ever willingly give it up! So just back off!!

IND29-1 A pipeline easement would not destroy property values, as discussed in section 4.8.3.3. Impacts on forest and other vegetation are discussed in section 4.4.2.3. NorthernStar's plan to mitigate impacts on residences within 50 feet of its pipeline construction right-of-way is discussed in section 4.7.3.3. See our responses to comments PM2-4 and PM6-85.

FERC EIS Hearing Members

Dear Members,

I oppose the proposed LNG project at Bradwood Landing.

IND30-1 This project is a direct threat to the restoration of salmon along the entire Columbia River basin into British Columbia, Canada. The gouging out of 47 acres of sediment in Clifton Channel will destroy habitat and organisms in the salmon food chain, as well as salmonides and smolts. Entrainment and impingement will destroy these and even larger fish. Fresh water organisms taken in as ballast and released later in the ocean will die in salt water. Maintaining the turning basin will result in continued silt disturbance, increased velocity of channel flow, more shoreline erosion and more destruction of wetlands than has been admitted previously by the applicant.

IND30-2 Applicant has not submitted any design to address entrainment or impingement, nor has the problem of wave stranding by these megalith tankers been considered.

IND30-3 This project is in direct violation of Goal 16 of the State of Oregon.

Sincerely,

Jean M. Dominey

Jean M. Dominey

Astoria, OR 97103

Attachment: Letter to Clatsop County Commissioners, 10/22/2007, by Jean M. Dominey

***Entrainment involves the drawing in of marine life through an intake tunnel, pipe, or canal at a velocity the marine animals cannot resist. Once drawn in they are subject to impingement, becoming trapped against 'prevention devices' such as screens, racks, bars, and barrier nets. Larger animals may then drown or suffocate after becoming impinged". www.nirs.org/reactorwatch/licensedtokill/executivesummary.htm

30

- IND30-1 Potential impacts on aquatic resources due to construction and maintenance dredging of the maneuvering area and berth (including habitat alteration, the removal of benthic organisms, entrainment and impingement, turbidity, and wake stranding) are discussed in section 4.5.2.1.
- Section 4.5.1.1 has been revised to include additional information on shoreline erosion. Further analysis will be included in the revised BA and EFH Assessment.
- Wetland impacts due to construction of the proposed project are discussed in section 4.4.1.
- IND30-2 Minimization of entrainment and impingement of fish is discussed in the response to comment FA1-28.
- Wake stranding is discussed in the response to comment FA2-19.
- IND30-3 While various sections of the EIS address estuaries and associated wetlands, the intent of the EIS is to evaluate impacts, and weigh them collectively, relative to the purpose and need for the project. Where practicable, mitigation measures are included as conditions to the EIS findings. Further, NorthernStar would comply with other federal, state and local environmental requirements as stipulated in table 1.3-1.

Re: Bradwood Landing: Draft EIS CP06-365 & 366

Following are my comments regarding the DEIS for the proposed Bradwood Landing LNG facility:

I. Omissions

IND31-1

- Sensitive Resources along the Waterway: Figure 4.7.1-1 p. 4-276.
 1. Station Camp and Dismal Nitch, part of the Lewis and Clark National Historical Park located 1-2 miles on either side of the Astoria Bridge on the Washington side.
 2. The Astoria Bridge connecting Oregon and Washington.
 3. Clatsop County's parks on or near the Columbia River including the John Day Boat Ramp, the Westport Boat Ramp and the Big Creek Park near Knappa.
 4. The Oregon Department of Forestry (ODF) campground and trail at Gnat Creek.
 5. The City of Warrenton Trails, part of which runs along the Columbia River.
 6. The City of Astoria River walk along the Columbia River

IND31-2

- The frequency of major floods in Northwest Oregon (five over the past 150 years), which usually closes the Columbia River to traffic with many freighters lined up along the Astoria waterfront. [It should also be noted that, according to ODF¹, the flood of 1996 caused "thousands of shallow, rapidly moving landslides."]

IND31-3

- The frequency in which the Coast Guard closes the bar at the mouth of the Columbia River to all traffic due to severe weather. [It was closed last

¹ ODF Issue Paper: Landslides and Public Safety, Big Picture Considerations, October 2, 2006.

Individuals

31

IND31-1

We discuss the LCNHP in sections 4.7 and 4.9. Station Camp and Dismal Nitch are outside of the Zones of Concern and would not be affected by the project. The EIS text has been revised to discuss the Astoria Bridge. Warrenton's river front trail. The City of Astoria River Walk, Clatsop County parks, and docks at John Day Park and Knappa are discussed in section 4.7. The docks at Westport would not be affected by the project. The ODF campground and trail at Gnat Creek is outside of the Zones of Concern and would not be affected by the project.

IND31-2

See our response to comment PM6-15. The Bradwood Landing terminal would be raised to be above the potential flood level.

IND31-3

LNG vessels would not cross the Columbia River bar during severe weather and would remain in the Pacific Ocean where protection would not be needed. An LNG vessel that has discharged its load would not require protection if it is delayed from departing the LNG terminal due to bar closure.

	November 8, 20072
IND31-3 cont'd	month due to 25-30 foot waves.] <i>Who protects LNG carriers when there is a major tie up like this?</i>
IND31-4	<ul style="list-style-type: none"> The fact reported in the URS report that a shielded arc welded pipeline failed in the 1964 9.2 Level Alaska subduction earthquake.² This is significant omission because the DEIS reassures the reader that "California has not experienced a major pipeline rupture during the past 61 years." (p.4-22) California has not experienced a 9 Level earthquake during this period, whereas Alaska has. A Level 9 earthquake is 30 times stronger than a Level 7. <p>2. <u>Errors</u></p>
IND31-5	<ul style="list-style-type: none"> "An earthquake associated with the portion of the Cascadian Subduction Zone in northwestern Oregon and southwestern Washington has not occurred in historic time." (p. 4-11) "Given these PGA's, and the lack of historical seismicity in the Pacific Northwest with regard to Cascadian Subduction Zone events to assist in bracketing earthquake recurrence, etc." (p. 4-11) <p><i>I consider these the most glaring and serious errors in the DEIS. To the uninformed, they downplay the serious seismic risk in this area. Based on geological research over the past 20 years, we can pinpoint the date of major subduction earthquakes over many thousand years, including a 9 Level on January 26, 1700.³ They reoccur every 300 to 500 years but can reoccur in 100 years. Thus, we are 307 years into this time period; we know a major earthquake could occur at any time! A local geologist estimated our risk of a major subduction earthquake during the next 50 years at 15 to 20 %. How do you reconcile these facts with the following statement in the DEIS?</i></p>
IND31-6	<p>URS (2006a) conducted a site-specific seismic hazard analysis for the proposed LNG terminal facility that indicated a peak horizontal bedrock acceleration of 0.38 gravity with a 2% probability of exceedence in 50 years (i.e. a 2,475-year return period) or peak horizontal acceleration bedrock acceleration of 0.17 gravity with a 10 % probability of exceedence in 50 years (i.e. a 475-year return period). (p. 4-11)</p>
IND31-7	<p>This is not an academic exercise to the people who live here. The knowledge acquired over the past 20 years has changed education, building codes, warning systems, signage, emergency preparedness, etc. My worse case scenario is if there was a Level 9+ quake in this area that would devastate</p>
	<p>² See URS Final Geohazard Report, February 2007, p. 4-2. They state that it failed during a massive flow liquefaction event and state that large scale flow liquefaction of this type is "not likely to impact the pipeline." This is not very reassuring.</p> <p>³ See URS Report February 2006, p. 5-2. URS used a recurrence interval for the maximum megathrust earthquake of 450 plus or minus 200 years in their probabilistic equations. p. 6-8</p>

Individuals

31

IND31-4	See our response to comment IND22-14.
IND31-5	See our response to comment PM6-18.
IND31-6	See our response to comment IND22-11.
IND31-7	See our response to comment IND22-12.

IND31-7 cont'd	<p style="text-align: right;">November 8, 20073</p> <p>Portland and the coast; the damage to the Bradwood terminal and/or pipeline could cause numerous fires in our forest and surrounding areas with no agency able to help us control them.</p>
IND31-8	<p><u>3. Hazards Associated with the Pipeline</u></p> <p>While I am very concerned with the geological hazards at the proposed terminal site, it is clear that they are being taken seriously. I do not get that same sense with the pipeline. I recognize that much work has been done to identify the faults and non-seismic landslide hazards. The issue that I am raising is has significant recognition been given to how these hazards would be magnified in the event of a massive earthquake. (See footnote 2 on previous page.)</p> <p>URS's Supplemental Geohazards Assessment Report, March 2007 acknowledges the liquefaction and lateral spreading especially along the Columbia River in Oregon, but then dismisses the hazard with the following statement:</p> <p style="padding-left: 40px;">Seismic wave propagation, tectonic subsidence, and tsunami/seiche hazards were not found to present a significant threat to the proposed pipeline. (p. 12)</p> <p>I do not understand the basis for this statement.</p>
IND31-9	<p>They also discuss the primary non-seismic hazards in Cowlitz County as landslides; various techniques are describes for mitigation. Once again, my concern is how well do these various techniques hold up in the event of a major earthquake or a major flood?</p>
IND31-10	<p><u>Recommendation:</u> Given the extreme impact if any errors or faulty assumptions have been made in the technical reports on geohazards, I strongly urge that FERC submit them to an independent scientific review.</p>

Individuals

31

IND31-8	<p>As described in section 4.1.4.3, liquefaction and lateral spreading are generally not significant hazards for pipelines due to their ductile nature. However, additional geotechnical field studies are required to determine appropriate site-specific mitigation measures for hazards along the pipeline route. Seismic loads would be factored into slope stability assessments. Also see the response to comment LA7-25.</p>
IND31-9	<p>See our response to comment PM6-19.</p>
IND31-10	<p>See our response to comment SA1-4.</p>

Subject: COMMENTS ON BRADWOOD FEDERAL EIS

Cfob-365
Cfob-366

07 Nov. 14

ORIGINAL

IND32-1

SECTION 3.1.6.3 ALTERNATIVE VAPORIZATION TECHNOLOGIES

SOURCES OF VAPORIZATION HEAT THAT WERE CONSIDERED

- AMBIENT AIR - INFEASIBLE BECAUSE OF COOL WEATHER
- RIVER WATER - ENVIRONMENTAL CONCERNS OF WATER DISCHARGE, ONLY FEASIBLE FOR 7 MONTHS OF YEAR
- ELECTRICAL POWER - TOO EXPENSIVE
- WOOD CHIPS - LACK OF STORAGE AREA, PRICE VARIATION, EMISSIONS, ROAD TO SITE INADEQUATE FOR DELIVERY BY TRUCK.
- WASTE HEAT FROM COGENERATION - NEED TO GENERATE TOO MUCH ELECTRICITY FOR GRID TO GET WASTE HEAT
- NATURAL GAS - SELECTED ALTERNATIVE BY BRADWOOD

THE NATURAL GAS ALTERNATIVE IS NOT FEASIBLE BECAUSE IT VIOLATES EMERGENCY OREGON LEGISLATION PASSED AUG 6,2007 (CLIMATE CONTROL ACT-HB3543) WHICH REQUIRES A REDUCTION IN GREENHOUSE GAS EMISSIONS IN OREGON.

- INCREASE CO2 GREENHOUSE EMISSIONS FROM NATURAL GAS IN NORTHWEST US BY 1.5%
- INCREASE CO2 GREENHOUSE EMISSIONS FROM NATURAL GAS IN OREGON BY 5%
- INCREASE TOTAL CO2 GREENHOUSE EMISSIONS IN OREGON BY 1%

BRADWOOD MUST BE BUILT WITHOUT USING FOSSIL FUELS FOR REGASIFICATION. THE EIS IS DEFICIENT FOR NOT INCLUDING THIS INFORMATION

Individuals

32

IND32-1

There are no federal standards or regulations regarding CO₂ emissions. Given that the FERC has exclusive jurisdiction over onshore LNG import terminals, Oregon's CO₂ emissions standards for new energy facilities do not apply to the project. However, NorthernStar has stated that it would voluntarily comply with Oregon's CO₂ emissions standards for new energy facilities. See section 4.10 of the EIS.

IND32-2

THE ANALYSIS OF THE ALTERNATIVE OF USING WASTE HEAT FROM COGENERATION WITH WOOD CHIPS AS A FUEL PRESENTED IN THE PRESENT EIS IS IN ERROR.

- THE AMOUNT OF WASTE HEAT REQUIRED FROM COGENERATION CAN BE REDUCED BY CO-LOCATING FACILITIES WHICH USE PROCESSES THAT CAN PARTIALLY HEAT UP THE LNG (AIR SEPARATION TO CREATE INDUSTRIAL GASES, ICE MAKING). THIS REDUCES REGASIFICATION HEAT REQUIRED FROM COGENERATION PLANT TO 70KW WHICH WILL GENERATE 25KW OF ELECTRICITY AND SUPPORT THE NEEDS OF BRADWOOD LNG WITH NO IMPACT ON GRID.
- USE WOOD CHIPS FROM CONSTRUCTION AND DEMOLITION WHICH IS PRESENTLY RECYCLED BY METRO PORTLAND TO PROVIDE AN AFFORDABLE, SUSTAINABLE WOOD CHIP FUEL
- RECYCLED CONSTRUCTION AND DEMOLITION WOOD WASTE HAS BEEN PROVEN BY 2006 TEST PROGRAM BY 6 NEW ENGLAND STATES TO BE ACCEPTABLE (LEVEL OF EMISSIONS) FUEL. AN AIR QUALITY PERMIT WAS GRANTED TO A SIMILAR WOOD WASTE PLANT IN LAKEVIEW OREGON THIS YEAR. EMISSIONS ARE NOT A PROBLEM
- SHIP FUEL BY BARGE, ONE A WEEK. THIS IS STANDARD PRACTICE ON COLUMBIA. BRADWOOD DOCK ONLY USED 15% OF TIME FOR LNG.
- USE THE 10 ACRE SITE ADJACENT TO BRADWOOD THAT IS PRESENTLY ZONED FOR FOR THIS USE WITH A CONDITIONAL USE PERMIT, A TWO WEEK SUPPLY OF WOOD WASTE(1 MILLION CU FT.) CAN BE STORED IN THREE COVERED 100 FT IN DIAMETER SILOS 45 FEET IN HEIGHT. THIS SITE ALSO IS LARGE ENOUGH FOR THE COGENERATION PLANT AND AIR SEPARATION AND ICE PLANTS. AN EXISTING RAIL LINE ALLOWS PRODUCT SHIPMENT.

THIS INFORMATION WAS PROVIDED TO FERC BY THE ATTACHED LETTER ON SEPTEMBER 21, 2006 WELL IN ADVANCE OF THE PREPARATION OF THE EIS.

BY NOT CORRECTING THE ANALYSIS OF THE WOOD WASTE SECTION OF THE ALTERNATIVE REGASIFICATION TECHNOLOGIES THE EIS IS NOT A DOCUMENT WHICH CAN BE USED FOR FERC DECISION MAKING AND IS SUBJECT TO COURT ACTION AS A DEFICIENT EIS.

Individuals

32

IND32-2

Our analysis in section 3.1.6.3 discussed the burning of wood chips as an alternative source of heat for the terminal vaporizers. Use of a 10-acre site adjacent to the proposed LNG terminal site for a wood chip fueled cogeneration facility would entail potential additional environmental impacts (e.g., wetlands, vegetation, air quality, noise, visual, etc.). We do not believe this alternative is environmentally superior to the proposed vaporization heat source of natural gas. Our EIS is not deficient and may be used by the Commission as part of its decision making process.

SUBJECT: BRADWOOD LANDING LNG PROJECT (DOCKET PF05-10-000)
ALTERNATIVE GASIFICATION SCHEME

DEAR MR. TURPIN,

THIS SUBMITTAL IS PER YOUR REQUEST FOR ADDITIONAL INFORMATION FOR THE FERC ENVIRONMENTAL IMPACT STATEMENT(EIS) FOR THE SUBJECT PROJECT. ENCLOSED PLEASE FIND A DRAFT COPY OF "COLUMBIA ONE" A 25 MW WASTE WOOD FIRED COGENERATION PLANT PROPOSED TO BE CO-LOCATED WITH THE BRADWOOD LNG FACILITY.

COLUMBIA ONE IS A UNIQUE ALTERNATIVE TO LNG GASIFICATION THAT WILL PROVIDE SIGNIFICANT MITIGATION TO THE IMPACTS OF THE BRADWOOD LNG PROJECT SUCH AS ADDING AN ADDITIONAL 80 FULL TIME FAMILY WAGE JOBS, IMPROVED AIR/WATER QUALITY AND SOLID WASTE DISPOSAL, AND A SUBSTITUTION OF ALTERNATIVE FUEL FOR FOSSIL FUEL.

THE ENCLOSED DOCUMENT IS FORMATTED AS A DRAFT OF A "OREGON SOLUTIONS PROJECT" AS MAY, IN THE FUTURE, BE DESIGNATED BY THE GOVERNOR. OBVIOUSLY WITHOUT FERC APPROVAL OF THE PROJECT AND A SUBSEQUENT ANALYSIS BY THE OREGON SOLUTIONS STAFF AND OTHER ORGANIZATIONS IDENTIFIED BY THE DOCUMENT, THERE IS NO COLUMBIA ONE PROJECT. THIS IS A DRAFT PROPOSAL FOR IMPLEMENTATION BUT IT IS A VALID DESIGN ALTERNATIVE FOR THE BRADWOOD PROJECT AND IT SHOULD BE CONSIDERED IN THE PREPARATION OF THE BRADWOOD EIS.

SINCERELY YOURS

Abbreviations Used:

FERC – Federal Energy Regulatory Commission
LNG – Liquefied Natural Gas
NG – Natural Gas
CEII – Critical Energy Infrastructure Information

- | | |
|---------|---|
| IND33-1 | 1. What specific criteria does the FERC use to determine if an LNG terminal facility site is suitable or not. And what differentiates a good location versus an unsuitable location. |
| IND33-2 | 2. What specific criteria does the FERC use to determine whether an LNG facility can be secured. How can a site as the proposed Bradwood site be made secure in relation to terrain, vegetative cover, immediate or adjacent access routes of the Railroad, Clifton Channel, Columbia River, US Highway 30(Oregon), Bradley State Park (Oregon), and Puget Island (Washington), with roads connecting to Washington State Route 4. |
| IND33-3 | 3. What specific criteria does the FERC use to determine whether an LNG vessel turning basin and berth is a suitable location and defined as safe and secure. Further explain how the proposed turning basin and berth can made safe and secure in relation to their proximity to the Columbia River Navigational Channel which is traversed frequently by large cargo vessels some of which have lost power and maneuverability and have run adrift. |
| IND33-4 | 4. What specific criteria does the FERC use to determine if the public is safe from an LNG facility. |
| | 5. What maximum number of people does the FERC consider an acceptable risk within 0.5 miles, 1 miles, 2 miles, 3 miles, 5 miles, 7 miles, and 10 miles in relation to the Sandia Laboratory Studies regarding LNG vessel's partial leak or breach and an LNG storage tank failure. |

Individuals

33

- IND33-1 A variety of qualitative and quantitative criteria are used to determine the suitability of an LNG terminal site. Regulatory specifications regarding the LNG facility layout and safety siting factors that must be met are described in sections 3.1.5.3 and 4.11. Other factors that favor site suitability are also discussed in section 3.1.5.3.
- IND33-2 As described in the WSR (see Appendix H), LNG facilities are subject to the security regulations in 33 CFR 105 and would be required to implement a Coast Guard-approved Facility Security Plan. A 200-yard security zone would be implemented around an LNG vessel at the LNG terminal and a 50-yard security zone would be implemented around the LNG terminal when an LNG vessel is not present (see section 4.11.5.5). Also see our response to comment IND23-1.
- IND33-3 LNG facilities must comply with the siting requirements of 49 CFR 193, Subpart B and NFPA 59A, 2001 edition (see section 4.11.4).
- IND33-4 The Sandia Report analysis of an LNG cargo tank breach considers impacts in three zones ranging from 500 meters to 3,500 meters. Consequences due to spills associated with LNG storage tanks are analyzed by calculating thermal exclusion zones and vapor dispersion zones. When assessing potential impacts, the FERC considered all pertinent resources within these areas. The level of risk is unrelated to the number of persons in a given area but to the likelihood of a spill occurring multiplied by the consequences of the incident. The draft EIS presents a consequence analysis and given the proposed mitigation measures, states that the likelihood of a spill occurring is highly unlikely.

IND33-5	6. What magnitude earthquake can the proposed Bradwood LNG facility withstand before any equipment failures occur considering the non-rigid soil type along the banks of the Lower Columbia River.														
IND33-6	7. What is the 99% Confidence Level (a statistical measure) that a major LNG facility pipe will fail, an LNG storage tank will fail, and the regasified LNG sendout pipeline will fail in relation to the known unstable soils and seismic instability of the Bradwood area in 5, 10, 20, 30, and 50 years.														
IND33-7	8. What specific criteria does the FERC use to determine if threatened, endangered, and protected species and their habitat will be undamaged and protected.														
IND33-8	9. What specific criteria does the FERC use to determine if a mitigation plan will actually mitigate damages.														
IND33-9	10. What is the FERC process to determine that any and all information, reports, studies, data, Environmental Impact Statements, and Water Suitability Assessments associated with the proposed Bradwood LNG permit application are comprehensive and accurate.														
IND33-10	11. What specific criteria does the FERC use to compare against the information, reports, studies, data, Environmental Impact Statements, and Water Suitability Assessments received to determine if the proposed Bradwood LNG facility site is suitable or not.														
IND33-11	12. Is there any United States location accessible or made accessible to an LNG vessel in comparison to the proposed Bradwood site that the FERC would not provide a site permit for as long as the applicants did the required paper work.														
IND33-12	13. What are the criteria that would cause the FERC to deny a site permit for a proposed LNG facility in comparison to the proposed Bradwood site.														
IND33-13	14. What FERC Department/Staff is responsible for comparing permit application information with FERC criteria, in reference to questions 11 and 13, and making the determination regarding site suitability and the Waterway Suitability Assessment. And has there been any actions to dismiss or bypass any permit application information in the determination of a permit application approval for the Bradwood proposal.														
IND33-14	15. Has there been any administration requests to fast track, expedite, or ensure approval of the proposed Bradwood LNG site permit.														
IND33-15	16. What is the position of the FERC to the Judge Radden decision regarding the protection of salmon and salmon habitat in relation to the dredging of historic Indian fishing grounds and documented irreplaceable endangered salmon species rearing grounds in the area of the Clifton Channel.														
IND33-16	17. How will the proposed ballast water screens which can shred juvenile salmon during ballast water intake protect salmon at the proposed Bradwood site.														
IND33-17	18. If under the equal protection provision an LNG vessel security exclusion zone equal in size to other security exclusion zones for LNG vessels operating in other areas of the country; is wider than the Columbia River Navigation Channel, and then blocks river transit of all other vessels which need to use the Channel. What methodology does the FERC use to explain the blockage of a major river artery of the Pacific Northwest's economy, in the import and export of trade through river commerce, river recreation, and marine services and support of trade in relation to the fact that this region has shown no measurable need for LNG. Not only in relation to the Bradwood LNG proposal but other proposals which could materialize, creating a frequently blocked Columbia River.														
	19. What are the long term projected losses or costs to the following businesses, public services, and economies due to the siting of an LNG facility(s) on the Columbia River in relation to river blockages and potential loss of shipping lines serving this region.														
	<table> <tr> <td>a. Grain exports</td><td>b. Container imports exports</td></tr> <tr> <td>c. Other exports</td><td>d. Vessel repair and maintenance</td></tr> <tr> <td>e. Fishing / Crabbing business</td><td>f. River related recreation</td></tr> <tr> <td>g. Restaurant & Lodging</td><td>h. Stevedoring</td></tr> <tr> <td>i. Port revenue and fees</td><td>j. Individuals

33

IND33-5	As described in section 4.1.3.3, the LNG tanks would be supported on deep foundations and the potential for soil liquefaction is proposed to be mitigated through vibroflotation. The final engineering design for the LNG terminal would incorporate detailed seismic specifications that would be required to satisfy the FERC's draft "Seismic Design Guidelines and Data Submittal Requirements for LNG Facilities." The specific magnitudes of the earthquakes are discussed in section 4.1.3.3.
IND33-6	With the mitigation measures described in section 4.1, unstable soils and seismicity would not result in an adverse impact on the LNG terminal or pipeline.
IND33-7	As described in sections 4.5 and 4.6, the project has the potential for adverse impacts on listed species; however, these impacts would be mitigated.
IND33-8	The FERC staff has established baseline mitigation measures in its Plan and Procedures. We evaluate the sufficiency of applicants' mitigation plans on a project-specific basis through staff evaluation and consultation with the appropriate resource agencies and stakeholders. Construction inspections and post-construction monitoring are conducted to document the effectiveness of construction mitigation measures and evaluate the success of restoration.
IND33-9	Information that is used for preparing a draft EIS is reviewed by the FERC staff, and our third-party contractors, who are independent, experienced environmental specialists. All data filed by NorthernStar are part of the public record, and some studies related to specific resources were reviewed by staff of other federal and state agencies, with their comments submitted to the FERC also placed in the files for this proceeding. The draft EIS is made available to the public and government agencies for review to help us ensure that the information presented is comprehensive and accurate. The WSA, prepared by the applicant, is classified as SSI and is evaluated exclusively by the Coast Guard.
IND33-10	The project must meet certain safety and environmental regulations and the FERC, Coast Guard, and COE must comply with certain statutes before issuing any permits and authorizations (see section 1.3). The Coast Guard will determine if the waterway is suitable for use by LNG marine traffic in its LOR. The design of the Bradwood Landing terminal is suitable, as discussed in section 4.11. See our response to comment IND33-9.
IND33-11	The FERC has denied authorization to a proposed LNG import terminal--the KeySpan LNG Facility Upgrade Project in Rhode Island. A project would not be approved if our assessment determined that the project would result in an unacceptable level of adverse impacts that could not be mitigated.

Individuals

33

- IND33-12 The FERC staff assigned to this project works in the Office of Energy Projects. The project team responsible for the production of this EIS is listed in Appendix J, and includes the FERC staff, and staff from NRG, our third-party environmental contractor. The Coast Guard is responsible for evaluating the WSA, using staff stationed in Sector Portland and the Pacific Command offices in Oakland and Alameda, California. NorthernStar is responsible for applying for all necessary permits for its project, and the status of those permit applications is listed in table 1.3-1.
- IND33-13 See our response to comment PM2-20. However, under the EPAct 2005, the FERC has an obligation to expeditiously review natural gas applications.
- IND33-14 The FERC staff is unaware of any official agency position on the Judge Redden decision.
- IND33-15 The purpose of the fish screens is to mitigate impacts of water withdrawal on juvenile salmon. Therefore, they would protect salmon.
- IND33-16 While a safety/security zone would be in place around an LNG ship, other vessels would be allowed to enter this zone with permission. This would also allow vessels to pass at four designated areas of two-way traffic along the LNG marine waterway. Through communication and scheduling, the Coast Guard anticipates that the safety/security zone would have a very minor impact on vessel traffic.
- IND33-17 Fire and safety departments would need to increase resources. As described in section 4.11.6, NorthernStar is in the process of developing an ERP and Cost-Sharing Plan identifying the mechanisms for funding all project-specific security/emergency management costs that would be imposed on state and local agencies. The Coast Guard has not yet obligated any resources to the project. Security escorts are expected to be delegated to local law enforcement entities, which could then be part of the Cost-Sharing Plan. All other items in this list would either be unaffected or would be beneficially impacted by the project (see section 4.8).

IND33-18	20. What methodologies does the FERC use to justify the direct and indirect short and long term damages to irreplaceable historic Indian fishing grounds and irreplaceable historic and current salmon rearing grounds caused by dredging of the Clifton Channel and frequent churning of the Clifton Channel bottom via the LNG vessel turnings.
IND33-19	21. What is the amount of damage to the Columbia River salmon habitat in comparison to the proposed applicant funded mitigation. Comparing the applicants proposed funded mitigation to the amount of funds currently going into salmon habitat restoration by non-LNG related sources. And the amount of damage repaired by the proposed applicant funds, in the repair attempt effected by the applicants proposed salmon restoration mitigation.
IND33-20	22. The endangered and protected Lower Columbian White-tailed Deer currently use the Bradwood site as habitat and to travel East and West along the river valley which has been stated by Wildlife officials to be beneficial for the deer in order to avoid genetic deterioration due to inbreeding. How will the FERC ensure that the deer will not be blocked by structures, lights, noise, and fences in the narrow corridor which exists at the Bradwood site.
IND33-21	23. Since the NG demand in the Pacific Northwest is considered stable with no additional supply needed, what is the criteria used by the FERC in the permit process to justify the siting of the Bradwood LNG facility over sites or potential sites within the region of the product end user.
IND33-22	24. Does the FERC cite a regional need for the Bradwood LNG proposal.
IND33-23	25. Is there a FERC rationale for placing an importance on the Bradwood LNG permit process.
IND32-24	26. In the FERC permit process of the Bradwood LNG proposal is the promotion of foreign imports rather than domestic energy production, including renewable energy, that would be far less vulnerable to attack, terrible accident, or susceptible to foreign supply disruptions, a major factor.
IND33-25	27. In the permit process of the Bradwood proposal is there a FERC provision for revising it's mission and administrative rules to promote domestic energy production, including renewable energy over foreign energy imports for National Economic Benefit.
IND33-26	28. What in the FERC permit process for the Bradwood proposal sendout pipeline, will ensure that the many field drains or drain tiles will be left undamaged or repaired to excellent condition in the farmlands it will pass through.
IND33-27	29. In the Bradwood permit process, of foreign imported LNG, what provisions are made by the FERC for the prevention of damage to gas equipment known to be damaged by imported LNG.
IND33-28	30. Under the FERC provisions for the use of eminent domain, what is the Pacific Northwest regional benefit to be provided as a public use and necessity.
	31. Under the FERC permit process for the proposed Bradwood LNG facility, how will the FERC provide for and ensure that the safety of the public will not be dependent on the private company operators of the LNG facilities including their sendout pipelines, knowing that not all leaks are reported. A known industry practice that can cause more casualties and severe incidents. And knowing that a safety conscience company may sell to a less safety conscience company at any time.
	32. In the permit process for the proposed Bradwood LNG facility how will the FERC ensure the public is safeguarded to the highest extent possible, using the best methods. Too include the latest in odorant technology.
	33. In the permit process how will the FERC ensure that the equal protection provision is provided for in safeguarding the public over the full length of the Bradwood proposal sendout pipeline, especially in regard to odorant in the product stream, knowing that odorant is required in the main NG transmission pipelines in other jurisdictions in which the pipeline connects.

Individuals

33

IND33-18	No historic Indian fishing grounds have been identified in the project area. See section 4.9. Impacts on salmon and mitigation are described in sections 4.5 and 4.6. The dredging of the turning basin would occur within the main stem of the Columbia River, adjacent to the navigation channel, and not in Clifton Channel. See also our response to comment IND82-5.
IND33-19	NorthernStar has made a commitment that the proposed project would provide an overall significant net benefit to the environment of the lower Columbia River ecosystem. We have recommended in section 4.4.1.2 that NorthernStar's final Compensatory Mitigation Plan be filed, along with agency approvals, with the Secretary prior to construction of the project. Compensatory mitigation funded by the applicant for preservation and restoration of aquatic habitat would be based on project-related impacts on salmonids; a comparison of this level of funding to that currently being contributed for salmonid restoration throughout the lower Columbia River is not relevant to the EIS. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.
IND33-20	See our response to comment FA4-6.
IND33-21	As described in section 1.1, additional supplies of natural gas will be needed in the Pacific Northwest. Because the objective Bradwood Landing Project is to serve the Pacific Northwest (see the beginning of section 3.1), we only looked at alternatives along the Pacific coast.
IND33-22	NorthernStar's applications are being reviewed in a manner consistent with the FERC staff's review of all other LNG import terminal applications.
IND33-23	NorthernStar proposes to import LNG to provide a new supply of natural gas to the Pacific Northwest, as explained in section 1.1. Section 3 discusses renewable energy resources. The FERC does not promote one form of energy over another nor does it promote use of domestic energy sources over foreign sources. Section 4.11 indicates we believe that with the measures to be implemented by NorthernStar and the conditions to be imposed by the Coast Guard, the chance of an accident or terrorist attack is highly unlikely.
IND33-24	Repair of field drains or drain tiles impacted by pipeline construction is a requirement for FERC-regulated projects, in accordance with the FERC staff's Plan.
IND33-25	See our responses to comments PM1-22 and PM6-79.
IND33-26	The Commission's Order for this project will present its findings of public convenience and necessity.

Individuals

33

- IND33-27 Section 4.11 addresses pipeline safety.
- IND33-28 See our response to PM5-81. See also our response to comment IND33-27.

IND33-28 cont'd	34. With respect to public safety in the permit process of the proposed Bradwood LNG facilities, how much weight does the FERC give requests on behalf of the public for safeguarding as compared to the permit applicant's willingness to provide them in relation to the fact that odorant safeguards are in common use. And is this the same weighting that FERC personnel would desire if they were the affected public.
IND33-29	35. Regarding LNG vessel navigation in the confined shorelines of the Columbia River valley, how will the FERC fully cover the risks and dangers in relation to the Bradwood proposal faced by the public and Coast Guard personnel, in the permit process, should an event or accident with LNG transport occur. 36. How can the FERC, in the permit process of the proposed Bradwood LNG facility, properly safeguard the public, public safety agencies, and their personnel by relying on, so stated by Sandia Laboratory's model, the limitations of which may not reflect actual occurrences, in reference to LNG vessel navigation events, accidents, or terrorist attack, in the destruction of the vessel. 37. How will the FERC through the permit process of the proposed Bradwood LNG facility, ensure the public and safety agencies personnel in a confined river valley, are properly safeguarded without information gained from full scale open water testing.
IND33-30	38. Can the FERC in general or as part of the Bradwood LNG permit process, perform or demand that the appropriate government agency or permit applicant perform realistic full scale LNG vessel testing in relation to safeguarding the public, safety agencies, and their personnel, from LNG vessel events, accidents, or explosions, prior to final permit approval. What process would be required to make this happen. And could full scale testing reflect other qualified scientific opinion and approach to benefit the public.
IND33-31	39. As part of the FERC permit process of the Bradwood proposal, what measures and procedures will be implemented to ensure the safety of densely populated regions further up river from terrorists taking the LNG vessel to any of those locations and exploding it.
IND33-32	40. As part of the Bradwood LNG permit process, will the FERC request that a fully independent risk analysis be performed in order to protect the public, especially for a confined river valley in which the Bradwood proposal is located. And what process would be required to make this happen for the benefit of the public.
IND33-33	41. In regard to Columbia River Navigation Channel and Clifton Channel dredging as part of the Bradwood proposal, the public could be better served if the FERC sought fully independent analysis of a full scale comparable example of river dredging effects to the down stream conditions rather than relying on limited computational models of those effects. And what permit process would be required to ensure this occurred under FERC.
IND33-34	42. What in the proposed Bradwood LNG facilities permitting process protects individuals and the public from sendout pipelines located too close to structures and residences if a leak, accident, blowout, or explosion occur. 43. What is the tested or is generally accepted from empirical evidence, damage distance from a regasified LNG sendout pipeline the size, pressure, flow rate, and pipe material as that of the Bradwood proposal. 44. How will the FERC through the permit process, ensure the safety of individuals, residences, structures, businesses, and the public in relation to the tested or generally accepted damage distance due to a leak, accident, blowout, or explosion of the proposed Bradwood sendout pipeline.
IND33-35	45. In regard to the FERC permit process for the proposed Bradwood sendout pipeline, when and for what purpose, and based on what criteria, has any LNG facility sendout pipeline or NG pipeline installation minimum distance requirements from residences and structures been lowered or removed from the governing Code of Federal Regulations and on what date did this occur.

Individuals

33

IND33-29	Safety and security issues, along with mitigation, are discussed in detail in section 4.11. The modeling approach used by FERC employed during project review included the best available methods and in areas of uncertainty, used conservative assumptions. Also, the GAO Report (GAO 2007) presented a survey of experts who work in areas related to LNG risk, hazards, and consequence modeling. The report determined that the primary hazard to the public would be heat from a fire. A total of 11 of 15 experts were of the opinion that current methods for estimating LNG fire heat hazard distances are "about right" or too conservative.
IND33-30	Full-scale LNG vessel breach scenario testing would be outside the scope of this EIS.
IND33-31	Credible terrorist attack scenarios were developed in the WSA including the measures needed to be in place to detect, deter, and respond. This was further analyzed in the WSR. The scenarios developed in the WSA process and the WSR analysis are considered SSI and not releasable to the public.
IND33-32	The FERC will not request a fully independent risk analysis because that would be outside the scope of this EIS.
IND33-33	The EIS discusses dredging in sections 4.2.2.2 and 4.3.2.3. See our response to comment IND33-18.
IND33-34	See our response to comment IND33-27. If an explosion were to occur from a gas pipeline, the resulting damage would depend on the volume of gas released before it ignites and the conditions in the vicinity of the leak (e.g., the topography, meteoric conditions). There are no established distances based on the pipeline characteristics.
IND33-35	A discussion of the DOT's Minimum Federal Safety Standards in 49 CFR Part 192 is included in section 4.11.9.1. These standards do not include requirements for a minimum distance between a natural gas pipeline and residences or structures; rather, the standards include requirements for pipeline design that varies depending on the presence of nearby residences.

- IND33-36 46. In regard to the safety issue of the proposed Bradwood LNG facility sendout pipeline distance from residences and structures, is the FERC placing the public at risk if no minimum distance is required under the permit process in relation to the destructive capability of high pressure large diameter NG pipelines.
- IND33-37 47. Under the FERC permit process for the Bradwood LNG proposal, what procedures allow and require an LNG facility sendout pipeline to be routed around certain businesses, properties, structures, and residences but not others. And how will the FERC ensure that any or all of the public can make use of this pipeline location procedure under the equal protection provision.
- IND33-38 48. Under the FERC permit process, what will be the temperature of the regasified LNG as it enters the sendout pipeline of the Bradwood proposal.
49. Under the FERC permit process, the following Bradwood proposal sendout pipeline temperature information request is a necessary component for the affected landowners to make adjustments to their farming or other business operations as needed:
- At 2 mile intervals for each of the following parameters, beginning at the Bradwood facility, ending at the Oregon shore of the Columbia River and beginning again at the Washington shore of the Columbia River
- Temperature of product in pipe
 - Temperature of ground surface directly above the centerline of the pipeline while the ground surface temperature 500 feet away is at temperatures ranging from 10degF to 110degF at 10degF intervals
 - Temperature of the ground surface 50 feet away from the centerline of the pipeline while the ground surface temperature 500 feet away is at temperatures ranging from 10degF to 110degF at 10degF intervals.
- IND33-39 50. In the FERC permit process for the Bradwood LNG proposal what criteria is used in the applicant's amount of spending on salmon habitat mitigation versus spending for public safety.
- IND33-40 51. How will the FERC in the permit process ensure that the public is properly safeguarded if odorant is not required in the regasified LNG sendout pipeline for the Bradwood proposal.
- IND33-41 52. In the permit process, how will the FERC ensure that a fully independent analysis of the Bradwood LNG proposal occurs regarding all aspects of the project including salmon habitat destruction and mitigation. And verify over the span of the existence the Bradwood proposal that habitat destruction mitigation measures are maintained, and the salmon habitat is truly mitigated and no other destruction has occurred or is ignored.
53. Through the permit process of the Bradwood proposal, how will the FERC ensure threatened and endangered salmon habitat is properly mitigated into the future when no guarantee of continued mitigation funding is indicated should the project fail for any reason, yet the habitat damage will have been done.
- IND33-42 54. Under the FERC permit process for defining CEII in the transport and transmission of LNG and regasified LNG, what criteria required rule changes under the definition of CEII to extend this provision to storage and construction of LNG facilities in the Bradwood proposal.
55. What is the purpose and public benefit of CEII as defined by the FERC when energy facilities are fixed structures, as is the Bradwood proposal, and easily identified simply by observation, including sendout pipelines which will be exposed at certain locations.
56. Under the FERC permit process for the Bradwood LNG proposal, how will the FERC ensure due process and redress regarding eminent domain will occur under the present FERC procedure of labeling necessary information to the affected landowners as CEII and thereby denying this information to guaranty due process and redress
57. How is the public benefited by restricting access to necessary information regarding the Bradwood LNG proposals under the FERC definition of CEII, thereby restricting their ability to make sound decisions based on the merits of a proposal.

Individuals

33

- IND33-36 See our response to comment IND33-35.
- IND33-37 NorthernStar selected the route for its sendout pipeline. The EIS, which is a public document, presents our review of that route. Section 4.7.3.3 discusses impacts on residences. We have recommended that the Commission Order include a condition that would assist in the mitigation of impacts on residences within 50 feet of construction work areas.
- IND33-38 The temperature of natural gas in the pipeline would be close to ambient temperatures and would not affect farming.
- IND33-39 The costs for salmon habitat mitigation and public safety are not related.
- IND33-40 The pipeline would be operated under the DOT's pipeline safety standards contained in CFR 49 Part 192, including leakage survey requirements in 192.706. See also our response to PM5-81.
- IND33-41 The FERC's environmental staff and its third-party contractor provide an independent analysis of the impacts of the project, including impacts on salmonids. Additional independent analysis is provided through cooperating agency review, the Pre-filing scoping process (see section 1.4), and the draft EIS comment process. The adequacy of compensatory mitigation proposed for the project is discussed in the response to comment FA2-10. Therefore, implementation of the final Compensatory Mitigation Plan would be assured through the FERC's authorization of the project. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.
- IND33-42 See our response to comment PM1-18.

cont'd
- IND33-43
- IND33-44
- IND33-45
- IND33-46
- IND33-47
- IND33-48
- IND33-49
- IND33-50
- IND33-51
- IND33-52
- IND33-53
58. In relation to the permit process, what criteria has FERC used to define LNG as CEII over qualified independent analysis which has shown that LNG in general and certain LNG proposals including the Bradwood proposal are not critical to the energy needs of the end users over short and long term and thereby non-critical to the nation as referenced by the study of Loretta Lynch.
 59. What is the highest ratio of air to regasified LNG that the mixture is still deadly: to humans, to plants, and to animals in the area of the Bradwood LNG proposal.
 60. What is the range of ratios of air to regasified LNG that will cause ignition in reference to the Bradwood proposal.
 61. Through the permit process of the Bradwood proposal what is FERC doing to lower and mitigate the potential incidents of death, injury, and damages to the public in responsibility for NG pipeline permits since the LNG facility sendout pipelines are under the jurisdiction of the FERC.
 62. In consideration of NG pipeline industry death and injury. The damage statistics indicate a number of incidents, leaks, blowouts, and explosions to NG pipelines in the region surrounding the Bradwood proposal site. The causes are due to corrosive soils, slide prone hills, and seismic activity. How many pipeline leaks, blowouts, explosions, deaths, injuries, and damage can be expected statistically on average with this proposal. And is there any quantity that would be considered too high by the FERC, permitting process.
 63. Considering the saturated corrosive soils the Bradwood proposal sendout pipeline will be routed through on the Oregon side of the Columbia River. How will the FERC through the permit process prevent pipeline leaks from spreading over large areas and asphyxiating pets, livestock, or humans or exploding causing death, injury, or damage.
 64. Considering the slide prone hills the Bradwood proposal sendout pipeline will be routed through on the Washington side of the Columbia River, how will the FERC through the permit process prevent pipeline leaks from spreading over large areas and asphyxiating pets, livestock, or humans or exploding causing death, injury, or damage.
 65. In the FERC permit process for the Bradwood proposal will there be any full scale LNG blast test reports utilizing the pipe materials selected for installation by the applicant to ensure the public is safeguarded from flooding should a pipeline blowout take out a levee that was not sufficiently protected. Or the public safeguarded from a hillside slide caused by a pipeline blowout that was not sufficiently protected against.
 66. In the FERC permit process for the Bradwood proposal, are there any signed affidavits by individual landowners specifically requesting to keep their names off of any affected landowner or pipeline route list.
 67. Is FERC allowed to deny access to all other affected landowner names under the Bradwood proposal other than those specifically requesting their names be withheld from affected landowner or pipeline route lists by signed affidavits.
 68. What is the criteria the FERC uses to justify a requirement for a Non-Disclosure Agreement as applied in the requests for information by affected landowners in the Bradwood permit process when no proprietary information is requested, no national security issues are involved, and what is requested is generally common LNG/NG industrial textbook, plant and pipeline information.
 69. In the FERC permit process for the Bradwood proposal, how do LNG facilities promote the public good through less dependence on foreign energy and support energy independence through domestic sources including renewable energy.
 70. In the permit process for LNG facilities such as the Bradwood proposal, what is the National Economic Benefit of LNG as compared to domestically produced energy including renewable energy.
 71. In the permit process for LNG facilities such as the Bradwood proposal, what is the National safety and energy security risks including terrorist attack of LNG as compared to domestically produced energy including renewable energy.

Individuals

33

- IND33-43 As described in section 4.11.1, natural gas (methane) is a simple asphyxiant and would need to be present at very high concentrations to cause asphyxiation. Methane can cause asphyxiation if oxygen concentrations are reduced to 10 to 12 percent. See our response to comment LA3-66.
- IND33-44 As described in section 4.11.1, methane vapors (regasified LNG) in air at mixtures between 5 percent and 15 percent by volume are flammable.
- IND33-45 Pipeline safety and the FERC's role are discussed in section 4.11.9.1.
- IND33-46 Using the Incident Rate for Earth Movement, it is estimated that an earth movement incident may occur every 2,075 years for the 36.3 mile pipeline.
- IND33-47 See our response to comment IND22-12. Furthermore, the high concentrations required to cause asphyxiation would not normally occur with transmission pipeline leaks as a confined space, such as a building would be required to concentrate the methane vapors.
- IND33-48 Full scale tests are outside the scope of this EIS.
- IND33-49 We are unaware of any signed affidavits from landowners requesting that their names be removed from the environmental mailing list for the project.
- IND33-50 See our response to comment PM1-18.
- IND33-51 The Commission's determination of public necessity will be disclosed in its Order for this project.
- IND33-52 Section 1.1 offers a brief summary about the project purpose and need. The Commission would make its determination of public necessity in its Order for this project. We discuss renewable energy sources in section 3.1.1.3. The economic benefits of this project are discussed in section 4.8.
- IND33-53 We are not aware of any specific studies on this topic.

IND33-54	72. What National Economic Benefit decrease will occur when the security exclusion zone around LNG vessels coming to the Bradwood LNG terminal are required to be at least equal to that of security exclusion zones around LNG vessels enroute to other United States LNG terminals. What impact will this have on the large grain export business and its associated businesses when those export ships are blocked from passage. And what multiple effect will each additional LNG facility or expansion of LNG storage have.
IND33-55	73. Considering that FERC is charged with securing public use and necessity, as part of the permit process on the Bradwood proposal, how will the FERC ensure that the superior public use and necessity of domestic energy supply are maximized and the national economic, safety, and energy security risks of LNG and foreign energy imports are minimized.
IND33-56	74. What mandate are the FERC personnel under to provide permits to LNG proposals in general and to specific LNG proposals at the Bradwood site.
IND33-57	75. In the FERC permit process on the Bradwood proposal where does it provide a listing for corporate, financial, and company operating personnel structure to protect the public.
IND33-58	76. Does the FERC permit process prohibit a performance audit of FERC personnel on the Bradwood proposal to ensure those affected by the project have been treated as favorably as the applicant.
	77. In the permit process how will the FERC ensure there are no conflicts of interest regarding the Bradwood proposal.
IND33-59	78. Considering that farming is a business and that humans require food more than LNG, how is the FERC, through the permit process ensuring that farmers, ranchers, food producers, fishermen, and other businesses have at least equal if not more weight and favorable treatment as the permit applicant in relation to the Bradwood proposals sendout pipeline.
IND33-60	79. Considering the cause and effects in the question immediately above, how is public use and necessity benefiting the local, regional, and national economies through the FERC permit process of the Bradwood proposal by causing the price of food to rise as well as everything that is transported via the Columbia River and the profits of fishermen, farmers, ranchers, and other businesses to go down. And what consideration have these factors been given in the FERC permit process. And what FERC procedure is required to include these factors in the permit criteria.
IND33-61	80. In the permit process how will the FERC ensure that the public, businesses, individuals, residences, and structures are not injured or damaged in relation to the Bradwood proposal.
	81. What is the FERC procedure with regard to the Bradwood proposal in the permit process should the public, businesses, individuals, residences, or structures be harmed or incur damages.
IND33-62	82. In the permit procedures with the Bradwood proposal, how will FERC ensure damages are minimized without the use of existing odorant technology or requiring the development of a more desirable and industry welcomed odorant technology for the proposed high volume high pressure larger diameter sendout pipeline.
IND33-63	83. What are the FERC permit requirements in the Bradwood LNG proposal to support, satisfy, and remedy recommendations on behalf of the public regarding LNG facilities including sendout pipelines that run counter to best technologies and methods or which endanger the public.
IND33-64	84. In the FERC permit requirements on siting the Bradwood LNG facility what are the specific equations, rules, and guidelines that allow LNG facilities to be built in less populated areas and not densely populated areas.
IND33-65	85. In the permit process for the Bradwood LNG facility has the FERC compared the benefits and costs of transmission of regasified LNG over long distances to growing renewable energy locally and throughout the nation. And what is the FERC procedure to make this comparison occur.
	86. In the FERC permit requirements for the Bradwood LNG facility why is there no criteria for LNG facilities to be built nearer to the population demand centers for the LNG product in order to increase cost efficiency of supply in the energy industry. And what is the FERC procedure required to make this occur.

Individuals

33

IND33-54	Other ships would not be blocked from passage during the LNG carrier transit in the waterway to the proposed Bradwood Landing LNG terminal. We do not think that other commercial ship traffic would be adversely affected or delayed by the project. See our responses to comments PM1-52, PM3-11, and others. The economic benefits of the project are discussed in section 4.8. Cumulative impacts from multiple LNG import terminals or other natural gas projects in the vicinity are addressed in section 4.12.
IND33-55	We address safety and security issues in section 4.11. See our response to comment IND33-51.
IND33-56	The NGA mandates that the FERC regulate the interstate transportation of natural gas. The EPAct 2005 gives the FERC authority to site onshore LNG import terminals, and obligates the FERC to expeditiously review all natural gas projects. See our response to comment IND33-22.
IND33-57	NorthernStar's corporate structure is a matter of public record and was provided in Exhibits A and B attached to its applications to the FERC. Public safety is addressed in section 4.11.
IND33-58	The FERC has Rules of Practice, found at 18 CFR 385, including our ex-parte rules, to ensure that all parties are treated fairly in a proceeding, and that applicants are not given preferential treatment over other stakeholders. We also have a conflict-of-interest policy.
IND33-59	The project would not have any significant adverse impacts on fishing (see sections 4.7.1.4 and 4.8.1.7) or farming (see sections 4.4.2 and 4.7.3.1). Rather than having negative impacts on local businesses, the project should benefit the local economy, as discussed in section 4.8. See response to comments PM3-5 and PM5-47.
IND33-60	See response to comment IND33-26.
IND33-61	Although liability is outside the scope of the EIS, financial liability due to a marine accident may be subject to the Limitation of Vessel Owner's Liability Act, 46 U.S.C. 181. Under 49 U.S.C. 60111, the Secretary of Transportation can order the operator of an LNG terminal to demonstrate and maintain financial responsibility in the amount that the Secretary feels adequate.
IND33-62	See our response to IND33-40.
IND33-63	Our review of project design, technologies, and safety is provided in section 4.11.
IND33-64	Population density is just one factor that is considered out of many in evaluating the suitability of a given site for an LNG terminal. There are no specific equations or rules regarding population density but proximity to residential areas influences the analysis of noise impacts, visual impacts, etc.
IND33-65	The EIS discusses renewable and other energy sources as alternatives to the proposed project in section 3.1.1.3.

- IND33-66 87. What local, regional, and National economic factors have been included in the benefit cost analysis of the local, regional, and National economies for consideration in the FERC permit process for the Bradwood proposal.
- IND33-67 88. What are the factors in the FERC permit process that determines demand for the proposed Bradwood LNG facility in a region where NG energy demand is being met or decreasing.
89. What is the FERC procedure to include lack of need for the proposed Bradwood LNG facility as determining criteria for an LNG facilities siting permit
- IND33-68 90. What is the FERC procedure to include sendout pipeline failure and loss of life as a factor in determining criteria for the proposed Bradwood LNG facility siting permit
- IND33-69 91. What is the FERC procedure to include the inability to adequately safeguard the incoming LNG vessels or the LNG facility due to terrain and vegetative cover as a determining factor for the proposed Bradwood LNG facility siting permit.
- IND33-70 92. What is the FERC procedure that determines excessive endangered species habitat destruction with ineffective mitigation in the proposed Bradwood LNG facility site permit.
- IND33-71 93. What is the FERC procedure to include excessive food source or local business destruction into the determining criteria for proposed Bradwood LNG facility site permit
- IND33-72 94. What is the FERC procedure to include negative local, regional, or national economic benefits into the determining criteria for the proposed Bradwood LNG facility site permit
- IND33-73 95. Considering that the affected landowners have elected representatives yet each is notified that their property could be affected and notified of their rights, how is FERC through the permit process of the Bradwood proposal ensuring that each of the affected Native American entities are notified of the affects to their historic and current fishing grounds, and supporting fish habitat.
- IND33-74 96. In the FERC permit process for the proposed Bradwood LNG facility it was indicated that an LNG site comparison and rating method be used to help determine future LNG sites on the merit and demerit point system. What were the results of the FERC in the development of this method and the criteria for it.
97. In the FERC permit process for the proposed Bradwood LNG facility, will all critical criteria be compiled in table format and published prior to the FERC final issuance of permit. And how will the FERC ensure that all criteria is included and what is deemed critical criteria.
- IND33-75 98. In the permit process how will the FERC require and ensure that the owners and operators of the Bradwood LNG proposal. And future owners and operators of the proposed Bradwood LNG facilities including sendout pipelines will follow all applicable permit requirements and procedures under the law.

I therefore make this Motion/Notice to Comment and Submit Questions, for any and all parties and or documents that this issue pertains to under the above Docket No's CP06-365-000, CP06-366-000, CP06-376-000, CP06-377-000, and for the reasons and facts stated in my Motion/Notice to Comment and Submit Question for the Draft DEIS.

Kimberly D. Bose
Secretary
Federal Energy Regulatory
Commission
888 First Street N.E.
Washington D.C. 20426
eService@ferc.gov

Individuals

33

- IND33-66 A discussion of potential impacts on local economies is included in section 4.8. The Commission's Order would include its determination of public need. See response to IND33-26.
- IND33-67 Section 1.1 explains that there is a future need for additional sources of natural gas in the Pacific Northwest. See our response to comment IND33-21.
- IND33-68 Pipeline safety is discussed in section 4.11.9. The pipeline must be constructed and operated according to DOT standards.
- IND33-69 The Coast Guard has determined that the Columbia River would be suitable for LNG marine traffic with the conditions described in the WSR (see section 4.11.5.5 and Appendix H). This includes adequate security for the LNG ships.
- IND33-70 The FERC's procedures for consulting with the FWS and NMFS regarding potential impacts on federally listed species are described in section 4.6. As stated in section 4.6.3, the FERC would not allow construction to begin until after we have concluded formal consultation with the FWS and NMFS.
- IND33-71 No food sources or local businesses would be destroyed by this project. See our response to comment IND33-59.
- IND33-72 See our response to comment IND33-66.
- IND33-73 Consultations with Native Americans are discussed in section 4.9.3. No historic Indian fishing grounds have been identified by Native Americans, the SHPOs, or cultural resources consultants that may be affected by the project. Sections 4.3 and 4.5 discuss impacts on fish habitat.
- IND33-74 Section 3 offers a discussion of alternative LNG terminal locations on the West Coast, and comparisons between LNG terminal sites in Oregon. The FERC does not do regional planning and reviews individual projects on their own merits. See our responses to comments PM2-32 and FA4-1.
- IND33-75 The Commission's project Order will outline all requirements. The FERC staff monitors authorized projects during construction and operation, conducts inspections, and reviews reports that must be submitted by NorthernStar. See sections 2.6 and 5.0.

Clifton 365
Clifton 366

- My name is Georgia Marincovich. We have homes on both ends of the county. We are landowners in Clifton Oregon which is a fishing village on the Columbia River. It was one of the first Salmon Cannery's in Oregon and is a historical fishing area and historical site. This area is also known for its wildlife, elk and deer hunting, duck and geese hunting, and has also been an area historically used by trappers of otters, neutria, beaver. There are Beaver building dams on Hunt Creek and there are sea otters that are swimming around the docks in Clifton. Interestingly Clifton does not appear on the LNG map.
- Tenasillahee Island has been sent aside as a Wildlife Refuge for White Tail Deer. It is a sanctuary for geese, ducks and eagles and also is a notable sport fishing area. Fisherman have fished the Clifton Channel for over a hundred years and there are established drifts in that area which have been cleared for drift fishing by the fishermen. The fishing cannery has a historic warehouse which is used for storing nets, and hanging and repairing nets. Fish are received at the station for delivery to market.
- My fear is that the LNG project will be built and this area will be destroyed. Hunts Creek is a valuable part of the estuary and the falls above Bradwood along with it and the surrounding wet lands could never be replacing by mitigation. When this huge project is completed this area will be destroyed. The project will suck 1 billion yes1 billion gallons of water from the Columbia River which is low on water now and in this water will be small fish and other nutrients needed for the wildlife in this area. This sucking of water for ballast will occur three times a week as I understand it.
- There are also important scientific studies on salmon smolt which is being done in this area and that project will be terminated. (The smolts will be sucked up and the estuary destroyed.) The Columbia River is one of a few rivers in the world which has a large amount of Salmon and Sturgeon and other fish. The Pacific Northwest and Alaska have the only rivers which support the Salmon Commercial Fishing Industry. We are spending millions of dollars to restore salmon habitat and wetlands in Oregon and it is hard to believe that anyone who has in education in this field would even think of allowing such a project to proceed in this area.
- We have been waiting to hear from the Federal Regulatory Agencies who have been mandated to protect our Salmon, And our environment under Section 404 of The Clean Water Act, The Magnuson-Stevens Fishery Conservation and Management Act, The Fish and Wildlife Conservation Act, The National Environmental Policy Act, The Rivers and Harbors Appropriation Act of 1899, the Endangered species Act, NOAA Fisheries Services Activities related to Wetlands Policy and Guidance. And other conservation agencies. The National Marine Fisheries Service, The Pacific Fisheries Management Council, Oregon Fish and Wildlife, Washington Dept of Fish and Game Who is protecting the environment? When did the Federal Regulatory Agencies who are to protect the environment sell themselves down the river to Politicians. Where are they in the midst of the oncoming disaster?

K-853

Individuals

34

- IND34-1 Clifton appears on a number of maps in the EIS, including figures 2.1-1, 2.1.2-1, 2.1.5-1, 4.7.1-1, and 4.7.2-1.
- IND34-2 If the LNG project is authorized and built, the area would not be destroyed. As discussed in section 4.3.2.3 and NorthernStar's terminal ESC Plan, NorthernStar would implement extensive measures to avoid and minimize impacts on Hunt Creek during both construction and operation of the LNG terminal. NorthernStar's final Compensatory Mitigation Plan would compensate for unavoidable impacts on wetlands (see section 4.4.1.2). Due to the ecological importance of Hunt Creek, NorthernStar would enter the Hunt Creek Mitigation Site (the portion of Hunt Creek below the falls) into a conservation easement to ensure the protection and preservation of the creek in perpetuity. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.
- IND34-3 LNG carriers would intake ballast and cooling water during normal operations, as is typical for all large cargo ships. The Columbia River flows at a rate of 45 million gpm more than 95 percent of the time; therefore, the amount of water that would be removed for ballast by the LNG vessels would not have a measurable effect on the volume of water in the river. See also our response to comment PM1-31.
- IND34-4 See our response to comments PM3-68 and FA1-28.
- IND34-5 Section 1.3 describes the role of various federal agencies with regulatory authority over applicable permits, approvals, and statutory requirements. See table 1.3-1 for a list of the major federal, state, and local permits, approvals, and consultations identified for construction and operation of the Bradwood Landing Project. See table 1.4-1 for a list of federal, state, and local agencies that have participated in interagency scoping meetings to help the FERC better assess and mitigate the potential environmental impacts of the Bradwood Landing Project. Many of these agencies have also provided comments on the draft EIS (see comments beginning with FA, SA, and LA). As part of the consultation process, the NMFS and FWS will develop BOs indicating whether or not the project is likely to jeopardize the continued existence of or adversely modify critical habitat of any federally listed species.

Response to Bradford Landing LNG

Cowlitz County should hesitate to welcome the Bradford Landing LNG project for several reasons, both related to our need for creating a sustainable community which offers and supports healthy living. Rather than embrace the chance for a small number of jobs that may or may not go to local residents or to people who choose to live in the county, we must consider the long-term impact of this project on the people and the land. The possible damage that can occur because of this LNG project versus the direct benefits to the region should stop us from endorsing this project.

While it is clear that we as car-driving, energy-consuming people must find ways to efficiently fuel our lifestyles, this LNG project should be denied in lieu of finding more suitable and less violent means of providing energy. Important to note is that the energy provided by this LNG project would not much benefit the region. Rather, as we know, pipelines through the county would carry the LNG to the main north-south pipeline which would then carry the LNG where it is needed—maybe north, maybe even east via other pipelines.

More than anything, Cowlitz County needs to aim higher than it has. We need to look toward a more sustainable future that provides more living-wage jobs to residents thus providing healthier lifestyles and supporting a social climate where individuals and families feel secure. Poverty and then, often, crime, happen most often because of a failing economy. Cowlitz County needs to find ways to attract sustainable, living-wage jobs while maintaining the natural environment and improving upon possibilities for riverfront enjoyment and public use, such as Willow Grove and other parks in the region. If we destroy these assets it only becomes more difficult to attract what we need: new businesses, companies willing to give Cowlitz County a try, employers that plan to invest and remain in the area.

It may seem a backward approach to some, but saying no to a project such as this one is a step toward envisioning a more sustainable future for more Cowlitz county residents. We must develop habits of planning that create a community where people have what they need and, eventually, feel invested in helping to keep the quality of life high. We need to create a community where it is natural that we not only consider the benefit or the detriment to our own lives and property but to the lives and property of our neighbors. As we come closer to creating a community where more people feel secure, able to earn a living wage, and see themselves as vital members of their community, we can build and prosper — without exploiting and destroying our gift, our natural resources.

This region is an attractive target for a business proposal such as that of Bradford Landing. They cannot be blamed for their proposal in our region. This region is sparsely populated, less educated, and generally poorer than the Puget Sound area, for example. Yet it is our responsibility to hold Bradford Landing accountable. Too often governments give in to the pressure of companies in order to collect a few tax dollars or for a few jobs or because we are just tired of fighting, but we must scrutinize and offer no bends in our environmental and social assessment of this project.

The following information is meant to support my argument that endorsement and support of the Bradford Landing LNG project will take Cowlitz County farther from the necessary goal of developing a sustainable community that provides both living wage jobs and a high quality of life for its residents. Bradford Landing is counting on this region to be asleep as they begin their work. They are counting on a relatively easy time inserting their will and beginning to earn profit. It is up to us to question and keep them accountable. They will not willingly comply with rigid guidelines or bow out because research shows this region not welcoming or appropriate for their project. It is our duty to question and make their work challenging and, perhaps, no longer happening in this region.

K-854

K-855

- IND35-1 1. In the EIS, numerous documents and evaluations have not been completed in time for inclusion, and it is stated in the EIS that the documents must be submitted before the close of the comment period. This does not allow time for any meaningful public review and comment of those documents, thereby thwarting the public review process. (e.g., cultural resources surveys and SHPO's review; EHA Assessment and BA; Waterbody Mitigation Plan)
- IND35-2 2. The EIS states that "the Bradwood Landing Project would require construction of facilities that do not fall under the Commission's jurisdiction" (three natural gas pipeline laterals and electric transmission facilities.) If these facilities are required for the proposed project, then not evaluating them is piece-mealing. The Biological Opinion and Environmental Impacts must address all of the project impacts, not just pieces of the impacts that fall within specific jurisdictions. The public and decision makers cannot make informed comments and decisions without understanding the full scope and impacts of the proposed project. All of the impact forecasts in the EIS are understated if they exclude portions of the project (three natural gas pipeline laterals and electric transmission facilities) and should be recalculated and recirculated for public comment.
- IND35-3 3. The document states that "we do not believe that commercial or recreational river users would be adversely affected." Commercial and recreational river users have made a very convincing argument that they will be adversely impacted both by legal traffic restrictions while LNG ships are in transit and by aesthetic changes. If this project is approved and implemented, and it is found that commercial and recreational river users will be adversely impacted, how will this impact be mitigated? How will the project mitigate adverse impacts to aesthetics that are likely to impact the recreational tourism that provides many jobs in the Puget Island, Skamokawa and Cathlamet area?
4. The vast majority of the Cowlitz PUD energy source is provided by:
Coal 2.2%
Hydroelectric (Water) 86.8%
Nuclear 10.0%
- *Includes the following fuel types - biomass, natural gas, petroleum, waste incineration and wind.
- IND35-4 Homes in the Cowlitz PUD service area are encouraged, through rebate incentives, to heat their homes and their domestic water with electricity. As industry consumes a greater percentage of Cowlitz PUD energy than residential customers do, clearly industry is supplied energy by electricity also. Washington voters passed an initiative clearly demonstrating their desire to increase renewable energy sources in the state, and in fact requiring that PUDs provide a greater mix of energy from renewable sources. Given this information, it is not at all clear that the project goal of "providing a new source of natural gas for the Pacific Northwest" is a goal shared by the people of Washington, yet it will require condemnation of land in the State of Washington for the proposed pipeline. How is the project justified if natural gas is not currently a major source of energy and does not qualify as a desired source of future energy given the requirement for increased renewable energy in the State of Washington? Bradwood Landing proponents provide a justification graph that does not include proposed and approved wind power projects, making the justification graph and the project justification suspiciously biased and not credible.
- IND35-5 5. How will the proposed safety requirements be funded? Will the shoreside firefighting capabilities be funded entirely by this project? Does this include all of the equipment and all of the expenses associated with additional personnel requirements? If not, why should local taxpayers permanently subsidize this project given the small number of permanent jobs it will bring to the area and the recreation/tourism jobs that will potentially be lost?

Individuals

35

- IND35-1 See our responses to comments PM6-94 and SA1-179.
- IND35-2 The electric power line is evaluated in the EIS. The nonjurisdictional laterals would be built and operated by entities other than NorthernStar, and their exact route is not yet determined. However, we have added discussion regarding general impacts based on the likely routes that would be used. Also we have recommended a condition be included in the project Order requiring additional information about the laterals, including environmental surveys and permit approvals. See section 2.2.
- IND35-3 There is no evidence that commercial or recreational river users would be adversely affected by this project. See sections 4.7.1.4 and 4.8.1.7, and responses to comments PM1-52, PM5-31, PM5-46 and others. As the Columbia River is a working river with existing ship traffic, the presence of LNG vessels should not have significant adverse impacts on aesthetics that would impact tourism. On the contrary, the Lower Columbia Economic Development Council has stated that many landowners and tourists come to Wahkiakum County to see the ships and river traffic and that the project would not hurt growth but add to it (see comment LA1). Visual impacts are addressed in section 4.7.1.5,
- IND35-4 See the revised discussion of the project purpose and need in section 1.1.
- IND35-5 See our response to comment PM1-1 and LA3-55

6. From the final draft mitigation plan:

"Upon completion of construction, restoring the ROW, with the exception that a 10-foot-wide path directly over the Pipeline will be maintained in a herbaceous state, and trees greater than 15 feet in height will not be allowed to grow within 15 feet of the Pipeline."

from page 8 of
http://www.bradwoodlanding.com/filing-papers/2007_08/FINAL%20Mitigation%20Plan%20Revision%207%208_1_07.pdf

- IND35-6 Based upon the information in the mitigation plan, the pipeline will result in increased edge habitat and therefore has the potential to increase impacts on species that are dependent upon closed canopy forest. I could not find that these impacts were discussed, analyzed and mitigated. The plan says that the route was realigned to minimize impacts to old growth forest, but what will be the impacts of the proposed project to species dependent on closed forest canopy (increased nest predation or parasitism, etc.) and how will those impacts be mitigated? Permanent impacts to forested areas should at a minimum be mitigated at a 3:1 ratio of creation or protection:impacts. Nest predation or parasitism impacts should be evaluated through studies which should be required as mitigation to be funded by the project proponent but overseen by resource agencies. Mitigation should be outlined that will be required if the studies indicate that impacts to nest success have occurred.
- IND35-7 7. The EIS states that water quality impacts to streams will be temporary. However removal of shrubs or trees and replacement of those shrubs and trees with herbaceous or grass species for the 10-foot width of the crossing, will result in higher light penetration at the crossing and therefore higher summer temperatures in the streams. As a number of the streams are on the 303(d) List for high summer temperatures, this impact will be significant and adverse and has the potential to impact federal listed as threatened or endangered salmon species.
- IND35-8 8. The EIS states that there is no evidence that property values would be impacted on Puget Island. However, it does not appear that the comparison of properties to other LNG area property values is valid because it does not appear that the property values of those surrounding properties is based upon access to scenic quality and rural atmosphere, as is the case in Puget Island. If Bradwood Landing will increase business and commercial growth in the project area as is suggested in the discussion of property values in the EIS (4.8.2.3), growth inducing impacts to the project area must be evaluated.
- IND35-9 9. The Bradwood Landing facilities should be required to provide electrical power to docked ships so that ships will not need to idle while docked to unload. This reasonable and prudent measure would reduce impacts to air quality. Cowlitz County has significant pollution, particularly from the Weyerhaeuser Plant, which has recently been on the list of the 10 most polluting plants in the country. Prevailing winds will blow pollution from Bradwood Landing towards Longview and Portland.
- IND35-10 10. The safety distance required for other U.S. LNG projects cannot be implemented for the proposed project. Alternative locations that would permit the accepted safety standards should be seriously considered rather than waiving the standards.

Submitted By Deborah Brink

Individuals

35

- IND35-6 Upland forested communities would be replanted in-kind with trees, with the exception of the portion of the right-of-way within 15 feet of the pipeline (30 feet total), thereby minimizing the extent of disturbance. NorthernStar's proposed tree planting exceeds the revegetation requirements of the FERC staff's Plan and Procedures. Impacts on terrestrial wildlife species due to construction and operation of the pipeline are discussed in section 4.5.3.3. The adequacy of NorthernStar's Compensatory Mitigation Plan is discussed in the response to comment FA2-10.
- IND35-7 As described in section 4.3.2.4, all waterbodies which are 303(d) listed for temperature would be crossed using the HDD or conventional bore method. Clearing within areas crossed using the HDD method would be limited to hand trimming associated with the temporary deployment of HDD guidance (telemetry) cables. NorthernStar would maintain a riparian buffer to minimize impacts associated with vegetation clearing at waterbody crossings.
- IND35-8 While we expect the project to stimulate the local economy, that does not imply that we predict that the area around the Bradwood Landing terminal would become more industrialized, because of current zoning. However, there are other industrial facilities already existing along the lower Columbia River, such as the Wauna mill. The area around the existing Portland LNG peak shaving plant already includes "many other industrial or commercial properties." Our analysis of potential impacts on property values took into account the mainly rural nature of the project area and nearby Puget Island. Also see response to comment IND3-16.
- IND35-9 See our response to comment FA3-4.
- IND35-10 No safety standards have been waived. All LNG import terminals that would fall under FERC's jurisdiction, regardless of location, are required to comply with the same safety standards and regulations.

IND36-1

1. In the EIS, numerous documents and evaluations have not been completed in time for inclusion, and it is stated in the EIS that the documents must be submitted before the close of the comment period. This does not allow time for any meaningful public review and comment of those documents, thereby thwarting the public review process. (e.g. cultural resources surveys and SHPO's review; EHA Assessment and BA; Waterbody Mitigation Plan)

2. The EIS states that "the Bradwood Landing Project would require construction of facilities that do not fall under the Commission's jurisdiction" (three natural gas pipeline laterals and electric transmission facilities.) If these facilities are required for the proposed project, then not evaluating them is piece-mealing. The Biological Opinion and Environmental Impacts must address all of the project impacts, not just pieces of the impacts that fall within specific jurisdictions. The public and decision makers cannot make informed comments and decisions without understanding the full scope and impacts of the proposed project. All of the impact forecasts in the EIS are understated if they exclude portions of the project (three natural gas pipeline laterals and electric transmission facilities) and should be recalculated and recirculated for public comment.

3. The document states that "we do not believe that commercial or recreational river users would be adversely affected." Commercial and recreational river users have made a very convincing argument that they will be adversely impacted both by legal traffic restrictions while LNG ships are in transit and by aesthetic changes. If this project is approved and implemented, and it is found that commercial and recreational river users will be adversely impacted, how will this impact be mitigated? How will the project mitigate adverse impacts to aesthetics that are likely to impact the recreational tourism that provides many jobs in the Puget Island, Skamokawa and Cathlamet area?

4. A very small portion of the Cowlitz PUD energy source is provided by natural gas. The Cowlitz PUD energy mix, as presented on their website, is as follows.

Coal	2.2%
Hydroelectric (Water)	86.8%
Nuclear	10.0%
Other*	1.0%

*Includes the following fuel types - biomass, natural gas, petroleum, waste incineration and wind.

Homes in the Cowlitz PUD service area are encouraged, through rebate incentives, to heat their homes and their domestic water with electricity. As industry consumes a greater percentage of Cowlitz PUD energy than residential customers do, clearly industry is supplied energy by electricity also. Washington voters passed an initiative clearly demonstrating their desire to increase renewable energy sources in the state, and in fact requiring that PUDs provide a greater mix of energy from renewable sources. Given this information, it is not at all clear that the project goal

FERC ORIGIN
OCT 7 NOV 14
The real reasons for the push to permit LNG facilities on the Columbia River

I hold in my hand statements published in December of 2003 by FERC

The title? CALIFORNIA NATURAL GAS MARKET OUTLOOK

IND37-1

A statement of interest. (and I quote) "Planned gas-fired electric plants in the west for the period 2003-2006 will be located along the major interstate natural gas pipelines, and along the intrastate natural gas pipelines in California."

Another FERC statement states "between 2006 and 2009, approximately 8.65 Bcf per day of natural gas may be available to California from potential LNG import terminals to be located in California and Baja, California."

Then the wars began. Here is a map showing 21 California, Baja California LNG projects put on hold or discontinued. NO LNG! WWII developed between Conoco Phillips, Marathon, Chevron, Texaco, Sempra, and Shell to gain the permit for the Baja, California LNG site. Sempra and shell joined forces and won that war.

Sempra has since dedicated 11 billion dollars to develop their west coast infrastructure. Sempra experienced a huge blow when their frontier line coal fired electric generator plant and their sunrise link coalfired electric generator plant and subsequent interstate electric transmission lines failed. After those defeats and the loss of the Frontier lines champion, California energy Czar Joseph F. Desmond, Sempra switched gears and concentrated on LNG gas fired generation. They are now working to achieve that end and Joseph Desmond is still a familiar name in that same pursuit. Joseph Desmond championed Sempra's Frontier transmission line and now champions NorthernStar's Bradwood landing as senior vice president of external affairs. A gas and oil exploration company by the name of Venoco owns GRACE, the oil platform that Northernstar has contracted to purchase for an offshore LNG terminal in California. Venoco now has plans to explore for natural gas in this region and is aware of previous explorations which discovered potential natural gas storage chambers in the region. Sempra has no storage chambers in their territories. Sempra's Chairman of finance is on the board of directors of Venoco.

Individuals

37

IND37-1

NorthernStar intends for its project to serve markets in the Pacific Northwest, not California. See responses to comments PM1-23 and PM5-43.

IND37-1
cont'd

Now comes Northwest Natural Gas , a partner with NorthernStar, and TransCanada's Palomar natural gas pipeline project. It turns out that a Mr. Henry Morse a present/or former CEO of TransCanada is the General Manager of the North Baja, California pipeline, Semptra's Costa Azul LNG hook up and is also the project manager for the Palomar project which will mesh with Bradwood Landing and intends to accommodate mid-west and southwest natural gas markets. Another FERC 2003 quote, " In 2011, increased pipeline capacity in the west is projected to serve the Midwest primarily and California to a lesser extent."

There ladies and gentlemen are the dots.. You connect them and then you must deny this or any permit for an LNG terminal on the still pristine Columbia River because this is about big government, big money and to hell with a forward looking part of America which is well into the process of generating clean, green renewable energy so that it won't be a parasite on this countries energy needs.

Testimony Regarding Proposed Liquified Gas Facility at Bradwood, Oregon

IND38-1

On Saturday, January 30, 1965, at 1:20 in the morning, after weeks of heavy rain, the cliff near Bugby Hole gave way and crashed into the Columbia River. A huge wave was generated, which surged across and washed over a section of the Puget Island dike, killing Haakon Gabrielsen, age 59, as it destroyed his house. Other homes were damaged, including those of Fred Aegerter and Tom Irving. Extensive damage was done to the dike, sloughs, and crops planted nearby. Representatives from the Army Corps of Engineers, Rep. Julia Butler Hansen, and other state and county agencies met to assess the area's needs. All of this, along with pictures showing the slide and the damages, was reported on the front page of the *Wahkiakum County Eagle* on February 4, 1965.

Many concerned local residents, myself included, have previously testified regarding this event, which happened only a few hundred yards from the proposed Bradwood liquified natural gas terminal. It appears, although I cannot find a clear diagram of the proposal, that the plan is to drill horizontally and run their pipeline right through the base of that very cliff.

What Was FERC's response to our testimony? Quoting from page 4-9 of the DEIS— "...we received comments about a landslide that reportedly occurred in 1965, upriver of and adjacent to the Bradwood Landing site.... We were unable to find information regarding such a landslide occurring in 1965. In addition, a review of aerial photographs from various intervals dating back to 1948 did not reveal any indications of landslides occurring within a 1-mile radius of the site."

So what was their problem? All someone had to do was walk into the local paper of record and ask publisher Eric Nelson, whose father wrote the original story and took the pictures, if he had anything on a slide in 1965. They would have got what I got in five minutes. Furthermore, the exposed cliff is still visible and anyone with an elementary knowledge of geology can see that a slide has occurred there fairly recently.

If you've lived here for more than two years, you know a basalt rockslide ends up blocking SR4 every couple of years, taking days, months or sometimes even years to clear, and that it's impossible to prevent them for happening.

Maybe that's it. No one from Northern Star or FERC has really shown much interest in *what it's like* to live around here—the fishing, the weather, the wildlife. Does this result in an inability to really care about

IND38-1

Information regarding the landslide that occurred in 1965 approximately one-half mile from the proposed LNG terminal site has been added to section 4.1.3.3. The geologic conditions at this location are not the same as at the LNG terminal location.

ORIGINAL

what this terminal and pipeline and all these tankers might really do to us around here. Or is there maybe even an agenda which is so focused on seeing a permit awarded as to knowingly suppress any inconvenient evidence? Why has Puget Island been left out of the background in so many renderings of the facility? Just ignore potential problems until you get your deal done?

My opinion has been all along that if ^{regulators &} a person really cared about the damage from a magnitude 9 earthquake, huge floods washing out the 500ft high ridge separating Bradwood from the mighty Columbia, basalt cliffs crashing into the river generating huge waves, maybe even all this happening at once, they wouldn't ^{allow or} put the terminal and pipeline there in the first place. ^{to be sited &}

The Greeks had a concept they called *hubris*, which is just a cockiness which makes you believe you can handle anything which might come along. It was forever causing guys to end up poking out their own eyes, or the gods punishing them by having their liver eaten by vultures for all eternity. The point was that when you are playing with powerful forces, you should have a little humility. No one *really* knows how to prepare an LNG terminal for a Cascadia Subduction Zone earthquake because there hasn't been one in 300 years. But we're due for one now. Don't you do something the rest of us will all regret.

Richard Beck . B.S.
502 SR 409
Cathlamet, Washington 98612

ACCOMPANYING EXHIBITS:

- A *Wahkiakum County Eagle* Thursday, Feb. 4, 1965.
- B Debris from slide, 1-30-65, with view of cliff in background.
- C 40-ton shovel washed carried across the dike by wave.
- D Debris, water, and buildings damaged by wave.
- E Map of area, showing location of slide and elevation of ridge.
- F Picture of slide taken 11-6-2007.

IND39-1 Comment noted.

NorthernStar would implement various mitigation plans to compensate for impacts on waterbodies, wetlands, vegetation, and habitats. NSNG will go well beyond what is required for mitigation and that is why I support Bradwood Landing and the Draft EIS.

NorthernStar has proposed a very robust Mitigation Plan, including restoration programs at Hunt Creek, Svensen Island, and Delameter Creek, to create or enhance wetland habitats as compensation for wetlands and habitats impacted by its project. I trust our state agencies to get this right and for Bradwood to meet or exceed the agencies standards.

Testimony to FERC
Public Meeting, November 8, 2007
Hilda Lahti School, Knappa, Oregon

07 Nov. 14
Docket No. CP06-365-000
Docket No. CP06-366-000

Bradwood Landing, LLC
NorthernStar Energy, LLC

IND40-1 Evidence submitted to you by many other people proves there will be substantial air and water pollution and environmental damage resulting from the construction and day-to-day operations at Bradwood. Additionally, this site is known to be at risk for a substantial earthquake, and the pipeline routes (through Washington and the Palomar line) snake through miles and miles of geologically unstable and unsafe land.

IND40-2 So what will happen in an emergency? The DEIS and local emergency resources share one common trait: both have significant, scary gaps.

The Knappa Fire District has "sole responsibility for emergency response and mitigation for incidents at Bradwood." To compile its "Resource Gap Analysis," the Fire District researched the four existing LNG terminal facilities in the U.S., incidents at the 2 LNG peak shaving plants in Oregon, and information from the Coast Guard and NorthernStar Natural Gas. I am attaching the report to for your consideration.

In its testimony submitted to the Clatsop County Commissioners on October 18, 2007, the fire district identifies massive gaps in its resources. As we all know, emergencies occur in every industry from a variety of causes. More employees, vehicles, equipment, training, and a new fire station facility within 3 miles of Bradwood are needed to cope with just the "predicted routine emergencies" at the terminal.

The report says that even these improvements will NOT be enough to deal with "catastrophic incidents." The report does NOT address resources needed for emergencies on LNG tankers, along the shipping channel, the proposed pipeline route, or in neighboring forests and communities. It does NOT include resources needed by other emergency responders, such as police, security, HazMat, and ambulances.

The Knappa, Astoria, Warrenton, and Clatskanie fire districts will need a total of 15 more full-time employees and 6 interns to provide what the Knappa district calls a "conservative, effective response to incidents at Bradwood Landing." The district will need numerous annual trainings for responders. It will need four specialized fire, rescue, and communications vehicles; a

IND40-1 Earthquake and landslides hazards and mitigation are discussed in sections 4.1.3.3 and 4.1.4.3.

watercraft; combustible and/or multi-gas detectors for all emergency vehicles and personnel; satellite communications equipment; and much more.

The fire districts can't afford these essential resources – and NorthernStar, the Coast Guard, the State of Oregon, Clatsop County, and the federal government have NOT offered to pay for them.

At the Clatsop County Planning Commission hearing in July, 2007, NorthernStar said it would have its own fire-fighting team on-site at Bradwood. However, after prolonged prodding from the Commissioners, the company admitted this would not be a free-standing unit, but simply assorted employees who would somehow manage to leave their own essential jobs at a moment's notice. The company did not reveal the equipment, personnel, or training it would provide. Of course, this assumes that NorthernStar would actually run and operate the Bradwood terminal, instead of selling the permitting rights to a major gas industry corporation.

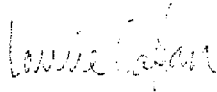

Environmental damage from even a routine industrial accident at Bradwood could be widespread, long-term, and devastating. It's hard to imagine what the impact of an actual catastrophe would be, especially without massive spending for equipment, personnel, and other resources throughout the estuary and beyond.

Why would the federal government even consider siting such a complex and potentially dangerous facility without ensuring the necessary resources to protect it?

This foolhardy proposal needs to die, NOW.

The reputation of FERC is suffering because of its enthusiastic support for the LNG industry. More and more Americans believe the agency should be called Friend to Every Resource Company, or, Fleeing - a polite 'F' word - the Environment and Rural Communities.

Please fulfill your responsibilities as a regulatory agency and protect the public from this horrific project. FERC must reject LNG at Bradwood.

Comments for the Public Record by Jerry Havens
FERC Public Hearing on Bradwood Landing
November 8, 2007 - Astoria, Oregon

IND41-1

Thank you for permitting me to comment at this public hearing. I am appearing as a scientist and as a concerned citizen to inform you of potential problems in FERC's approval of vapor cloud exclusion zones prepared for the Bradwood Landing DEIS.

Recent events indicate to me that FERC's compliance with the Congressional mandate to consider remote siting of LNG terminals in order to protect public safety is being based largely on exclusion (safety) zones required by U.S. Department of Transportation regulation 49 CFR 193. As a result, the establishment of such exclusion zones, which are mandated for land-based facilities only, has become the key method by which sufficiently remote siting is insured. I believe that such methods as are presently applied do not and can not insure the public safety as intended. In the limited time available, I will comment only on the vapor cloud exclusion zone determinations.

Presently, only two modeling models are approved for determining vapor cloud exclusion zones for LNG terminal applications. The DEGADIS model, of which I am a co-author, was developed with support of the U.S. Coast Guard and the Gas Research Institute. Approved for use in the federal regulation in the early 1990's, DEGADIS does not account for any holdup of LNG vapor by dikes or other obstructions (to flow). Because of the need for models which can account for such complicated effects (the real world), the FEM3A model was developed as a result of a ten-year-long research effort supported by the Gas Research Institute and a consortium of international LNG interests, for which I was the Principal Investigator. FEM3A, approved in 2000, is clearly specified in 49 CFR 193 as the model that must be used if vapor holdup by impoundments or vapor fences is to be taken into account.

Here, the applicant attempts to take the (vapor-holdup) effect of the impoundment into account without using the only permissible method (FEM3A) for doing so. Instead, it

Individuals

41

IND41-1

See our responses to comments IND73-1 through IND73-5.

IND41-1
cont'd

uses DEGADIS coupled with an absurd assumption that the LNG vapor evolved from a spill would accumulate in the impoundment without mixing with air. In effect, the applicant assumes that zero LNG vapor would be released from the impoundment during the first several critical minutes after a spill, when the rate of vapor generation from the spilled LNG is the greatest. This assumption has the effect of substantially reducing the calculation of the size of the vapor exclusion zone. And -- most important -- the assumption has been proven to be wrong. Experiments have conclusively shown that the LNG vapor does not simply remain in an impoundment until the volume of the pure, unmixed and unwarmed vapor exceeds the volume of the impoundment. But that absurd, and demonstrably wrong, assumption is the basis for the calculation of the vapor exclusion zone in this case. To be reasonable, the calculation must be redone, either using DEGADIS without attempting to take the effect of vapor holdup in the impoundment into account, or by using FEM3A, which correctly factors in the effects that the impoundment does have.

I believe that the vapor cloud exclusion zones determined in the DEIS fail to provide for public safety as intended by 49 CFR 193 in two other ways:

- The design spill used by the applicant here has been arbitrarily specified as the breakage of a 6-inch line on the cargo unloading line for the facility, with a ten-minute duration spill of 140,320 gallons, while the impoundment volume into which the spill would occur has been sized (and therefore deemed credible) to account for a ten-minute duration spill of 529,091 gallons resulting from a full rupture of the ship unloading line. My review of eleven other environmental impact statements shows DEIS approval for design spill from the ship unloading line ranging from 28,900 gallons (Keyspan) to 812,000 gallons (Trunkline). I do not understand how FERC can approve such a large variation in the design spill which determines the extent of the vapor cloud exclusion zone. After all, the ship unloading lines, as well as the arrangement of the smaller lines serving the unloading line are all based on similar technology and design specifications. Since the vapor cloud zone determinations are directly related to the size of the

Individuals

IND41-1
cont'd

spill. the lack of consistency shown in the design spills selected by the various applicants could have the appearance of simply determining the size of the spill that the property line distance allows.

- The determination of the vapor cloud exclusion zone has been made assuming a wind speed of 2 m/s. This assumption is not conservative; although allowed by 49 CFR 193, the basis for this assumption predates scientific findings that 2 m/s wind speed cannot be assumed to be worst case. As both theoretical models and experimental evidence indicate, the maximum downwind safety zone can occur at a wind speed higher than 2 m/s (4.5 mph), and such higher wind speeds are not an unusual condition. In this regard, I point out that the fire radiation exclusion zone is required to be determined, as Bradwood Landing appears to have done, for the wind speed that maximizes the exclusion zone. The same reasoning is applicable to the determination of the vapor cloud exclusion zone.

Comments of Jim Kodama on the Bradwood Landing DEIS 11/08/07

I read in the paper that tonight we'd hear from Jerry Havens on the subject of LNG. So I spent a few minutes on Internet and here's what I found.

To believe Mr. Havens' claim that he is not an LNG proponent or opponent is to ignore the obvious. He is simply a hired gun, brought in by project opponents, to scare the bejeezus out of people who aren't familiar with the details of this project, the safety record of the industry, or the science behind LNG. Mr. Havens would have us live our lives in fear that there's a terrorist hiding behind every tree and bush in the Pacific Northwest, just waiting for the chance to get us.

The US Coast Guard is aware of the risks posed to LNG carriers from terrorists as well as the robust construction of LNG carriers. The measures identified by the Coast Guard are designed to "harden the target" and make it difficult for a terrorist to damage an LNG carrier.

In 2004, Sandia National Laboratories published "Guidance on Risk Analysis and Safety Implications of a Large Liquefied Natural Gas (LNG) Spill Over Water". This 167 page report has been widely accepted as accurately representing the risks of an LNG spill over water. The report discusses the issues relating to a massive spill into the water and it also discusses the probability of such an event. Bradwood Landing used the Sandia Labs guidance to analyze their project.

The probability of an accidental release of LNG is extremely unlikely. In fact, it's close to zero. On the Columbia River, LNG carriers will be tethered to tugboats and will travel at 12 knots or less. The bottom of the river is mostly sand. Given these factors and the excellent safety record of the pilots, it is extremely unlikely that an LNG carrier would suffer an accident that could breach the cargo tanks. In fact, to date, there has never been a significant spill of LNG from any LNG carrier.

It turns out that Mr. Havens has testified against many LNG projects across the county. He was recruited by the mayor of Fall River, Massachusetts to oppose the Weaver's Cove LNG project. He has filed testimony against Sound Energy Solutions in Long Beach, California.

IND42-1

Comment noted.

K-871

IND42-1
cont'd

And for some people here today, Mr. Havens should be a familiar face. In 2005, an environmental group opposed to Bradwood Landing brought Mr. Havens to Astoria to deliver his fear-mongering stump speech.

So I have to wonder, Mr. Havens, who is paying for you to be here today? I challenge you to tell us.

Despite his testimony, since Mr. Havens made his concerns known to the Secretary of Homeland Security in Feb. 2004, FERC has issued (14) separate Final Environment Impact Statements, related to LNG facilities. I have included a list of these in my written testimony.

Finally, most telling was the rebuttal testimony I came across in the Weavers Cove project, and I quote, "Finally, and perhaps most importantly, Dr. Havens is not an expert on the safety and security of LNG vessels or the security of LNG terminal facilities. He has no identifiable experience whatsoever in analyzing terrorism events, their effects, their probabilities or the potential to mitigate such threats."

It concludes, "In summary, based on these flaws, Dr. Havens' modeling, and his criticisms based on that modeling, are erroneous, unreliable and add nothing to this record. His opinions, whether voiced to the Commission or to the Congress, are just that, opinions, but opinions nevertheless, unsupported by scientific or technical analysis."

Thank you,

Jim Kodama

01 Nov 14

ORIGINAL

I believe that Bradwood Landing will continue to meet and exceed the standards of Federal, State and County Agencies, as the project continues through the permitting process.

- Water intakes by LNG ships at berth would be screened to prevent the entrainment or impingement of Salmon or Steelhead smolts.....this sets a high standard for shipping on the Columbia.

Federal Energy Regulatory Commission
Public Comment Meeting
November 8, 2007
Knappa, Oregon

RE: CP06-365
NorthernStar Natural Gas, LLC
Proposed Bradwood , Oregon LNG Regasification Terminal

Thank you for one last opportunity to publicly express my concerns with the DEIS as printed. I hold a degree in Biology, Master's Degree in Technology and advanced certification in brain research. I am not an amateur to research and understand the hours of commitment FERC staff and 3rd party contractors have put into this document. As I stated last evening, though, it has many, many missing pieces and I can't help but wonder if that was done deliberately. If so, one's imagination could run overtime as to why. So let imaginations fly. Many times, it's not imagination but reality that results.

IND44-1 Mr. Friedman, you have stated multiple times over the course of this week that landowners could go to NorthernStar to get an answer as to IF the pipeline was on their property and at what mile marker. All my husband could get for an answer was, "The drill site is not on your property." Tonight, Gary Coppedge of NorthernStar told my husband, once again, the drill site is not on our property and that, in fact, they, NorthernStar did not know where the drill site was to be on *either* side of the river. The revised Cowlitz County Geohazard report supported our claims that the hillside near the proposed HDD drill site to have been on our property was unstable and further recommended three possible alternative placements for that drill site. Two recommendations would have seriously increased cost to NorthernStar as well as require additional HDD's up the Abernathy Creek draw. The third alternative was to move the drill site west of the proposed site. That would mean further up on top of the ridge within the association of homeowners to which we belong. Based on a neighborhood survey on feelings toward the proposed NorthernStar LNG project and the relative location of KB Pipeline within our neighborhood, only one piece of property was left.

The proposed major horizontal directional drill site for placement of the 30-inch pipeline under the Columbia River has been moved and not by just a few feet but over the width of at least, 2 five acre parcels, or, approximately 1350 feet or about a quarter of a mile. This new location has not been communicated to landowners in the area and will be located within a few feet of a year-round creek that feeds into Mill Creek, one of the last NATIVE SALMON RUN creeks left on the entire Columbia River. Along each side of the unnamed creek wetlands exist. Eagles, owls, raccoons, deer, elk, many birds and other wildlife call that area home.

Furthermore members of the homeowner's association,--Mr. Coppedge, Mr. Garrett and any other NorthernStar representatives who may be present--have the right to know the location of that drill site because you will affect their lives far more than the owner of that one piece of property who has no plans to build on it, now or in the future. It is our association's private road you will use to access that property. Your permission from us is needed as well.

Individuals

44

IND44-1 See our responses to comments IND72-1 and IND72-2.

IND44-1
cont'd

Because all of this information is conspicuously missing from the DEIS, and because the location change was known by the FERC prior to issuance of the DEIS, I, therefore, formally demand all further discussion and consideration of this Draft Environmental Impact Statement be stopped until all pertinent environmental, water quality, road, safety, socio-economic, affected residential and any other additional necessary information is gathered and reports submitted to the appropriate agencies for their review and comment AND a new draft environmental statement released for comment by the public.

My formal request along with supporting documents is being formally submitted by electronic and regular mail service with copies submitted to the State of Washington, Senators Cantwell and Murray, Congressman. Brian Baird, Mr. Brian Hatfield, Mr. Dean Takko, Mr. Brian Blake, Cowlitz County Commissioners, the Cowlitz County Planning Department, as well as appropriate environmental agencies.

Thank you.

FERC file ID=11471107

The William&Doris Dragich Trust : do file this Motion/Notice to Comment and Submit Questions with the Commission as a party or parties that are requesting to comment and submit questions based on these facts:

Questions for The Federal Energy Regulatory Commission in the siting of Liquefied Natural Gas at Bradwood, Oregon, Lower Columbia River Region Draft DEIS:

1. On September 7th,2005 an original list of 512 landowners was submitted to FERC by Northern Star Energy LLC's legal representative Van Ness and Feldman. Copies were sent to FERC and contractor Natural Resources Group.At that time no CEII was proclaimed and no privacy claim invoked. All future request for landowner lists or pipeline route maps were denied.
2. On December 14th,2006 a Biological Assessment Meeting on the Bradwood proposal was held.No notification was given to interveners and interveners who were present were denied attendance and reasons as to why they were denied attendance. In reference to ex parte communication it is noted on the meeting roster that John Buchovecky, Northern Star legal representative and Gary Coppedge,Northern Star Vice President were in attendance.
3. In a FERC manual titled: Ideas For Better Stakeholder Involvement; Page 9,Industry Options Chapter,Titled:Make Route Information Easy and Understandable. Northern Star either has claimed exemption under item 4 of the Freedom of Information Act, or CEII exemption under FERC Rule 630.

I therefore make this Motion/Notice to Comment and Submit Questions, for any and all parties and or documents that this issue pertains to under the above Docket No's.CP06-365-000, CP06-366-000, CP06-376-000, CP06-377-000, and for the reasons and facts stated in my Motion/Notice to Comment and Submit Question for the Draft DEIS.

Washington, DC 20426

Subject: PF07-13-000 Motion to Split the Palomar Application and Combine Segment 2 with Bradwood Landing, CP06-365-000, et al.

Dear Ms. Bose

I request FERC order Palomar to split its application into two parts and that FERC consider Segment 2 as integral to the Bradwood Landing approval process, CP06-365-000, et al.

The motion is made based on the following evidence:

1. The Daily Astorian (Nov. 27, 2006, *Who knows where the gas will go?*) reported the following (highlights added):

Joe Desmond, NorthernStar vice president of external affairs, said the Bradwood project doesn't need the Palomar gas line because it has its own pipeline - that hooks into the Williams Northwest system.

But Williams Northwest Pipeline spokeswoman Michele Swaner said her company doesn't have room for all the gas NorthernStar plans to import to its Bradwood facility.

"It does make sense that they signed up on Palomar," she said. "Physically, we're capable of receiving it, but it would take the place ... of all the other gas supplies flowing in that system both north and south. We have long-term agreements in place. ...We're unlikely to disrupt the relationship we already have with our customers right now."

Even with the projected declines in supply from Canada and the Rocky Mountains, she said, there's not enough demand for gas in Oregon and Washington to absorb the full volume from Bradwood. But she said there is demand for that volume in California. Williams has a stake in a different LNG pipeline that would run east from the proposed Jordan Cove LNG terminal in Coos Bay to meet the Williams pipeline south of Roseburg, near the California border.

Peter Hansen, chief executive officer of the competing LNG development company, Oregon LNG, said his company had to change its pipeline route because - even without gas from Bradwood Landing - the Williams pipeline at Kelso was full. Oregon LNG now plans to run a 117-mile pipeline similar to the Palomar line down to Northwest Natural's Molalla hub.

"That's why Bradwood's doing the Palomar pipeline, because they have recognized the Williams pipeline doesn't have room," Hansen said.

IND46-1

We have added new text to section 1.0 describing the capacity of the Williams Northwest pipeline system for the natural gas from the Bradwood Landing Project. Natural gas supply and demand in the Pacific Northwest are addressed in section 1.1. See also our responses to comments PM1-10 and PM3-50. The Jordan Cove LNG Project and Oregon LNG Project are discussed in section 3.1.3.4.

IND46-1

K-879

IND46-2

2. Page 2-28 of the Bradwood Landing DEIS describes the Palomar pipeline as follows,

[T]he Palomar pipeline would then proceed northwest to interconnect with Northwest Natural's existing storage field at Mist. From Mist, the Palomar pipeline could branch off to serve the Bradwood Landing LNG facility.

At best this description is erroneous; at worst misleading. An honest description of the Palomar pipeline would have been, it makes a bee-line to Bradwood with a possible spur to Mist; a spur that is not now part of Palomar's NOI.

FERC, thus far, has steadfastly declined to consider Palomar as a predictable, and now necessary, outcome of Bradwood. It is a matter of fact that Segment 2 of Palomar requires Bradwood (especially now that the Mist spur is clearly off the table). The evidence above points to Palomar not only being necessary to Bradwood, but perhaps primary or even its sole outlet.

I believe Palomar was, in the first instance, not properly considered in Bradwood, based in part, on an erroneous description of the Palomar purpose and alignment.

FERC should correct these oversights by granting this motion.

Regards,
Marc Auerbach
Birkenfeld, Oregon

Individuals

46

IND46-2

See our response to comments PM1-24 and CO4-1 regarding the purpose and route of the Palomar pipeline. The Palomar pipeline is not inter-dependent on the Bradwood Landing Project, and will be studied separately by the FERC, and reviewed on its own merits.

Sirs:

IND47-1 I am opposed to the proposed LNG facility at Bradwood Landing in Oregon. This development is not needed in Oregon. We do not need the amount of gas the project will supply. We are working in Oregon to reduce our fossil fuel use. We need to be creating more renewable, cleaner, and safer energy sources.

IND47-2 This facility would endanger Oregon's people, environment, and certain aspects of its economy. The project will require the construction of hundreds of miles of pipeline which will result in the loss of thousands of acres of forests and farms. The necessary dredging of the Columbia River will degrade salmon habitat. The facility will require security buffers that will impede commerce and recreation. The facility will basically be a giant bomb waiting to go off either accidentally or by terrorist attack.

IND47-3 The facility would benefit primarily energy companies and California where most of the gas would go. Californians have already rejected proposals such as these in their state because of the many risks involved. Why should Oregonian's shoulder California's risk and environmental degradation?

Sincerely,
John Peterson
Portland, OR

Individuals

47

IND47-1 See the revised discussion of the project purpose and need in section 1.1 and the expanded discussion of renewable energy sources as alternatives to the project in section 3.1.1.

IND47-2 The Bradwood Landing pipeline would be 36.3 miles long. Impacts on salmonids would be mitigated and the impacts of the safety/security zone around the LNG ships would be minor. Safety and security measures would be implemented to protect against accidental or intentional LNG releases.

IND47-3 NorthernStar intends for its project to service markets in the Pacific Northwest, not California. See our response to comment PM1-23.

Re: Docket No. CP06-365-000 et al.

November 28, 2007

To Whom It May Concern:

In general, I find the venture capitalists promoting this concept have misnamed themselves.....not "NorthernStar" but "NorthernScar" would be more appropriate for the environmental scar they are proposing for the Lower Columbia Drainage area.

IND48-1 The greatest flaw in this DEIS is its failure to show a real purpose and need. NorthernStar's business plan appears to be.....if we build it, they will buy it. Section 1.1 Purpose and Need, pg. 1-3 states this project will "provide up to 1.3 BCFD of natural gas to the Pacific Northwest." On p.1-4 they state "For a high growth case, the Northwest Gas Association predicts regional gas average demand to reach 2.6 BCFD, an increase by about 25 percent over current levels." Thus, NorthernStar expects to supply 50 percent of the projected gas demand with their more expensive LNG. They fail to explain how or why.

IND48-2 Another flaw in this DEIS is its failure to consider the capacity of the 20 inch KB pipeline now flowing East through Cowlitz County. If its flow is reversed, the proposed 30 inch line could be reduced to a 22 inch line. The construction 100 foot scar could then be reduced to 50 feet and the permanent easement to 30 feet. This would cut the environmental impact in half.

IND48-1 See the revised discussion of the project's purpose and need in section 1.1, and our response to comment IND33-26.

IND48-2 The existing KB pipeline already serves the Beaver power plant. The KB pipeline flows in the opposite direction of the proposed Bradwood Landing pipeline. The KB pipeline transports gas from the existing Williams Northwest system west to Beaver. The KB pipeline would be too small to handle all the natural gas from the Bradwood Landing LNG terminal, and could not meet all of the proposed project objectives.

K-882

Individuals

48

IND48-3

As a property owner with the KB pipeline running through three quarters of a mile of my forest land, plus my experiences with a B.S. in Civil Engineering, forty five years as an industrial contractor, ten years as a Diking District #1 supervisor and ten years on the Washington State Forest Practices Appeals Board, I feel well qualified to critique the pipeline portion of this DEIS. My tree farm at 230 Grasset-Poston Road will be adjacent to the proposed pipeline for one half mile and then impacted by it for one quarter mile.

Maybe if we listened, history wouldn't have to repeat itself? I have experienced the false promises of the KB group: to replant trees, to plant for wildlife, to maintain a privacy screen, to clear only ten feet on top of the pipe.....none of which happened because permits are granted but nobody follows up.

This draft DEIS contains pipeline gray areas that need attention:

4.8.3.5 Tax Revenues, pg. 4-351 states: "Property taxes on the pipeline would be assessed by and paid to.....Cowlitz County in Washington." Property taxes should be clearly specified as real estate & personal property taxes. Current County policy unfairly charges the landowner for real estate taxes and the pipeline companies only for personal property taxes. In my case, three acres of forest land have been converted to Industrial land with no back taxes required and KB rides free with me paying their land tax. NorthernStar should be required to pay all current real, personal property and conversion back taxes.

4.4.2.3 Existing Upland Vegetation, pg. 4-115 states: "In areas where timber would be harvested, the trees would be cut and stacked for commercial sale. The logs would be hauled to the market and the proceeds of the sale collected by the property owner." This is not the way it is done. NorthernStar should conduct a timber cruise, pay for the timber rights, take out DNR forest practice permits and pay for the value of any reproduction trees that are not yet ready for market.

2.3.3, Pipeline and Associated Facilities, pg. 2-35 states: "Where the Bradwood pipeline would be adjacent to the existing KB pipeline, the temporary construction right-of-way would overlap onto the existing pipelines permanent right-of-way. The overlap would be up to 10 feet....., but no closer than 15 feet from the existing pipeline." Will the property owner be paid for this encroachment? On a large portion of my land the KB pipe is 20 feet from the property line. Thus only 5 feet of spoil could be deposited if the 15 feet takes precedent.

IND48-3

We will require NorthernStar to follow through with all mitigation and restoration commitments. Section 2.5 describes our environmental compliance inspection and monitoring program. Condition 14 requires the use of third-party environmental compliance monitors.

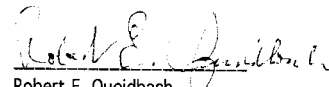

Individuals

48

IND48-3
cont'd

Finally, there should be a standard easement with site specific clauses plus a liability hold harmless clause, a statement that NorthernStar pays all current real estate and personal property taxes, plus any conversion back taxes, and upon the 50 year (pg. 2-63) abandonment of the pipeline there shall be a recorded reconveyance and release of the right-of-way easement.

Respectfully submitted,

Robert E. Quidbach

jnreed48@hotmail.com

This is my second set of submissions on the draft Environmental Impact Statement for the Bradwood Landing proposal. It should be read as supplementary to the first set of comments. I attempted to submit this material electronically but the FERC website could not confirm my user address.

Expertise

As mentioned in my former filings, I am retired after spending six years in senior management positions within the upstream LNG business (production, liquefaction, and transportation). My former company has been in the upstream LNG business since the late 1960's. In addition, I have also held the positions of Chief Engineer for international operations and of Chief International Negotiator.

I have visited some half dozen LNG terminals in the Far East to understand the operating procedures and conditions that might affect the delivery of LNG but do not have professional qualifications in LNG terminal design or operation. I am relatively new to the Pacific Northwest and therefore am unfamiliar with specific conditions along and in the Columbia River and its estuary.

Individuals

49

K-885

This second set of comments is a more generalized discussion of the draft Environmental Impact Statement than my first submission; this submission identifying issues missing or omitted. Consequently, it does not generally contain section or page references.

MITIGATION VS. IMPACT

IND49-1 I AM NOT FAMILIAR WITH THE DETAILED REQUIREMENTS OF DOMESTIC U.S. ENVIRONMENTAL IMPACT STATEMENTS. INTERNATIONALLY, THEY CAN BE DESCRIBED AS 'BEFORE AND AFTER' STATEMENTS. INTERNATIONAL ENVIRONMENTAL IMPACT STATEMENTS ARE NOT JUST A GENERALIZED DISCUSSION OF MITIGATION EFFORTS AS SEEMS TO BE THE CASE WITH THE SUBJECT DRAFT EIS. INTERNATIONAL ENVIRONMENTAL IMPACT STATEMENTS ASSUME THAT MITIGATION IS INHERENT IN THE ORIGINAL PROPOSAL. SO A CONCLUDING STATEMENT SUCH AS "WE INTEND TO INSTALL FISH EXCLUSION SCREENS ON THE WATER INTAKES" WOULD BE UNUSUAL IN AN INTERNATIONAL EIS.

LET ME BROADEN THAT EXAMPLE. THE BRADWOOD LANDING SCHEME CALLS FOR SALMONOID EXCLUSION SCREENS. IT DOESN'T TELL US WHAT THE POPULATION IS BEFORE AND IT DOESN'T TELL US WHAT THE POPULATION WILL BE AFTER. THERE IS NO KILL RATE ESTIMATE I CAN FIND FOR THE USE OF MITIGATION EXCLUSION SCREENS. ALL WE KNOW IS THAT THE FACILITY WILL HAVE EXCLUSION SCREENS OF UNKNOWN EFFICACY.

ONE SHOULD COMPARE THIS APPROACH TO THAT OF THE BONNEVILLE DAM AUTHORITY. THE AUTHORITY HAS PERFORMED STUDIES THAT SHOW 85% OF SALMONOIDS SURVIVE PASSAGE THROUGH THE TURBINES. THE FISH SKIMMING BYPASS SYSTEM FURTHER REDUCES THE LOSS BY A VARIETY OF NUMBERS DEPENDING ON THE MODE OF OPERATION. THIS IS MORE SIMILAR TO WHAT I WOULD EXPECT IN AN INTERNATIONAL EIS.

FURTHER BROADENING MY EXAMPLE REDUCTIO ABSURDUM, I RECALL THE ORIGINAL NORTHERNSTAR PROPOSAL TO USE AIR HEAT EXCHANGERS (INSTEAD OF SUBMERGED COMBUSTION VAPORIZERS IN THE CURRENT PROPOSAL). IF THIS EIS WERE TO DRAFTED FOR AIR HEAT EXCHANGERS, INSTEAD OF SPECIFYING THE RESULT PRODUCING "X" GPM OF RAINFALL OR FOG (INSERT YOUR OWN NUMBER), IT WOULD SAY NORTHERNSTAR WOULD MITIGATE THE EFFECTS OF RAINFALL BY REQUIRING ALL THEIR EMPLOYEES TO WEAR HATS AND THOSE EYE

Individuals

49

IND49-1 Section 4.5.2.1 has been revised to include additional information on the potential impacts on aquatic resources, including salmonids, due to entrainment and impingement. As described in section 4.5.2.1, fish screen designs have been reviewed and approved by the NMFS. Furthermore, we have recommended that NorthernStar conduct post-construction monitoring to assess the effects of impingement and entrainment from use of the screened water supply system on juvenile salmonids during terminal operations and provide annual reports to both the FERC and NMFS regarding the efficacy of the screened water intake system, which would identify any problems and address how such problems would be rectified; therefore, impacts on fish in the vicinity of the intake screens are not expected to be significant. See also our response to comment PM1-31.

K-886

IND49-1
cont'd | GLASSES WITH WINDSHIELD WIPERS. THIS WOULD NOT BE AN ENVIRONMENTAL BEFORE AND AFTER STATEMENT, AS I AM ACCUSTOMED IN THE INTERNATIONAL ENERGY BUSINESS.

ABANDONMENT

IND49-2 | PRESUMABLY THE BRADWOOD FACILITY WILL EXPERIENCE REMEDIAL WORK AT THE END OF ITS USEFUL ECONOMIC LIFE. WHILE EXTENSIVE DISCUSSION IS NOT USEFUL AT THIS STAGE, INASMUCH AS REMEDIAL TECHNIQUES EVOLVE OVER TIME, A STATEMENT AS TO THE END CONDITIONS SHOULD BE CONTAINED IN AN ENVIRONMENTAL IMPACT STATEMENT.

I DO NOTE THAT THERE IS NOW SOME OUTSIDE DISCUSSION OF END-LIFE OPERATIONS NOT ADDRESSED IN THE DRAFT EIS. IN THE ENERGY BUSINESS, WE DON'T TYPICALLY CALL IT DECOMMISSIONING. THIS SOUNDS MORE LIKE A MILITARY TERM TO ME. IN THE OIL AND GAS INDUSTRY, WE CALL IT ABANDONMENT. TECHNICALLY, ABANDONMENT IS A LOT OF WORK BUT IS REALLY A NO-BRAINER. IT IS THE REMOVAL OF THE FACILITIES, THE CLEANING OF THE SITE AND THE RESTORATION OF THE SITE TO A STANDARD SPECIFIED IN THE ENVIRONMENTAL IMPACT STATEMENT.

WHAT IS NOT A NO-BRAINER IS HOW WE CAN ASSURE OURSELVES THAT THERE WILL BE AN ENTITY LEFT STANDING WHO WILL HAVE THE FINANCIAL CAPABILITY TO UNDERTAKE THE ABANDONMENT TASK. WITH LARGE OIL COMPANIES, A CORPORATE GUARANTEE IS USUALLY SUFFICIENT INASMUCH AS A LARGE BODY OF ASSETS WILL STILL REMAIN AT THE END OF THE LIFE OF A SINGLE FACILITY. A SPECIALIZED CORPORATE ENTITY FORMED EXCLUSIVELY FOR AN LNG TERMINAL MAY NOT HAVE ANY FINANCIAL RESOURCES TO UNDERTAKE ABANDONMENT AT END-LIFE UNLESS IT HAS PROVIDED FOR A SPECIAL SECURITY STRUCTURE. ONE MUST REMEMBER THAT THE OPERATOR WILL BE DISTRIBUTING ITS PROFITS SO THERE MAY BE ONLY MINIMAL AMOUNTS OF MONEY LEFT WHEN THE FACILITY COMES TO THE END OF ITS USEFUL ECONOMIC LIFE. WE FACE THE POTENTIAL OF HAVING A RUSTING EYESORE MOTHBALLED AND LEFT IN PLACE, OWNED BY A FINANCIALLY EXHAUSTED FINANCIAL SHELL. THE SIZE OF THIS OBLIGATION IS PRETTY BIG. IN THE ENERGY BUSINESS, THE COST OF ABANDONMENT CAN RUN UP TO 25% OF THE CAPITAL COST OF THE FACILITY.

UNLESS FERC REQUIRES THE ESTABLISHMENT OF SOME FORM OF ABANDONMENT SECURITY, THE RIVER USERS WILL BE WELL AND TRULY EXPOSED.

Individuals

49

IND49-2 We address abandonment in section 2.9. NorthernStar has filed a decommissioning plan with Clatsop County and committed that it would provide financial assurances in the form of a surety bond or letter of credit for an amount appropriate to cover the reasonable costs of decommission the facility

Individuals

49

THE USE AND VALIDATION OF MODELS

IND49-3 THERE HAS BEEN NUMEROUS MENTION OF THE USE OF COMPUTER MODELING TO DETERMINE THE EFFECTS OF THE LNG TERMINAL AT BRADWOOD LANDING. I DON'T KNOW MUCH ABOUT THE COLUMBIA RIVER AS SUCH BUT I HAVE HEARD ALL KINDS OF DISCUSSIONS REGARDING MODELS FOR NOISE, SEDIMENTATION, POOL SPILL VAPOR AND COMBUSTION FRONTS, AND SO ON. THE MOST RECENT DISCUSSION IS THE TESTIMONY OF Dr. J. HAVENS, WHO ASSERTS THAT THE VAPOUR MODEL IS BEING MISUSED. I HAVE NO PARTICULAR EXPERTISE IN THAT SPECIFIC DISPUTE BUT I WOULD LIKE TO COMMENT ON HOW MAJOR ENERGY COMPANIES ADDRESS THE USE OF COMPUTER MODELING.

TYPICALLY, WE HAVE A VERY GOOD INTUITIVE IDEA OF THE EFFECTS OF OUR OPERATIONS, BASED ON A DEEP EXPERIENCE OF OPERATING MAJOR FACILITIES. THESE INTUITIONS ARE BACKED UP BY MANY LONGTIME AND PROVEN CALCULATIONAL METHODS. IN THE PAST, THERE WERE ALSO MANY PUBLISHED FIELD STUDIES THAT GAVE US CONFIDENCE IN OUR CALCULATED RESULTS. WITH THE ADVENT OF TRUE COMPUTER SIMULATION MODELS, WE WOULD STILL PERFORM PARALLEL TRADITIONAL CALCULATIONS. IF THE COMPUTER MODELS DEVIATED SIGNIFICANTLY FROM THE CALCULATIONS BASED ON YEARS OF EXPERIENCE AND REFINEMENT, WE WOULD READDRESS THE QUESTION TO VALIDATE THE MODEL (THIS IS NOT TO SAY THAT THIS IS THE ONLY WAY TO VALIDATE MODELS). WE WOULD THEN USUALLY ATTEMPT TO DETERMINE WHICH MODEL INPUTS WERE MOST INFLUENTIAL TO THE RESULTS OF THE COMPUTER SIMULATION AND ASSESS OUR CONFIDENCE IN THOSE INPUTS. THIS WOULD OFTEN RESULT IN SOME MODIFICATION IN THE COMPUTER INPUTS.

FOR EXAMPLE, I HAVE BEEN TOLD THAT EXPERIENCE WITH DREDGING OPERATIONS IN THE COLUMBIA RIVER OVER MANY YEARS SUGGEST THAT THE PROPOSED TURNING BASIN CAN FORM A SEDIMENT TRAP IN FRONT OF THE CLIFTON CHANNEL. AS I UNDERSTAND IT, NORTHERNSTAR'S MODEL INDICATES THAT THE DREDGING WILL NOT SIGNIFICANTLY INFLUENCE SEDIMENTATION IN THE CLIFTON CHANNEL. PERSONALLY, I HAVE NO IDEA. THIS IS A PERFECT EXAMPLE OF WHEN IT IS APPROPRIATE TO REVISIT MODEL ASSUMPTIONS. THERE IS NO INDICATION, HOWEVER, OF ANYONE REVISITING AND VALIDATING THE COMPUTER MODEL TO DETERMINE WHETHER IMPORTANT INPUT IS UNCERTAIN OR VARIABLE, AS WOULD TYPICALLY BE DONE BY A MAJOR ENERGY COMPANY.

IND49-3 We explain how we modeled the thermal and vapor exclusion zones at the LNG terminal in section 4.11.

IND49-3
cont'd

I REMEMBER A DEVELOPMENT IN INDONESIA WHERE A SINGLE HAND CALCULATION AND THE RESULTING REVISIT OF THE MODEL INPUT RESULTED IN THE REDUCTION OF THE NUMBER OF WELL SLOTS IN A PLATFORM BY 30% AND A REDUCTION OF SOME 25% IN CAPITAL EXPENDITURES; ALL BECAUSE THE INPUT TO THE MODEL WAS RE-EXAMINED AND FOUND TO BE FAULTY.

THE DRAFT EIS, OTHER RECENT SUBMISSIONS, AND PUBLICALLY AVAILABLE SUPPORT DATA DO NOT OFFER THE LEVEL OF CONFIDENCE IN MODELING REQUIRED IN THIS INDUSTRY.

DESIGN CONCERNS

IND49-4

THERE ARE NUMEROUS DESIGN CONCERNS, LARGE AND SMALL, THAT LOOK RISKY IN THE NORTHERNSTAR PROPOSAL AS DESCRIBED IN THE DRAFT ENVIRONMENTAL IMPACT STATEMENT. WHILE THESE DESIGN CONCERNS MIGHT BE ADEQUATELY ADDRESSED IN THE FUTURE, IT IS NECESSARY TO BE VERY SURE THAT NORTHERNSTAR HAS THE INTERNAL FINANCIAL AND TECHNICAL COMPETENCE TO IDENTIFY AND ADDRESS THESE CONCERNS. IN PAST SUBMISSIONS, MY CONCERNS HAVE BEEN IN REGARDS TO:

- THE SCADA CONTROL SYSTEM
- CORROSION PROTECTION
- FIRE CONTROL AND SUPPRESSION
- EMISSIONS, LIGHT AND NOISE
- FOUNDATION INTEGRITY

PERHAPS THE MOST SERIOUS "UNDEFINED" RISK IS THE FACILITY FOOTPRINT. NORTHERNSTAR HAS PROPOSED A VERY SMALL FACILITY FOOTPRINT BY INTERNATIONAL COMPARISONS. REDUCED FACILITY FOOTPRINTS OFTEN GIVE RISE TO UNINTENDED BUT SERIOUS DESIGN AND OPERATING LIMITATIONS. UNFORTUNATELY, THESE LIMITATIONS ARE NOT REVEALED UNTIL COMPLETION OF THE FEED ("FRONT END ENGINEERING DESIGN"). WE ARE THEREFORE ALL FACING A CONUNDRUM TOGETHER. IN AN ATTEMPT TO SATISFY ASCETIC AND ENVIRONMENTAL CONCERNS, NORTHERNSTAR MAY BE COMPROMISING OPERATING EFFICIENCY AND SAFETY.

THIS IS WHY HAZ-OP STUDIES ARE SO VITAL AND WHY THEY MUST BE PERFORMED BY PERSONNEL VERY FAMILIAR WITH THE OPERATION OF LARGE SCALE ENERGY FACILITIES, A CONCERN THAT SHOULD BE ADDRESSED BEFORE PERMITS ARE ISSUED.

Individuals

49

IND49-4

If NorthernStar receives initial authorization from the FERC, it would be required to provide additional detailed design information and other safety and security information. After the information is filed with the FERC, there would be several reviews and approval points after the initial authorization, including reviews by the Coast Guard.

K-890

CATASTROPHIC LOSS

IND49-5 AS TO MAJOR CONSEQUENCES, WE KNOW ALL ABOUT THE U.S.S. COLE IN YEMEN AND HOW TERRORISTS COULD CAUSE A BIG LNG POOL FIRE WITH A ZODIAC AND SOME EXPLOSIVES. BUT I AM GOING TO ASSUME THAT THE COAST GUARD AND THE NAVY HAVE CONSULTED ON THE PROPER SECURITY DISTANCES (YOU MIGHT WANT TO CHECK TO MAKE SURE).

IF BRADWOOD LANDING WAS LOCATED IN AN ACTIVE MARITIME ENVIRONMENT WITH REDUNDANT RESOURCES AND THE AVAILABILITY OF NEW HIGH YIELD FOAMS AND EMERGENCY RESPONSE, AND FINALLY IN A PLACE WHERE IT WAS NOT SO EASY FOR SOME YAHOO TO LOAD A ZODIAC FULL OF FERTILIZER AT SWENSON PARK, OUT OF THE SIGHT OF THE COAST GUARD, AND GO CRUISING, WE ALL MIGHT BE MORE PHEGMATIC. INSTEAD, THE SETTING OF THE PROPOSED TERMINAL HAS MANY CITIZENS JUSTIFIABLY ALARMED. AN ACTUAL SITE-SPECIFIC EXAMINATION OF A CATASTOPHIC LNG LOSS SHOULD BE UNDERTAKEN.

UNLIKE THE MANY LNG TERMINALS THAT OPERATE AROUND THE PACIFIC RIM, THE BRADWOOD SITE IS SITUATED IN A DENSELY FORESTED AND REMOTE AREA. SMALLER SPILLS OF LNG, DUE TO OPERATIONAL FAILURES, REPRESENT POTENTIALLY A GREATER CONSEQUENCE THAN THOSE ELSEWHERE. POOLS CAN ELONGATE IN THE COMBINED CURRENT AND WIND ENVIRONMENT. THAT IS WHY THE DRAFT ENVIRONMENTAL IMPACT STATEMENT SHOULD ADDRESS SMALL SPILLS OR RELEASES, POTENTIALLY STRUNG OUT ALONG THE COASTLINE, AND DETERMINE HOW MANY ACRES OF FOREST WOULD BE INCLUDED WITHIN AN IGNITION FRONT. IT IS NOT EVIDENT FROM THE DRAFT EIS HOW A PRODUCT SPILL WILL BE CONTAINED, OTHER THAN BY BARRIERS. IT IS CERTAINLY NOT EVIDENT IN THE DRAFT EIS THE EXTENT OR EFFECT OF A FOREST FIRE.

WATER DISPOSAL

Page 2-24

IND49-6 FRANKLY, I AM JUST FATIGUED TO FIND THAT YET ANOTHER ORGANIZATION PROPOSING FACILITIES, WHICH INCLUDE THE PROVISION FOR THE DISPOSAL OF WASTE WATER INTO PUBLIC BODIES OF WATER. HAVEN'T WE COME TO THE POINT WHERE INDUSTRIALS SHOULD JUST INJECT THEIR WATER IN DISPOSAL WELLS (WHERE THE ACQUIFERS ARE OF LESSER QUALITY) INSTEAD OF SAYING, "WELL, IT'S JUST A LITTLE BIT"? I WENT THROUGH THIS WHOLE DISPOSAL EVOLUTION IN THE OIL BUSINESS. WHEN I STARTED IN THE BUSINESS,

Individuals

49

IND49-5 As discussed in section 4.11 of the final EIS and as shown in table 4.11.4-1, spills at the LNG terminal would be contained by the outer tank containment wall, or 1 of 2 impoundment sumps. In accordance with 49 CFR 193, thermal exclusion zones and vapor dispersion zones have been calculated for a variety of spills at the LNG terminal and are discussed in section 4.11.4. Table 4.11.5-2 in Section 4.11.5 presents calculations along with hazard distances for a variety of spill sizes from LNG carriers.

IND49-6 See our response to comment PM5-60.

49

K-891

IND49-6
cont'd

WE HAD PERCOLATION PITS WHERE THE WATER WOULD EITHER EVAPORATE OR ENTER THE SURFACE WATERS. I RECEIVED PROPOSALS THAT WANTED TO FLUSH OUT PIPELINES WITH WASTE WATER INTO STORM SEWERS LOCATED JUST ABOVE RECHARGING LAKES FOR DRINKING WATER. IT IS JUST SO TIRESOME TO HEAR THE SAME OLD JUSTIFICATIONS FOR DOING WHAT IS WRONG.

IF THE COLUMBIA RIVER JURISDICTIONS JUST STOPPED THE DISPOSAL OF WASTE INTO THE COLUMBIA RIVER AND INSTEAD MANDATED INDIVIDUAL OR GROUP REINJECTION, THIS PLACE WOULD BE IN A WHOLE LOT BETTER SHAPE. THE LEAST THESE JURISDICTIONS CAN DO IS START AND CERTAINLY AT LEVELS PROPOSED. THE TECHNOLOGY EXISTS AND IS SO ROUTINE THAT IT IS INEXPLICABLE THAT NEW DISCHARGE SOURCES ARE STILL BEING CONTEMPLATED. NORTHERNSTAR PROPOSES TO DISPOSE OF ALMOST 5500 BARRELS OF WATER PER DAY CONTAMINATED WITH CHEMICAL TREATMENTS OF VARIOUS CONCENTRATIONS (THEIR ONLY SEEMING CONCERN IS THE TEMPERATURE OF THE DISCHARGE). THIS LEVEL OF DISPOSAL WOULDN'T BE TOLERATED FROM OILFIELDS AND IT SHOULDN'T BE TOLERATED HERE.

PERMITTEE

IND49-7

FINALLY, I BELIEVE THAT FERC SHOULD ADDRESS THE INTERNAL TECHNICAL CAPABILITIES OF THE OPERATOR, NORTHERNSTAR, WITHIN THE FRAMEWORK OF ITS ABILITY TO PERFORM UNDER AN ENVIRONMENTAL IMPACT STATEMENT. SURELY, FERC WOULD NOT ISSUE A PERMIT TO JUST ANYONE. THE QUESTION MUST BE ASKED: CAN NORTHERNSTAR ACTUALLY PERFORM UNDER ITS PERMITS? LNG HAS BEEN A BUSINESS FOR THE BIG BOYS NOT JUST ANY GROUP THAT IS INTERESTED IN MAKING MONEY OR THINKS IT WOULD LIKE TO BE IN THIS BUSINESS. I BELIEVE THAT STILL IS THE CASE.

I WOULD NOTE HERE THAT FOREIGN COUNTRIES DEMAND A FULL DESCRIPTION OF COMPANY PARTICULARS BEFORE AWARDED EVEN AN EXPLORATION CONCESSION. THE ONLY DESCRIPTION OF NORTHERNSTAR I CAN FIND IS THEIR SECURITY AND EXCHANGE COMMISSION FILING, WHICH IS INADEQUATE FOR A PROJECT APPROVAL OF THIS TYPE.

LET ME DESCRIBE ONE REASON WHY PERMITTEE TECHNICAL CAPABILITY IS INHERENT IN AN ENVIRONMENTAL IMPACT STATEMENT:

WHEN A COMPANY HIRES AN EPC CONTRACTOR (ENGINEERING, PROCUREMENT AND CONSTRUCTION), THE OPERATOR (IN THIS

IND49-7 See responses to comments IND3-4, IND33-57, and IND33-75.

Individuals

49

IND49-7
cont'd

CASE, NORTHERNSTAR) NORMALLY HAS A SIGNIFICANT INHOUSE TECHNICAL EXPERTISE GROUNDED IN EXPERIENCE RUNNING ACTUAL FACILITIES. WHEN WE RECEIVE A PRELIMINARY DESIGN, WE CHECK AND CONFIRM THE DESIGN. WE ASK WHETHER WE CAN OPERATE IT SAFELY AND EFFICIENTLY. WE APPLY LESSONS LEARNED FROM OUR OWN OPERATIONS. THERE ARE NUMEROUS TECHNICAL CORRECTIONS MADE BY THE OPERATOR, OFTENTIMES BECAUSE EPC COMPANIES DO NOT HAVE THE LEVEL OF QUALITY ASSURANCE OR THE DEPTH OF TECHNICAL UNDERSTANDING OF BIG PLAYERS. THIS IS EXPERIENCE THAT RUNS DEEP IN THE ORGANIZATION. THE EXPERIENCES OF SENIOR MANAGEMENT ARE NOT PARTICULARLY HELPFUL (OR I MIGHT ADD, WELCOME), IN THIS EXERCISE. OPERATIONS PEOPLE ASK WHETHER WE HAVE HAD PROBLEMS WITH VARIOUS DESIGN SELECTIONS, HOW WE WILL UNDERTAKE MAINTENANCE AND REPLACEMENT, WHAT REDUNDANCIES WE BELIEVE ARE PRUDENT, AND THE LIST GOES ON. THIS IS NUTS AND BOLTS STUFF. BUT IT REPRESENTS WHETHER AN ENVIRONMENTAL IMPACT STATEMENT IS A FEASIBLE COMMITMENT OR JUST A DOCUMENT.

NORTHERNSTAR, NO MATTER HOW MANY SENIOR PEOPLE THEY GO OUT AND HIRE, SIMPLY DOES NOT APPEAR TO HAVE THE DEPTH OF TECHNICAL SKILL NOR THIS INSTITUTIONAL WISDOM. WITHOUT IT, YOU ARE ACCEPTING A DESIGN BASED ON THE DESIGN ECCENTRICITIES OF AN EPC CONTRACTOR, AN ENTITY NOT DRIVEN PRIMARILY BY OPERABILITY (IN FACT, MANY SAY A CONTRACTOR IS DRIVEN BY "CHANGE ORDERS"). MANY OF THE DESIGNERS IN EPC COMPANIES ARE HIRED JUST FOR A SINGLE PROJECT AND DO NOT HAVE THE INTEGRATED DESIGN PHILOSOPHY OF A MAJOR PLAYER IN THE INDUSTRY. IN READING THE SEVERAL SUBMISSIONS OF NORTHERNSTAR OVER THE LAST YEAR OR SO, I HAVE NOT BE FAVORABLY IMPRESSED WITH THE DEPTH OF TECHNICAL WORK OR THE UNDERSTANDING OF THE REQUIREMENTS OF AN INTEGRATED PROJECT AND VALUE TRAIN OF THIS SIZE.

THIS IS NOT TO SAY THAT NORTHERNSTAR IS NOT TRUSTWORTHY OR SINCERE. I CREDIT THEM WITH DOING THEIR BEST. I DO NOT DOUBT THAT THEY COULD SUCCESSFULLY CONSTRUCT AND OPERATE STANDARD INDUSTRIAL FACILITIES, SUCH AS BIODIESEL PLANTS. I QUESTION, HOWEVER, WHETHER LNG TERMINALS IN THE COLUMBIA RIVER IS THE APPROPRIATE PLACE FOR COMPANIES LIKE NORTHERNSTAR.

Attention: Bradwood Landing / Oregon LNG Pipeline
Docket CP06-365-000

IND50-1

I am writing this letter to let you know that we oppose the Oregon LNG pipeline, the Bradwood terminal and the Palomar Pipeline. It is our belief the pipelines are a dangerous threat to the Oregon coast, Columbia River, The Deschutes River, their tributaries, prime farm land, forests, the salmon recovery efforts, plus many endangered species, and our personal safety and welfare. We are also upset because Oregonians are losing the use of their land and income through eminent domain for a project that does not serve "public need and necessity" in the Pacific Northwest. In addition, there has not been an independent assessment of the demand for LNG to justify the need for the projects.

Not only will the proposed high pressure 36 inch Oregon LNG pipeline and the Palomar pipeline be carrying non-odorized gas that will serve less than 10 per cent of the Oregon residents, it will be built at the permanent expense of rural resident's ability to make crop choices to support their families. This pipeline forces farmers to stop growing deep rooted crops over the right away, destroys field drainage systems, blocks underground irrigation supply lines and sprinkler systems, cuts through septic drain fields, plus restricts access of heavy equipment to logging and farming of fields on either side of the pipe line. In addition the pipeline is in direct violation of Oregon's "Exclusive Farm Use" laws that Oregon farmers must follow when operating their farms.

There are several reasons why we are strongly opposed to this proposed pipeline right-away:

1. The Oregon LNG pipeline will run near our house and through the middle of our septic drain field.
2. The pipeline has no economical benefit or value to us.
3. The pipeline will cut through two different field drainages easement from neighboring farmers that empty into the stream on our property.

IND50-1

The purpose and need for the Bradwood Landing project is addressed in section 1.1. Safety is addressed in section 4.11.

K-893

Individuals

50

4. It could handicap access to the back portion of our property that has only one access.
5. This will make the fourth gas line in our local area if Palomar goes through.
6. Most importantly, as individuals we are fearful and uncomfortable with a possible gas line and/ or leak near our house.

In summary, we do not want to see a gas pipeline that will serve less than 10 per cent of Oregon residents going through on the backs of rural residents. If the gas line must go in, then we feel it should be much smaller in diameter and follow public right of ways or fence lines away from buildings and private residents.

Sincerely,

Robert and Rhea Jacobs

IND51-1

Reference is made to the water usage information presented in the DEIS on page 4-53 as Table 4.3.1-1.

As found in the DEIS Table 4.3.1-1 and as discussed on page 4-77, the indicated water discharge from the submerged combustion vaporizers is expected to be 160 gallons per minute. Please refer also to the applicant's Note 4, Resource Report 2, Table 2-2, and Resource Report 2, 2.3.6 'Disposal of Water to Surface Water Bodies - Operations', page 2-15 [FERC Accession Number 20060605-4005 CD-1].

Noted on line 19, page 1 of 3, of the Selas Vaporizer Data Sheet, [applicant's "Bradwood Landing Terminal Application for Air Contaminant Discharge Permit" pages 34 through 36 of 129 [FERC Accession Number 20070522-0112] is the calculated "Water Overflow Rate" of 19 gallons per minute from each vaporizer.

Considering a worst-case condition of all seven vaporizers operating, the expected outflow would be $7 \text{ SCV's} * 19 \text{ gpm} = 133 \text{ gallons per minute}$. This results in a discrepancy of $160 \text{ gpm} - 133 \text{ gpm} = 27 \text{ gallons/minute}$. Over the course of a year this aggregate difference would be approximately $27 \text{ gpm} * 60 \text{ min} * 8760 \text{ hours} = 14.2 \text{ million gallons per year}$.

It should be noted that the Thermal Mixing Model Report [FERC Accession Number 20071016-0189] prepared by the applicant's consultant, *Coast and Harbor Engineering*, uses an outflow rate (Variable Q0 = 0.1052 E-01 m³/s page 11 of 40, and Q0 = 0.010515 m³/s page 28 of 40) that equates to 166.67 gallons per minute.

- It is recommended that the FERC require the applicant to account for the apparent difference, and identify the source of the additional water if any. It is further suggested that the thermal mixing model be re-examined as the stated outflow discharge rate is different than the value noted in Resource Report 2 and the DEIS.

4-149	4.5.2 LNG Terminal - LNG Terminal Operations - Routine Discharge of Condensate Water from the SCVs
4-219	Table 4.6.2-1 Summary of Potential Impacts and Mitigation Measures for Federally Listed Species Associated with the Bradwood Landing Project

Individuals

51

IND51-1

The draft EIS states that about 160 gpm of condensate would be generated by the vaporizer, and this equates to 230,400 gallons per day. Meanwhile, the modeling done for the NPDES permit shows a figure of 0.24 million gallons per day or 240,000 gallons per day. This is not an inconsistency, but is rather just the result of rounding. To be conservative, the modeling of the discharge rounded 230,400 gallons per day up to 240,000 gallons per day to give a round number that can be more easily displayed. In addition, this represented the maximum value for the amount of condensate generated, based on a peak natural gas send out rate of 1.3 Bscfd. The section of the NPDES permit that shows the volume of water as 0.2 million gallons per day refers to the average flow of condensate generated, which is based on a natural gas send out rate of 1.0 Bscfd. If more significant figures were shown, the average flow would actually be slightly less than 0.2 million gallons per day, but to be conservative it was simply rounded up.

IND52-1

Reference is made to the discussion of wind power as an alternative energy source found on page 3-5 and 3-6 of the DEIS. While it is acknowledged that wind power represents only a portion of the total Pacific Northwest energy portfolio, and requires load shaping from other sources of energy; the dismissive presentation of wind power in the DEIS is a) incorrect, b) is predicated on outdated information from seemingly a single source, and c) does not address the Pacific Northwest as a whole. A far more balanced picture is found in more contemporary information from the intergovernmental Northwest Power and Conservation Council [NWPCC].

Noted in the Northwest Power and Conservation Council document *"The Role of Renewable Sources in the Fifth Power Plan"* dated 5 October 2006 at page 6 of the report under the heading:

'CURRENT RENEWABLE RESOURCE DEVELOPMENT ACTIVITY'

"Over 2600 megawatts of generating capacity of all resource types will have been placed in service in the Northwest between adoption of the 5th Plan in December 2004 and the end of 2008. About 800 megawatts is operating, 960 megawatts under construction and 880 megawatts currently scheduled for completion by the end of 2008 (Figure 2). *About 1720 megawatts (65 percent) of the total are renewable energy resources. Nearly all of this (over 99 percent) is wind capacity.*"

(emphasis in italics added)

Figure 2: Northwest resource development 2005 - 2008

Individuals

IND52-1

Although wind power and solar power are renewable energy alternatives that are currently in commercial production and use, the amount of energy from local small-scale production could not provide the same amount of energy on a long-term basis as would be provided by the proposed project. Furthermore, renewable energy alternatives would not meet the stated objectives of the project. See also our response to comment PM1-12.

IND52-1
cont'd

As can be seen from the above, the 400MW, wind power figure noted in the DEIS is incorrect. Additionally, while the assertion on page 3-4 of the DEIS that most new electrical generation is from natural gas fired sources was true in 2003, this assertion has been rendered moot by the recent accelerated development of wind powered generation.

Noted in the Introduction to latest NWPCC Biennial Monitoring Report on the Fifth Power Plan dated January 5, 2007:¹

"The Plan found that the region had a surplus of generating capability and that the need for new generation from coal or natural gas likely would not occur until after 2012; after the 5-year action plan period."

And in the Summary,¹

"High energy prices and concerns about potential climate-change policy have also led to aggressive development of wind power in the Pacific Northwest in the two years since the Council adopted the Fifth Power Plan. New generation capacity and slow demand growth have increased the electrical supply surplus in the region, which further delays the need for new generating capability."

Finally, as noted in the latest NWPCC Energy Outlook:²

September 2007 Summary: The region's power supply is estimated to be about 2,300 average megawatts surplus (it takes about 1,000 average megawatts to supply a city the size of Seattle). The surplus includes about 2,200 average megawatts of uncontracted regional resources and only counts hydroelectric generation based on the driest historical condition. The likelihood of a significant electricity service disruption due to a lack of resources is forecast to be very low for the next 5 years.

- In view of the above it is recommended that FERC and its contract consultants re-evaluate for the FEIS:

a) the role of alternative energy sources in relation to the proposed project using more contemporary, and broad-based regional data, and

IND52-2 b) the public convenience and necessity of the proposed project in view of the projected regional surplus even under worst-case conditions.

IND53-1

Reference is made to the water usage information presented in the DEIS on page 4-53 as Table 4.3.1-1

The submerged combustion vaporizers use a water bath surrounding the stainless steel LNG vaporizer tubes as a heat transfer medium. Noted in Table 4.3.1-1 and as found in the applicant's Resource Report 2, Table 2-1 "Construction Water Use" [FERC Accession Number 20060605-4005 CD-1] the Initial Charging of the SCV's water baths will require approximately 200,000 gallons of water. However, not found in the DEIS or any of the information available for public review is any accounting of the water required to refill a vaporizer unit (approximately 28,600 gallons) after it has been serviced, nor is the draining of the vaporizer tank taken into account in the noted DEIS Table 4.3.1-1 or Resource Report 2, Table 2-2. Reference is made to the following operational narrative text found in the applicant's Resource Report 13, at Section 13.7.3.4 on page 13-32 [FERC Accession Number 20060605-4005 CD-1]

"13.7.3.4 Operation and Control

The vaporizers are arranged in parallel. Under normal operation, only 6 units are in operation. The remaining unit, acts as a spare to enable ongoing maintenance, change out of water baths and to cover single unit downtime without impacting on terminal send-out capacity.

It is intended that the sequencing of the vaporizer duty cycles will be performed automatically within the plant DCS."

(Emphasis added in bold)

Identical language is also found in the "Air Quality Report" in section 2.2.6 'Vaporizers' on page 2-8 [FERC Accession Number 20070522-0112].

No schedule or other information as to the frequency of this maintenance procedure was found in the applicant's materials available for public review. Furthermore, it is not known if the applicant intends to sequester the water drained from the vaporizer tank and then restore it to the vaporizer tank after maintenance. Therefore, an accurate assessment of the water resource impact this procedure may have over the course of a year or the expected lifetime of the facility cannot be made.

Individuals

53

IND53-1

The SCVs would be subject to various maintenance checks throughout the life of equipment. Draining of the water bath for maintenance inspections is expected to occur once per year. The unit would likely be refilled with the water produced from the other vaporizers.

IND53-1
cont'd

The National Marine Fisheries Service (NMFS) has also noted this operational aspect as found in "Request for Additional Information for the Bradwood Landing LNG Terminal..." [FERC Accession Number 20070511-5068] on page 10, lines 22 through 25.

- "22 The submerged combustion vaporizer (SCV) water bath would use 0.2 million gallons of
- 23 groundwater (page 2-11).
- 24 Explain whether the SCV water bath would need to be periodically drained and refilled.
- 25 Indicate proposed discharge site of any drained water."

The applicant has not responded to this question in either the initial response [FERC Accession Number 20070614-0147] to the NMFS request, or in supplemental responses [FERC Accession Numbers 20070710-0030, 20070814-0074, and 20071016-0234]. It is not known if this response is contained in the Non-Public document FERC Accession Number 20071016-0235. In a memo dated 08/29/2007 [FERC Accession Number 20070830-0035], it is noted that the dialogue between the applicant and the NMFS is ongoing, and that the NMFS has requested that the applicant reorganize and resubmit all information developed for each topic on the agenda. It is further noted in recent memo [FERC Accession Number 20071120-0083] that this item (SCV recharging for maintenance) is still outstanding.

- It is recommended that prior to preparation of the FEIS, NorthernStar Natural Gas fully identify and quantify all water useage (intake and discharge) to the Federal Energy Regulatory Commission.

Re: Docket No. CP06-365-000 et. al.

December 4, 2007

Dear Ms. Bose,

Thank you for the opportunity to comment on the FERC DEIS of the Bradwood Landing Project.

I would like to bring the following to the attention of staff,

IND54-1

1. 4.7.1.4. Recreation, Public Interest, and Special Use Areas.

Also pages, 2-9 Figure 2.1.2.1., page 4-426

Much liberty has been taken to determine the "Zones of Concerns" overlaps, which makes one wonder from what point they have been taken.

According to my calculations with the aid of NOAA Charts #18521, 18523 the results show that the following areas are well within Zone 1, represents 500meter (1650ft.)

Clatsop Spit, public beach access,
Hammond, OR. Waterfront and boat basin,
Tansy Point, Camuthers Park.

Entrance of the Skipanon waterway, which is the access to the Warrenton boat basin,
Astoria's downtown waterfront with many hotels, restaurants, tourist activities, etc.
Port of Astoria with the Cruise ship docks,
West mooring basin,

The designated anchorage areas 110.228 on both sides of the navigable channel.

Individuals

54

IND54-1

The methods for determining the Zones of Concern are discussed in section 4.11.5.3. We disclose in section 4.7.1.4 that portions of the JBHNR and Astoria waterfront would be overlapped by Zone 1. Section 4.11.5.4 discloses that there are 22 structures overlapped by Zone 1 on Puget Island. However, we believe that Fort Stevens State Park (including Clatsop Spit), Hammond, the Warrenton waterfront (including Carruthers Park), and Skamokawa Vista Park are located within Zone 2.

K-903

Page 2.

IND54-1
cont'd

All public and private land on the Washington side of the river from Altoona, WA. up to the terminal, including Skamokawa waterfront with many residences, Vista Park, Boat launch, Price Island, the mouth of the Elchoman river, Julia Butler-Hansen MWR, and the Northwest portion of Puget Island with many residences.

Many of the waterfront access areas are used for recreation, e.g. camping, fishing or picnic.

IND54-2

Air Quality and Noise, page 4-382

With some forward thinking and the current focus on Global warming the applicant NSNG should be required to disclose the amount of CO2 being discharged. in part due to the SCV (Submerged Combustion Vaporizers) are the highest CO2 polluters of any vaporizer system. (see page 3-42)

To reduce CO2 emissions and eliminate warm water discharge into the river, the FERC should recommend or demand the use of STV vaporizers. (page 3-42)

Please hold the applicant to the highest standards and technology available.

Sincerely

Frans Eykel

Individuals

54

IND54-2

Section 4.10.1 has been updated to include the estimated greenhouse gas emissions resulting from the construction and operation of the project. Section 3.1.6.3 includes an analysis of the vaporization technologies, including STV, considered for the Bradwood Landing Project.

K-904

To: F.E.R.C
 Individual Testimony regarding the application by Northern Star to build a Liquid Natural Gas Facility at Bradwood, Or.
 December 13, 2007
 Dockets CP06-365, CP06-366, CP06-376, CP06-377

I am writing to encourage F.E.R.C. to deny the application by Northern Star for a Liquid Natural Gas facility in Bradwood, OR. I believe that Bradwood is an unsuitable location for environmental, safety and eminent domain reasons. Dredging of a prime salmon estuary is a major alteration to a pristine portion of the Lower Columbia River. The width of the Columbia and the distance between Bradwood and Puget Island is not sufficient to have a true exclusion zone. The safety response to a potential spill or fire cannot adequately protect the residents who live nearby this facility. The recent wind and rainstorms, and yesterday's major mudslide onto Hwy 30, near Clatskanie (not that far from Bradwood) have demonstrated how difficult (or impossible) it might be to respond to an emergency. Here is a link to video of the mudslide.

http://www.koin.com/global/video/popup/pop_player.asp?ClipID=2011903&h1=Update%3A%20Slide%20Closes%20Highway%2030&vt1=v&at1=News&d1=180434&launchPageAdTag=Homepage&activePane=info&playerVersion=1&hostPageUrl=http%3A//www.koin.com/&md=1241582

The location of this facility and running pipelines through private properties, State Forests, etc. is not an acceptable risk. Private land should not be taken away for the profits of a private corporation selling a foreign fossil fuel

Northern Star had hired an "army of lawyers" and produced some great 50 page Powerpoint presentations to present this project as being advantageous to the local Communities. The fact that the Palomar project is now openly acknowledged is a true picture of the intentions of Northern Star. They stand to make a huge profit selling an approved project to a company who will send a large portion of the gas to California. The promises of Northern Star do not translate to actions by the company who will build and operate this plant.

Gary Marzolino
 56 Fernhill Rd
 Cathlamet, WA 98612

Individuals

55

- IND55-1 See our response to comment FA1-24.
- IND55-2 Section 4.11 includes a discussion on modeling and the exclusion zones for the LNG terminal. Figures 4.11.4-1 and 4.11.4-2 show the thermal exclusion zones and vapor dispersion zones. Section 4.11.5.3 presents the hazards associated with a spill from an LNG carrier and describes the zones of concern and what communities would be affected by each zone of concern.
- IND55-3 See our response to comment IND22-20.
- IND55-4 No State Forest lands would be crossed by the pipeline. NorthernStar would seek to obtain an easement across landowners' property. Private land would not be taken away from landowners and, with few exceptions, a landowner would not be precluded from using their property in any way after construction of the proposed pipeline. See responses to comments PM2-4 and CO8-6.
- IND55-5 It is not the intention of either the Bradwood Landing Project or the Palomar pipeline project to send large portions of natural gas to California. See also our responses to comments PM1-23, PM1-24, and LA3-8.

ORIGINAL

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street N.E.
Washington, D.C. 20426

Dear Secretary Bose,

We voice strong objection to your DEIS on the proposed Bradwood Landing terminal and processing plant -- 20 miles east of Astoria on the Columbia River (the project of NorthernStar Natural Gas, a Texas-based company that has never built a terminal or a pipeline). We also oppose the Oregon LNG (Leucadia Corporation of New York) proposed terminal -- in Warrenton on the Columbia.

We are equally against the proposed pipelines (Palomar -- NW Natural Gas with TransCanada) that relate to these proposed terminals and processing plants. Our objections are based on the following:

- IND56-1 • The intention of the above mentioned companies is mainly to supply California with LNG, imported to and transported throughout Oregon from places like Iran and the Soviet Union (largest world natural gas reserves, Oil and Gas Journal 12/8/06). LNG is a foreign supplied petroleum (oil and natural gas) product, perpetuating our reliance on foreign energy sources.
- IND56-2 • No natural gas from the pipeline would be available locally; it can't be tapped from a high pressure pipeline. Even if available locally, it would be much more expensive than domestic natural gas because of the cost of transportation, security and processing of imported gas.
- IND56-3 • Extraction of LNG from foreign lands, transportation and liquefaction adds 35-50% to greenhouse gas emissions. Imported LNG has a large carbon footprint and can't be seen as a viable 'alternative energy source'.
- IND56-4 • Liquefied Natural Gas (LNG) is super cooled to minus 261 degrees Fahrenheit into its liquid form. Potential leaks, spontaneous ruptures, earthquakes or terrorist attacks on a terminal or pipeline causes the pressurized gas to meet air and explode into eruptive fires that are impossible to put out and must be left to burn themselves out. We live by the old Tillamook burn area and would hate to see a repeat. Natural gas industry experts supported by peer reviewed studies and findings have stated that for safety reasons, no person should be within 900 feet or more on either side of a 36-inch natural gas pipeline where there is a rupture. Recently a pipeline exploded and started brush fires in Port Arthur, Texas. Two years ago in Washington State two boys were killed by an exploding pipeline.

If this is approved, you will be wreaking havoc on this beautiful waterways state. You will be lacing our estuaries, creeks, and rivers with 36" pipelines only 3 - 5 feet underground filled with dangerous, expensive, imported LNG. In Gales Creek you will be rubber stamping a pipeline that intertwines with Forest Grove drinking water. A past Republican Governor, who was far-sighted in caring for his beloved state, Tom McCall, said, ""Oregon is demure and lovely, and ought to play a little hard to get. And I think you'll all be just as sick as I am if you find it is nothing but a hungry hussy, throwing herself at every stinking smokestack that's offered."

Sincerely,

Norm and Nancy Monroe
18200 NW Timber Road
Forest Grove, OR 97116

Cc: Governor Kulongoski, Senator Wyden, Senator Smith, Congressman Wu, State Senator Elizabeth Johnson and State Representative Deborah Boone

Individuals

56

- IND56-1 The market for the natural gas from the Bradwood Landing Project is the Pacific Northwest not California. See our response to comment PM1-23.
- IND56-2 The Bradwood Landing pipeline would interconnect Northwest Natural's interstate system from which the natural gas would be transmitted to local distribution systems. The natural gas transmitted to the Williams Northwest pipeline also would be available for local distribution systems. The natural gas from LNG would be priced based on market conditions the same as other available natural gas.
- IND56-3 Section 4.10.1 has been updated to include the estimated greenhouse gas emissions resulting from the construction and operation of the project.
- IND56-4 LNG and natural gas pipeline safety is discussed in section 4.11.

Re: Docket No. CP06-365-000 et al.

Dear Ms. Bose,

FILED
OFFICE OF THE
SECRETARY
2007 DEC 12 P 2 33
WASHINGTON FIELD OFFICE

IND57-1

Thank you for the opportunity to comment on the Draft Environmental Impact Statement of the Bradwood Landing Project. My comments particularly concern fish and commercial fisheries of the Columbia River. I would note that despite the fact that I provided Northern Star with a copy of my history of the Columbia River commercial fisheries (*Legacy and Testament*, the story of Columbia River Gillnetters, Pullman, Washington State University Press, 1994), they did not note it in their bibliography, nor refer to it in the text. This may explain the numerous mistakes contained in Vol. I of the EIS, noted in the next paragraph.

There are numerous errors of fact in the section on commercial fisheries on p. 4-120-121. In the second paragraph of p. 4-121, please note that spring chinook fishing may also occur in May, summer chinook fishing occurs in June and July, and August fishing for chinook is more than one or two days. Also omitted are other activities, such as snagging, which take place before fishing seasons in order to clear debris from the fishing grounds ("drift rights.") All of these need to be added to the paragraph. Further, in the next paragraph on sturgeon fishing, sturgeon fishing was not just a byproduct of the salmon gillnet fishery, but also has its own gear and been a significant component of the catch. The sturgeon caught in the lower river are used almost exclusively for food, not caviar. Due to the size of fish that may be retained, caviar is seldom found in them, being a product of larger and more mature fish. Current policy with both Washington and Oregon Departments of Fish and Wildlife is to extend the sturgeon season throughout the year, so that sturgeon catches occur from January to late October and early November. Sturgeon are a high value fish.

The third paragraph is also incorrect. Eulachon (smelt) are not used as bait in commercial sturgeon fisheries, only in recreational fisheries. The fourth paragraph indicates that terminal fisheries for salmon occur in Grays Bay in Washington; actually, they occur in Deep River, a tributary of Grays Bay.

IND57-2

These errors are of concern, because they have led to Northern Star's rather cavalier attitude towards the effect of their ship traffic on gillnet fishermen plying their trade. (pp. 4-329-430). The commercial fleet is not just based in Astoria, as stated on p. 4-329, but continues all the way to within a few miles of Bonneville Dam. There are fishing areas located within a mile of the Northern Star project. Reducing the fishery to "just a few days, occasionally even hours" does not take into account that fishing periods change dramatically from year to year and are entirely dependent on salmon run predictions. Further, it should be obvious, using Northern Star's assertion of a fishing season that lasts "just a few days, occasionally even hours," that

Individuals

57

IND57-1

Section 4.5.1.1 of the EIS has been revised to address this comment.

IND57-2

Section 4.8.1.7 has been revised to state that the commercial fishing fleet is based out of various locations along the Columbia River. As stated in this section, commercial fishing along the Columbia River has been limited to a season lasting just a few days, occasionally evening hours in recent years and is not intended to imply that this schedule is standard for fishing from year to year.

K-907

K-908

- IND57-3 encountering a ship every 1.5 days, even if only for a few minutes (which is highly debatable and is only an unproven assertion of Northern Star), could cost fishermen substantial income in a time of reduced fishing periods. Thousands of fish are often harvested in each fishing period during peak periods of abundance.
- IND57-4 Northern Star also asserts that "drift rights ... do not have any legal recognition in Oregon and Washington," implying that they therefore do not have to pay attention to them, although they are negotiating with drift right owners in the vicinity of their plant. Oregon and Washington both issue permits to pull snags on drifting grounds, which indicates that they recognize where the fishing grounds are. Regardless of legal right, which is debatable in this area, Northern Star needs to recognize that the fishing fleet will be using certain fishing grounds during the seasons, will be snagging those grounds, and that its ships will be traversing those grounds. I provided a map of drift rights and fishing grounds to Northern Star at one of their public hearings, but I note that it is not part of their EIS. Their ship traffic will be affecting the livelihoods of several hundred people on the river, and they need to address this issue with more specific proposals. How are they going to notify fishermen of a ship, whether entering or exiting the river? Which drift areas will be most affected? What proposals are there to work with fishermen on traffic issues in narrower areas of the river?
- IND57-5
- IND57-6 Of more concern to me than these errors, which indicate a lack of understanding of the fishery and how the LNG terminal and ship traffic will affect it, is the lack of detail in plans for fish. The filling of the log pond described on pp. 4-139 --140, is just one example. The action is described as "permanent loss of habitat." Northern Star will "mitigate for...the permanent loss of habitat...by developing high quality replacement habitat in consultation with NMFS and ODFW." I see nothing in the Plan that indicates how and where that replacement will happen, nor any analysis of what kind of habitat the pond provides that can be "mitigated" by providing similar habitat elsewhere. I would point to a document by Charles Simenstad and Dan Bottom, Guiding Ecological Principles for Restoration of Salmon Habitat in the Columbia River Estuary, which states: "Protection of existing habitat is critical to the success of estuarine restoration" (Protect First, Restore Second), p. 2. The larger issues of the "lack of empirical data ...available to define the specific habitat needs of salmon within the Columbia River estuary" or ensuring that restorative measures "will be ecologically effective" that the document points out, are unaddressed by Northern Star.
- IND57-7 Similarly, Mary Austill Lott, in her M.S. thesis "Habitat-Specific Feeding Ecology of Ocean Type Juvenile Chinook Salmon in the Lower Columbia River Estuary (Seattle: University of Washington, 2004) indicates that shallow wetlands and emergent marsh habitats support a greater abundance of the food preferred by juvenile chinook salmon than forested or scrub-shrub wetlands, although these may have other uses by fish. It is critical to know the specifics of Northern Star's proposal for mitigation, and whether the company plans to provide identical habitat in an adjacent locale. It does not appear that Northern Star has analyzed the type of habitat it is permanently destroying, nor provided any specific information as to how it will mitigate that same habitat or where. Will the mitigation be located in the same area? What exactly is planned? What are the numbers and kinds of fish that will be affected, and how will their loss be compensated either in the same locale or elsewhere? The same insufficiency of information occurs in the discussions of mitigation of pipeline construction. There seems to be no actual data as to what fish are actually in the planned areas of impact, when they are there and in what numbers. 4-166-167
- IND57-8

Individuals

57

- IND57-3 See our response to comment IND57-2.
- IND57-4 Section 4.8.1.7 has been revised to include additional information regarding drift rights, as described in Irene Martin's book "Legacy and Testament: The Story of Columbia River Gillnetters."
- IND57-5 The security escorts traveling with the LNG carriers would likely approach nearby boats to inform them of the security zone associated with the LNG carriers. Final details regarding the security zone would be included in the Vessel Traffic Management Plan. As discussed in the response to comment PM2-19, the security zones would not necessarily require that boats move away from the LNG carriers, but rather it is intended to establish the Coast Guard's authority in the area surrounding the LNG vessel to ensure safety during the transit.
- IND57-6 NorthernStar's *Preliminary Engineering Design Draft Mitigation Plan* describes both where compensatory mitigation is proposed and how mitigation would occur. We agree that the protection of existing habitat is important for estuarine restoration. As described in section 2.1.5, NorthernStar has proposed to preserve both the lower Svensen Island and Hunt Creek Mitigation Sites as part of its Compensatory Mitigation Plan. The adequacy of the compensatory mitigation is discussed in the response to comment FA2-10. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.
- IND57-7 As described in section 4.4.1, wetland habitats that would be impacted by the Bradwood Landing Project were classified according to the Cowardin et al. (1979) system. As described in section 4.4.2, upland habitats that would be impacted by the project in Oregon were classified based on the Oregon Habitat Mitigation Policy. Although the State of Washington does not have a similar habitat classification system, 18 priority habitats have been identified by the WDFW. These are described in section 4.4.2 and depicted in Appendix C of the final EIS.
- The adequacy of compensatory mitigation is discussed in the response to comment FA2-10.
- IND57-8 See our response to comment SA1-10.

IND57-9

As my final overarching comment, I believe that the salmon of the Columbia River have been suffering the "death of a thousand cuts." Each new dam, irrigation project, industrial facility and other construction has altered, degraded or removed habitat, producing a cumulative effect of altered habitat and water conditions that salmonids have had to try to adapt to. Their declining numbers should tell us that they are having trouble doing so. Northern Star points out that implementation of its SEI "is expected to result in a net benefit to fishery resources on the lower Columbia River." This implementation is entirely voluntary, and should not even be considered as a part of this application. A critical look at the project and its effects must take into account its damages to fish and fisheries and the very real risks involving construction and mitigation.

I may be reached at 360-795-3920; imartin@iinet for further information. Thank you.

Sincerely,

Irene Martin.

Individuals

57

IND57-9

As stated in section 4.6.3, the FERC would not allow construction to begin until after we have concluded formal consultation with the FWS and NMFS.

Assurance of implementation of the SEI is discussed in the response to comment FA4-12.

K-910

IND58-1

Reference is made to the information regarding cruise ship operations as noted on Table 4.8.1-5 on page 4-328 of the DEIS, and as discussed on page 4-332:

"Cruise Ships

During scoping, comments were received regarding potential project-related impacts on cruise ships that use the navigation channel of the Columbia River to reach Astoria. The Port of Astoria has been visited by cruise ships since 1996, and has invested more than \$10 million in improvements at Pier No. 1 to accommodate these vessels (Port of Astoria, 2006b). Eighteen cruises are scheduled to call on the Port during 2007 between April and November. The Coast Guard also recognized this issue, and its VSR contains the following conditions:

- when any cruise ship is moored at Astoria, LNG vessels would be restricted to transiting in good visibility (6 miles or more);
- any cruise ship at Astoria would require separate waterfront security when an LNG vessel is in transit in the vicinity; and
- a cruise ship and an LNG vessel would not be placed in a meeting situation.

We believe that with implementation of the conditions of the WSR, the potential for LNG marine traffic in the waterway to adversely affect cruise ships traveling to or docking at Astoria is extremely remote."

The presented information does not fully address the true scope of all cruise ship operations associated with the lower Columbia River affected by LNG carrier operations upstream from the Port of Astoria to river mile CRM38.

Two cruise line companies currently operate on the Columbia River between Portland and Astoria on a regular scheduled basis. Majestic America Line (formerly known as America West Line) operates the cruise ships: *Empress of the North* (223 guests/84 crew), *Queen of the West* (142 guests/47 crew), and *Columbia Queen* (150 guests/57 crew). The Cruise West division of West Travel, Inc. operates the *Spirit of 98* [96 guests], *Spirit of Discovery* [84 guests], and the *Spirit of Alaska* [78 guests]. These ships, which have been in operation for a number of years, carry tourists to several ports along the Columbia River adding not only to the economies of Astoria and Portland, but to these ports of call as well. The itineraries of the ships takes them not only past the Bradwood Landing terminal site, but places these ships in the traffic pattern of the lower Columbia River at times the LNG carriers might also be in transit.

The Majestic America Line Columbia River cruise "Northwest Rivers" has approximately eight to ten sailings per month. A review of the Majestic America schedule for 2008 notes a total of eighty (80) sailings starting in March and concluding in December. Cruise West's Columbia River schedule for 2008 has fifteen (15) sailings mostly in September and October.

The quantity of cruise ship calls noted on DEIS Table 4.8.1-5 as 26 in 2006 does not appear to include the port calls arising from the operation of the Majestic America Line or Cruise West ships.

The Economic Report prepared by the applicant's economic consultant does not address the tangible economic impact of the port calls, nor the jobs represented by the direct crew, administrative personnel or outside vendors associated with operations these ships.

Additionally, if as noted in the DEIS text shown above: *"a cruise ship and an LNG vessel would not be placed in a meeting situation."* has the applicant factored the movements of the noted vessels into the scheduling of construction dredging, maintenance dredging, or LNG carrier operations?

- In view of the significant potential economic and scheduling issues raised by the operation of these cruise ships, it is recommended that the Draft EIS be revised to accurately reflect ongoing cruise ship operations from Astoria to destinations beyond CRM38.

Re: Bradwood Landing LLC
Docket No. CP06-365-000 et. al.

Dear Ms. Bose:

Please enter the attached document containing my comments on the Draft
Environmental Impact Statement for the subject project into the public record.

Thank you for your attention to this matter, I remain...

Very truly yours,

A handwritten signature in dark ink, appearing to read "R. Duncan MacKenzie", is written over a light gray rectangular background.

IND59-1

Reference is made to the discussion of Routine Discharge of Condensate Water from the SCV's found on pages 4-149 and 4-150. It is noted that the condensate discharge will be approximately 68°F and will contain a concentration of total dissolved solids about 10 times the concentration found in the river. It is assumed that the dissolved solids are primarily the reaction products arising from treatment of the condensate water to adjust the pH and are sodium carbonate and sodium nitrate.

The National Marine Fisheries Service [NMFS] has commented on this aspect in its "Request for Additional Information for the Bradwood Landing LNG Terminal..." [FERC Accession Number 20070511-5068] on page 10, lines 27 through 43:

"27 Condensate discharged to the Columbia River would be a constant temperature (68°F) and have
28 total dissolved solids content of about 10 times the concentration in the river (page 7-28). The
29 BA states that the discharge would not have a measurable effect on the total dissolved solids
30 content outside a mixing zone that extends about 10 feet from the diffuser (page 7-28).
31 • Explain how the mixing zone was calculated, and whether a mixing zone was also
32 calculated for water temperature.
33 • Indicate how many days per year (provide estimated range) discharged water would be of
34 a different temperature than the receiving waters. Indicate how many days per year it
35 would be warmer and how many colder.
36 • When receiving water temperatures are cooler than 68°F, explain why condensate
37 temperature cannot be reduced using the LNG to allow discharged water to more closely
38 approximate Columbia River water temperature.
39 • Indicate whether the dissolved solids would contain any contaminants.
40 • Indicate whether the condensate would be tested. If so, describe what elements,
41 compounds, or contaminants would be tested for.
42 • Explain what effects to pinnipeds, ESA-listed fish, and quality of EFH are expected
43 within the mixing zone."

The applicant has partially replied to the NMFS in a letter dated 6 July 2007 [FERC Accession Number 20070710-0030] on pages 25 and 26, that scaling down a heat exchanger system to use LNG to cool the discharge water is too expensive and not a feasible solution.

However, this argument is less than convincing as the proposed and permitted LNG terminal at Kitimat, B.C. will employ a covered settling pond to precipitate the dissolved solids, and an LNG/condensate water heat exchanger to hold the discharge water to +/-0.5°C of the receiving waters. Found in Appendix D on pages 217 and 218 of the Kitimat LNG Terminal - Environmental Assessment Report and Comprehensive Study Report prepared by the British Columbia Environmental Assessment Office dated 13 April 2006¹ is the following description of the system:

1] <http://www.ceaa-acee.gc.ca/050/documents/14504/14504E.pdf> attached as Exhibit 1

See our responses to comments PM5-59 and PM5-60.

IND59-1
cont'd

"Operation The primary water management issue during the operation phase is the characterization, treatment and disposal of wastewater generated from the Submerged Combustion Vaporizers (SCVs), which are the equipment that warms the LNG to allow vaporization (transformation of liquid to gas). The vapourizer consists of an enclosed water bath (25- 30°C) into which exhaust from a natural gas fired burner is allowed to percolate through and heat the water. The LNG (at -160°C) passes through a heating bundle (stainless steel tubing that is surrounded by the warm water bath) where it is warmed to approximately 5oC and regasified. The advantages of this system include:

- no water requirement except for initial fill;
- quick start up ability and tolerance for load fluctuation; and
- high thermal efficiency.

At commissioning stage, each vaporizer is filled with chlorine free potable water. The water specification requires the absence of dissolved matter, which may cause scaling or promote corrosion. Due to the condensation of the water vapour condensed by cooling the flue gas, excess water with some dissolved carbon dioxide (CO2) is produced. The volume of water produced by this condensation process is estimated to be 10 m3/h. In order to maintain the water level of the bath constant, an overflow rate equal to the condensing rate is maintained and the excess water is sent to a settling pond. When the natural gas is burned, the CO2 in the flue gas will dissolve in the warm water bath and produce a low concentration of carbonic acid (H2CO3) making the water bath slightly acidic. Therefore, means are required to control the pH of the water bath and effluent between 6.5 and 9. This will be achieved using an automatic neutralization process. Neutralization of the acidity will be achieved using caustic soda (NaOH) from a storage tank. Products of the neutralization process include water, carbon dioxide, sodium carbonate (350 mg/L average to 380 mg/L maximum) and sodium nitrate (30 mg/L average to 100 mg/L maximum).

The temperature differential between the ocean water and the discharged SCV effluent will also be controlled automatically. Using the cold temperature of the LNG, a heat exchanger will be used to adjust the temperature of the condensate water to within +/- 0.5°C of the ocean temperature prior to discharge from the settling pond into Emsley Cove.

The settling pond will be covered so only SVC effluent is in the pond and continuous, automated monitoring will be used to ensure that the pH and temperature of the water is acceptable for discharge. Water quality monitoring and testing in the settling pond will be incorporated into the EPP for the site. Testing procedures will ensure that the water released from the settling pond meets provincial requirements for release."

(emphasis in italics)

There is concern that the current design envisioned by the applicant does not address the long-term effects on the downstream river environment occasioned by a localized 'plume' of sodium carbonate and sodium nitrate sediment emanating from the outfall. The solubility of sodium carbonate in water is a function of water temperature. The noted average temperature of the river is not conducive to dissolving a substantial portion of the sodium carbonate discharged. The overall perceived effect would appear to be a continual rise of water alkalinity in the outfall and down stream areas of the river.

cont'd

As found in the United Nations Environmental Programme publication *SODIUM CARBONATE CAS N°: 497-19-8 SIDS Initial Assessment Report For SIAM 15*, Boston, USA, 22-25 October 2002 [attached as Exhibit 2] sodium carbonate in concentrations greater than 100mg/l will cause mortality in fish. However, for Amphipoda, salmon and trout, lethal effects were observed at 67-80 mg/l although these studies had a low reliability².

In view of the applicant's numerous press releases extolling its environmental responsibility and as is found at the bottom of page 4-150 "the applicant is committed to provide an overall net benefit to the environment of the lower Columbia River ecosystem.", the applicant's argument of expense found in the response to the NMFS is considered unavailing as a justification for ignoring practicable thermal pollution mitigation measures for this critical habitat area.

- In view of the potential thermal pollution of the receiving waters and the potential for long term discharge of alkaline sediment into the river over the operational life of the facility, it is strongly suggested that FERC recommend that the applicant:
 - a) Fully examine and address the long-term effects of alkaline buildup downstream of the SCV outfall, and
 - b) Review the Kitimat LNG system of discharge water treatment for incorporation of this system into the applicant's proposed facility design.

2] The study referred to in the UN document is a citation of McKee & Wolf (1963). Water Quality Criteria. California State Water Resources Control Board. Publication 3-A.

Washington, DC 20426

RECEIVED
OFFICE OF THE
SECRETARY
DEC 13 P 2:53

Ms. Bose,

The following are my written comments on the Draft Environmental Impact Statement for Bradwood Landing, Docket No. CP06-365-000 et al:

- IND60-1 | Page ES-1 Define Pacific Northwest. According to Ken Zimmerman, a consultant for the Oregon Public Utilities Commission, 75% of this gas will be going to California.
- IND60-2 | Page ES-2 Identify the interstate pipeline to be interconnected with Bradwood. Two have been mentioned in different documents: The Williams Northwest line and the KB pipeline.
- IND60-3 | Page ES-2 No permit should be issued until the Final Pipeline Design Geotechnical Report is done. The only survey for landslide areas at this point has been done from the air. Bradwood proposes to cross landslide areas using HDD. They also propose to put monitors on the pipeline in these areas. How can this be accomplished without digging, thus causing a surface disturbance that could lead to further erosion and land movement?
- IND60-4 | Page ES-3 The proposed mitigation site on Delameter Creek does not meet "like for like" standards of the ESA.
- IND60-5 | Page ES-4 Apply dollar amounts to the negative aspects and impacts to the area. Only then can the determination be made that it will have a "beneficial impact on the local economy".
- IND60-6 | Page ES-5 The Emergency Response Plan and the Cost Sharing Plan should be spelled out in the DEIS so that communities can evaluate economic impacts.
- IND60-7 | Pages ES6-7 Where is the criteria used to evaluate the alternatives?
- IND60-8 | Page 1-4 An independent needs assessment should be done, not relying on the figures given by industry lobbyist, the Northwest Gas Association. The Review of Pipeline Utility Corridor Capacity and Distribution for Petroleum Fuels, Natural Gas and Biofuels in Southwest Washington, submitted to the Washington Legislature by ICF International on 11/17/2007 would be a better source.
- IND60-9 | Pages 1-8-9 The Biological Opinion should be a part of this document.
- IND60-10 | Pages 2-6-7 NorthernStar would offer "contract incentives" to suppliers to retrofit tankers so that they would comply with the ballast filtration system. What happens if they don't comply?
- IND60-11 | Page 2-13 The plan for the facility is clearly not in compliance with SIGTTO's requirement in Information Paper 14 that states LNG receiving facilities and moorages should not be located on the outside bend of a river. The project is also not in compliance for channel width. SIGTTO also mentions 4 tugs per tanker, not the 3 that NorthernStar will provide on a lease basis.
- IND60-12 | Page 2-25 The Williams Northwest pipeline system is currently fully subscribed at the interconnect point. Williams spokesperson, Michele Swaner was quoted on 11/27/07, saying they have long term contracts for supply and customers. How is NorthernStar going to utilize that system?

Individuals

60

- IND60-1 | See our response to comment PM1-23.
- IND60-2 | The Executive Summary identifies the Williams Northwest pipeline as the terminus of the Bradwood Landing sendout pipeline. The project does not interconnect with the KB pipeline.
- IND60-3 | See our response to comment LA7-25. Installation of strain monitors and HDD boreholes would cause minimal surface disturbance.
- IND60-4 | See our response to comment FA2-10.
- IND60-5 | The Executive Summary is meant to be very brief, and cannot discuss any issues in detail. Our discussion of potential socioeconomic impacts associated with the proposed project is included in section 4.8.
- IND60-6 | See our response to PM1-1. NorthernStar is currently in the process of developing an ERP and Cost Sharing Plan in consultation with appropriate federal, state, and local agencies and has filed a draft with the FERC. See also our response to comment LA3-55.
- IND60-7 | The criteria used by the FERC to evaluate alternatives are discussed in the introduction of section 3.1 and in section 3.1.5.3.
- IND60-8 | See our response to comment PM1-8.
- IND60-9 | See our response to comments PM6-94 and FA2-24.
- IND60-10 | See our response to comment PM1-31.
- IND60-11 | The SIGTTO standards are taken into consideration and implemented as appropriate.
- IND60-12 | See our response to comment PM1-10.

K-917

K-918

IND60-13	Page 2-28 The Palomar Pipeline should be considered as an equal part of this project. That proposed pipeline would carry the gas to the TransCanada pipeline at Maupin, Oregon and south to California. One will not exist without the other.
IND60-14	Page 2-32 There are no guarantees that the plant will not be sold, either before construction or after, thus negating the Salmon Enhancement Initiative.
IND60-15	Page 2-42 This site is dredge spoils, vibroflotation will not be adequate protection from soil settling and liquefaction during a seismic event.
IND60-16	Pages 2-49-51 Waterbody Crossings. Landowners are currently operating under DNR rules disallowing activity within specified distances of creeks and rivers. Why should this pipeline be installed by the open trench method on tributaries to salmon bearing streams? Also, what happens in the event of a "frac-out" at a HDD site?
IND60-17	Page 2-62 Given the location of the facility, it will be impossible to make it secure. The surrounding hillside provides cover for any agent wishing to damage the plant.
IND60-18	Page 2-62 The Emergency Response Plan for pipeline emergencies needs to be made public. Nowhere in the DEIS is there a description of the environmental consequences in the event of a pipeline explosion.
IND60-19	Page 2-63 There needs to be a bond established to deal with the abandonment of the plant and the pipeline.
IND60-20	Page 3-1 How can it be a public convenience and necessity to issue a permit for a pipeline that has no interconnect with an existing pipeline?
IND60-21	Page 3-1 Nowhere in the FERC evaluation criteria is the impact on human beings discussed.
IND60-22	Page 3-2 By FERC's own reckoning, if the Palomar Pipeline is constructed it will function to provide gas to the northwest.
IND60-23	Page 3-2 Conserving gas should be the highest priority. Both Oregon and Washington have enacted laws to make our states more reliant on renewable energy in the near future.
IND60-24	Page 3-12 In October of this year the CFO of Sempna, who will operate the Costa Azul LNG plant in Baja California, stated that there will be no need for any other LNG facilities on the west coast; that they could accommodate all needs for LNG.
IND60-25	Page 3-45 Where is the data to support the assertion that the HDD of the Columbia River would be "unconstructable" at the Bradwood Landing site.
IND60-26	Page 3-51 Table 3.1.8-2 shows an alternative route at MP 33.9. Information here does not correspond with information in Table 4.7.3-7. Here it says the variation would be 300 ft. from several residences, while in the later table, it says 4.4 feet from the construction zone. Also the "soon to be abandoned power line right-of-way" is now under control of the landowner.
IND60-27	Page 3-52 Where does the "least environmentally damaging practicable alternative" fit into the Endangered Species Act?
IND60-28	Page 3-53 What is the true nature of the dredging? Is it for deepening the turning basin or offering a cheap fill needed to raise the grade of the facility site?
IND60-29	Page 3-58 The Coast Guard Water Suitability Report should be made public.
IND60-30	Page 4-11 The site is <u>conservatively</u> classified as a "High" hazard area relative to earthquake potential. Define "active fault".

Individuals

60

IND60-13	As described in section 3.1.2.2, we consider the Palomar Project to be a separate undertaking from the Bradwood Landing Project. Neither project is inter-dependent on the other. If Palomar is not authorized or built, the Bradwood Landing Project could still go forward, and visa versa. Relative to the Palomar pipeline market, see our response to comment PM1-24.
IND60-14	See our response to comment FA4-12. The operator of the facility must adhere to all of the conditions of the Commission's Order.
IND60-15	Vibroflotation has been recommended by geotechnical engineers as an effective method to minimize the potential for liquefaction at the terminal site. NorthernStar would be required to demonstrate that the proposed ground improvements actually achieved the intended design values before receiving authorization to construct the remainder of the facility.
IND60-16	Waterbody crossings using open-cut methods as they relate to the WDNR's Forest Practice Rules are discussed in the response to comment PM4-11. NorthernStar's HDD Contingency Plan describes in detail procedures that would be followed in the event of a frac-out. Directions for accessing NorthernStar's HDD Contingency Plan via the eLibrary can be found in the response to comment FA3-13.
IND60-17	The Coast Guard has determined measures which will mitigate risks to the security of the LNG terminal. Also, section 4.11.8 provides a discussion on terrorism and security. It is possible that a release from the LNG storage tanks could be caused by an intentional act, such as a terrorist attack. Although an intentional breach scenario could result in greater thermal radiation in the immediate vicinity of the release, such scenarios are typically associated with the desire to inflict damage to major infrastructure and population and commercial centers
IND60-18	See our response to comment PM1-1 and LA3-55
IND60-19	See our responses to comments IND3-22 and IND49-2.
IND60-20	The Bradwood Landing sendout pipeline will connect to other pipelines, including the existing Williams Northwest system.
IND60-21	Impacts of the project on humans are discussed throughout the EIS under numerous resource topics, including land use, recreation, and visual resources, socioeconomics, air quality and noise, and reliability and safety.
IND60-22	While Palomar proposes to transport natural gas produced in Canada and the Rocky Mountains to the Portland metropolitan area, the Bradwood Landing Project would provide a new source of natural gas to the Pacific Northwest through the importation of LNG. The two projects are not mutually exclusive, and could both provide additional supplies of gas to the region from different sources. See also our response to comment PM1-24.
IND60-23	The EIS discusses conservation under section 3.1.1.2.

Individuals

60

- IND60-24 NorthernStar believes that there is a need for an LNG import terminal to serve the Pacific Northwest. There are many independent studies, cited in section 1.1 of this EIS, to support the need for the Bradwood Landing Project. As explained in section 3.1.3.1, we do not think that the Costa Azul LNG import terminal in Mexico would provide natural gas to the Pacific Northwest, because it would mainly be serving markets in northern Mexico and southern California instead.
- IND60-25 The HDD crossing of the Columbia River from the Bradwood Landing LNG terminal was ruled out due to the width of the river at that location. In addition, a crossing of the river at Bradwood Landing would place the sendout pipeline in the town of Cathlamet, Washington. From there eastward to the proposed interconnection with the existing Williams Northwest system near Kelso, the route would have to traverse rough topography.
- IND60-26 Variation NS-8 in table 3.1.8-2 has been revised to more correctly state “The HDD entry pit work space for the alternative route variation would be *within* 300 feet from several residences...” Also the text has been updated to indicate the power line right of way is abandoned.
- IND60-27 The alternatives analysis was performed to fulfill the requirement of the NEPA not the ESA. However, our alternatives analysis did discuss potential impacts on federally-listed threatened and endangered species at other project locations. No alternative LNG terminals and associated sendout pipelines were identified that would not potentially impact ESA protected species.
- IND60-28 Dredging would be required to construct the maneuvering basin for the LNG terminal as described in sections 2.1.3.1 and 2.4.1.2.
- IND60-29 The WSR is public and can be found in Appendix H of the EIS.
- IND60-30 An active fault is generally considered to be a fault that has undergone movement during the Holocene Epoch (approximately the last 10,000 years).

K-920

IND60-31	Page 4-12 The upper 85 feet at the site would liquefy during an earthquake. Again, vibroflotation is no defense against liquefaction.
IND60-32	Page 4-22 The proposed pipeline would cross a seismic hazard area at the Cowlitz River. The liquefaction zone here is reported to be 100-125 feet deep. Further it states that in " recent history, no accounts of damage to any existing pipelines have been documented in the project area." This discounts the three explosions of the Williams Northwest pipeline in the past dozen years, first in Castle Rock, WA, secondly in Kalama, WA and lastly in Toledo, WA.
IND60-33	Pages 4-45-49 ESC not defined.
IND60-34	Page 4-121 Recreational fisheries deserve more consideration than one paragraph.
IND60-35	Page 4-139 The Bubble Curtain Contingency Plan needs to be approved before the final EIS.
IND60-36	Page 4-166 Bentonite would cover the spawning grounds of fish, some protected by the ESA, rendering them unusable.
IND60-37	Page 4-183 Produce the data to support the claim that most of the Chinook salmon spawning in Washington streams within the project area are either hatchery strays or first generation descendants of hatchery fish.
IND60-38	Page 4-256 The Cowlitz Indian tribe recently petitioned to have the eulachon (smelt) listed on the ESA.
IND60-39	Page 4-284 FERC finds the land-use laws of Oregon inconsistent with this development. Final decision of Clatsop County Commissioners is pending.
IND60-40	Page 4-302 Why does the pipeline route differ from the existing ROW of the KB pipeline?
IND60-41	Page 4-313 This project must abide by Cowlitz County's Critical Areas Ordinance Plan, currently being updated.
IND60-42	Page 4-313 Compensation must be required for landowners whose septic systems or water sources are compromised.
IND60-43	Page 4-316 Define "close proximity". The fastest growing area in Cowlitz County is Lexington, an unincorporated community of 7200 residents and the location of a planned elementary school, well within the thermal radiation zone.
IND60-44	Page 4-321 The potential impacts of LNG Marine Traffic go further upriver than Puget Island, WA. Shipping on the entire Columbia River system will be impacted, all the way to the grain shippers of Umatilla.
IND60-45	Page 4-328 The estimate of 1500 recreational boats on the Columbia between February and October is woefully low.
IND60-46	Page 4-337 The data cited by the Argonne National Laboratory is 17 years out of date.
IND60-47	Page 4-347 No mention of the stern-wheeler cruise ships that use the Columbia between Astoria and Portland.
IND60-48	Page 4-351 NorthernStar will not own the property where the pipeline is installed. How can they claim to pay \$740,250 in property taxes to Cowlitz County. That is a very specific number.
IND60-49	Page 4-426 The GAO has asked for a new Sandia study to be done addressing impacts of a cascading failure. This project should not go forward until that study is completed.

Individuals

60

IND60-31	See our response to comment IND 60-15.
IND60-32	The reference to pipeline damage is meant to apply to damage resulting from lateral spreading. See also our response to PM2-16.
IND60-33	ESC refers to Erosion and Sediment Control. The Acronyms and Abbreviations section has been revised to include this definition.
IND60-34	Potential impacts on recreational fishing are discussed in section 4.7.1.4.
IND60-35	See our response to comment LA3-33.
IND60-36	NorthernStar's HDD Contingency Plan describes in detail procedures that would be followed in the event of a frac-out. Directions for accessing NorthernStar's HDD Contingency Plan via the eLibrary can be found in the response to comment FA3-13. Potential direct and indirect impacts on aquatic resources, including federally listed salmonids, are discussed in section 4.5.2.1.
IND60-37	All cited references are provided in Appendix H. Section 4.6.1.1 has been revised to include updated information on Chinook spawning in Washington streams in the vicinity of the project area.
IND60-38	As mentioned in the revised section 4.9.3, the Cowlitz Indian Tribe wrote a letter to NorthernStar indicating their support for the project.
IND60-39	See our response to comment PM1-9. On March 20, 2008, Clatsop County accepted NorthernStar's land use changes.
IND60-40	Realignment away from the KB pipeline route have been necessary at locations where the KB pipeline was constructed in areas containing geological hazards such as poor slope stability, or to reduce stream crossing impacts.
IND60-41	See our response to comment PM4-12.
IND60-42	See our response to comment PM2-4. Impacts on private water systems or septic systems are addressed in section 4.7.3.3.
IND60-43	Thermal radiation zones are used only for LNG facilities, and are not applied to natural gas pipelines. A discussion of natural gas pipeline safety is included in section 4.11.9.
IND60-44	See our responses to comments PM1-14, PM1-52, PM3-11, PM5-31, PM5-47, and others.
IND60-45	Section 4.8.1.7 has been revised to correct the number of recreational fishing boats.
IND60-46	See response to comment IND3-16.
IND60-47	See our response to comment PM2-17.
IND60-48	Property taxes for a piece of property are generally based on the actual use of the land. Therefore, NorthernStar would be required to pay property tax for the portion of a property crossed by the easement that it owns.
IND60-49	See section 4.11.5.3 for a discussion of the GAO February 2007 report on LNG spill studies, including the Sandia study.

- IND60-50 | Page 4-443 Table 4.11.9-2 shows outside force to be the highest cause of incidence. Later data shows corrosion to be the leading cause of pipeline accidents. In Cowlitz County, land movement is the only cause of the recent pipeline explosions.
- IND60-51 | Page 4-455 The statement that NorthernStar would have trained personnel and fire fighting equipment needs to be clarified. At the Clatsop County Planning Commission hearings, it was made clear that the personnel and equipment would be for the facility, not to come to the aid of surrounding communities.
- IND60-52 | Page 4-456 The estimates on ship traffic need to be taken in context. The Coast Guard is requiring the use of smaller (140,000 cm) ships, necessitating more trips to achieve full use of the facility. If the third tank is approved in the future, that will add to ship traffic. Given the "security" zones around the tankers, this will have major implications on Columbia River traffic.
- IND60-53 | Page 5-5 Additional study needs to be done on vegetation types. Douglas Fir plantations have been identified as "scrub-shrub".
- IND60-54 | Page 5-5 Who is responsible for surveying for noxious weeds on the ROW?
- IND60-55 | Page 5-17 Why should the public be responsible for any of the costs for safety and security at the terminal and near vessels that serve the facility?
- IND60-56 | Page 5-17 If equal weight is given to the "no action" alternative, it is clear that this is what would be best for the environment. Without the independent needs assessment and the independent economic assessment, there is no evidence supporting the positive aspects of this project.

Respectfully,

Gayle Kiser, landowner

2112 West Side Hwy.
Kelso, WA 98626

Individuals

60

- IND60-50 | See our response for comment PM2-16.
- IND60-51 | NorthernStar filed a draft ERP which outlined its cost-sharing proposal to improve the resources available to local first-responders. This draft will be reviewed by the FERC and the Coast Guard. After consulting with appropriate local agencies about the draft ERP, we will request that it be revised by NorthernStar to meet our expectations and requirements, and provide the level of services necessary to protect local communities. This is further discussed in section 4.11.6.
- IND60-52 | The maximum number of annual LNG carrier trips would be 125 regardless of carrier capacity. If expansion of the facility requiring a third LNG storage tank is proposed in the future, an application for FERC authorization would be required, which would include an environmental review under the NEPA.
- IND60-53 | As described in section 4.4.2, upland habitats that would be impacted by the project in Oregon were classified based on the Oregon Habitat Mitigation Policy. Although the State of Washington does not have a similar habitat classification system, 18 priority habitats have been identified by the WDFW. These are described in section 4.4.2 and depicted in Appendix C of the final EIS. Because specific information on the Douglas fir population being described in the comment is not clear, it cannot be responded to.
- IND60-54 | To prevent and mitigate for the distribution of noxious weeds during construction and control noxious weeds that develop after construction, NorthernStar has agreed to implement measures as described in its *Noxious Weeds and Soil-borne Plant Disease Control Plan*. We have recommended that NorthernStar continue to consult with the COE, FWS, NMFS, Oregon and Washington Departments of Agriculture, and other appropriate resource agencies to revise its Plan. NorthernStar has agreed to monitor revegetation of non-cultivated areas during the first and second year after construction to determine whether the herbaceous vegetative cover or density in the construction area is similar to that in adjacent areas not disturbed by construction or if there are excessive noxious weeds. If there are excessive noxious weeds after the first or second growing season, an agronomist would determine the need for additional restoration measures that NorthernStar would implement, as necessary. The FERC staff would also conduct inspections to monitor the project for compliance with the Commission's environmental conditions and project mitigation measures proposed by NorthernStar or required by the regulatory agencies. Other federal, state, and local agencies with jurisdiction or permitting authorities would conduct oversight inspections and monitoring, to the extent deemed necessary by those agencies, in order to meet their regulatory responsibilities.
- IND60-55 | See our responses to comments PM6-24 and LA3-55.
- IND60-56 | Section 3.1.1.4 describes our conclusions regarding the no action alternative.

K-921

The Federal Energy Regulatory Commission has undertaken a deeply flawed process in evaluating the environmental impacts of Northern Star company's Bradwood Landing Liquid Natural Gas Terminal. The draft environmental impact statement (EIS) which FERC released in August, 2007, documents a failure to comply with the letter and the spirit of the National Environmental Policy Act.

There are two overarching problems: the failure to consider the cumulative impacts of all developments closely related to the proposed terminal, and the failure to consider alternatives, including the "no action" alternative.

IND61-1 | The Bradwood Landing draft EIS does not even mention the proposed Palomar pipeline, which will transport the imported fossil fuel from the Bradwood terminal to Central Oregon. Palomar is the subject of a separate EIS which just got underway in November, 2007. The impacts and hazards of the Bradwood terminal by itself are horrendous, and the bland statements that the hazards are negligible and the impacts can be mitigated are not convincing. Add the impacts of ripping a 200+ mile wound through Oregon's scenic and working landscapes, and the cumulative impacts are overwhelming. Then, add the danger of a flammable gas in a pressurized (but not odorized!) 36 inch pipeline running through earthquake and landslide-prone country. It is hard to imagine any amount of benefit which would outweigh these impacts and hazards.

IND61-2 | LNG proponents like to point out the safety record of terminals around the world. They don't like to talk about the record of leaks, explosions, fireballs, and fatalities associated with gas pipelines. Have you seen a picture of the explosion following the leak of a gas pipeline on the Umatilla Indian Reservation in Eastern Oregon in January, 1999? Check it out at <http://www.eere.energy.gov/tribalenergy/pdfs/umatilla.pdf>. Then just imagine that picture in the dry forests of the Coast Range or on the Mt. Hood National Forest in late summer, or near the school and among the houses, gardens, and farms in my community of Gales Creek.

IND61-3 | The other flaw in the Bradwood EIS process is the failure to honestly consider the alternatives. According to the White House Council on Environmental Quality, NEPA regulations require

"the EIS to examine all reasonable alternatives to the proposal. In determining the scope of alternatives to be considered, the emphasis is on what is 'reasonable' rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant."

Region X of the Environmental Protection Agency used this argument in urging FERC to combine the EIS process for the Palomar pipeline and the Oregon LNG Terminal and Pipeline, yet another EIS process which began in November 2007. The proposed Jordan Cove terminal on Coos Bay and its associated pipeline should probably also be included, since the ostensible benefits of the three projects all concern increasing the West Coast supply of natural gas.

Individuals

61

IND61-1 | The Palomar pipeline was discussed in sections 2.1.6 and 4.12 of the draft EIS. We have moved our discussion of the Palomar pipeline to section 3.1.2.2 in the final EIS in response to comments on the draft EIS. As described in section 3.1.2.2, the Palomar pipeline is a separate project from the Bradwood Landing Project and its environmental impacts are being evaluated in a separate EIS to be prepared by the FERC.

IND61-2 | Pipeline accident data are discussed in section 4.11.9.2.

IND61-3 | The EIS does consider alternatives, under section 3.0. The no action alternative is addressed under section 3.1.1. The proposed Palomar Pipeline Project is discussed in the EIS under sections 2.1.6 and 3.1.2.2. As explained in section 2.1.6, we will be conducting a separate, stand alone environmental review of the proposed Palomar Pipeline Project, because it is an independent project not dependent on the Bradwood Landing Project. The Jordan Cove Energy LNG Project is discussed in section 3.1.3.4. As explained in that section, the FERC would also conduct a separate, stand alone environmental review of the Jordan Cove LNG Project, because it is not related to the Bradwood Landing Project. Section 1.1 of this EIS explains the need for the project, using several independent studies that examine future energy needs in the Pacific Northwest. While renewal resources and conservations are admirable approaches to meeting the future energy needs of the region, alone they cannot completely fulfill anticipated future demands, as discussed in sections 3.1.1.2 and 3.1.1.3 of this EIS. (See our response to comment PM3-56.)

IND61-3
cont'd

The "no action" alternative is dismissed with the statement that project's objectives of adding to the NW supply of natural gas would not be met, as if adding more fossil fuels to our region is in itself so desirable it needs no further justification. "No action" would of course have none of the terrible environmental impacts and hazards associated with construction of the terminals and pipelines. The downside of "no action," according to the proponents of these actions, is that we would not have enough energy to provide a "bridge" to a future of renewable energy to which even the most enthusiastic investors in fossil fuels must give lip service.

But what does this mean? Has the gap which must be "bridged" for Oregon or for the West, ever been quantified? The FERC staff member who chaired the November hearing on Palomar said that his agency is not responsible for energy planning or for determining the need for the projects which they assess. Who does have that responsibility? If no one does, how can a "no action" alternative be evaluated at all?

Suppose that we did determine that, if present trends in energy use and the pace of development of renewable energy in our region continued, there would indeed be a period of some years in which we would not have enough energy in Oregon or the West. Wouldn't we choose to take all possible action to change those trends rather than further endangering our Columbia River salmon? Wouldn't we invest in insulating our buildings more effectively rather than inflict a permanent fifty-foot-wide clear-cut swath through Northwest Oregon's public and private forests? Wouldn't we accelerate the pace of wind, solar, geothermal, and ocean energy development rather than assume the risk of a catastrophic pipeline explosion and fire in one of the many communities through which these pipelines will pass?

These are the real alternatives that would be considered in a credible EIS process which would meet the requirements of the law. Tweaks to the pipeline route, devising engineering solutions to landslide and earthquake hazards, or picking out one of these groups of speculators to get permission to ravage our River and our landscape for out-of-state profit are not alternatives at all.

Anne Berblinger
Gales Meadow Farm
Gales Creek Oregon 97117

IND61-4

My family's farm is one of many through which one or both of the pipelines are proposed to pass. I submitted the following to FERC on the specific effects of the LNG pipeline on Gales Meadow Farm:

The proposed LNG pipeline appears to run lengthwise through our farm, along the bottom of the hill on the east side of our field (the scale and resolution of the map available at the FERC hearing were not adequate to ascertain exactly where on our farm the pipeline would be constructed).

Individuals

61

IND61-4

The proposed Bradwood Landing pipeline is not routed near Gales Creek, Oregon. The Gales Meadow Farm may be crossed by some other natural gas pipeline (such as Oregon LNG or Palomar) that is being studied in a different proceeding before the FERC.

IND61-4
cont'd

- ☐ A 150' construction easement would encompass all of our main cultivated field and most of our cultivated land.
- ☐ We would be out of business for an entire growing season.
- ☐ Our relationships with our customers, which we have been building for eight seasons, would be destroyed.
- ☐ 15+ years of building the soil, improving its tilth, and creating habitat for beneficial microbes, insects, other invertebrates, reptiles, and amphibians, would be destroyed by introducing heavy construction equipment onto our land, compacting the soil, and disrupting the soil structure.
- ☐ Our underground irrigation system, including our delivery pipes and our innovative subsurface drip tape would be disrupted.
- ☐ The drainage tile at the south end of our field would be destroyed.
- ☐ Our domestic well and the domestic well of a neighbor (which is on our property) would be impacted. We have an excellent well and good water quality, rare in the Gales Creek Valley.
- ☐ The conifer plantings we have established as a buffer with neighboring conventional farming operations (a condition of organic certification) would be cut down and we could not replace them.
- ☐ Almost certainly, our organic certified status would be lost for a minimum of three years, possibly forever.

IND61-5

- ☐ A rare and possibly endangered plant (*trillium parviflorum*) which grows on our property, and which we have carefully protected, would be impacted.
- ☐ In summary, construction of the proposed natural gas pipeline in the proposed alignment would destroy our small business.

Our family business has tried to do our share in reducing the use of fossil fuels and our carbon footprint. We invested, with the help of the Oregon Energy Trust, in a photovoltaic system which has produced almost 2500 KWH so far. This last summer, with the help of the USDA EQIP program, we switched from overhead sprinkler irrigation to drip irrigation, saving both water and the energy used for pumping. We deeply appreciate the public investments which enabled us to undertake these projects. The public and private tools to move us to renewables and to reduce our contributions to global climate change already exist! Let's get more money and staff into these programs, train more people and private companies to do the work, and encourage more landowners and businesses to take advantage of them.

Individuals

61

IND61-5

Based on a review of the list of properties crossed by the proposed pipeline, it does not appear that any properties owned by the Berblinger family would be directly impacted by the proposed pipeline route. Therefore, impacts on the population of *Trillium parviflorum* are not anticipated.

IND62-1

Reference is made to the ancillary Support Facilities associated with the LNG Terminal description as found in the DEIS on page 2-23 under section 2.1.3.6 Nitrogen System, and to the Pipeline and Associated Aboveground Facilities as covered in Section 2.1.4.

The applicant's Resource Reports 1, 11, and 13 note that a nitrogen system will be provided to produce nitrogen gas for purging pipes, process equipment, and vessels only. Nowhere in the DEIS, nor the publicly available Resource Report design materials reviewed is any mention of the need or method to be used to adjust the Higher Heating Value [HHV] of the imported gas to meet the transmission specifications required for interstate pipeline transmission. The only acknowledgement the applicant has shown with regard to the issue of HHV adjustment is found in a 25 July 2006 document from the applicant's lawyers [FERC Accession Number 20060725-5035] on pages 24 and 25 as follows:

"K. Gas Interchangeability and Gas Quality

.... Clearly, any re-vaporized LNG that is transported to the interstate pipeline grid must meet the gas quality standards of the interconnecting interstate pipeline(s). Any gas that Bradwood Landing transports or ships will be required to be capable of introduction into downstream systems in accordance with tariff requirements and FERC policies. At this point however, it is premature to discuss the potential supply arrangements for the imported LNG. Suffice it to say that the gas will meet the gas quality provisions contained in downstream pipeline tariffs. Bradwood Landing recognizes the importance of interchangeability, but submits that this concern does not require resolution prior to approval of the authorization it seeks."

With the exception of Trinidad and Tobago, LNG produced around the world has HHV values which range from 1100 to 1150+ Btu per cubic foot; far higher than natural gas from domestic sources. The potential supply market for the facility would not seem provide LNG of a sufficiently low HHV to accomplish in-tank blending. Furthermore, there is a tendency for the HHV values to increase over time through the transport and delivery cycle as "boil off" of the lighter hydrocarbons occurs. While liquefied natural gas can be supplied with the HHV adjusted by the supplier prior to shipment, it is a costly alternative and decreases the flexibility of the shipper to supply a wide market or divert a cargo to another receiver.

Individuals

62

IND62-1

NorthernStar would have to comply with the emission limitations documented in an ODEQ Air Contaminant Discharge Permit for the terminal. If compliance testing indicates that the vaporizers are not complying with their source specific emission limitations, action would be required by the ODEQ to reduce the emission to comply or apply for a modification to the permitted emission limits to account for any increases.

IND62-1
cont'd

It should be noted that the current Williams Northwest Pipeline (the currently intended major transmission pipeline tie-in for the project) transmission specifications do not appear to have maximum HHV values, nor are maximum or minimum Wobbe Index values given, as traditional supplies from Canada have historically been within acceptable ranges¹. This fact may account for the applicant's apparent lack of address to this issue. However, if the National Gas Council Plus interim guidelines, developed in anticipation of increasing LNG imports, are adopted by Williams Northwest; then the HHV will be limited to a maximum of 1110 Btu/scf and the Wobbe index will be required to be +/-4% of historical values (the four year average has been 1351).

There are two aspects of this issue, which despite the applicant's protestations noted above, would appear to require resolution prior to approval of authorization or preparation of the FEIS.

- 1) Found on lines 30 through 36, page 1 of 3, of the Selas Vaporizer Data Sheet, [applicant's "Bradwood Landing Terminal Application for Air Contaminant Discharge Permit" pages 34 through 36 of 129 [FERC Accession Number 20070522-0112] is the composition of the fuel for the submerged combustion vaporizers and the HHV value noted as 1068 Btu/scf². In the absence of design information or mention of the manner HHV adjustment will be accomplished, how is the applicant capable of assuring the Oregon Department of Environmental Quality that the stated fuel composition and HHV are correct and will be held to the values stated? If these values cannot be substantiated, all Air Quality modelling and emissions data could then be called into question.

IND62-2

- 2) Has the attendant noise and potential cooling water demand of an air separation unit(s) of sufficient capacity for nitrogen injection, or compressor capacity for air injection adequately been accounted for in the applicant's submissions? The operational equipment list and associated noise data found in the applicant's Resource Report 9 [FERC Accession Number 20060605-4000] Section 4.3, page 9b-10 as Table 9B-5 makes no mention of this equipment. Additionally, no mention of equipment required for HHV adjustment is found in DEIS Section 4.10.2.2 at page 4-392, Table 4.10.2-4.

IND62-1
cont'd

- It is requested that FERC recommend that the applicant address the manner in which HHV adjustment will be accomplished to yield a suitable Wobbe Index and to insure that the anticipated emissions will conform to the submitted data contained in the ACDP and FEIS.

IND62-2
cont'd

- It is further requested that FERC recommend that the applicant review the application information as to noise and water resources arising from the associated HHV adjustment equipment for re-evaluation by FERC in its preparation of the FEIS.

IND63-1

Noted in the DEIS on page 4-346, and again on page 4-416 is the fact that the Portland and Willamette railroad tracks are adjacent to the facility and within the thermal exclusion zone. Also noted on pages 4-111 and 4-112 is the provision of a five (5) foot impoundment dike (containment berm) surrounding the LNG storage facility.

As found in Resource Report 13 [FERC Accession Number 20060605-4005 CD-1] the applicant notes specific compliance with codes and regulations that are applicable to aspects of the terminal's physical design.

13.13 REGULATORY COMPLIANCE

"A Code Compliance Tables completed by Whessoe are provided. Additional details of where the Project design complies with 49 CFR Part 193 and NFPA 59A are included in this Section 13.13."

13.13.1 49 CFR Part 193

"Table 13.13-1 lists the sections of 49 CFR Part 193 and the reference in this Resource Report 13 where each requirement is discussed. Some references are continued at the end of this section."

While the applicant has taken special care to point out compliance with one aspect of 49 CFR 193.2155 noted as:

13.13.3.3 193.2155 - Structural requirements

"The new LNG storage tanks are not located within a horizontal distance of one mile from the ends, or 0.25 mile from the nearest point of a runway." Page 13-60

A far more applicable aspect of this regulation is to be found in the complete text of the cited regulation at 49 CFR 193.2155 (a) (5) (ii) immediately prior to the above noted item, which states:

"49 CFR 193.2155 Structural requirements.

(a) The structural members of an impoundment system must be designed and constructed to prevent impairment of the system's performance reliability and structural integrity as a result of the following:

(5) If applicable, the potential impact and loading on the dike due to—

(iii) If the LNG facility adjoins the right-of-way of any highway or railroad, collision by or explosion of a train, tank car, or tank truck that could reasonably be expected to cause the most severe loading."

[45 FR 9203, Feb. 11, 1980, as amended by Amdt. 193-17, 65 FR 10959, Mar. 1, 2000]

K-930

IND63-1
cont'd

As can be seen in the proposed site plans, the impoundment dike (containment berm) surrounding the LNG storage tanks is directly adjacent to the railroad right of way. However, not found in any of the design criteria considerations for the impoundment dike (containment berm) contained in the applicant's Resource Report 13, or any other publicly available material is any mention of conformance to the above noted regulation. While this information may appear in Table 13.13-1, this table has been designated CEII and is therefore unavailable for public review or confirmation.

- It is recommended that the FERC address and comment as appropriate regarding this deficient aspect of the project application.

Washington, D.C. 20426

RE: Northern Star Energy LLC, Bradwood Landing LLC,
Natural Gas Import Terminal facilities and associated
facilities in Bradwood, Clatsop County, Oregon
Docket Nos. CP06-365-000; CP06-366-000; CP06-376-000; CP06-377-000

Dear Secretary Salas:

This comment is being filed with the Commission as follows:

- IND64-1 I am truly concerned about this project. The pipeline will be within 100 ft. of my property. There will also be a valve located on my property. Will there be an alert system in case of a leak? How often will the line be checked? As for
- IND64-2 The valve, there is acknowledged concern about noise levels. Will there be a noise barrier around the valve? How often will it be checked & by who?
- IND64-3 More than an acre of land will be logged prematurely. Will we be compensated appropriately? Will NorthernStar pay for all of the logging process? We will not be able to replant that land.
- There are too many questions and concerns for this project to continue.

Yours truly,

(Signature) Brenda Scott
(Print name) Brenda Scott
(Address) 847 Eufaula Hts Rd
(City, state) Longview, WA

Individuals

64

- IND64-1 We discuss potential pipeline impacts on residences in section 4.7.3.3. We have recommended that the Commission Order contain a condition that NorthernStar would be required to file a plan outlining how it would mitigate impacts on any residence with 50 feet of the construction right-of-way. Pipeline safety is addressed in section 4.11.9. The pipeline would be installed according to DOT standards.
- IND64-2 Noise associated with the pipeline valves has been evaluated and is summarized in the draft EIS. Based on preliminary engineering estimates, some valves would likely require additional noise control measures, which may include an enclosure or noise barrier. We are recommending that NorthernStar verify compliance with our 55dBA criterion by submitting a post-construction noise survey.
- IND64-3 As discussed in section 4.7.3.1, an easement agreement between a company and a landowner typically specifies compensation for losses resulting from construction, including losses of non-renewable and other resources, damages to property during construction, and restrictions on existing uses that would not be permitted on the permanent right-of-way after construction. Typically, pipeline companies pay for the logging to clear the construction right-of-way through timbered areas, unless some other arrangements are made with the landowner.

K-932

my comments concern these questions::

- IND65-1 | 1.the disposal of any and all spurious(to the methane in the cargo) alcanes, (heptanes, etc.) since they may be separated, what process or procedure will effect this separation? fractionation? how will these byproducts be removed from the site? by rail? by barge? has this and its accompaniant security, etc. been considered or allowed for? this seems dangerous to my family and community,as well as other communities in columbia county as they,and we, all are proximous to the local R.R. line and the columbia river.
- IND65-2 | 2.the containment berm(s): how can they contain a volume of "spilled lng" when it will expand its volume up to 600 times when it escapes or pours out from a leak in the containment vessel(s) and is warmed by the ambient air or ground temperatures?
- IND65-3 | 3.the feasability re. the pipeline capacity: Williams pipeline officials have stated that there is no capacity for any more gas in their system.also ther are more than 10 communities or population clusters along the proposed pipeline route, what warning systems/shutoffs and how many will be installed along the pipeline route? how can the residents of the dikelands, essentially islands whose grade is below the river's,be protected from their lands filling up with gas from a spill? how could the residents evacuate, as they recently had to, when egress is severely limited by having only one highway(30),and the narrowness of the geography of the columbia river canyon?
- IND65-4 | 4.what "local" or "regional"needs will this gas serve? why can't the proposed pipeline serve each and every community it transits as a "regional need"?
- IND65-5 | 5.as recent federally named "disasters" involve the instability of the earth and rock in the area including adjacent identical geology, and identical unstable geology on the washinton side, does the terminal/refinery site and the route of the proposed pipeline to serve it and its terminations (emergent and submergent) adjacent to the columbia river constitute a constant danger to residents? has corrosion been considered? self-evident corrosion is in plain sight in the clatsankie and port westward areas.
- IND65-6 | 6:since all heavily-laden ships sail on the high tide,how will the order of departure be arranged with other departing cargo traffic? where will the "waiting" ships anchor?

patrickcunningham@lowergorgeousnews.com

Individuals

65

- IND65-1 | No byproducts would be generated by the regasification process that would require disposal.
- IND65-2 | As discussed in section 4.11.4, any spills at the terminal would be directed to 1 of 2 impoundment sumps. Vapor dispersion calculations were performed for both of the impoundment sumps to determine if there was a spill at the terminal, how far the flammable vapors would travel.
- IND65-3 | See our response to comment PM3-50.
- IND65-4 | Details on warning systems and emergency evacuation are provided in the ERP, which is currently under review.
- IND65-5 | Purpose and need are discussed in section 1.1. The Bradwood Landing pipeline would transmit the natural gas to the Northwest Natural and Williams Northwest pipeline systems. From there, the natural gas could be transmitted to local distribution systems already in place.
- IND65-6 | Landslide risk and mitigation is discussed in sections 4.1.3.3 and 4.1.4.3.
- IND65-7 | Mitigation for pipeline corrosion is addressed in section 4.1.4.3.
- IND65-8 | The coordination of ship arrivals would be made by the pilots. In addition, section 4.8.1.7 has been revised to include additional discussion regarding potential for navigational conflicts LNG carrier traffic may have with other commercial ships traversing the Columbia River Bar.

December 17, 2007

I am writing in opposition to the proposed LNG terminal and pipeline at Bradwood, Oregon. As the FERC knows from reading the testimony submitted to you, this project is foolhardy, dangerous, and a potential disaster for the Columbia River and its environs and people. LNG does NOT belong on the Columbia River.

The geologic, scientific, economic, and safety reasons to reject LNG are endless. Here are five reasons why you should say NO LNG in Oregon.

1. The report from Oregon's Department of Geology and Mineral Industries (DOGAMI) shows that careless, inaccurate, and misleading science has been used to justify Bradwood. Here are three of its most damning conclusions:

IND66-1 | ♦ "Erroneous technical statements within the DEIS raise overall concerns about the qualifications of the applicant (NorthernStar) with respect to technical and public safety issues."

IND66-2 | ♦ "The site has very poor foundation soils, is in a high seismic hazard area, and potentially subject to other severe geologic hazards. The role of the geotechnical and geologic hazard information and project members appears to be inadequate."

IND66-3 | ♦ DOGAMI says repeatedly that there is "no reference to a detailed study or evaluation by a qualified geologist or engineer" and no scientific data to support several specific statements.

IND66-4 | 2. The Knappa Fire District report raises further alarms. The Oregon fire district has "sole responsibility for emergency response and mitigation for incidents at Bradwood." Yet Knappa itself is only an intersection with hundreds of rural households spread out along Highway 30 and the Columbia River. It relies on volunteer firefighters and the help of volunteers and few paid firefighters from other fire districts – some of which are at least 30-40 minutes away.

After researching the four other LNG terminal facilities in the US, the fire district identified massive gaps in its resources needed to cope with simply the "predicted routine emergencies" at the terminal. Filling that gap will require more employees, vehicles, equipment, training, and a new fire station facility within 3 miles of Bradwood

Who is going to pay for all this? NorthernStar, the federal government, and the State of Oregon aren't offering any money, "Cost sharing" between NorthernStar and local governments and special districts is a joke. There is a massive disparity between the industry-subsidized financial resources of NorthernStar and the funds from a county of 38,000 people. Does the FERC expect Clatsop County taxpayers to pay millions of dollars to underwrite the LNG promoters' scheme?

Individuals

66

IND66-1 See our responses to comments SA1-89 and SA1-93.

IND66-2 See our responses to comment SA1-4.

IND66-3 See our response to comment SA1-89.

IND66-4 See our response to comment PM6-24 and LA3-55.

K-934

IND66-5 3. Our recent hurricane - 36 hours of heavy rains and 90+ mph winds - left fallen trees blocking roads and highways, emergency communications down for days, and a massive mudslide covering the highway just a few miles from the road to Bradwood. Even if county taxpayers could afford to finance all the needed upgrades to the area's emergency forces, this hurricane demonstrated just how fragile our area's communications and transportation systems are.

Wiser heads than I are addressing the very real logistical environmental, geological, and construction issues regarding a terminal and pipeline that were raised by this storm.

IND66-6 4. As you might recall, the Columbia River shipping channel comes within a few hundred yards of the City of Astoria and is not much further away from other communities and residential areas downriver from Bradwood. The City Of Astoria's testimony to the Clatsop County Board of County Commissioners on October 22, 2007 said, "Until the full public safety impacts are specifically and precisely identified, and until these impacts are fully mitigated to the satisfaction of the City of Astoria and all affected communities, the project should not proceed forward."

IND66-7 5. NorthernStar's testimony at Clatsop County hearings was full of distortions, omissions, and outright lies. Please don't believe their "convenient fiction" that the Bradwood LNG gas will stay in California. It is insulting for NorthernStar and FERC to pretend that the proposed LNG terminals in Oregon will benefit the Northwest. The only pipeline with room for the Bradwood gas is the proposed Palomar Pipeline, which goes straight to California. At least Oregon LNG is willing to tell the truth: "The Pipelines to CA WILL Be Kept Full!" That is what Oregon LNG told the California Energy Commission on July 26, 2007.

IND66-8 It is outrageous that the federal government - Mr. Cheney, the FERC, the Dept. of Energy, and others - continue to promote LNG. It is a fossil fuel that largely comes from countries hostile to the United States and that is also sought after by China, India, and other countries. Will we soon be fighting wars over LNG?

I encourage the FERC Commissioners to draw on your political courage and principles. Speak up against LNG. Preserve Oregon's distinguished legacy of community, long-term vision, and respect for our people and world. Help our nation create a sustainable, innovative, and progressive energy future. Deny the NorthernStar application.

Sincerely,

Laurie Caplan

IND66-5 See our response to comment IND22-20.

IND66-6 NorthernStar has consulted with the City of Astoria and other local communities in developing its ERP. The FERC must approve the plan before NorthernStar could receive authorization to begin construction.

IND66-7 See our response to comment LA3-8.

IND66-8 Even the State of Oregon has acknowledged that LNG may play a role in the future energy mix for the Pacific Northwest. As explained in section 1.1, LNG may be needed to bridge the gap between domestic supply and future demands for natural gas in the United States. There are 15 nations that currently export LNG, and they contain 33 percent of the world's natural gas reserves. Right now the largest exporter of LNG to the United States is Trinidad and Tobago. The Bradwood Landing Project most likely would receive shipments from around the Pacific Basin, which could include Alaska and Australia.

Re: DEIS Comments on Bradwood Landing LLC - Docket No. CP06-365-000, et al.

Dear Secretary Bose:

Below are the many concerns I have with NorthernStar's Bradwood Landing project.

IND67-1 | This project may operate for as long as 50 years or more. NorthernStar has no plans for removal of the LNG terminal and pipeline upon abandonment if market conditions make the operation unprofitable or owners seek bankruptcy. (DEIS 2-63)

IND67-2 | The purpose of the project is to provide natural gas to residential and industrial customers in the Pacific Northwest. (DEIS ES-1) Identify what area is included in the "Pacific Northwest." NorthernStar has publicly stated several times that this natural gas will not be going to California. Beginning on page 54 of NorthernStar's application to the SEC, NorthernStar clearly states their intent and desire to get the gas to California.

IND67-3 | Cumulative effects of the pipeline with regard to conservation, economics, aesthetics, general environmental concerns, wetlands, historic properties, fish and wildlife values, flood hazards, floodplain values, land use, shoreline erosion and accretion, water supply and conservation (including wells, underground springs and drain fields), water quality, energy needs, safety, and consideration of property ownership are not addressed in the DEIS.

IND67-4 | There is no mention in the DEIS of impacts to city, county and state roads during construction of the pipeline.

IND67-5 | The proposed pipeline route crosses many slide areas. Cowlitz County has a lengthy history of landslides. "The proposed pipeline would cross 31 potential landslide areas." (DEIS 4-20) (DEIS 5-2) Years past there have been three explosions of the Williams line due to land movement, as well as their pipeline falling into the Toutle River last winter. The Kelso-Beaver pipeline is above ground with monitors for several hundred feet in an area near Lexington. A landowner in that area was actually forced to move his home due to land movement caused by the KB pipeline installation.

IND67-6 | The impacts to forestland would be great. A total of 229 acres of forestland would be cleared and 166 acres of ag land would be cleared using the proposed pipeline route. (DEIS 3-50)

IND67-7 | The secrecy of the actual pipeline route and secrecy of the landowner list does not allow the appropriate studies or analyses to be completed.

IND67-8 | The secrecy of the Emergency Response Plan does not allow citizens to review and comment.

Individuals

67

IND67-1 See our response to comment IND49-2.

IND67-2 The Pacific Northwest includes the states of Idaho, Washington, and Oregon. The target market for the gas is the Pacific Northwest, not California. See our responses to comments PM1-23 and PM5-78. .

IND67-3 Our discussion of potential cumulative impacts associated with the proposed pipeline is included in section 4.12.

IND67-4 A discussion of potential impacts on roads is included in section 4.8.3.7.

IND67-5 See our response to comment SA5-1. Geological hazards along the pipeline route in Cowlitz County, Washington are addressed in section 4.1.4.3.

IND67-6 Section 4.4.2.3 discusses measures that would reduce impacts on forest along the pipeline.

IND67-7 The pipeline route is not a secret. It is illustrated in Appendix B of this EIS. Nor is the landowner list a secret. Landowners are listed in Appendix A of this EIS. Our EIS included an appropriate analysis of pipeline route alternatives in section 3.1.8.

IND67-8 The ERP is developed under consultation with appropriate federal, state, and local agencies. NorthernStar would be required to submit its final ERP for review and written approval by the FERC before any final approval to begin construction. If the needed resources are not available and properly funded, operation of the project would not be approved. The draft ERP is not a secret. It was filed as part of the public record on March 24, 2008.

- IND67-9 | There are only three shut-off valves proposed on the Washington side of the pipeline located at mp26, mp31 and mp36 where it connects to Williams. (DEIS 2-27)
- IND67-10 | Even though an odorant is not required by law, the pipeline in Washington state would be a 30 inch pipeline at high pressure (possibly 1280 psi). (DEIS 2-27) NorthernStar publicly stated that adding an odorant is not cost effective. What about the safety of citizens living within the pipeline hazard zone.
- IND67-11 | The failure by NorthernStar to seriously consider other alternative pipeline routes is not mentioned in the DEIS nor in the Revised Oregon JPA. The method of research NorthernStar used to determine the pipeline route is not addressed.
- IND67-12 | There is no substantive risk assessment provided for the pipeline.
- IND67-13 | The safety hazards for introducing imported gas directly into the existing natural gas system are not addressed in the DEIS. The composition of LNG is different.
- IND67-14 | There is no mention of surge pressure control provided in the LNG pipelines. Per SIGTTO Standards, Site Selection and Design for LNG Ports and Jetties, Information Paper No. 14, page 25.
- IND67-15 | Pipeline safety is not clearly addressed. Section 192.615 "each pipeline operator must establish an emergency plan that includes procedures to minimize the hazards in a natural gas pipeline emergency." (DEIS 4-442) "No additional specialized local fire protection equipment would be required to handle pipeline emergencies." (DEIS 4-442)
- IND67-16 | There is no mention in the DEIS of the February 2001, Nisqually Quake northeast of Olympia, Washington that was felt locally and resulted in minor local damage. In DEIS 4-22 - Section 4.1.4.3 Geologic Hazards "Given that the proposed pipeline route does not cross any known active faults, earthquakes and associated seismic risk are not anticipated to have a significant impact on the proposed pipeline." There is no reference to studies performed at the University of Washington which indicate a strong possibility of a major quake along Western Washington/Oregon and affecting the entire region.

Yours truly,

Sandra M. Davis
1002 Abernathy Creek Road
Longview, WA 98632

Individuals

67

- IND67-9 | Pipeline safety is discussed in section 4.11.9. The pipeline must meet DOT standards, including spacing between MLVs.
- IND67-10 | See our response to comment PM5-81.
- IND67-11 | We considered alternative pipeline routes in section 3.1.8 of the EIS. While the project proponent selected its proposed pipeline route, we studied that route against several alternatives to see if any alternative would offer significantly less impacts on environmental resources.
- IND67-12 | See section 4.11.9.
- IND67-13 | Natural gas has varying characteristics depending on where it is produced. Natural gas from LNG tends to have a higher heat content than domestic natural gas. See also our responses to comments PM1-22 and IND33-27.
- IND67-14 | The SIGTTO standards are taken into consideration when applicable.
- IND67-15 | NorthernStar would be required to file an emergency plan for the pipeline before the FERC would allow construction to begin. See also our response to comment PM5-52.
- IND67-16 | The Nisqually earthquake has been added to section 4.1.3.3 as has a description of large subduction zone earthquakes in the region. As indicated in section 4.1.4.3, unless a pipeline directly crosses an active fault with a substantive amount of displacement or an area subjected to significant lateral spreading due to liquefaction, it is not particularly susceptible to damage during an earthquake.

Rainier, OR 97048

K-939

IND68-1 Reference is made to the operational noise aspects of the LNG terminal as found in the DEIS on page 4-392, Table 4.10.2-4. There appear to be a number of missing elements, notably the noise contributions from:

Nitrogen Package
Vapor Return Blowers, quantity unknown
Sendout Pumps, 5 units at 2335Hp each
In-Tank LNG Pumps, 6 units at 265Hp each
Air Separation Unit or Compressors associated with HHV adjustment if these are to be the HHV adjustment means to be used

The overall dBA figures given are uncharacterized as to whether the value is a single unit or multiple units and whether the figure includes the motor associated with a device or is the device alone. The quantity of units of a specific type is undocumented.

It is noted that the noise level of the SCV's is 118dBA. Does this level represent a single unit or the worst case of all seven units operating simultaneously? Additionally, not noted is information if this level is a generalized composite value comprising the numerous sources present on the SCV such as SCV Vaporizer Primary and Secondary Combustion Air Blowers, Blower Motors, Blower Intake and Exhaust Stack or a specific element.

The 118dBA noise level of the SCV is uncharacterized as to center octave frequency distribution and is an overall soundpower measurement only. If there is a significant low frequency component this will affect the overall perception of the noise.

IND68-2 The applicant's Resource Report 9 submission [FERC Accession Number 20060605-4000] Section 4.5 Sound Propagation Factors, page 9b-11 notes:

"3. Hills surrounding the facility were modeled from GIS contours at 20-meter height intervals to simulate shielding from the terrain at NSAs to the west of the facility."

This assumption ignores the fact that the closest inhabited areas are to the East of the site on Puget Island. The hills rather than shielding the shoreline area of Puget Island serve as a reflective surface instead; especially the rock faces at the south end of the site.

IND68-3 Finally, no mention is made of potential objectionable transient or repetitive noises such as venting, compressor operation, or noises arising metal expansion or contraction that may expected from the operation of the facility.

Individuals

IND69-1

Noted in Section 4.11.2 of the DEIS on page 4-404, and found as Recommendation 82 on page 5-31 is the requirement that the final design incorporate redundancy for critical, hazard, sensor and systems. It is to be hoped that this redundancy will apply to the LNG storage tank level, temperature, density monitor system. This system is necessary to monitor and prevent the potential for LNG storage tank 'rollover'.

The applicant has sought to address this potential problem with instrumentation as found in Resource Report 13 [FERC Accession Number 20060605-4005 CD-1]:

13.8.8 Tank Instrumentation

"13.8.8.5 Density Monitoring

An independent level, temperature, density (LTD) system monitor, with density difference alarm, will be installed. The system will monitor the level verses temperature verses density profile. This device will be utilized to monitor for liquid stratification and potential rollover situations." Page 13-43

The issue here is that it would appear that the LTD monitoring system is nominated in the singular i.e. "An independent level, temperature,....". It is unclear from the narrative if there are other specific level, temperature, and density sensors acting in tandem. If this is a safety critical system, it should be considered in the context of a potential single point failure.

Additionally, the system would seem to be merely monitoring the conditions and annunciating an abnormal condition. It would be left to a human operator to initiate remedial action as found in the following narrative from the applicant's Resource Report 13:

"13.8.17 Procedures for Monitoring and Remediation of Stratification

The LNG tanks will be equipped with density monitoring instrumentation to indicate stratification and potential rollover problems, *and allow early operator action*. The LNG storage tanks will be capable of top or bottom filling from an LNG carrier to avoid stratification. In addition, facilities will be provided to circulate the stored product so that if stratification begins to develop, the tank contents can be thoroughly mixed. This will involve pumping LNG from the bottom of the tank and returning it to either the top or the bottom as needed." Pages 13-49 and 50

(Emphasis added in italics)

Individuals

69

IND69-1

The LNG tanks would be equipped with density monitoring instrumentation along with numerous other measurement devices which can be used to monitor for conditions which would lead to roll over. Monitoring equipment and early operator action are the most effective means of handling roll over conditions. Section 4.11.2 includes a condition requiring the final design to include a hazard and operability review of the completed design.

Individuals

69

IND69-1
cont'd

It is possible the applicant may be seeking to exploit this phenomenon to reduce operational energy costs. As excepted from the following paper presented in the LNG – Control and Simulation sessions of the American Institute of Chemical Engineering 2006 Convention:

“LNG Rollover: Converting a Safety Problem to Tank Loading Operational Asset

Yan Jun Wang, Chemical Engineering, Mary Kay O'Connor Process Safety Center, College Station, TX 77057 and Harry West, Department of Chemical Engineering, Texas A&M University, College Station, TX 77057

“Rollover following density stratification in LNG storage tanks was considered a problem, which required careful monitoring following several unexpected rollover events in the 1970s. However today density stratification is routinely used to reduce high LNG boil-off gas rates, particularly when tank filling through the top loading nozzles is required for heavier LNGs. Thus boil-off gas compressor and pre-heater costs can be reduced both during and after unloading LNG Tankers.”

However, if the applicant intends to use this technique it should be fully disclosed in subsequent operational procedures, subjected to a Failure Mode and Effects Analysis [Hazards and Operability], and the operators properly trained in its implementation.

It is not possible for this writer to know if this perceived issue has been adequately addressed by the applicant in the documents “Supplemental Responses to Staff for Cryogenic Information Requests” [FERC Accession Numbers 20061026-0145 and 20061026-0146], as this information has been declared CEII.

- It recommended that the final design and operational procedures of the facility be fully vetted by competent peer review to ensure compliance with all applicable codes and standards.

K-944

Rainier, OR 97048

Individuals

70

K-945

IND70-1 Noted in the DEIS recommendations on page 5-30 as item 66, is the provision of survey bench marks on the LNG storage tank foundations. It is assumed that these bench marks are to be used to monitor differential settlement or loss of planar orientation (tilt) of the storage tanks as found in Section 7.4.1 of the '*Draft SEISMIC DESIGN GUIDELINES and DATA SUBMITTAL REQUIREMENTS FOR LNG FACILITIES*' (January 2007).

However, since this recommendation appears outside of the cited scope this document's applicability to recommendations 43-56 as found on page 5-27, the inclusion of recommendation 66 could be viewed as ambiguous. Additionally, while the metrics of differential settlement and planar tilt are given in Section 7.4.1, a requirement for the applicant to address the procedures to be implemented in the event that limits are exceeded is left unstated.

IND70-2 The procedure for hydrostatic testing of the LNG storage tanks is detailed in the DEIS on page 4-72. The applicant proposes to test each tank individually so as to conserve test water. However, it is perceived that while this test protocol will provide information reflecting the scenario of one tank empty and one tank full; it may not accurately reflect the soil structure interactions arising from the scenario of both tanks imposing full loads to the site soils.

IND70-1
cont'd

- It is suggested that for the FEIS, FERC consider including recommendation 66 within the scope of recommendations covered by the noted seismic guideline document, and require that the applicant furnish procedures to address the manner in which corrective mitigation for settlement and planar tilt limit exceedance will be performed.

IND70-2
cont'd

- It is suggested that FERC and its outside consultants review the testing protocols envisioned by the applicant for the hydrostatic testing of the LNG storage tanks in view of the unique seismic characteristics of the site.

Individuals

70

IND70-1 A settlement monitoring system would be installed to measure and record inner and outer container movement during construction and the hydro test. Section 4.11.2 includes a condition requiring NorthernStar to report any abnormality of significant magnitude to FERC staff immediately, which would include tank settlement measurements exceeding the design limits.

IND70-2 The LNG storage tanks would not be hydrostatically tested at the same time. If the same water could not be used to test both tanks, it would be because the second tank would not be ready to test when the first tank test is finished.

Washington, D.C. 20426

Re: DEIS Comments on Bradwood Landing LLC - Docket No. CP06-365-000, et al.

Dear Secretary Bose:

IND71-1

Clatsop County hired an "independent" company to assess the safety needs and costs of implementation for the importation of LNG on the Columbia River. In their report to the county dated July 2007, PBS&J, the company hired by Clatsop County to undertake this analysis, reported:

"The ERP (Emergency Response Plan) should plan for the worst events, even if the probability of their occurrence seems low. Clatsop County residents need to be assured that appropriate measures can and will be taken to deal with catastrophic events (such as a major explosion) if there is credible evidence that such an event could occur." (Public Safety Assessment, p.10, July 07.)

The most recent update from PBS&J is dated November 2007. It was jaw dropping for me to work my way through this report and realize the gaping holes in the ERP and the complete lack of a cost sharing agreement. The realities of this written report are in direct conflict with the oral report given by Northern Star at the Clatsop County Commissioners public hearing on November 19, in which they claimed to have a cost share agreement in place.

In my analysis of the PBS&J November 2007 report I am especially alarmed regarding these major areas of concern:

Columbia Memorial Hospital, Astoria, OR

- Columbia Memorial Hospital is the only hospital in Astoria and the only hospital between Astoria and the proposed Bradwood Landing LNG site 25 miles up river. CMH would be responsible for the treatment of burn victims resulting from a fire associated with an accidental or intentional spill of LNG during transportation up the Columbia River, transferring from the ships to the plant and/or storing at the Bradwood regasification plant.
- Columbia Memorial Hospital is NOT a designated burn center. This fact is never addressed in the PBS&J reports.
- At the minimum CMH should be requesting funding, facilities, equipment, personnel and training to become a designated burn center. CMH has requested nothing as reported in the PBS&J Nov. 07 report, no upgrades nor cost sharing. In fact, Appendix A: Meeting attendees (Nov. 07) lists no one attending from CMH.

Individuals

71

IND71-1

See our responses to comments IND60-6 and LA3-55.

K-947

IND71-1
cont'd

- In addition it seems prudent and responsible to plan for the transport of potentially large numbers of burn victims to Portland or other designated burn centers. We should see requests for additional ambulances, helicopters and helicopter landing pads. No such requests appear anywhere in the PBS&J Nov. 07 report.

It is noteworthy that Peter Hackett, an employee of Bradwood Landing, is on the board at CMH and that Northern Star has made substantial contributions to CMH Foundation.

Lack of a signed Cost-sharing Plan

The Fire Chiefs in our communities took this responsibly seriously, including undertaking their own studies to compare our fire fighting resources and response time to a major incident with other communities of similar size. The discovery that our rural communities are in no way prepared to deal with LNG should surprise no one.

"Knappa has a 15 minute response time and Astoria has a 30 minute response time, which are five to nearly 10 times greater than the average 3.5 minute response time for Cove Point, Newport and North Bay." (p.29, Nov. 07)

While Knappa Fire district did an excellent job of identifying their needs, their concerns have not been adequately addressed by Northern Star:

Knappa Fire District has requested 8 full time employees and 6 Interns. Bradwood Landing LLC resource proposal for Knappa Fire district is 1 FTE (Trainer). Knappa Fire District has also requested a fire station within 3 miles of Bradwood facility and the Bradwood Landing LLC resource proposal includes zero fire stations within 3 miles of Bradwood Facility.

"The local emergency response community was not in agreement on the amount of resources that would be needed to respond to a fire associated with the LNG terminal. As a result no agreements were reached on the resources needed to respond to a fire at the Bradwood LNG Terminal. Currently, there is not a signed mutual Cost Share agreement between all parties." (ERP Revisions and Response Resource Cost Share Report, p.21-22, Nov. 07.)

Lack of an Evacuation Plan

- The Downtown waterfront of Astoria containing both the retail business section and private homes, is well within the burn zone of a vapor cloud fire from a passing LNG tanker.
- Astor Elementary School houses 400 students in grades 1, 2 and 3. It is a three story building facing the Columbia River with the outdoor playground on the river side. Astor sits on a hill and there are no structures, hills nor trees between the school and the site line to the main channel of the Columbia River.
- LNG tankers should not be allowed to pass within the vapor burn zone of a public school. If someone were foolish (or greedy) enough to allow this – what is the evacuation plan for 400 children with little or no notice of a vapor cloud fire?

These requests seem to be bare minimum requirements if this hazardous industry is to be allowed into our communities.

Re: NorthernStar Natural Gas, Inc.
Bradwood Landing LNG Terminal Permit Application
Filing CP06-365-00 et al

Ms Bose:

Attached are our comments in response to the Draft Environmental Impact Statement for the proposed Bradwood Landing LNG project of NorthernStar Natural Gas, Inc. Please note there are key points, issues, misinformation and missing data that need to be addressed prior to the final EIS being issued. Our comments include, but are not limited to, the following:

1. *Questionable location of HDD drill site on both sides of Columbia River from Port Westward into Cowlitz County, Washington*
2. *Lack of study and/or consideration of road bearing limits on primitive public roads in Cowlitz County*
3. *Geo-hazard concerns for Cowlitz County including*
 - a. *Seismic fault lines*
 - b. *Identified landslide areas*
 - c. *Previous pipeline failures due to ground shift*
4. *Lack of independently identified need for LNG in the Pacific Northwest*
5. *Negative impact on regional economics due to hampered ship traffic*
6. *Lack of financial solvency of NorthernStar Natural Gas*
7. *Lack of pipeline safety and emergency response measures for SW Washington*
8. *Failure of NorthernStar to recognize and follow permit application process in Cowlitz County*

Individuals

9. *Failure of NorthernStar to communicate with landowners*
10. *Inaccurate information and maps contained within DEIS WITH the knowledge of the Federal Energy Regulatory Commission*
11. *Inaccurate identification and reporting of residences, out-buildings and private water supplies along proposed pipeline route*
12. *Failure of the United States through the FERC to hold all LNG applicants to the same level of standards as those recognized and used throughout the world LNG industry. It is through the strict adherence to these standards the impeccable record of the industry was achieved.*

With our comments are several attachments that include the full version of public comments during the week of November 5, 2007. We feel the information contained within the full version is important and should be included with this document.

To place the DEIS of a project of this magnitude out for public comment without securing independent, complete and verifiable documentation for need as well as holding the applicant accountable for each and every step of the process including filing for all local, county, state and federal permits, along with providing true, accurate and up-to-date reports, routes, maps, models, etc. goes beyond reason. For a federal agency charged with "regulating" the energy industry, what has occurred is a free-for-all at the expense of the public, and, most especially, the private landowner. To hear an agent of the FERC tell a crowd of people at the recent scoping meeting held in Molalla, Oregon, that FERC's job is to permit the projects and the market will determine which terminal(s) will be built, shows a lack of direction and guidance as well as indicates a need to reign in the power of the FERC. If this were to be truly "regulated" regional studies would be conducted and an independent "needs assessment" completed rather than an energy speculation land grab. It is disappointing to see our federal government revert back to colonial times where search and seizure was the rule and a person's home free for the taking by the king's men.

It is our sincere hope the Federal Energy Regulatory Commission will look carefully at this project and make the obvious decision that Bradwood, Oregon and the Lower Columbia River are the wrong place for an LNG terminal of any kind.

Thank you, again, for this opportunity to comment on this highly important document.

William P. Castle

IND72-1 See the response to comment PM1-38. Geological hazards along the pipeline are discussed in section 4.1.4.3.

IND72-2 The proposed location for the pipeline crossing of the Columbia River has not been revised since the issuance of the draft EIS. Based on the project alignment sheets and as shown on the topographic Pipeline Location Maps (included as Appendix B), the proposed exit site for the HDD drill would be located in the drainage system associated with Abernathy Creek, not Mill Creek. The species and life stages of federally listed salmonids known to occur within Abernathy Creek are described in section 4.6.2.3. Potential impacts on aquatic resources (including salmonids) due to the proposed crossing of the Columbia River are discussed in section 4.5.3.1.

Finalization of the pipeline route is typically not complete until shortly before the initiation of construction activities. Therefore, we have recommended in section 2.2.2 that final routing and design information be filed with the Commission prior to pipeline construction.

IND72-2 cont'd	<ul style="list-style-type: none"> Mill Creek not included in DEIS nor any studies whatsoever by NorthernStar or any other environmental agency conducted and included. 		<p>be considered until pipeline route is finalized and appropriate studies conducted with all associated agencies given time to review and comment. It is apparent by the lack of information in the DEIS that other agencies were not informed of the HDD site change nor given a chance to investigate or comment as evidenced by NorthernStar's recent responses to additional information requests.</p>	<p>Letter to USFWS dated October 15, 2007 from NorthernStar</p>

IND72-4

2. Roads	Load Limitations		
<ul style="list-style-type: none"> o Road Modifications o Primitives Public Access Roads in Cowlitz County, WA o Lack of load bearing studies on Cowlitz County public and/or private roads. 	<p>2-35 Paragraph 1 "Modifications or improvements to existing roads used to access the project would not be required."</p> <p>Paragraph 3 "NorthernStar would access the construction right-of-way via 32 existing public and private roads that intersect the right-of-way. The majority of roads are classified as dirt roads."</p> <p>Table 4.7.3-3 Page 4-308</p> <p>Table 4.2.3-2a "NorthernStar would use existing access roads that would not require modification or improvement and would, therefore, not represent additional soil impacts."</p> <p><u>Impacts and Mitigation 4-98</u></p> <p>Paragraph 3 "NorthernStar would use existing access roads, which would not require modification or improvement and would, therefore, not represent any additional impacts on wetlands."</p> <p>4-305 Paragraph 4 "NorthernStar would access the construction right-of-way via existing public and private roads that intersect the right-of-way. Modifications or improvements to support the expected loads would not be required."</p> <p>P4-353 Paragraph 2</p>	<p>Since the majority of Cowlitz County is considered "rural" it must be brought to the attention of the FERC that, like Clifton Road, many roads in this county are narrow and to the point of some being single to 1-1/2 lanes rather than the standard 2 lanes. Yes, these are public roads with some even paved.</p> <p>One particular road is Whitewater Road (formerly known as Old Mill Creek Road). This is the planned access road to reach the proposed Columbia River HDD site. Whitewater is a paved road to the end of the county access, barely 1-1/2 lanes in width and is the only access in or out for approximately 20 homes. It is considered hazardous, has blind spots and curves with no room on either side for turnouts. What shoulder there is, is soft and narrow. Whitewater Road will be heavily used for at least 37 days during the drilling process. No road studies have been conducted to determine the ability of this road, or any road in Cowlitz County, to sustain the weight of the 3 tractor trailers to haul in the drill rig let alone the amount of other rigs to bring in support equipment as well as the tremendously increased amount of daily truck traffic.</p> <p>The county road portion of Whitewater ends at a private gate but Whitewater Road continues on as a private home-owners association road to 20 private parcels. Recent utility work to install new power cabling is testament to what minor traffic of heavy trucks and equip can, and will do to this road bed.</p> <p>Twenty families depend on Whitewater Road as their only access in and out—there is no other access.</p> <p>No safety measures to warn residents of traffic from either direction on the public portion of this</p>	<p>See attachment 2</p> <p>FERC Public Comments</p> <p>November 5, 2005</p> <p>Clatskanie, Oregon</p>

IND72-4

Section 4.8.3.7 has been revised to include additional discussion of NorthernStar's requirements regarding local road permits and our recommendation that NorthernStar revise its final traffic management plan to include measures to reduce impacts on narrow roads (including Whitewater Road, also known as Old Mill Creek Road) that would be used to access the construction right-of-way.

IND72-4 cont'd		"NorthernStar would use existing public and private roads that intersect the right-of-way to obtain access during construction. Load limits on public roads would be observed to prevent damage to the road surface, road bed, culverts, and bridges. Access road modifications proposed by NorthernStar are limited to grading and the addition of gravel to prevent rutting.	road is mentioned in the DEIS. We all travel this road slowly and cautiously because we realize the danger. That same caution cannot be guaranteed by NorthernStar, Northwest Natural Gas and/or the company they actually hire to construct the pipeline. Load bearing and traffic studies on public and private roads should be conducted prior to release of FDEIS as has been done with Clifton Road	Cowlitz County Public Works 2008-2013 Transportation Improvement Program http://www.co.cowlitz.wa.us/publicworks/roads/2008%20-%202013%20TIP%20Project%20Summary.pdf Slide 12
	IND72-5	<ul style="list-style-type: none"> o Road Traffic o Closures of roads due to pipeline construction 	<p>Page 4-343 Section 4.8.2.7 Road Traffic</p> <p>Page 4-352 Section 3.8.3.7 Paragraph 1 "Construction of the pipeline facilities could affect transportation and traffic in the project area by increasing the number of vehicle trips per day on area roads as a result of commuting and construction vehicle traffic as well as temporarily closing some minor roads during pipeline construction."</p>	<p>What is the definition of "minor". Due to the rural aspects of Southwest Washington and Northwest Oregon, those "minor" roads are the only access to many homes. The closure of those roads to landowners, emergency vehicles and/or delivery/medical services for even a brief period of time could create severe hardship especially on the elderly. There are no alternative routes for many locations. You close these roads and people are stranded either in their home or away from it.</p>
	IND72-6	<p>3. Trespass/Vandalism</p> <ul style="list-style-type: none"> o Cost to landowners o Loss of privacy o Personal liability expenses 	<p>Page 4-457 Section 4.12.6 Cultural Resources "Increased access by rights-of-way and service roads would</p>	<p>Who pays for damages? 72

IND72-7 Section 4.7.3.3 has been revised to update the status of residences near the proposed pipeline route and our recommendation that NorthernStar prepare site-specific residential construction mitigation plans for all residences within 50 feet of the construction right-of-way.

IND72-8 As discussed in section 4.7.3.1, the new easements that NorthernStar would need to acquire to construct and operate the proposed facilities would convey both temporary (for construction) and permanent rights-of-way to NorthernStar and would give NorthernStar the right to construct, operate, and maintain the pipeline facilities. NorthernStar would negotiate a one-time payment for each easement. An easement agreement between a company and a landowner typically specifies compensation for losses resulting from construction, including losses of non-renewable and other resources, damages to property during construction, and restrictions on existing uses that would not be permitted on the permanent right-of-way after construction. The acquisition of an easement is a negotiable process that would be carried out between Northwest and the landowner and is beyond the scope of this EIS.

IND72-8 cont'd	<ul style="list-style-type: none">o Ambiguous determination of standards.	would be in accordance with any agreements between NorthernStar and individual landowners.” 3-36 3.1.5.3 Site Review Population Centers/Residences “Similarly, alternative LNG terminal sites were considered preferable if the location did not require LNG ships to transit near residentially and commercially developed shorelines.”	included. Loss of landowners’ rights—NorthernStar’s standards for right-of-way restoration. Clarification of “NorthernStar’s standards” is needed in this section. Who determines NorthernStar’s standards? Why aren’t county, state or other standards used? Can NorthernStar’s standards be changed at any time? Who regulates them?									
IND72-9	<ul style="list-style-type: none">o Population density within rural areas should not be the determining factor of “acceptable risk” for loss of life		Astoria is commercially and residentially developed. LNG ships will place the downtown area of Astoria within the blast zone. Puget Island is a residentially developed shoreline with homes well within zones of concern. Residences are closer than ½ mile from the terminal and less than ¼ from the tanker when moored.

IND72-9 Population density is just one factor in evaluating LNG terminal sites for suitability. For example, in our alternatives analysis, we viewed the Bradwood Landing site as more favorable than the Tansy Point site based on the lower population density. In sections 4.7 and 4.8, our EIS acknowledges that populations at Astoria and Puget Island would be within the Zones of Concern for LNG marine traffic going to the Bradwood Landing LNG terminal. However, there are no residences within 0.5 mile of the proposed LNG terminal.

IND72-15 cont'd			information is against international industry standards.	
IND72-16	Tug assistance—number of tugs, size of tugs vs size of ship and horsepower necessary per tug.		Two 60-ton Bollard tugs will assist with transport of LNG carriers in the Columbia River channel. No limitation on size of carrier is mentioned, however, SIGTTO standards strongly suggest otherwise. Though the combined tonnage may cover the standard, having less than the required number of tugs may hamper control in an emergency. It is also important to note the tonnage of 120 to 140 is for carriers up to 135,000 m ³ , smaller than NorthernStar's anticipated carrier size.	Section 8.1.2 Page 14 SIGTTO
IND72-17	Bradwood terminal location won't meet internationally accepted standards.		Spending a small amount of time reading the SIGTTO standards creates a better understanding as to how the industry attained its safety reputation. Why the United States chooses not to follow the same standards is beyond reason. If they did, we wouldn't be commenting on this DEIS for this terminal would not pass.	
IND72-18	Buying support		Sponsorship of, and participation by invitation only full expense paid golf tournaments for Union representatives, financial gifts to local charities and foundations, and glitzy ad campaigns have not gone unnoticed. Dividing communities and pitting friends and neighbors against each other should never happen. Nor should it go unnoticed that tactic of donating large sums of money to a community foundation then dictating how that money will be spent—emergency services NorthernStar promised to provide. Instead they make a full tax-deductible donation and have that pay for their obligations. A classic case of corporate America having its cake and eating it too.	

Individuals

72

IND72-16 See our response to comment IND60-11.

IND72-17 See our response to comment IND60-11.

IND72-18 Most of this comment does not address environmental issues, and is outside the scope of our EIS. If the project is authorized and built, NorthernStar would have to provide funds for local governments as part of the cost-sharing portion of its ERP. It has also volunteered to fund the SEI. NorthernStar has elicited some support among local communities, in part, because it would provide a new source of natural gas to the Pacific Northwest, it would hire local workers, and its project would have economic benefits for the region as explained in section 4.8.

Docket No. CP06-365-000 et al.**

December 20, 2007

Due to time limitations on my presentation at the 11-08-07 FERC hearing in Knappa, Oregon, I here repeat the text of my comments at the hearing and add specific questions regarding the determination of vapor-cloud exclusion zones which I did not have time to present, as well as add comments relating to marine (shipping) safety issues that I believe should be considered in the process of siting the proposed Bradwood Landing terminal.

Comments on Vapor Cloud Exclusion Zone Determinations

IND73-1

Recent events indicate to me that FERC's compliance with the Congressional mandate to consider remote siting of LNG terminals in order to protect public safety is being based largely on exclusion (safety) zones required by U.S. Department of Transportation regulation 49 CFR 193. As a result, the establishment of such exclusion zones, which are mandated for land-based facilities only, has become the key method by which sufficiently remote siting is insured. I believe that such methods as have been approved by FERC in the DEIS for Bradwood Landing do not and can not insure the public safety as intended.

Presently, only two models are approved for determining vapor cloud exclusion zones for LNG terminal applications. The DEGADIS model, of which I am a co-author, was developed with support of the U.S. Coast Guard and the Gas Research Institute. Approved for use in the federal regulation in the early 1990's, DEGADIS does not account for any holdup of LNG vapor by dikes or other obstructions (to flow). Because of the need for models which can account for such complicated effects (the real world), the FEM3A model was developed as a result of a ten-year-long research effort supported by the Gas Research Institute and a consortium of international LNG interests, for which I was the Principal Investigator. FEM3A, approved in 2000, is clearly specified in 49

Individuals

73

IND73-1

We have updated the text in section 4.11.4 for clarification.

K-964

IND73-1

cont'd

CFR 193 as the model that must be used if vapor holdup by impoundments or vapor fences is to be taken into account.

As described in the Bradwood Landing DEIS, the applicant attempts to take the (vapor-holdup) effect of the impoundment into account without using the only permissible method (FEM3A) for doing so. Instead, it uses DEGADIS coupled with an absurd assumption that the LNG vapor evolved from a spill would accumulate in the impoundment without mixing with air. In effect, the applicant assumes that zero LNG vapor would be released from the impoundment during the first several critical minutes after a spill, when the rate of vapor generation from the spilled LNG is the greatest. This assumption has the effect of substantially reducing the calculation of the size of the vapor exclusion zone. And -- most important -- the assumption has been proven to be wrong. Experiments have conclusively shown that the LNG vapor does not simply remain in an impoundment until the volume of the pure, unmixed and unwarmed vapor exceeds the volume of the impoundment. But that absurd and demonstrably wrong assumption is the basis for the calculation of the vapor exclusion zone in this case. To be reasonable, the calculation must be redone, either using DEGADIS without attempting to take the effect of vapor holdup in the impoundment into account, or by using FEM3A, which correctly factors in the effects that the impoundment does have.

I also believe that the vapor cloud exclusion zones determined in the DEIS fail importantly to provide for public safety as intended by 49 CFR 193 in two other ways:

- The design spill used by the applicant here has been arbitrarily specified as the breakage of a 6-inch line on the cargo unloading line for the facility, with a ten-minute duration spill of 140,320 gallons, while the impoundment volume into which the spill would occur has been sized (and therefore deemed credible) to account for a ten-minute duration spill of 529,091 gallons resulting from a full rupture of the ship unloading line. My review of eleven other environmental impact statements shows DEIS approval for design spills from the ship unloading line ranging from 28,900 gallons (Keyspan) to 812,000 gallons (Trunkline). I do

Individuals

73

IND73-1
cont'd

not understand how FERC can approve such a large variation in the design spill which determines the extent of the vapor cloud exclusion zone. After all, the ship unloading lines, as well as the arrangement of the smaller lines serving the unloading line, are all based on similar technology and design specifications. Since the vapor cloud zone determinations are directly related to the size of the spill, the lack of consistency shown in the design spills selected by the various applicants could have the appearance of simply determining the size of the spill that the property line distance allows.

- The determination of the vapor cloud exclusion zone has been made assuming a wind speed of 2 m/s. This assumption is not conservative; although allowed by 49 CFR 193, the basis for this assumption predates scientific findings that 2 m/s wind speed cannot be assumed to be worst case. As both theoretical models and experimental evidence indicate, because of increased air mixing with evolved LNG vapor (air entrainment) at higher wind speeds, the maximum downwind safety zone can occur at a wind speed higher than 2 m/s (4.5 mph), and such higher wind speeds are not an unusual condition. In this regard, I point out that the fire radiation exclusion zone is required to be determined, as Bradwood Landing appears to have done, for the wind speed that maximizes the exclusion zone. The same reasoning is applicable to the determination of the vapor cloud exclusion zone.

Finally, regarding the vapor cloud exclusion zone determinations described in the Bradwood Landing DEIS, I would appreciate FERC's clarification of the methods used to determine the vapor cloud exclusion zone of 243 feet cited on page 4-418 -- by providing the values used for thermal conductivity, density, and heat capacity of the (concrete) material composing the sumps into which the design spills occur.

Comments on the Potential for Cascading Failures of LNG Ship Containments

IND73-2 Having visited the proposed Bradwood Landing site and the shipping route thereto, the latter coming into close proximity to the city of Astoria while passing under the Astoria bridge, I believe that serious consideration should be given to recommendations to Congress by the Government Accounting Office (*MARITIME SECURITY – Public Safety Consequences of a Terrorist Attack on a Tanker Carrying Liquefied Natural Gas Need Clarification*, GAO-07-316, February 2007) to determine the potential for cascading failures of the LNG containments (tanks) that might follow a terrorist attack. The GAO has called the cascading failure issue the leading unaddressed priority need for LNG safety research associated with LNG shipping. If an LNGC were to be attacked in the proximity of the bridge at Astoria, and cascading failures of the ship's containments were to occur, it could result in a hydrocarbon pool fire on water with magnitude beyond anything that has been experienced to my knowledge, and in my opinion could have the potential to put people in harm's way to a distance of approximately three miles from the ship. I believe that the parties that live along the Columbia river where this threat could affect them deserve to have a rational, science-based determination made of the potential for such occurrences, no matter how unlikely they may be considered.

Individuals

73

IND73-2 As discussed in section 4.11.5.3 of the EIS, cascading damage was evaluated in the Sandia Report and, while possible under certain conditions, is not likely to involve more than two or three cargo tanks, and is not expected to increase the overall fire hazard by more than 20 to 30 percent. The majority of the GAO expert panel agreed with Sandia that cascading events are not expected to significantly increase the overall fire hazard, and the majority felt the Sandia calculations were either accurate or overly conservative. We have updated the text in section 4.11.5.3 for clarification.

I moved my family to Astoria two years ago in large part for the safety and security we found this region to hold. The slow pace of life, the strong sense of community, the avid artistic culture, the practically unspoiled scenery, and the romanticism of the "working river" with anchored ships and fishing boats in the river every day were also large draws. As a businessman and investor for the past 40 years, I knew this to be a place in which local investment opportunities would be helpful, profitable, and numerous. We thought we had found paradise, somewhere we could settle in, help with the raising of our grandchild, and enjoy the rest of our years.

We are now living in fear that a LNG facility could be soon approved 30 some miles upriver from our home, requiring a ship loaded with potentially explosive materials to pass by just about every day. These LNG tankers will not only compromise the feeling of safety in town and along the river, they also will help destroy the economy of fishing, recreation, and tourism that our area's inhabitants have worked so hard over the last decade to strengthen. Bringing LNG to a facility upriver will make this wild area a possible terrorist target, and will require the clearing of most of the river, bridge, and downtown Astoria every time a ship passes by. What fisherman, kayaker, or sightseer wants to deal with that inconvenience?

This proposed LNG facility at Bradwood Landing would be being placed at "the holy grail" of salmon rearing habitat on the already damaged, salmon-deficient Columbia River. There just is not better habitat for that period of the salmon's life anywhere on the river anywhere, nor can it be mitigated in any true sense. Destroying it would be devastating; going through with this proposal on these grounds should be illegal.

Not only would a LNG facility be disastrous for Astoria, smaller communities, and all surrounding residents of the plant and river, but the associated pipelines that would have to be built in order to make a new facility viable could be possibly even more detrimental to our environment, spanning hundreds of miles through prime farmland, vineyards, forests, and public lands. This pipeline would cross hundreds, if not thousands, of streams, adding silt to our already damaged waterways. There is just no way for responsible pipe installation to occur on the entirety of the line; there would not be enough profitability for the pipeline company if it were to put in the hours needed to ensure the lack of destruction to the environment.

The DEIS is insufficient and flawed for this project. It does not adequately study the effects on endangered wild salmon and steelhead. It does not adequately study the potential effects on the safety of surrounding communities. It does not adequately study the history of landslides in the direct vicinity of the proposed Bradwood Landing LNG site. It does not adequately study the impacts to the wetlands and river, nor does it study and ask to change the mitigation plans sufficiently. FERC should not approve this project as it stands, as reported in the DEIS.

If we must create LNG receiving and processing facilities, why not place them offshore, where no one could be harmed, where terrorists would not be tempted to attack, where vital river, estuarine, and wetland life is not to be affected? I wish that you, employees of FERC, would use the full scope of your power and choose to site these plants in appropriate locations, and not just where the big money corporations think they can get away with it. LNG, in responsible locations, wouldn't be so bad.

Individuals

74

- IND74-1 The safety/security zone around the LNG ships would have a minor impact on recreational river use. Also see our response to comment PM6-48.
- IND74-2 As described in section 4.6.3, the FERC would not allow construction to begin until after we have concluded formal consultation with the FWS and NMFS.
- IND74-3 The Bradwood Landing pipeline would be 36.3 miles long and would cross 94 waterbodies. Impacts and mitigation associated with waterbody crossings are described in detail in section 4.3.2.4 and 4.5.3.1. To minimize impacts on surface waters, NorthernStar would adhere to the protective measures specified in its pipeline ESC Plan for construction in Oregon and its SWPPP for construction in Washington, as well as our Procedures and applicable permits. In addition, to ensure impacts on aquatic habitats are minimized, we have recommended that NorthernStar continue to consult with the COE, NMFS, FWS, and appropriate federal and state agencies to finalize its Waterbody and Wetland Construction and Mitigation Procedures Plan that describes the specific methods of in-water habitat mitigation to be conducted.
- IND74-4 See our response to comment PM4-20. Impacts associated with landslides are addressed in section 4.1. Impacts on wetlands are addressed in section 4.4.1. Impacts on salmon are addressed in sections 4.5 and 4.6. Safety is addressed in section 4.11.
- IND74-5 We evaluated offshore alternatives in section 3.1.4.

IND74-6

We, Oregonians, do not appreciate being practically forced to house this facility and pipeline. And all for the use of Californians, who denied projects being proposed there, and for the pocketbooks of greedy energy speculators from Texas. We do not want this project here. We have overwhelmingly come out against LNG on the Columbia River. And we will fight this project to its death.

Do the right thing: Deny Bradwood LNG and its associated pipeline.

Individuals

74

IND74-6

The project is intended to serve the Pacific Northwest, not California. See our response to comment PM1-23 .

As a public citizen that you, FERC, represent and have responsibility for in this area of energy and its safety, I strongly recommend you DENY the Bradwood Landing LNG facility proposal by NorthernStar, on the grounds that the DEIS is insufficient and flawed.

After reviewing your 600-page Draft Environmental Impact Statement on the Bradwood project, I found that you severely shorted the study with regards to some serious impacts to the local area. These impacts are as follows:

- IND75-1 | • Conflicts between LNG tankers and other boats, including those in our bustling fishing and tourism industry, on the Columbia River;
- IND75-2 | • Existing geologic hazards at the Bradwood terminal site, including frequent history of landslides, the soft ground associated with wetland areas, and the great possibility of a major earthquake and tsunami in the near future, and along its pipeline route;
- IND75-3 | • Potential damage from LNG tanker fuel oil spills or tank breaches, affecting tens of thousands of local residents, historic areas, and river species, including several already endangered;
- IND75-4 | • Threats to a fishing- and tourism-based growing economy;
- IND75-5 | • The dependence of the Bradwood terminal on a second pipeline, the Palomar Gas Transmission line, which would rip through the heart of Oregon's farm and forest lands, and to which this project cannot be connected, as they are "separate", though Bradwood LNG cannot function without this future pipeline.
- IND75-6 | The DEIS is fatally flawed for this project for the above reasons, as well as for the fact that the area upon which this LNG facility would be placed and the portion of the river that would be damaged by the turning around of huge tankers CANNOT BE PROPERLY MITIGATED. This area is prime habitat for young salmon, habitat that cannot be found anywhere else on the Columbia River, nor can it be formed by human hands somewhere else. There are some (many) things that just cannot be mitigated; some things nature just does a thousand times better. We cannot allow this area of our already damaged river to be destroyed.
- IND75-7 | I, and thousands of others in Astoria and surrounding communities, strongly feel that you, FERC, need to do your own analysis on the economic impact, the environmental impact, and the validity of this Bradwood LNG site without the Palomar Pipeline. Should you find any impacts to be insufficiently studied, or that the LNG facility would be moot without its supposedly unassociated Palomar Pipeline, I urge you to extend the public comment period, propose further studies, and insist upon this project being decided upon only in connection with the Palomar Pipeline.

Individuals

75

- IND75-1 | See our responses to comments PM1-14, PM1-52, PM3-11, PM5-31, PM5-47, and others.
- IND75-2 | Geologic hazards and mitigation are discussed in sections 4.1.3.3 and 4.1.4.3.
- IND75-3 | LNG releases from LNG ships are addressed in various places throughout section 4.0. Section 4.11.5 specifically address spills from LNG carriers, the distances the hazards from these spills would extend (Zones of Concern), the carrier routes, and the communities that would fall in these Zones of Concern.
- IND75-4 | A discussion of recreation and tourism associated with the Columbia River and areas surrounding the proposed LNG terminal and natural gas pipeline is included in sections 4.8.1.8, 4.8.2.8, and 4.8.3.8. We concluded that the project would not have any significant impacts on fishing and tourism.
- IND75-5 | See our response to comment LA3-8.
- IND75-6 | The adequacy of mitigation is discussed in the response to comment FA2-10.
- IND75-7 | The Bradwood Landing Project has its own sendout pipeline and is not dependent on the Palomar pipeline, which is a separate project. The Commission will make its determination of economic viability and public need in the Order for this project. See our response to comment LA3-8.

IND75-8 | The DEIS does not include plans already in place to protect the river and the estuary, including several endangered species recovery plans. Should mitigation plans and efforts be found to be sufficient to not encroach upon these existing plans, they should be made binding, and not kept voluntary. And they should be seriously followed up on, with requirements for approval upon completion of these mitigation efforts. We cannot allow the river, estuary, and endangered species to be further destroyed in any capacity by this project.

IND75-9 | Though I do have some doubts about LNG as a "clean energy source for the future" in general, I do feel strongly that this Bradwood Landing LNG facility proposal is not a good one for Oregon. The siting of this facility is not smart, being some 38 miles upriver, and in prime habitat for already endangered salmon rearing. Should we need LNG, let's site it closer to the mouth of a river, not in close range to large population centers, and in already industrialized areas. Or preferably, offshore.

Please do your jobs and deny this facility's proposal on the grounds that its siting creates too many problems and affects too much of an already hurting ecosystem.

Individuals

75

IND75-8 | Section 4.12.2 has been revised to include a summary of plans currently in place to protect the lower Columbia River. The assurance of the Compensatory Mitigation Plan and SEI are discussed in the response to comments FA2-10 and FA4-12, respectively. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.

IND75-9 | Alternative onshore LNG terminal locations closer to the mouth of the Columbia River are discussed in section 3.1.5 and offshore alternatives are discussed in section 3.1.4.

21 December 2007

IND76-1

Noted in the DEIS recommendations on page 5-31 as item 81, is the following text:

"Drawings and all information shall be clearly legible on 11- by 17-inch paper and the piping legend and symbology shall be in accordance with accepted practice. "

The Commission's recommendation is well founded. Many of this applicant's submissions (e.g. the P&ID drawing included in the applicant's "Bradwood Landing Terminal Application for Air Contaminant Discharge Permit" [FERC Accession Number 20070522-0112]) would appear to have been executed with a dull crayon and reproduced in a manner that renders the drawing or information all but illegible. Please refer to Exhibit 1 attached.

In this instance, it is unrealistic for the Oregon Department of Environmental Quality, the agency charged with the review of the applicant's ACDP permit, to make an informed decision without accurate, legible information.

- It is suggested that FERC and other affected agencies reject any information submitted in which any presented information, data, or designs are occluded, illegible, or ambiguous in design intent.

Individuals

76

IND76-1

We discuss that NorthernStar must obtain an air quality permit from the ODEQ in sections 1.3 and 4.10.1. The ODEQ would be responsible for review of any permit application it receives.

77

IND77-1

Notably absent from the DEIS is any discussion or evaluation of the potential consequent effects on aquatic species and habitat occasioned by the discharge of regulated air pollutants from the facility returning to the watershed and river as acidic rainfall. Indeed, the discussion of rainfall in the area of the facility is limited to the brief acknowledgement of the potential for high rainfall characterized in the first paragraph of Section 4.4.2.1 on page 4-108 as:

"The waterway for LNG marine traffic would be located within the Coast Range ecoregion. This ecoregion consists of highly productive, rain-drenched coniferous forests that cover the low mountains of the Coast Range."

and, as noted in Section 4.10.1.1 Waterway for LNG Marine Traffic/Climate,

"Rain and drizzle, with fog and low clouds, are frequent from the late fall to early summer months."

This last sentence is somewhat of an understatement as this region of the river experiences an average of approximately 80 inches of rainfall yearly.¹ The western slope of the coastal range mountains in the area can experience up to 200 inches of rainfall per year.² The statement regarding climate information noted in Section 4.10.1.2 on page 4-371 as:

"The National Weather Service (NWS) maintains a climate station at the Astoria Regional Airport in Astoria, Oregon, located in Clatsop County and the Kelso-Longview Regional Airport in Cowlitz County, Washington. Climate data from these stations are available from the Western Regional Climate Center from January 1, 1899 to the present. *These data should be representative of conditions in the area of the proposed terminal.*"

(emphasis noted in italics)

is incorrect as it ignores the unique micro-climate of the region. Astoria receives an average of 67 inches of rain per year, and Longview/ Kelso only 46 inches per year.

Found in the applicant's "Bradwood Landing Terminal Application for Air Contaminant Discharge Permit" (ACDP) [FERC Accession Number 20070522-0112] on page 40 of 129 is the fact that an estimated 122.6 tons of nitrous oxides, and 199.6 tons of carbon monoxide will be discharged from the facility each year. Refer also to Table 4.10.1-6 on page 4-374 of the DEIS. Since discharge level of these criteria pollutants is above the 100 ton/year threshold level the applicant must file for a Title V Air Contaminant Discharge Permit with the Oregon Department of Environmental Quality as is noted on page 4-375 of the DEIS.

Individuals

77

IND77-1

The climate information documented in the Section 4.10.1 of the EIS is representative for the region where the project would be located.

EPA's Acid Rain Program, an emissions trading program targeting coal-fired power plants, has reduced emissions of sulfur dioxide and nitrogen dioxide through capping emissions and allowing affected facilities to buy and sell emission credits. The proposed project is not subject to the requirements of the Acid Rain Program. Therefore, wet and dry deposition modeling was not conducted and is considered to be outside the scope of the EIS.

IND77-1
cont'd

The PSD impacts of Carbon Monoxide and Nitrogen Oxide were estimated by the applicant's consultants and found to be within the limits allowed. However, no modelling of dry or wet deposition of nitrogen was done.

In view of the higher than assumed rainfall in the area of the proposed terminal, and the significant level of a criteria pollutant discharge which forms a major constituent of acid rain; it is suggested that this aspect of the DEIS is flawed. The approach taken in the DEIS to this issue as merely one of Air Quality ignores the impacts arising from acid rain contributions to the watershed of the area.

- It is recommended that FERC and its contract consultants review the climate data used on a more site-specific basis, which takes into account the local micro-climate.
- It is further recommended that dry and wet nitrogen deposition modelling be done to assess the biological impacts arising from acid rain in the region. Modelling should be performed not only for short-term effects, but cumulative effects arising from operation of the facility over its expected usable life span.

The rationale behind the NEPA process - that agencies should be fully informed of the environmental consequences of their actions before making a decision - is especially important when dealing with an issue such as invasive species, where problems are often unanticipated side effects of otherwise desirable actions.

IND78-1

The DEIS briefly addresses the introduction of exotic or invasive organisms to the region in Section 4.5.1.1 on page 4-124. Noted also in Section 2.1.1.5 on page 2-6 is the following statement regarding the handling of LNG carrier ballast water:

"Ballast water is typically only discharged during loading operations at the LNG export terminal or during mid-ocean ballast water exchanges during the transit from the import terminal to the export terminal. No ballast water would be discharged near the LNG import terminal."

However, apart from a description of the screened water intake for ship ballast and cooling water found on pages 4-144 and 4-145 to "minimize" entrainment of biota; there is nothing found in the DEIS that addresses the potential environmental consequences of ballast water exchange or dumping of the estimated 6.3 billion gallons¹ in open ocean exchange or foreign ports.

The International Maritime Organization has adopted the *International Convention for the Control and Management of Ships Ballast Water & Sediments* (13 February 2004), a voluntary standard dealing with ballast water management. However, it is important to recognize two shortcomings of the open ocean exchange procedure. First, the ability to safely conduct ballast water exchange depends upon weather and sea surface conditions, and it is not always possible to perform an exchange. Second, there will still be some residual density of uptake biota in the ballast tanks following exchange, rendering the process is only partially effective.²

Reference is made to NEPA and to the provisions of Executive Order 13112 dated 3 February 1999, Section 2 (1), (2), and especially (3) which states:

"(3) not authorize, fund, or carry out actions that it believes are likely to cause or promote the introduction or spread of invasive species in the United States *or elsewhere* unless, pursuant to guidelines that it has prescribed, the agency has determined and made public its determination that the benefits of such actions clearly outweigh the potential harm caused by invasive species; and that all feasible and prudent measures to minimize risk of harm will be taken in conjunction with the actions."

(emphasis added in italics)

IND78-1

Section 4.5.1.1 has been revised to include additional information on the potential for introduction of aquatic species to the lower Columbia River system.

IND78-1
cont'd

- It is suggested that FERC and its contract consultants re-examine the remedial measures proposed for the prevention of exotic and invasive species to the waters of the Columbia River estuary. The Oregon Department of Environmental Quality has already submitted comment on the lack of efficacy of these proposed measures.

IND78-2

- It is strongly recommended that FERC and its contract consultants review the consequences arising from the dumping of up to 6.3 billion gallons of Columbia River water in the middle of the ocean, or a foreign port, which may lack facilities to sequester and treat the ballast water.

- 1] Bradwood Landing LNG Import Terminal CP06-365-000 Draft Environmental Impact Statement, page 4-67, [FERC Accession Number 20070817-4000]
- 2] National Ballast Information Clearinghouse, *Present Ballast Water Management Practices*, <http://invasions.si.edu/nbic/managementpract.html>

Individuals

78

IND78-2

Additional information on the potential for the introduction of invasive species to the lower Columbia River through hull fouling has been added to section 4.5.1.1. We believe that this discussion is relevant to the lower Columbia River, the open ocean, and waters at the LNG export facility.

Attention: Kimberly D. Bose
Secretary

Subject: Bradwood Landing LNG
Project, Bradwood, Oregon
Docket: CP06-365-000

RECEIVED
OFFICE OF THE
SECRETARY
FEDERAL ENERGY
REGULATORY COMMISSION
2007 DEC 18 P 2 58

Gentlemen:

IND79-1

Please be advised that I support the application and approval of NorthernStar Gas Company's Bradwood Landing LNG Project.

My support is based on my review of the project and my background and experience as Vice President El Paso LNG. In addition to being Vice President El Paso LNG Co., I was Vice President and Director El Paso Marine Co. which operated nine (9) LNG carriers six (6) American flag and three (3) Liberian flag but all nine (9) vessels employed American citizen crews.

El Paso Marine Company recruited crews, provided LNG training prior to assignment to the vessels with specific retraining points. Training covered the use of navigation, engine room and control simulators with emphasis on the type of vessels, routes and ports. Crew training is essential.

El Paso LNG Chairman, President and Executive Officers were dedicated to a safe efficient operation. This dedication was from the Chairman down to and through the ship crews.

NorthernStar Gas Company's dedication to a safe efficient operation follows that of El Paso LNG Company.

Individuals

79

CONCERNING: Bradwood LNG Terminal
Reference **Docket No. CP06-365-000** on the original and
1 –copy ATTENTION: Gas Branch 3, PJ11.3

Public Comments Regarding Proposed Project

IND80-1

The pipelines that connect the proposed Bradwood LNG Terminal are integral to the feasibility of the project. It is unreasonable to assume that the two projects can be considered separately. The Governor of the State of Oregon stated in his cover letter to the FERC concerning the State's FERC review:

“Liquefied Natural Gas terminals also introduce a companion suite of issues associated with natural gas pipelines that carry LNG from terminals to service areas, sometimes at great distances. The social and environmental impacts of these pipelines are of as much concern to the State as the terminals themselves. Accordingly, Oregon agencies have also identified and evaluated the environmental and social impacts of these pipelines through federal and state permitting processes.”

We specifically request FERC to include all the comments from the Palomar Gas Transmission Project, FERC Docket No. PF-7-13-000, into the Bradwood LNG Terminal review Docket No. CP06-365-000.

The following Outline of Concerns, are related to the pipeline that is proposed to carry re-gasified LNG from the proposed Bradwood Terminal to the trans-Canadian pipeline in Central Oregon.

Individuals

80

IND80-1

As described in section 3.1.2.2, we consider the Palomar Project to be a separate undertaking from the Bradwood Landing Project. Neither project is inter-dependent on the other. If Palomar is not authorized or built, the Bradwood Landing Project could still go forward, and vice versa. Comments on the Palomar pipeline project are available for public review via the FERC's eLibrary under the Palomar pipeline Docket Number (PF7-13-000). We will not duplicate them under the Bradwood Landing Docket Number.

K-982

Page 2

IND80-2 In addition to these concerns, I feel that FERC has needlessly subjected the citizens of Oregon to a review of a proposal whose need has not been quantified. I formally request that FERC stop the review of all LNG related proposals in Oregon, and perform a programmatic EIS that includes a comprehensive needs analysis. The Governor agrees with the necessity of first determining a societal need before proceeding with a FERC project review. Again quoting the Governor's same letter to FERC:

"The need for the facility has not been established and the alternative analysis is inadequate. The DEIS does not adequately analyze market data and natural gas supply trends to support the claim by the developers that additional supplies of LNG are needed in the Pacific Northwest. Nor does the DEIS contain a comprehensive list of alternatives that include no action, energy conservation, expansion of existing infrastructure, and potential new sources of natural gas, including domestic, continental and offshore supplies."

IND80-3 The current FERC review process is not being conducted in a fair and open manner. In fact, it appears as though the process has been designed to separate potential opposition to the LNG projects proposed in the State of Oregon. The separation of the Bradwood LNG Terminal proposal from the Palomar Pipeline has prevented those property owners affected by the pipeline from having timely notification and a reasonable chance of participating in the EIS of the Bradwood Terminal. Only the extension of the review process requested by Congressman Wu has allowed any comment. I have documented to both Congressman's Wu's office and Senator Ron Wyden's offices numerous ways that the FERC review process has been flawed in its execution.

We believe that FERC is not justified in continuing to review any of the three LNG terminals and their related pipelines until it has completed a programmatic EIS with a comprehensive energy needs analysis that clearly and scientifically proves that any of the proposed projects are needed for the future energy needs of the State of Oregon.

FERC must also commit itself to conducting said programmatic EIS in a manner that is responsive and open to public comment. Public input should be solicited in public hearings that are held Statewide, publicized at least several months in advance, and are inclusive of all the stakeholders in the State.

Sincerely,

Paul Sansone and Susan S. Vosburg

Individuals

80

IND80-2 See our response to comment IND52-2. We review alternatives in section 3.

IND80-3 As explained in section 3.1.2.2, we consider Palomar to be an independent project, to be reviewed separately from the Bradwood Landing project. Separate proceedings for the Bradwood Landing and Palomar projects do not preclude an interested party in participating in both.

K-983

Outline of Concerns

- I. Geology and soils, and other hazards:
 - a. Pipeline follows the Molalla seismic fault, one of the most active faults in Oregon.
 - b. Much of the valley bottom is comprised of sandy and loamy soils that liquefy during earthquakes.
 - c. Flooding, stream channel changes and landslides are known hazards along Gales Creek. Up to six feet in stream levels can occur in as little as a twenty-four hour period. In the 1996 flood, a large landslide dammed Gales Creek at peak flood stages exceeding the 100-year flood plain. The creek jumped its normal channel and moved up to 300' in places scouring a new channel several hundred feet wide and up to 16' deep. The proposed location of creek crossing is highly vulnerable to similar changes. The bridge crossing Gales Creek at Clapshaw Hill Rd. was heavily damaged by this flood and is in proximity to the proposed creek crossing.
- II. Water and Aquatic Resources
 - a. The mid and upper reaches of Gales Creek Valley is a sensitive aquifer. Low producing wells and pockets of brackish water will make existing water wells highly susceptible to damage from pipeline construction.
- III. Vegetation and Wildlife
 - a. Pipeline construction and ongoing right-of-way will create greatly increased weed pressure on existing farms and forestry operations. These weeds will greatly increase the cost of normal farm and forestry operations.
 - b. Pipeline rights-of-way will become refuges for the Willamette Valley Pocket gopher because standard control measures will not be possible. Rodent elimination tools utilize propane and oxygen to create concussion killing with blasts to the tunnel networks.
- IV. Threatened and Endangered Species
 - a. Gales Creek is critical habitat for endangered fish including Steel head trout and Coho salmon which having spawning beds at the proposed locations of crossing Gales Creek.
 - b. Gales Creek is of critical importance to the Tualatin River drainage because of the loss of habitat from construction of Scoggins Reservoir and the loss of breeding habitat in the upper Scoggins drainage. Clean Water Services is attempting to reduce water temperatures, which would rise from removal of riparian trees.
 - c. Sensitive flora includes: Nelson's Checker-mallow (*Sidalcea nelsoniana*) is a threatened plant that is growing along the proposed pipeline route. Kincaid's Lupine (*Lupinus sulphureus* ssp. *Kincaidii*) is also growing in the proposed pipeline route.
 - d. Bald eagles hunt and nest along Gales Creek and are a threatened species.

Individuals

80

Individuals

80

K-985

- V. Land Use
 - a. Pipeline rights-of-way are highly disruptive to farms and forestry operations. Conflicts include: limitation of equipment crossing pipeline rights-of-way, change of field layout, imposition of barriers to normal operations, inability to grow crops requiring sub-soilers or deep spading, compaction of soils and mixing of soil horizons lessening soil fertility.
 - b. Construction damage to existing drainage tiles, disruption of drainage systems and loss of neighboring productive farmland.
 - c. Conflict and damage to existing in-ground irrigation systems including mainlines, control wiring, and valves. Systems typically 2-4' deep and proposed routes would bisect many existing systems.
 - d. The economic loss of thousands of acres of prime forestland in direct conflict with Oregon State-wide land use planning goals, local zoning, and governmental tax base and past tax incentives to encourage conservation.
 - e. The economic loss of thousands of acres of prime farmland is in direct conflict with Oregon Statewide land use planning goals, local zoning, and government tax base and past tax incentives to encourage conservation.
 - f. Extreme Fire Hazard
 - No local fire suppression capacity for increased risk
 - Proposed pipeline location very near site of largest forest fires in Oregon history (Tillamook Burn).
- VI. Socioeconomic
 - a. Loss of Forestry and Farms jobs vs. temporary construction jobs
 - b. Furthering dependence upon imported fossil fuels instead of building a renewable energy infrastructure.
 - c. Democratic processes have been damaged by the manner that the FERC review process has been conducted. The problems include: uneven notification of affected property owners and stakeholders. The misleading newspaper publication of notices concerning the FERC meetings. The splitting-up into different FERC reviews of the two pipeline proposals and the two LNG plants proposed to supply these pipelines. The extremely short lead times of the meeting notifications. The moving of proposed pipeline locations and the non-availability of maps showing proposed locations.
 - d. FERC should be required to restart the review process with all the proposed projects bundled into a single review to achieve a comprehensive analysis of the projects combined impact.
- VII. Air quality and noise
 - a. The upper and middle reaches of the Gales Creek Valley are subject to extreme air inversions during heat waves in summer and during cold snaps in winter. A pipeline leak during these periods would trap large quantities of gas close to ground level with the possibility of asphyxiation of local

residents, including an entire elementary school located in the middle of the inversion zone.

VIII. Reliability and Safety

- a. A single pipeline accident during high fire danger periods could spark a cataclysmic conflagration capable of destroying 100's of billions of dollars in timber that comprise the Tillamook Forest.
- b. A single pipeline leak with out odorization during an air inversion could kill hundreds of young children.

IX. Cumulative Impacts

- a. Construction of the proposed pipeline would enable the construction of LNG plants on the Columbia River. The combined project would significantly disrupt commerce on one of the region's most valuable waterways, negatively impacting major shipping ports supporting the local economy. A few hundred temporary construction jobs gained would significantly impact fishing, forestry, farming, shipping and related employment. The importation of more fossil fuels from politically unstable sources of supply would make the Country less economically and politically secure.

Re: DEIS Comments on Bradwood Landing LLC - Docket No. CP06-365-000, et al.

Dear Secretary Bose:

IND81-1 In the Waterway Suitability Report for Bradwood Landing LNG dated February 28, 2007, the U. S. Coast Guard reports that the Astoria-Megler Bridge will NOT be closed when LNG tankers pass under it. As reported on March 6, 2007 in a Summary of Key Findings of Publicly Available Summary of the U.S. Coast Guard Waterway Suitability Report for Columbia River LNG (for Bradwood LNG) states: "This raises serious concerns, given that at other LNG import sites like Boston Harbor, bridge closure is an integral part of LNG safety measures when an LNG tanker passes under a bridge. Because of the clear risks of terrorist attack that LNG tankers could face when passing under a high-traffic bridge, Astoria will either be put at increased risk of accident if the bridge is not closed, or deal with the type of significant traffic management delays that face cities such as Boston that have LNG ports now face."

IND81-2 Also, "...while we can only speculate about what information is contained in the non-public portions of the WSR, it is reasonable to assume that materials kept secret contain additional and specific information about the actual vulnerabilities of the proposed LNG projects."

Yours truly,

Sandra M. Davis
1002 Abernathy Creek Road
Longview, WA 98632

Individuals

Type of Submission: Comment on Filing

Please accept my comments outlined herein on FERC's Draft Environmental Impact Statement, Bradwood Landing Project, August 2007.

Among the multitude, there are at least three critically important issues that must yet be fully evaluated and documented for agency and public review in the Draft EIS (DEIS):

- IND82-1
- IND82-2
- IND82-3
1. All Salmonids federally/State-listed as threatened or endangered, and their critical habitats, are of paramount importance to the Columbia River Basin. Northern Star's (FERC's) proposed dredging and disposal will have significant adverse environmental effects that have yet to be given high priority, field-documented and evaluated for the DEIS.
2. Northern Star's hydrodynamic model, used by FERC without qualification to conclude that dredging and maintenance of the ship turning basin will not affect river conditions, has significant discrepancies and is not reliable. Independent expert peer review is at least required.
3. Side-slope adjustment following dredging will migrate transversely away from the toe of the dredging footprint over time, eroding critical shallow water habitat for endangered salmonids along and into the Bradwood shoreline. NS recognizes this resulting erosion in their Hydrodynamic report, but FERC has yet to mention or document this serious impact for DEIS review. A deep shoreline bank protection system, e.g., rock riprap or sheet pile, would be required to protect the LNG site against worst case conditions.

Comments on the three above issues are outlined below:

1. THREATENED/ENDANGERED SPECIES/HABITAT PROTECTION

Protection of threatened/endangered salmonids and their critical habitat is of paramount importance. The DEIS should include comprehensive detailed and site-specific field and literature documentation of seasonal and long-term occurrence and uses to be affected by LNG development at Bradwood. Although 700,000 cubic yards (cyds) of dredging would occur in water deeper than the so-called 'shallow water habitat' horizon of -20 ft., benthic, rearing and migration values in even deeper waters are significant to species

Individuals

- IND82-1
- IND82-2
- IND82-3
- See our response to comment PM3-68.
- See our responses to comments IND82-3 and IND82-5.
- We have recommended in section 4.2.2.2 that NorthernStar prepare a plan to monitor the side slopes of the maneuvering area after dredging and implement mitigation measures if necessary. Should the project be approved, our recommendation would become a condition of the authorization.

propagation and recovery. All should be thoroughly and specifically documented and evaluated. For example:

- IND82-4 ☐ River flow through Clifton Channel feeds the entire Cathlamet Bay protected sensitive critical estuarine habitat area about 20+ miles downstream to Tongue Point. Dredged removal of 700,000 cyds at its upstream mouth would open Clifton Channel to diverting increased downstream flow from the main channel, which would increase current velocities and resulting long-term erosion downstream through the Channel and Cathlamet Bay. Contrary to Northern Star's assertion that this area is geophysically stable, reliable science-based study documents that this important backchannel estuarine habitat area is in long-term erosion trend, with progressive loss of shallow- and mid-water habitat, marshes, wetlands and riparian zones critical to all species (e.g., Lower Columbia River Bi-State Program, Tetra-Tech, 1996; CREST/CRDDP, 1983; Graves, et. al, 1995; Thomas 1993: none of which are referenced in FERC's NS DEIS). Loss of critical estuarine habitat is not a minor factor.
- IND82-5 ☐ A principal factor in long-term erosive loss of this critical estuarine habitat is that large annual Columbia River freshets (floods) no longer occur due to upstream flow regulation (dams). The associated historic annual sediment flood-deposition into the braided shallow water Clifton Channel/Cathlamet Bay backchannel system is lost, but natural flow-related current-driven sediment transport processes continue by gradually eroding the bed and banks. This erosion trend is moderated by whatever natural sediment bedload moving down the main River is still diverted into and through Clifton Channel/Cathlamet Bay. The proposed LNG deepened ship basin will create a classic 'sediment-trap' for deposition (entrapment) of natural River bedload sediment transport now moving downstream through the area into Clifton Channel/Cathlamet Bay, thereby requiring its maintenance dredging and removal from the ship basin. Interception and removal of this important sediment source at the head of Clifton Channel would further starve the remaining downstream system of its natural bedload sediment source, and aggravate erosion trends in Clifton Channel/Cathlamet Bay. This would not be a minor impact.
- IND82-6 ☐ Any change in flow through Clifton Channel and Cathlamet Bay will also impact critically important salinity intrusion patterns in the lower estuary habitat, which will affect threatened/endangered salmonids. This effect should be evaluated and documented for the DEIS.
- IND82-7 ☐ Considering there are only two sides to the Columbia River, then the Oregon side immediately along Bradwood shoreline must provide the rearing and migration route for half (50+%) of the juvenile threatened/endangered salmonids in the Columbia Basin. Even more than half, since the important Willamette River stocks also migrate along the Oregon shore. It is of paramount importance for the DEIS to fully describe, with specific and detailed data from field and literature studies, the seasonal and long-term use of this specific critical habitat pathway by

Individuals

82

- IND82-4 The amount of material to be dredged from the maneuvering basin for the Bradwood Landing Project represents less than 1 percent of the total material dredged for the navigation channel from the mouth of the Columbia River to Portland. Therefore, we do not believe that impacts further downstream from about Clifton Channel would be distinguishable.
- IND82-5 As described in section 4.2.2.2, significant changes to the overall bed conditions in the Clifton Channel are not anticipated as a result of the proposed project. However, as discussed in section 4.5.2.1, additional analysis of potential impacts on salmonids from alterations to sediment transport and deposition (including alterations to Clifton Channel) will be included in the revised BA and EFH Assessment.
- IND82-6 Potential impacts on salinity levels due to the LNG ship berth and maneuvering area are discussed in the response to comment IND100-2.
- The EIS is a summary document and based on CEQ guidelines presents a full and fair discussion of significant environmental impacts. Because alteration of salinity levels is not expected to be significant it is not discussed further in the EIS.
- IND82-7 Additional information has been provided in section 4.6 describing juvenile salmonids that rear in the vicinity of the LNG terminal site. Potential impacts on aquatic resources (including salmonids) due to dredging, alteration of shallow water habitat, and shoreline modification are included in section 4.5.2.1. Further discussion of salmonid occurrence within the project area as well as potential impacts from construction and operation of the project will be included in the revised BA and EFH Assessment.

IND82-7 | these species, and the potential impacts upon them of Bradwood dredging and shallow water and shoreline modifications.

cont'd

2. HYDRODYNAMIC MODEL [Refer: NS "Hydrodynamic and Sediment Transport Assessment, May 24, 2006 (West, 2006)"]

IND82-8 | Northern Star proposes to remove 700,000 cyds of natural shoaled sediment by deepening the upstream entrance to Clifton Channel from the main Columbia River channel. This shoal is a classic point-bar formed upstream from the pile-dike (M38.26) and dredged material deposition island (O-38.3) placed by the Corps of Engineers at the mouth of Clifton Channel. These flow control structures are long-maintained by the Corps to help control loss of main River flow to the Clifton side-channel. Maximizing main channel flow by controlling flow loss to side-channels assists the Corps by reducing maintenance dredging of the federal navigation channel.

Northern Star conducted a mathematical model study to make findings about the potential effects on River/Channel hydraulics that would result from dredged-enlargement of upstream mouth of Clifton Channel to the main channel (NS above, West, 2006). Their findings concluded that:

- ☐ Removing part of the existing shoal by enlarging the entrance connection of Clifton Channel to the main Columbia River by dredged deepening for the ship turning basin will reduce flow into Clifton Channel by about 5%. (Note: this finding of a flow reduction by channel enlargement is contrary to expected effect when deepening a side-channel entrance from the main channel.)
- ☐ And then, that mooring a large ship there, which blocks and therefore reduces that now enlarged flow cross-section, will even further reduce flow into Clifton Channel by about another 2%.

These findings are contradictory to river hydraulic experience. First, removal of the shoaled control-entrance to Clifton Channel by dredging would be expected to lessen existing flow control and allow increased loss of main channel flow into Clifton channel. Secondly, their model results indicate that both the dredged deepening of the channel entrance and then blocking part of that enlargement with a large ship will each reduce flow into Clifton Channel; this is an apparent contradiction in model results (i.e., both enlarging and then reducing the flow section each reduces flow into Clifton Channel). There are other apparent discrepancies in their model results. For example, the model predicts that the flood-tide flow (i.e., upstream-directed flow as each tide rises) in Clifton Channel will increase by more than 20% in the face of increased upriver runoff flow from 125,000 cubic feet per second (cfs) to 210,000 cfs. That isn't possible; Clifton Channel flood-tide strength should decrease with increased upriver runoff. As the Columbia River runoff flow increases into the estuary (e.g., upriver flooding/freshets), the tidal component at any given point in the River decreases. There is much available River and

Individuals

82

IND82-8 | See our responses to comments IND82-3 and IND82-5.

IND82-8

cont'd

even other model data to verify that, but instead the Northern Star model has contradictory results.

Neither the Hydrodynamic Report, nor FERC in using its results, make any mention of these apparent significant contradictions, nor of any verification with real River behavior. What the Report did say, however, is that "...there is some discrepancy in the simulated stages and velocities with the observed stages and velocities" (Hydrodynamic report, p. 59). Initially, the discrepancy between model and observed river velocity was more than 30% (p. 58, table 11); this is a large discrepancy which tends to invalidate a model. By test-adding more main river flow to the mathematical model than observed, velocity discrepancy was reduced to about 10%; although the substituted flow increase was not real (observed), it gave better model answers for Northern Star. Yet with these and other discrepancies, NS and FERC use model results to conclude that Clifton Channel flow will be reduced---by less than the magnitude of the initial and the remaining model discrepancies. This is not a verified reliable model for the conclusions reached by FERC, especially when used to justify your conclusion that flow changes from dredging will not adversely affect threatened/endangered salmonids or their habitat.

Specifically, the Northern Star model results are not a reliable basis on which to assure that there is no risk of adverse impacts to threatened/endangered salmonids or the critical shallow water habitat of Clifton Channel and Cathlamet Bay.

The US Army Corps of Engineers has historically controlled main river flow away from side-channels, such as Clifton Channel at hundreds of sites---on the Columbia River, the Missouri River, the Mississippi and others, to divert flow into the main channel to help maintain deeper waters for navigation. And not even once did they do that by deepening the entrance to a side-channel carrying flow away from the main channel. Studies (e.g., expert modeling, including movable bed physical models), long-term experience and common sense told them to instead close the side-channel flow off with structures or fills. That is exactly the purpose for Corps placement of the pile-dike and dredged material fill at the upstream mouth of Clifton Channel to form the point bar which controls flow loss to Clifton Channel. Yet Northern Star and FERC now propose to enlarge this partially blocked channel opening by dredged removal of part of the point bar. If dredged-deepening the upstream entrance to side-channels is the answer to diverting side-channel flow into the main channel, that is cheap and the Corps could save millions of dollars a year by instituting the Northern Star/FERC practice of simply dredging deeper entrances to the side-channels, everywhere, including on the Columbia River, ---and all of the expensive flow control structures/fills would be gone. That will not happen because deeper side-channel entrances enable flow loss from the main river, which results in increased maintenance dredging and public costs to maintain the federal navigation channel. The DEIS should correlate its findings with river experience and expertise.

A independent expert professional and public review is required of Northern Star's entire Hydrodynamic and Sediment Transport Assessment model and its findings. This should be completed before advancing any considerations or decisions to accept or apply its results as any basis to permit the proposed dredging and risk its impacts to the critical

Individuals

82

IND82-8 | shallow water habitat of Clifton Channel and Cathlamet Bay. The DEIS should document and present the results in the DEIS for agency and public review and comment.
cont'd

3. SIDE-SLOPE ADJUSTMENT

IND82-9 | In hearings which I attended and as presented by FERC in the DEIS document, Northern Star plans to dredge a 700,000± cubic yards ship basin in water deeper than 20 ft. Their premise is that offshore water deeper than -20 ft. is not used by ESA-listed juvenile salmonids, and therefore is not a significant habitat concern for dredging (that conclusion is not correct; even deeper habitat is important). It was stated that the average dredging cut will be about 8 to 10 ft., with a cut side-slope of 3 ft. Horizontal to 1 ft. Vertical (1V:3H). It is not identified that this average cut of 10± ft. means that the dredge cut varies from zero-ft. where it connects to the -43 ft. Federal channel, to about 20± ft. along its interior sides. A 15 ft. to 20 ft. cut is a very large cut. FERC does not provide site bathymetric (depth) data describing the dredge cut or adjacent fringe area, but should.

This steep 1V:3H cut will not stand. Instead, the river natural hydrodynamic and gravity forces will cause the disturbed bedform to seek its equilibrium by transverse side-slope adjustment migrating into the dredging footprint over time. Natural riverbed slopes in this area appear to vary from, say, a steeper 1V:20H to flatter than 1V:50H [from latest Corps of Engineers hydrographic cross-line survey CL-36-361 (3/21/07)]. The dredge-disturbed bedform side-slope adjustment would spread the 1V:3H cut-slope toward shore beyond the initial and maintained dredge footprint and into adjacent critical shallow water habitat depths less than 20 ft.

Such side-slope adjustment following dredging in an uncohesive riverbed is normal and expected. For example, in its federal channel deepening project, the Corps of Engineers estimates that such side-slope adjustment of even the relatively minor 3 ft. cut will contribute to long-term maintenance dredging volumes greater than the initial project dredging, with the transverse slope adjustment spreading laterally beyond the channel boundaries. Their past experience is that such side-slope adjustment from even minor dredge cuts can extend more than 1000 ft beyond the dredging footprint (USACE Columbia River Channel Improvement Study, FEIS, August 1999, pg. 6-2). A 20 ft. dredge cut at Bradwood is far more significant and will result in a more aggressive lateral side-slope adjustment. Northern Star properly acknowledges that such transverse side-slope adjustment will occur, and that its effects “...are likely to extend all the way to shore and eventually lead to increased shoreline erosion” (Northern Star’s Hydrodynamic and Sediment Transport Assessment report, 5/24/06, pg. 22). However, neither FERC nor NS accounts at all for this in its dredging footprint (i.e., 1V:3H side-slope) or volumes, shoreline and shallow water erosion, or its potential impacts on critical habitat. This is a critical omission that should be corrected for the DEIS. Nor is this important effect on actual basin enlargement and resulting hydrodynamics apparently reflected in the as-built model bathymetry---which could invalidate model results.

Basic factors at Bradwood:

Individuals

82

IND82-9 | See our response to comment IND82-2.

IND82-9
cont'd

- ☐ Side-slope adjustment by transverse migration back into the new (and maintained) dredged cut will occur over time. This process is normal, expected and already well-recognized by both Northern Star and the US Army Corps of Engineers.
- ☐ After dredged removal, side-slope adjustment will continue until the river bedform again reaches its natural slope in equilibrium with River hydrodynamic forces at that site.
- ☐ The side-slope adjustment period may go on for 5 to 10 years or more.
- ☐ Natural bedform slopes in the Northern Star dredging area are in the order of 1V:20 H to flatter than 1V:50 H.
- ☐ Dredge-cut side slope adjustment will eventually erode to the shoreline in sandy areas, resulting in erosion of shallower habitat areas and sandy shoreline.
- ☐ Past Corps experience documents side slope migration resulting from even minor channel dredging extending more than 1000 ft. away from the dredged cut.
- ☐ Northern Star proposes to dredge to -43 ft. depth within about 300 ft. from the sand-fill Bradwood beach and shoreline.
- ☐ Based on the Corps cross-line survey(s), Northern Star dredged cut will be as much as 15 to 20 ft. deep along the Bradwood shoreline.
- ☐ FERC and Northern Star do not provide bathymetric data for either the dredging area or shoreline fringe upon which to identify or judge potential side-slope adjustment into shallow water and shoreline habitats.
- ☐ FERC and Northern Star identify a 1V:3H construction side-slope, but do not identify any post-dredging natural side-slope adjustment of this steep construction slope to the shallower shoreline.

The dredged cut side-slope of 1V:3H assumed by Northern Star and FERC cannot stand over time. Although Northern Star acknowledges this, both FERC and Northern Star omit it from their project plans. The cut side-slope will migrate transversely back into the dredged cut over time until the resulting eroding bedform in the fringe area reaches its natural side-slope equilibrium with river hydrodynamic forces at that site.

For example, a 1V:3H side-slope for a maintained 18 ft. dredged-cut to -43 ft. would extend 54 ft. ($3 \times 18 = 54$) beyond the (toe of the) dredging footprint to daylight at a local sediment surface of -25 ft. ($43 \text{ less } 18 = 25$). While eventual side-slope adjustment erosion back to the natural river bedform for this area of, say, 1V:20H, would extend 860 ft. ($20 \times 43 = 860$) away from the dredging foot-print or more than 500 ft. into the existing Bradwood riparian shoreline, eroding shallow water habitat and shoreline in-between. Lesser side-slope adjustment to a steep 1V:10H slope would extend 430 ft. ($10 \times 43 = 430$) beyond the dredged toe, or more than 100 ft. into the Bradwood shoreline 300 ft. away. That Bradwood shoreline and the LNG site is historic erodable river sediment infill.

Except for the agreed engineering certainty that transverse side-slope adjustment will occur upon dredging, there is no accepted methodology or modeling to accurately predict the eventual equilibrium side-slope resulting from dredging the 15 ft. to 20 ft. cut within $300 \pm$ ft. of the Bradwood shoreline in the variable setting of tides, range of river flows, seasonal bedload movement, local hydrodynamic factors, and nearshore wave and wake

Individuals

82

IND82-9 cont'd	<p>effects in the lower Columbia River.. But it will be flatter than FERC's 1V:3H, and could approach the existing local steeper natural side-slope of about 1V:20H over time.</p> <p>Erosion of the riverbed fringe area to the shoreline by transverse side-slope adjustment beyond the dredging footprint is serious for at least five important points:</p>
IND82-10	1. Although the dredging takes place in water deeper than -20 ft. depth, the resulting transverse side-slope adjustment will erode and remove significant area of existing critical shallow water habitat area less than 20 ft. deep along the Bradwood shoreline fringe.
IND82-11	2. With side-slope adjustment (bedform erosion) from dredging, Bradwood shoreline will require erosion protection, e.g., rock-riprap and/or sheet piling, to protect the upland LNG site, including from worst case scenarios. This hard-boundary fix will in turn amplify hydrodynamic erosion effects on shallow water habitat nearshore (e.g., turbulent reflection of wave/wake energy), as well as remove the ecologically important (e.g., for juvenile salmonids) existing natural riparian shoreline. For long-term shoreline protection and LNG site safety, bank protection installation may need to reach as deep as the proposed dredged bottom at -43 ft.
IND82-12	<p>3. Transverse side-slope adjustment into the dredged prism will further enlarge the flow section at this site, allowing increased main River flow into Clifton Channel. This would increase river velocities and erosion potential (sediment transport) there and downstream through existing shallow water critical habitat areas already experiencing erosion losses.</p> <p>4. Enlargement of the flow section resulting from side-slope adjustment should be considered in the as-built bathymetric parameters for Northern Star's hydrodynamic model assessment. It was not. Omission tends to invalidate model results used by FERC and Northern Star to justify their finding that main River flow into Clifton Channel, and therefore any associated erosion potential there and downstream, will actually decrease by dredged enlargement of the connection between the Channel and the main River flow.</p> <p>5. Any change in main river flow into Clifton Channel will affect flow downstream through the critical shallow water estuarine habitat of Cathlamet Bay. Changes in river flow through this important backchannel reach would alter existing estuarine salinity intrusion patterns and related ecology in this protected sensitive habitat area.</p> <p>FERC should fully identify, evaluate, and document for public review and comment in the Draft EIS (DEIS), all field and technical findings for the recognized side-slope adjustment, which Northern Star states will occur, as a result of Bradwood dredging. It is an important issue that would have significant adverse environmental impacts on riparian shoreline and critical shallow water habitat for endangered salmonids, as well as for site safety.</p> <p>GENERAL COMMENT</p>

IND82-11	See our response to comment IND82-2.
IND82-12	See our responses to comments IND82-2 and IND82-4.

IND82-13 | Additionally, I am concerned about both the tone and lack of quantitative information in the DEIS which seem to indicate that it is not yet ready for agency and public review and comment. So many critically important issues are left with vague or incomplete documentation and/or a "...we believe" (we being FERC) statement. Slanted words such as 'only' are used to diminish the reviewer's perception of magnitudes that instead should be simply and accurately specified in the DEIS; this implies attempting to lead a reviewer to FERC's favorable view, which seems inappropriate in an objective federal EIS. And in places, lack of understanding, data and/or expertise on significant environmental issues/impacts are substituted by FERC 'recommendations' (but not requirement) to Northern Star for some future study, planning and/or design. When and if that further important work is eventually documented, it should be included in the DEIS for agency/public review and comment. For one example, even the critically important Biological Assessment and specific mitigation plans for impacts to endangered salmonids and habitat haven't been completed nor yet made available for DEIS review. That is absolutely fundamental to project consideration at the DEIS stage. It seems as though FERC is offering a vague and incomplete DEIS with the expectation that agency and public review will limit its final EIS. That should not be the case. I urge you to modify the DEIS approach to first be expertly and technically complete, and then be objectively issued for agency/public review and comment. It is not a simple benchmark to be checked off as a completion.

Thank you for the opportunity to review and comment at this stage of a DEIS for your Bradwood LNG project.

Respectfully,

John Vlastelicia

Re: Bradwood Landing: Draft EIS (CP06-365-000 et al.)

In late October, I sent a 13 page document (plus attachments) outlining my concerns with the Proposed Bradwood LNG facility. (Memo to FERC from Carolyn Eady, October 22, 2007) Since then, two issues have arisen that deserve further comment.

1. Extreme Weather

On pages 10 and 11 of my earlier memo, I described my concerns related to the impact that extreme weather would have on the proposed facility. I did not know then that the worse was soon to arrive. On December 2nd and 3rd, the North Coast area of Oregon had the most extreme weather in its recorded history – a hurricane with winds well over 100 miles per hour and heavy rains extending for many hours.

The area is still trying to recover. Hundreds of homes and business were damaged or destroyed; millions of board feet were blown down or snapped off in the western part of the county; all communications, including cell phones, were out for days; and power was out for 3- 5 days or longer. (Hospitals were dependent on ham radio operators for any communication with the outside world.) Utility crews came in from surrounding states to help rebuild the transmission, fiber optic cable and power systems. Many highways were closed for days, including all roads leading to and from Portland due to sinking, flooding and/or downed trees. The Coast Guard closed the entrance to the Columbia River. Two of the three weather buoys off the coast were destroyed.

Individuals

About a week after the storm, the heavy rainfall was blamed for a major mudslide that inundated U.S. Hwy. 30 west of Clatskanie. (See picture on page 4.) It took several days before a house and many feet of logs and mud could be cleared and the highway opened for traffic. During that time, Wauna Mill employees and others who lived on the other side of the slide, were forced to take the Westport ferry to get around it.

IND83-1 Given the critical nature of the proposed Bradwood LNG facility and its dependence on sophisticated systems and trained personnel for safe operation, I urge you to get a response from the applicant that answers the following:

- ☐ Describe in detail how this facility would have been able to function safely in the conditions I described.
- ☐ Would they have an independent power source that could maintain all critical functions for 5-7 days, with no supplies or contact from the outside?
- ☐ Would they have adequate provisions to operate for a week with the staff on duty when the storm hit?
- ☐ What assurance do we have that their 36 inch high pressure line could withstand a slide similar to the one that occurred on Hwy. 30?

Whether it is due to global warming or just a change in the weather pattern, severe storms seem to be occurring more frequently. It is critical that the applicant make provisions for these types of events.

2. Pipeline

IND83-2 This past summer, a separate FERC application was filed for the Palomar pipeline, a proposed pipeline that is suppose to connect with Bradwood's. In the November 27, 2007 issue of the *Daily Astorian*, Joe Desmond, Northern Star vice president of external affairs, said the Bradwood project doesn't need the Palomar gas line because it has its own pipeline – that hooks into the Williams Northwest system. However, Michele Swaner, spokeswoman for the Williams system made the following statement:

Her company doesn't have room for all the gas Northern Star plans to import to its Bradwood facility. Physically, we're capable of receiving it, but it would take the place of all the other gas supplies flowing in that system both north and south. We have long-term agreements in

Individuals

83

IND83-1 NorthernStar is in the process of developing an ERP which contains contingencies for weather-related events.

IND83-2 See our response to comment PM1-23 and our discussion on purpose and need in section 1.1 regarding the market for the Bradwood Landing natural gas. As discussed in section 1.0, the Williams Northwest pipeline would have capacity for the natural gas from the Bradwood landing pipeline project. As described in section 3.1.2.2, we consider the Palomar Project to be a separate undertaking from the Bradwood Landing Project. Neither project is inter-dependent on the other. If Palomar is not authorized or built, the Bradwood Landing Project could still go forward, and vice versa.

IND83-2
cont'd

place....We're unlikely to disrupt the relationship we already have with our customers right now. She added that even with the projected declines in supply from Canada and the Rocky Mountains, there's not enough demand for gas in Oregon and Washington to absorb the full volume from Bradwood. But she said there is demand for that volume in California.

This report clearly reveals two facts: 1) This facility is *not* being built to serve Oregon and Washington, thus seriously questioning FERC's assessment for the need for such a facility in Oregon. If California has a need, then the facility should be located in California. 2) If the Palomar pipeline is a key to the successful operation of Bradwood, then its consideration by FERC should be part of the Bradwood application.

Thank you for your consideration of these additional issues.

Sincerely,

Carolyn Eady

Docket No. CP06-365-000

Comments on Bradwood DEIS

Carol Carver, 541 West Birnie Slough Rd, Cathlamet, WA 98612

IND84-1 | In general I am gravely concerned that many issues are simply “recommended” or are postponed for accomplishment until well after the permitting or construction, for example:

- In section 4.11.6, Emergency Response: The Emergency Response Plan should be completed and approved PRIOR to issuing the permit, rather than as written in the DEIS, prior to initial site preparation. FERC is considering approving a permit for a large LNG facility that will be located within 1/2 mile of people’s residences, not to mention the moving Zone 1 that will follow the ship 38 miles up the river. The ERP should be written and approved, including evacuation plans, **before** permitting takes place. FERC’s use of the word “recommendation” should be replaced with “shall”. In 5.1.11, last paragraph.

IND84-2 | □ In section 4.11.4 thermal exclusion zone is described using the on-land tanks as the center from which distances are calculated. FERC should also require that similar calculations occur, using the docked ship as the center. Until the ship is off-loaded and after it is docked, it is in effect a storage tank that is located much closer to the residences on Puget Island than are the on-land storage tanks. Homes on Puget Island are one-half mile from the Bradwood’s shore.

Individuals

84

IND84-1 | If the project were authorized, the ERP would need to be approved by the FERC before NorthernStar would be given approval to begin construction. See also our response to comment PM1-1.

IND84-2 | See our response to comment PM1-3.

- IND84-3 □ 4.3.2.3, page4-75, Northern Star references the City of Portland's Stormwater Management Manual for calculating stormwater runoff volumes. We have at least twice the amount of rain as Portland. FERC should check to be sure rainfall in the neighborhood of 60-90 inches yearly was used in this calculation, not Portland's rainfall.
- IND84-4 □ 4.8.2.4 Property Values: concludes that the presence of an LNG facility does not have significant positive or negative impact on property values. Why is the research done for Harpswell Maine by Prof George Tulley of Univ. of Chicago and RCF Economic and Financial Consulting not quoted, in which he finds a "dramatic (negative) impact on property values in proximity to LNG terminals"?
- IND84-5 □ 4.1.3.3 Geologic Hazards: section delineates that soil will liquefy in the event of a large seismic event to a depth of 85 feet. However there is no recommendation in relation to the soil level actually dropping after such an event. Professor Atwater of the University of Washington has documented a 3-foot drop in soil level after the last major seismic event in the vicinity of Bradwood, in the 1700's, which he feels the area is overdue to experience once again. What would be the consequence of a 3 foot drop in soil level after soil liquefaction and why is this not addressed in the DEIS? Does the conclusion that soils will liquefy to 85 feet include the fill that is planned for the site?
- IND84-6 □ On page 4-31, Figure 4.2.2-1 is a mistake indicative of the generally sloppy manner in which the DEIS compares to information submitted in various other ways by Northern Star: on this page the mighty Columbia River is labeled "Willamette" River. If you going to propose changing our way of life in so many ways that it completely wearies me to consider them, at least get the name correct of the river on which this facility is proposed.

Re: Draft Environmental Impact Statement
Docket Nos. CP06-356-000 et al.

Dear Secretary Bose:

I am submitting this letter to express my concern over the review process involving two liquid natural gas (LNG) terminals near Astoria and the pipelines which are planned to run through our neighborhoods, farms and timber lands in Oregon.

As you are aware, three LNG projects are planned in Oregon, two on the Columbia River and one in Coos Bay on the Southern Oregon coast.

The Palomar pipeline is a joint venture of NW Natural Gas and TransCanada, which operates a large pipeline going from Canada to northern California. This pipeline would transport natural gas from the proposed Bradwood Landing LNG import terminal 20 miles east of Astoria on the Columbia River. It would be 36 inches wide and would travel about 120 miles from the terminal to Molalla, and from there another 110 miles east to Maupin (Wasco County) to connect to a large interstate TransCanada pipeline to California. The pipeline would run through the Oregon Coast Range to the community of Timber, along Timber Road to Glenwood, through the Gales Creek Valley, passing just west of Forest Grove, and through or near Gaston, Yamhill, Carlton, and Woodburn before ending in Molalla.

The Bradwood Landing LNG terminal and processing plant is a project of NorthernStar Natural Gas, a Texas-based company that has never built a terminal or pipeline. As you know, FERC has already reviewed their draft environmental impact statement (DEIS) and issued the opinion that the project would have *"limited significant environmental impacts"*, posing *"no unacceptable environmental problems."*

Individuals

85

K-1001

As you or your consultants are obviously not aware, or chose to ignore, the Bradwood Landing LNG terminal would create significant environmental impacts on Oregon and the Columbia River as outlined in the following bullets:

- IND85-1 * The Columbia River bar is one of the most dangerous in the country and this river is used extensively by other commercial river traffic, commercial fishermen, recreational boaters and scenic tour businesses. Adding supertankers filled with LNG, which carry 30 million gallons of LNG poses a considerable risk to existing river traffic, public safety, and the environment. Accidental groundings, capsizing, and wrecks requiring rescue and clean up missions are common place events on this river bar annually. Adding these LNG supertankers to the volume of river traffic already using this tributary would add incalculable risks to public safety and the environment.
- IND85-2 * The dredging required to construct this LNG terminal would drastically increase pollution and sedimentation within the river causing un-repairable damage to already threatened and decreased salmon and steelhead runs as well as significantly disrupting feeding and nesting habitat for migratory bird populations. Planned dredging of 700,000 cubic yards and the 'blender action' of these huge supertanker props as they use this stretch of river would have a devastating effect on fish populations and other aquatic life in this critical river channel.
- IND85-3
- IND85-4 * Other threats created by this LNG terminal include potential leaks of LNG and other pollutants into the river and/or surroundings from the supertankers at the terminal, the potential of explosions and fire at tanker docking stations or in/or around the terminal which would potentially cause catastrophic pollution in the river around Bradwood Landing all the way down river to the mouth of the Columbia.
- None of the above cited risks are improbable and any one of them would be devastating to the Columbia River eco system, to the population surrounding this terminal and to the Oregon economy.
- IND85-5 A shorter, 35-mile pipeline is included in this project; would go under the Columbia River to Kelso, Washington where it would connect to the Williams pipeline that supplies Washington and Oregon. Many of the above cited concerns for the Bradwood Landing terminal would also apply to this pipeline which is proposed to cross the Columbia River system.

The only reason to build the western half of the Palomar pipeline is to

Individuals

85

- IND85-1 See our response to comment PM6-48.
- IND85-2 Based on the results of testing conducted on the sediments to be dredged, dredging would not release contaminants into the river. Dredging would have localized and short-term turbidity and sedimentation impacts.
- IND85-3 Propellers of the LNG carriers would not have a devastating effect on fish in the turning basin. Sections 4.5 and 4.6 contain detailed discussions of potential impacts on fish and wildlife associated with the removal of 700,000 cubic yards of sediment for the maneuvering area and ship berth. As discussed in section 2.1.5, NorthernStar's revised Compensatory Mitigation Plan will be included in the FERC's revised BA and EFH Assessment. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.
- IND85-4 See section 4.3.2.2 for a discussion of LNG spills and resulting impacts on water quality.
- IND85-5 As explained in section 3, the Bradwood Landing pipeline would be shorter than the pipelines proposed by either Palomar or Oregon LNG. The environmental impacts associated with the Bradwood Landing pipeline are addressed in the EIS.

K-1003

- IND85-6 connect the Bradwood terminal to the TransCanada pipeline so that gas can go to California. As noted above, Bradwood Landing already has plans for a pipeline through Kelso to supply the Northwest, so the Palomar pipeline is not needed for that purpose. Northwest Natural Gas has indicated that it would buy less than 1/10th of the output of the Bradwood terminal, and has stated that it could not support the Palomar pipeline by itself without other customers, that is, California energy companies.
- IND85-7 As you are also aware, a second terminal and pipeline have been proposed by Oregon LNG (owned by Leucadia Corp. based in New York), and is in competition with the NorthernStar terminal. Oregon LNG was formerly the Skipanon Natural Gas Facility, owned by Calpine, which went bankrupt and sold the project to Oregon LNG in Jan. 2007. Oregon LNG is operating on a 'shoe string' budget and has totally failed to comply with notification requirements to property owners along the pipeline, as well as, demonstrate it's ability to truthfully represent safety and environmental claims about this project to the communities adversely affected by these projects. They are resistant to providing any type of performance bond or other safety or environmental guarantees to property owners or governmental agencies through which their pipeline passes, and have taken the position that the public should simply 'trust them'. This is a totally irresponsible position to present to the community in light of the history of insolvency represented by the principals of Oregon LNG, which were also involved with Calpine, prior to its demise. To allow Oregon LNG to embark upon a project of this scope, with its history, is totally selling out Oregon interests to the interests of a private corporation involved in a very high-risk energy speculation scheme.
- Oregon LNG's terminal and processing plant would be in Warrenton, Oregon at the mouth of the Columbia River. Again, many of the public safety, marine safety and environmental concerns stated above with the Palomar project, directly apply to this project and should not be minimized by a Federal agency in the interest of needlessly "streamlining" an application or review process for a private, for profit group of speculators.
- The pipeline route would closely parallel the Palomar route through the Coast Range, the communities of Glenwood, Gales Creek Valley, Forest Grove, Gaston, Yamhill, Carlton, and continue all the way to the transfer station in Molalla. All along this pipeline path, the geology has been determined to be very unstable and at high risk for earthquake, landslides and flooding. In a recent article in the Oregonian

Individuals

85

- IND85-6 See our response to IND55-5. The Bradwood Landing Project is intended to serve markets in the Pacific Northwest, not California. The Palomar pipeline is a separate project targeted to supply gas to the Portland metropolitan area and the Willamette Valley.
- IND85-7 The Palomar and Oregon LNG projects are briefly discussed in section 3. However, the FERC intends to conduct separate environmental reviews of those other projects.

K-1004

IND85-7
cont'd

newspaper this December, following heavy rains, flooding and landslides in northwestern Oregon, Dan Postrel, a spokesman for the Oregon Department of Forestry stated, "The Coast Range is inherently unstable and has a history of having the land slide away; it's happened for eons." This is the exact area where both pipeline projects are planned to cross through.

In addition, this pipeline is currently planned to cross hundreds of streams and rivers which serve as migratory and spawning habitats for salmon, steelhead and trout species as well as species of endangered plants and insects.

The two pipelines would be only 1-2 miles apart for some of the route but are often in much closer proximity to each other and occasionally cross paths over the 120 miles they travel, thus creating and significantly compounding both risks to public safety, risks to the environment and livability of these areas along the route. Unfortunately, once easements are granted across private property and/or once private property has been seized under the authority of eminent domain for these projects, additional pipelines can be 'piggy backed' onto these existing rights of way; thus compounding the violation of the rights of private property owners, the risks to public safety and potential for environmental damage. One of our neighbors personally witnessed this in New Jersey, where one pipeline was expanded to five pipelines over the same route within a few years, with ever-wider "easements" taken from the landowners.

The FERC Review Process

FERC conducted a public meeting in Forest Grove on Sept. 19, 2007 with Oregon LNG to inform the public of the project and to take public comments. At that meeting many citizens eloquently expressed their concerns and fears about the project and the damage it would do to their land, their livelihoods and their communities, as well as, expressing their frustration with the lack of information or notification about the hearings from either Oregon LNG or FERC. However, I have not been able to find these public comments posted to FERC's website, as promised, in the above referenced meeting. In addition, we have not been provided with adequate maps to comment on the specific route the pipeline will take, or the locations of pumping stations along the route. After the scoping hearings and an extremely short comment period, FERC then took a few months to prepare the DEIS during

Individuals

K-1005

IND85-7
cont'd

which time details of each project can be revised without the opportunity of the public to offer comment on the revisions.

It would appear that FERC is approaching this 'review process' more as a *partner* of the private LNG corporations rather than as an agency of the Federal Government, funded by Federal tax dollars, paid by citizens whose interest or mandate is to insure public interests and safety are satisfied. This is not how our Founding Fathers envisioned Democracy working. Public trust in our State and Federal governmental agencies is earned by open and honest processes being employed by our government. America can't stand another government agency placing the interests of mega corporations over the interests and concerns of the public, such as we witnessed with the recent sham hearing of the FCC. FERC officials would do well to learn from the mistakes made by the arrogant and corrupt Chairman of the FCC and not follow in his footsteps with the LNG project review processes, and further erode the credibility of the Federal Government with its citizens.

IND85-8

As stated above, FERC is doing no overall assessment of the need for imported LNG, followed by an evaluation of the total number of terminals and pipelines that might be necessary, or best sites available or best practices to most efficiently provide the service or product, if needed. FERC has allowed the 'cart to get well ahead of the horse' in this application and review process and it is, in my view, criminal to allow tax dollars to be wasted by FERC on a review process that may ultimately be determined to be unnecessary based on future energy needs for this region.

The U.S. currently has 5 LNG terminals, including one in Alaska. Since 2005, proposals have been made for an additional 45 terminals, including 5 in Oregon. The current process of reviewing all of them, one at a time, with no overall strategic planning, means that companies are racing each other to be the first to gain approval and thus reap huge profits. FERC's definition of "need" appears to be the existence of customers willing to buy the gas, no matter where they live, after each project is completed without any regard to the regional needs, financial, environmental or societal impacts to individual property owners and local communities, in the path of their rush to maximize corporate profits.

Were it not for the numerous adverse impacts on the individual property owners near the terminals and pipeline, the associated public safety issues surrounding such facilities and the devastating

Individuals

85

IND85-8 See our responses to comments PM2-32, PM4-1, FA4-1, and IND33-52.

IND85-8
cont'd

degradation of the environment and livability of the State, as a result of each of these projects, this process would have allowed these issues to have been glossed over; thereby allowing the paradigm of market forces, and 'possible' future needs, seem like a rational strategy. However, common sense would dictate, comprehensive and objective analysis of future energy needs be conducted well in advance of the review process for construction of any one of these projects. It defies logic why US Government tax dollars are being wasted to separately review three different LNG projects in Oregon in advance of any needs analysis being conducted on future needs for the Northwest.

FERC should be required to stop the three current project review processes until the need for even one LNG terminal and pipeline is established.

Each of the two proposed import terminals and pipelines sited in NW Oregon would have the capacity of transporting 1.3 bcf/d of gas; the construction of just one of these projects would more than triple Oregon's gas supply requirements. The consumption of natural gas throughout the region has been flat over the past 15 years. Increases in demand in the Northwest are projected to be quite small and should be met by the State's initiative to increase use of renewable energy.

Oregon Senate Bill 838, passed on June 6, 2007, mandates that Oregon utilities get 25% of their energy from renewable sources by 2025. Meeting this target would take care of Oregon's future energy needs. An oversupply of natural gas would undermine Oregon's law and energy policy, and would divert resources from the urgently needed development of renewable energy sources that promote independence and lessens the effects of Global Warming. Therefore, it boggles the mind why FERC would even entertain an application for construction on even one of these projects, let alone the Oregon LNG, Palomar and the Coos Bay project all at the same time. It is obvious that these pipelines would bring in an excessive supply of natural gas that is not needed now, or in the foreseeable future.

However, if this determination that additional LNG is needed for this region in the near future, then, and only then, should our tax dollars be spent to review proposals to satisfy this need. FERC should then be required to undertake a combined and comprehensive review process (for Oregon LNG and Palomar) which would incorporate a cost-benefit and/or risk-reward analysis weighing the interests of the local communities, the state and the region prior to approving even one of these questionable projects.

Individuals

K-1007

IND85-9 Does California need this natural gas? The 2006 California Gas Report, released by a consortium of California gas and electric utilities, projects that demand in California will decrease through 2015. An LNG terminal has already been built and will become operational in January 2008 at Costa Azul, Baja Mexico that will transport gas via pipeline to California; an expansion and extension of the California pipeline has already been approved. The California Lieutenant Governor has stated that this will provide all of the State's natural gas needs for the foreseeable future, and furthermore has said that the plan to bring LNG to California through the Oregon "back door" undermines California's priorities and energy policy, including its aggressive programs to promote conservation and renewable energy resources.

IND85-10 FERC is required to issue a "Certificate of Public Necessity" prior to approving projects such as these and thus far there has been no definitive proof of public necessity established, other than claims offered by the private corporations, who stand to benefit by sacrificing the livelihood of thousands of small farmers, owners of timber land and fishermen in Oregon.

Impact on Landowners in the Pipeline Path

IND85-11 While Federal law provides that private property can be taken for LNG pipelines by eminent domain, against the wishes of landowners, if a mutual agreement cannot be reached between the pipeline company and the landowner, a judge will decide what compensation the landowner will receive. The compensation matrix is not based on the full value of the land—it is not for purchase of the land but only for an easement, which typically is worth about 10% of the land value (and the landowner continues to pay the property tax). In similar cases in southern Oregon, landowners received "pennies on the dollar" and the individual property owner and community is left with the additional indignity of paying to clean up the environmental mess left by the pipeline company which chose to disregard contractual agreements to mitigate inconvenience, use restrictions and environmental damage to property and streams and wetlands along the pipeline path.

This does not take into consideration that a pipeline corridor may alter or restrict use of the entire property, cut it in half, and/or in many cases make it impossible to continue previous activities such as farming and timber management. Furthermore, with a pipeline in place or even planned, property values will plummet and land will more than

Individuals

85

IND85-9 See our response to comment PM1-23.

IND85-10 Under section 3 of the NGA, a public necessity determination is not required for an LNG import terminal and no natural gas ratepayers are at risk for higher rates or stranded investments resulting from construction of the Bradwood Landing LNG terminal. The Commission's Order for this project will present its findings of public convenience and necessity for the pipeline.

IND85-11 See response to comment PM1-15. The project would not result in the loss of livelihood for anyone along the pipeline route. After the pipeline is installed, it would be restored to its previous condition and use. However, trees could not be within 15 feet of the centerline and no improvements could be built over the permanent right-of-way.

K-1008

IND85-11 | likely become un-saleable at current market values. Some landowners have been told they could not even get insurance to their farms or property following approval of the pipeline project. The result for many individuals in the path of these projects will be the loss of their livelihood and life savings. It strikes us as an extraordinary abuse of power that two competing, privately owned, corporations can use the power of the Federal Government to seize our land against our will for the purpose of profit, not for the greater good of the community. Before eminent domain can be used, FERC must issue a "Certificate of Public Necessity." We see no such necessity for building these pipelines. They amount to use of eminent domain for speculation, private gain and greed.

IND85-12 | The pipelines would take a permanent 60-foot-wide easement that would be logged, cleared and maintained by the company, with access rights at any time. During construction they would clear a temporary easement of about 120 feet (the width of the sections equate to that of 4 a lane highway with a generous center median). No trees and many perennial crops will be allowed to be replanted within this corridor, but invasive weeds will proliferate and many endangered native plants will be sacrificed along the way. In other places the easements where vegetation are sprayed with herbicides to control brush, many organic farm operation certifications will be revoked, and the eco-friendly and local fresh food market would be destroyed in the communities in the path of the pipeline. This is just one example of the consequences of the pipeline to the citizens of Oregon. If you include damage to timber, fisheries and farming, you see that the pipeline could have a huge economic impact to the citizens, living in the small towns and rural areas of Oregon, which lie in the 230 mile swath that the pipeline travels in Western Oregon.

IND85-13 | Both pipelines will be 36 inches in diameter. In the case of the Oregon LNG pipeline, it is planned to be just 3-5 feet underground. Pipelines are known to spontaneously rupture and explode with disastrous consequences. A few years ago, two boys in Washington State were killed by an exploding gas pipeline, and a pipeline exploded and started brush fires in Port Arthur, Texas this October. The natural gas in a pipeline is under very high pressure (Oregon LNG representatives state 1400 psi will be the operating pressure), so a rupture would cause an extremely large and devastating explosion and fireball, with obvious results if such an event occurred in a forested area in the summer. Just a reminder to FERC officials who do not live in Oregon, the Tillamook Burn Fire started in Gales Creek by a spark from a logging operation. This fire devastated tens of thousands of

Individuals

85

IND85-12 The Bradwood Landing pipeline would have a permanent right-of-way 50-foot-wide. Sections 4.4.2 and 4.7.3 address permanent impacts on upland vegetation and land-use, respectively.

IND85-13 Pipeline safety is addressed in section 4.11.9. See our response to comment IND60-6.

IND85-13 | acres of prime old growth forest land in Northwest Oregon. This is the
cont'd | exact area where both of these LNG pipelines are targeted to pass
through.

According to a September article in the "Hillsboro Argus," there have been 866 natural gas pipeline accidents in the U.S. since 2000—about 1 every 3 days. As previously stated, our State Forestry Dept. and remote rural communities do not have adequate fire and emergency services to cope with this level of disaster, however, these are the communities which stand in the path of these pipeline projects.

Broader Negative Impacts of LNG Import Terminals and Pipelines

IND85-14 | The proposed pipelines would be needed specifically to transport imported LNG. Our country has a stated goal of reducing our dependence on imported energy. Imported LNG does not reduce this dependence, but rather perpetuates it. The major sources of LNG for these facilities would most likely be Indonesia, Algeria, Nigeria, Russia and Qatar; Iran has some of the world's largest reserves. These are obviously not the most stable countries from which to tie our future energy dependence, nor are they our most stable or best allies. Therefore supplies and costs of LNG would, by logical extension, be unstable, and we will continue to be at the mercy of numerous tenuous political and economic factors, just as we currently are for our supply of imported oil.

IND85-15 | Imported LNG will not reduce the cost of natural gas to Oregonians. Because of the cost of transportation, security and processing, it is more expensive than domestic natural gas. Its cost is not determined by local need, but by global supply. Right now the LNG supply is less than the demand. Europe and Asia are currently outbidding the U.S. for LNG, so that terminals that have already been built are unable to obtain a supply and are sitting idle or operating far below capacity. This means that the cost of imported LNG will be higher, if we can even get it at all, from several of the traditional sources.

IND85-16 | Although domestic natural gas is a relatively clean fuel, imported liquefied natural gas (LNG) is a different story. Extracting the LNG, transporting it from far corners of the globe, and the liquification process itself, are highly energy intensive and add approximately 25-50% to greenhouse gas emissions, producing large amounts of carbon

Individuals

85

IND85-14 | The Bradwood Landing sendout pipeline would transport natural gas from vaporized LNG. While NorthernStar does not have to reveal the sources of its imported LNG, it may come from politically stable exporting places around the Pacific Basin such as Alaska and Australia. See our response to comment IND66-8.

IND85-15 | Market factors, which are affected by supply and demand, change over time. NorthernStar believes imported LNG can compete with North American natural gas, and may result in stabilization of prices, as explained in section 1.1.

IND85-16 | Section 4.10.1 has been updated to include the estimated greenhouse gas emissions resulting from the construction and operation of the project. See our response to comment PM1-22.

IND85-16 cont'd	<p>that contribute to global warming, according to many energy experts. With these factored in, LNG is as dirty as oil.</p> <p>Expansion of LNG facilities is part of a "dinosaur" policy to continue to promote the fossil fuel industry, rather than put serious effort into alternative energy sources, including conservation strategies. The latest report of the Intergovernmental Panel on Climate Change (which just won the Nobel Prize, together with Al Gore) includes the most dire warnings yet on the accelerating pace of climate change, and the UN Secretary-General has said that "we are on the verge of a catastrophe." This is not the time to increase the use of fossil fuels—it is a short-sighted and ultimately suicidal strategy.</p> <p>On 11/16/07 the federal Ninth Circuit Court of Appeals, in a suit brought by several states against the Bush administration to challenge federal fuel economy standards, ruled that greenhouse gas emissions and effects of global warming <u>must</u> be considered in setting such standards. Judge Betty Fletcher wrote that the "impact of greenhouse-gas emissions on climate change is precisely the kind of cumulative-impacts analysis" required as part of Environment Impact reviews. The Supreme Court also recently ruled that the EPA can regulate greenhouse gas emissions. Therefore, <u>FERC must now take this issue into consideration in their review of LNG projects.</u></p>
IND85-17A	<p>The LNG companies will tell you that LNG can't burn. That's true while it's still at 260 degrees below zero. But as soon as it is released into the air it warms up, mixes with oxygen in the air, LNG becomes an extremely high explosive risk. Large quantities burn so hot that the</p>
IND85-17B	<p>fires cannot be put out and just have to burn themselves out. Oregon LNG officials stated last week that there would be automatic shut off valves installed along the pipeline to reduce the risk of explosions should a leak occur. However, when pressed for details, Peter Hanson also stated these valves would be about five miles apart. Considering the pressure and volume of gas contained in a five mile stretch of 36" diameter pipe, this provides no comfort to local emergency responders and even less to local residents along the pipeline.</p>
IND85-18	<p>Tankers filled with LNG, and the processing plants on the Columbia River, pose a frightening security risk to residents of both Washington and Oregon. A typical tanker carries 30 million gallons of LNG. Richard Clarke, the National Security Advisor who tried in vain to warn of the 9/11 attacks, identified both LNG tankers and terminals as prime terrorist targets. A tanker explosion could release as much energy as 50 Hiroshima-sized atomic bombs, with a fireball at least 3 miles wide;</p>

Individuals

85

IND85-17A	<p>As discussed in section 4.11.1, LNG is not explosive as it is normally transported and stored. Natural gas vapors (primarily methane) can explode if contained within a confined space, such as a building or other structure, and ignited.</p>
IND85-17B	
IND85-18	<p>The Coast Guard has established a moving safety/security safety extending 500 yards around the vessel while transiting, a 200 yard security zone around the vessel while it is moored, and a 50 yard security zone around the facility when there is not a vessel moored. This should have minor impacts on shipping and recreational river use. Section 4.11.5.3 presents the hazards associated with a spill from an LNG carrier and section 4.11.8 discusses terrorism and security issues. It is possible that a release from the LNG storage tanks could be caused by an intentional act, such as a terrorist attack. Although an intentional breach scenario could result in greater thermal radiation in the immediate vicinity of the release, such scenarios are typically associated with the desire to inflict damage to major infrastructure and population and commercial centers.</p>

IND85-18
cont'd

release and ignition of 1/10th of a tanker's cargo would fatally burn people a mile away, according to a report by Sandia National Laboratories. Some of the main sources of LNG (Algeria and Indonesia) have serious terrorist issues, so one could imagine a tanker becoming a Trojan horse, loaded with time-delayed explosives. Plane crashes, accidental or deliberate, would also be a serious threat. The U.S Coast Guard released a Waterway Suitability Report calling the Bradwood Landing site "unsuitable without extensive measures to improve safety and security." These measures would have major impacts on both sides of the river, because security restrictions would interfere with shipping and recreation. Large exclusion zones would be necessary around an LNG facility, including areas where all travel or activity is prohibited, flight paths restricted and bridges closed. This would restrict commerce, travel and recreation on the Columbia River. These supertankers would, in effect, impose a rolling blockade on the Columbia River to insure cargo security is maximized.

In summary, FERC should not make siting decisions for LNG projects without first accessing the comprehensive, objective, scientific analysis available as to future energy needs, and the social, economic, and environmental impacts of these projects. All potential sources of energy must be evaluated prior to granting cart blanche approval for any energy infrastructure construction project which potentially interferes with the property rights of, the public safety of, community livability of and environmental security of citizens of this great United States of America. This will require FERC to slow down the review process and conduct an objective needs analysis for future energy requirements for the region, then to fully involve State government and local stakeholders in a collaborative decision making process, to establish a plan to satisfy priority needs which are identified. Only by working together can a truly satisfactory plan for our regional energy needs be accomplished.

Sincerely,

Charles Straughan

Subject: Comments to the Federal Energy Regulatory Commission
Draft Environmental Impact Statement (DEIS) for the proposed
Bradwood, Oregon facility.

[PLEASE NOTE WE WISH TO BE ON THE ADDRESS LIST TO RECIEVE
ALL MAILINGS RELATED TO THIS SUBJECT]

Ms. Bose,

Background & interest:

Our family has a home on Pleasant Point Road, Skamokawa, Washington, immediately opposite Mile Post 33. We have yet to learn of any valid reason for permitting the transportation of Liquid Natural Gas (LNG) on the Columbia. In fact data suggests there is no requirement for this facility to supply natural gas for the Northwest. But even if there were a need for natural gas, it is clearly a dangerous operation with environmental, security and safety hazards that can be significantly reduced or mitigated by siting the facility off-shore, or on a coastal site.

We recognize the need for imported energy to the U.S. even though we regret the shortsightedness of the Federal, State and local governments in failing to mandate vigorous conservation for all forms of energy used by the population and not promoting renewable energy systems more strongly. Encouraging importation of fuel, in our opinion, leads us into a future crisis. Our energy dollars would be far

Individuals

better spent in producing electric power from renewable sources, thus eliminating the need to import LNG.

The choice of the Bradwood site is extremely poor, and evidence that the proponent, Northern Star, did not evaluate its proposal's impact on the community and the valuable natural environment. The area from Astoria to Bradwood includes one of the few unspoiled reaches of the Lower Columbia, and includes large areas of natural and protected wildlife, enabling citizens to benefit from their natural heritage. The terrain is still much as Lewis & Clark found it 200 years ago. This is a natural legacy that should not be violated unless there is absolutely no alternative. Clearly alternatives exist. The proponent should be made to show why other viable alternatives should not be considered.

It is our belief that the FERC should deny this application because of its potential damage to the citizens and environment of the Lower Columbia. We realize that the proponent has the right to request the EIS process to proceed, but feel he should consider a site that has less potential for environmental, community and human damage. Lessons learned from other large scale questionable projects (e.g. the Sea-Tac third runway, which was proposed in 1987 and is still not complete) shows that controversial proposals can be held up in the courts for years, especially when environmental issues are challenged.

Qualifications:

Mike Rees is a retired engineer from the Boeing Company (30 years); Jane Rees is a PhD nutritionist and human biologist on the faculty of the School of Public Health and Medicine at the University of Washington, Seattle (35 years).

Summary:

From our review of the DEIS we find:

1. The DEIS is inadequate as a basis to proceed to a FEIS. The data cited are inadequate and there is too much speculation as to what the proponent might implement.
2. The stipulations of specific recommended requirements are significant in quantity (over 100) and should require the proponent to respond with detailed plans for public review before proceeding to the Final EIS (FEIS).
3. The DEIS requires a Supplemental EIS (SEIS) that addresses these shortcomings before consideration of an FEIS.

Individuals

86

IND86-1

We believe the EIS has been prepared in compliance with NEPA regulations and that it is adequate. A supplemental EIS is not necessary. See our responses to comments PM4-20 and PM6-94.

Comments to Draft EIS dated August 2007.

- IND86-1 cont'd | We submitted scoping comments to you on October 15, 2005. We understanding the lead agency is required to address all submitted Scoping Comments, in the DEIS. This DEIS does not address many of our comments, therefore we find it inadequate. We ask that the lead agency review all the scoping comments, and address those not included in the DEIS in an SEIS.
- The following specific comments are identified by section number and page number, where possible:
- 3.1.1**
- IND86-2 | (Pg 3-2 DEIS) The "No Action" alternative includes the statement "If the Commission selects the no action or postponed action alternative, the objectives of the proposed project would not be met and Northern Star would not be able to import LNG to provide natural gas to markets in the Pacific Northwest."
- Recent studies indicate that the likelihood of natural gas from the proposed Bradwood facility being used in the Northwest is small. What is likely is that the output from Bradwood would be used by the California market, if at all. We note that the California Energy Commission 2007 Integrated Energy Policy Report, dated December 5, 2007 recommends California *"Supports displacing natural gas with renewable sources to generate electricity and alternatives such as solar for water and space heating."*
- Please update the projections of the need for gas in the Northwest and California using the latest data available, and provide an estimate of the use of the output from Bradwood for the next 30 years.
- 3.1.6.3**
- IND86-3 | (Pg 3-43 DEIS) Please evaluate the effect on the aquatic habitat of the vaporization technology discharge that requires additives of sodium carbonate, sodium nitrate and other sodium salts.
- (Pg 3-43 DEIS) Identify what are the "other sodium salts"?
- IND86-4 | (Pg 3-43 DEIS) The DEIS indicates that no water would be taken from the Columbia River for vaporizing technologies, however water

Individuals

86

- IND86-2 | We have updated and expanded our purpose and need discussion in section 1.1 and included information to clarify that the natural gas would not go to California.
- IND86-3 | Table 4.3.2-4 shows the constituents expected in the SCV discharge. The discharge would meet ODEQ standards and the requirements of the NPDES permit, which are designed to be protective of the aquatic environment.
- IND86-4 | Sections 4.3 and 4.5 discuss discharge of water from the SCVs and potential impacts on aquatic habitats and resources of the lower Columbia River. Our revised BA and EFH assessment will address impacts and mitigation from this proposed action on federally listed fish and the FWS and NMFS will have an opportunity to provide their analyses in their BOs. Also see our response to comment PM3-27.

IND86-4
cont'd

condensate would be discharged into the river which would be treated for pH neutralization and be at 68 deg F. (1996 USGS reports 41 deg in March and 71.4 deg in July) The amount of water that would be discharged is stated to be 160 gpm, or nearly a quarter of a million gallons per day. Where has the appropriate Fish and Wildlife agency addressed the effect of this discharge on the local aquatic habitat? How is the pH neutralization system designed to prevent accidental discharge of non-neutralized water?

(Pg 3-43 DEIS) Describe the impact on aquatic habitat of discharging water condensate at 68 deg F when the ambient water temperature of river water temperature is 41 deg F (a difference of 27 deg F). It should not be difficult to ensure the discharging water condensate be within ± 5 deg F of the ambient river water temperature. A system of monitoring the temperature should be in place.

4.1.3.3

IND86-5

(Pg 4-9 DEIS) The DEIS did not address the landslide that occurred in the area upriver from the Bradwood site. As indicated by testimony from Mr. Beck on November 6th, at the FERC meeting in Cathlamet, such a slide did occur, was reported in the local press, and caused significant damage and a loss of life. Please address this event and the likelihood of such an occurrence that could affect the Bradwood site, and access to the site for emergency services. Also please review the recent slide near Clatskanie (December 11, 2007), and whether such a similar event could occur at Bradwood, and the likelihood that an LNG facility contributes to the danger of unstable earth and slides.

4.10.2.2

IND86-6

(Pg 4-389 DEIS) The noise analysis in the DEIS is insufficient. As indicated in our scoping comments dated October 15, 2005 it is not reasonable to identify noise levels in only the Dnl metric. Dnl is misleading, it does not address the impact of short duration noise amplitudes that are significantly higher than the average levels. For example, if a large cannon were located at the Bradwood Site and fired every 15 minutes throughout the day, the effect on residents of Puget Island would be extremely annoying. However, because the Dnl metric averages the noise levels over 24 hours (with an adjustment for nighttime sensitivity between 10 pm and 7 am) the noise from the cannon would make an insignificant difference to the Dnl average value. Therefore the SEIS should also address the noise metric Time Above or TA in which the total time above certain noise levels, say 60 dBA in a 24 hour period, is reported in minutes. With a construction period of 36 months and a pile driving program of 4 months,

Individuals

86

IND86-5

See our response to comment PM3-39.

IND86-6

A sufficient analysis of noise impacts is provided in section 4.10.2. See our response to comment PM3-28.

IND86-6 cont'd	expressing the noise levels in Dnl is totally inadequate. Communities would need realistic noise assessments. Similarly, for the proposed project operational phase the analysis should include ship docking operations, valve operations and other short duration, high amplitude noise levels in the Time Above metric. If Northern Star were truly interested in measuring and minimizing the impact on the adjacent communities, they would include at least three noise monitors (one on the Bradwood site, one on Puget Island, Washington, and one by the nearest community to the Bradwood site in Oregon) to evaluate noise complaints that would surely occur.
IND86-7	<p>4.7 (DEIS Pg. 4-273) The DEIS states "These communities already view thousand of ships traveling up and down the Columbia River" which is true, but the number of ships of the size of typical LNG tankers or larger, observed on the Columbia River annually, is not included. Please identify this number.</p> <p>Specific Scoping Comments not addressed (areas of concern are highlighted)</p> <p>Scoping comment: Show several alternative sites that would not require the use of the Columbia River for transporting LNG. e.g. off-shore locations. Analysis of alternatives should be in sufficient detail as to make a comparative evaluation possible in each of the twelve areas identified in the NOI published on September 13, 2005 (page 4).</p>
IND86-8	<p>The DEIS (Section 3.0) does consider some alternative sites, however they are not analyzed for the 12 points identified in the NOI. The 12 points should be addressed in the SEIS (where applicable) for each alternative:</p> <p>Geology and soils, water resources, aquatic vegetation and wildlife, threatened and endangered species land use, recreation, and visual resources, cultural resources, socioeconomics, marine transportation, air quality and noise, reliability and safety, and cumulative impacts.</p> <p>Scoping Comment: Show the expected air and water pollution that would occur for the worst case scenario, over the life of the project. Include the measurement systems that would be in place to monitor the air and water pollution levels.</p>
IND86-9	The DEIS does not specify air and water pollution monitoring systems or their locations. These should be addressed before considering a permit for this project.

Individuals

86

IND86-7	The addition of 125 LNG carriers for the Bradwood Landing LNG terminal would represent an increase in vessel traffic of about 25 percent for large, deep-draft vessels currently transiting these waterways but only a 7 percent increase overall in total commercial traffic. See table 4.8.10-5 for the number and types of commercial ships that use the lower Columbia River.
IND86-8	The EIS summarizes the results of the alternatives analysis. We looked at factors that were appropriate for distinguishing among the sites and data that could be reasonably obtained for each site.
IND86-9	Specific air emissions monitoring requirements for the Bradwood Landing terminal emission sources will be identified in the Air Contaminant Discharge Permit to be issued by the ODEQ as required by applicable federal and state air quality regulations. Water quality monitoring would be carried out in accordance with the requirements of the NPDES permits issued by the ODEQ and WDE.

Scoping Comment: Show the effect of artificial light pollution at the proposed facility. Include an analysis of the artificial lighting on communities and residences within 5 miles. Analyze alternative lighting schemes including use of directional lighting and non-reflective surfaces (including camouflage) on paved areas, facility structures, docks, cranes, etc. to eliminate visible glare in adjacent communities, and wildlife refuges.

IND86-10 | The DEIS does not address the effects of facility lighting, light pollution and light reflection on the communities and wildlife refuges. Please address these issues, taking into account the weather possibilities at Bradwood, before considering a permit for this project.

Deleterious effects on Global Climate Change (topic not covered in DEIS)

IND86-11 | According to scientific reports it is typical for an LNG system in the US to have a 1.5 percent leakage rate (Nature April 2004). This leakage occurs primarily from valves, pumps and mechanical systems used either to convert the liquid to gas, to transport the gas along pipelines, and from spills and accidents. Further, natural gas is essentially methane, a 24 times more potent greenhouse gas than carbon dioxide. At peak output of 1.3 Bcf per day, from Bradwood Landing, would amount to approximately 20 million cf of methane gas vented to the atmosphere per day; equal to nearly 500 million cf of carbon dioxide per day (or 61 million lbs or 31 thousand tons of carbon dioxide per day). Neither the expected leakage nor its environmental impact is addressed in this DEIS. The SEIS should include the realistic maximum expected leakage rate of the total system, and the effects of that leakage on the environment including global warming (i.e. in carbon dioxide equivalents) over the life of the system.

Thank you for the opportunity to submit these comments for your consideration.

Sincerely,

Mike & Jane Rees

Individuals

86

IND86-10 | Visual impacts associated with lighting at the proposed LNG terminal are discussed in section 4.7.2.7. In addition, this section has been revised to include additional information regarding NorthernStar's terminal lighting plan.

IND86-11 | See our response to comment IND85-16.

IND87-1

I am opposed to the proposed Bradwood Liquefied Natural Gas import facility in Clatsop County, Oregon. The facility proposes to dredge and fill shallow water habitats and wetlands in and adjacent to the Columbia River estuary. The Columbia River estuary is critical habitat to many species of fish, birds and wildlife. Over the past 150 years, the Columbia River estuary has lost over half of the tidal wetlands due to development along the shorelines. Thousands of acres of shallow water habitat have been destroyed through both dredging and filling of dredge spoils to create islands such as Rice Island, Lois Island and Mott Island.

The proposed Bradwood Liquefied Natural Gas import facility would further destroy valuable habitats. A very small percentage of the Columbia River estuary was designated Aquatic Natural in Clatsop County's Land and Water Use Comprehensive Plan. The Bradwood Facility is proposing to first change the zoning of Aquatic Natural to Aquatic Development and then dredge the area. This shallow water habitat is vital to migrating salmonids and sturgeon. The shallow water habitats that are being proposed for dredging have thousands of benthic invertebrates per square meter that are the base of the food web in the Columbia River estuary.

The Columbia River estuary has been modified by humans for the past 150 years. The estuary is on the verge of collapse. We cannot allow any more dredging of significant habitats.

Individuals

87

IND87-1

Section 4.5.2.1 has been revised to quantify direct impacts on shallow water. Potential impacts on wetlands and wildlife due to construction and operation of the LNG terminal are described in sections 4.4.1.2 and 4.5.2. See also our response to comment SA1-16.

- IND88-1** | For obvious reasons, I don't believe anyone would consider siting an LNG terminal at Carmel-by-the-Sea in California or at Martha's Vineyard in Massachusetts. And for those reason and more, it makes no sense to consider locating an LNG terminal in the Columbia River Estuary near Astoria, Oregon.
- If LNG is needed in this country, FERC could be considering sites where a terminal would blend in, where the local population wants it and where infrastructure is largely in place. It is likely that hospitable places can be found in America's so-called "rust belt," for example, where industrialized areas have been abandoned because of global shifts in manufacturing.
- The Lower Columbia River is not such a place. Here, the economy has been growing vigorously since the mid 90s. Unemployment is low. Quality of life is very high. And tourism is in full flower.
- At the same time, this is a place teeming with nature in a way that provides a window into America's past. Bald Eagles fly over our rivers and forests, where elk, deer, bear, cougar, coyote and other native animals thrive. The Columbia River is a haven for salmon, steelhead, sturgeon, sea lions and other species unique to the Estuary.
- I am sure you are aware that local people turned out in large numbers at every opportunity to fight the siting of an LNG terminal here, and to oppose construction of pipelines over unspoiled lands. Meanwhile, most of the relatively few who testified in support were from elsewhere and, like the speculators promoting the project, had little knowledge of or connection to the Lower Columbia.
- IND88-2** | At the beginning of December, this area was hit by hurricane-force storms with winds over 100 mph and heavy rain. All of the roads leading in or out of the area were blocked by fallen trees and mudslides. Power and phone service were knocked out for days. The Columbia River Bar had to be closed – a not infrequent occurrence here in the winter as it is the infamous "graveyard of the Pacific."
- IND88-3** | Meanwhile, scientists have been warning us that the region is overdue for another major earthquake, which experts predict could hit nine on the Richter scale. Does that sound like a good spot for an LNG terminal?
- Perhaps an LNG terminal could breath new life into some abandoned industrial area with existing infrastructure. Here, however, it would spoil what many have worked long and hard to build with great success.
- I sincerely hope that FERC is actively planning for the best logical sitings of LNG terminals on behalf of America, its people and its environment, and not just refereeing a helter-skelter race by speculators for pots of gold.
- Thank you for the opportunity to offer a local perspective.
- Roger Rocka, 362 Duane Street, Astoria, OR, 97103
(Former Exec. Director of the Astoria-Warrenton Area Chamber of Commerce, 1994-2005.)

Individuals

88

- IND88-1** The FERC does not select the locations for proposed LNG facilities. The locations are selected by the applicant and the FERC then conducts an environmental assessment for that location.
- IND88-2** See our response to comment IND22-20.
- IND88-3** The LNG terminal would be designed appropriately for its seismic setting.

To Whom It May Concern:

I am writing to urge you to say no to LNG on the Columbia River. Allowing a fossil fuel enterprise to establish itself here would invite safety, environmental, health, and economic problems. Questions over the area's geologic concerns need to be addressed, especially in light of the recent storm's devastation. Putting in LNG terminals where there is the potential for major storms, landslides, earthquakes, and other geologic issues seems like a poor choice. Additionally, the threat to the salmon and environment need to be more carefully considered.

My husband and I moved to this area because we were drawn to the environmental richness and quality of life that the Astoria area offers. The quality of life that living by the Columbia allows would be directly affected by allowing LNG tankers in and building large, permanent structures to house the fuel. As a school teacher and resident, I am very concerned about the safety and health issues involved in having LNG tankers and facilities nearby. So far, the explanation for risks and emergency assistance has been insufficient.

Not only would establishing LNG sites in this area cause environmental, safety, and economic concerns relating to fishing and tourism, but it is unnecessary. The people of this area deserve more than what LNG promises. Please do not make it easy for LNG to change the landscape of such a unique cultural and environmental treasure. Consider more carefully all of the negative effects on the environment and people in this area.

Sincerely,

Tammy Dowling

Individuals

IND89-1

Geologic hazards and mitigation are addressed in sections 4.1.3.3 and 4.1.4.3. Safety is addressed in section 4.11.

IND89-2

See our response to comment PM3-68. Impacts on salmonids are addressed in sections 4.5 and 4.6.

IND89-3

As discussed in section 4.7.1.5, LNG carriers would be generally consistent with large tankers that currently use the navigation channel heading to and from upriver ports. We address the safety of LNG carriers in section 4.11.5. Because the lower Columbia River already has industrial, commercial, and residential development, the Bradwood Landing Project is not likely to change the quality of life in the region.

IND89-4

A discussion of the hazards associated with a spill from an LNG carrier is presented in section 4.11.5.3. Also, see our response to IND60-6 and LA3-55.

Docket No. CP06-365-000

IND90-1

Please read the following article paying
close attention to the highlighted sections.

Please note that Chuck D. Winter Northern
States spokesman calculated the Bradwood
Landing Facility at 600 million dollars, and
Michael Olson principal utility appraiser for the
Oregon Department of Revenue makes it clear
that for tax purposes the project is large.
I believe this situation constitutes a legal
definition of large.

Large projects are not allowed under the
Clatsop County Comprehensive Plan. Therefore
I believe the Clatsop County Planning
Commission and the Clatsop County Commission
erred when they called the Bradwood
Landing Project medium and voted to
approve it.

Sincerely
Paul Darnley

IND90-1

With an operational footprint of only 40 acres, the Bradwood Landing LNG terminal would be smaller than many other current and proposed LNG terminals in the United States, and smaller than other existing industrial developments on the lower Columbia River, such as in Longview, Washington.

Re: docket No. CP06-356-000 et al

Re: Ballast and Filter Water System at the Proposed Bradwood LNG Facility

1. Ballast-Related Physical Properties and LNG Cargo Assumptions

- ☐ Density of Fresh Water (FW) -1000 kg per cubic meter or 264 gals/cubic meter
- ☐ Density of LNG - 450 kg per cubic meter
- ☐ Comparison weight LNG/weight of H2O = $450/1000 = 0.45$
- ☐ 21,800-gals/min average rated maximum output flow on a main salt water-circulating pump for cooling water on a steam ship. This flow rate would be when steam is being used in the main engine, flow rate for port operations would be temperature controlled for maximum cooling efficiency and would average about 50% or less of maximum output. This would equal about 10900 gals/min.
- ☐ $10900 \text{ gals/min} = 2477 \text{ m}^3/\text{hr}$ ($10900 \text{ gpm} \times 60 \text{ mph}/264 \text{ gpm}^3 = 2477 \text{ m}^3/\text{hr}$)
- ☐ $21800 \text{ gals/min} = 4954 \text{ m}^3/\text{hr}$ ($21800 \text{ gpm} \times 60 \text{ mph}/264 \text{ gpm}^3 = 4954 \text{ m}^3/\text{hr}$)

2. Ballast and LNG Cargo Operation Assumptions

- ☐ The maximum LNG discharge rate as configured in the DEIS by three 16" unloading arms, each rated at 5000 cubic meters per hr is 15000 cubic meters per hour.
- ☐ The USCG in their Waterway Suitability Review has approved LNG tankers with a cargo capacity of 148,000 cubic meters.
- ☐ Northern Star has requested LNG tankers with a cargo capacity of 200,000 cubic meters for service. Vessels of this capacity have not been approved for this location by USCG until after the applicant has completed a site-specific analysis.
- ☐ Effective cargo discharge volume is approximately 0.92 of total cargo capacity based on the need for return fuel and the need to keep the cargo tanks cooled.

3. 148,000 Cubic Meter LNG Vessel Cargo Discharge

- ☐ Effective LNG cargo capacity of 148000 cubic meter vessels is 136,160 cubic meters ($148,000 \times 0.92$).
- ☐ Discharging 136,160 cubic meters of LNG at a discharge rate of 15000 m³/hr, gives a discharge time of 9.1 hours. The actual discharge time will be more due

Individuals

91

K-1023

to the fact that start up pumping will be at a slower rate and the pumping rate near the end will be slower. For this scenario we will assume 10 hour discharge time

- ☐ Equivalent LNG weight to Ballast Water weight would be $136,160 \text{ m}^3 \times 0.45 = 61,272 \text{ m}^3$ of H₂O.
- ☐ Rate of fresh water ballast during unloading would be $61,272 \text{ m}^3$ divided by 10 hrs = $6,127 \text{ m}^3/\text{hr}$ H₂O for ballast and cooling.

4. 200,000 Cubic Meter LNG Vessel Cargo Discharge

- ☐ Effective LNG cargo capacity of 200,000 cubic meter vessels is 184,000 cubic meters ($200,000 \times 0.92$).
- ☐ Discharging 184,000 cubic meters of LNG at a discharge rate of 15,000 m³/hr, gives a discharge time of 12.3 hours. The actual discharge time will be more due to the fact that start up pumping will be at a slower rate and the pumping rate near the end will be slower. For this scenario we will assume 13 hour discharge time
- ☐ Equivalent LNG weight to Ballast Water weight would be $184,000 \text{ m}^3 \times 0.45 = 82,800 \text{ m}^3$ of H₂O.
- ☐ Rate of fresh water ballast during unloading would be $82,800 \text{ m}^3$ divided by 13 hrs = $6,369 \text{ m}^3/\text{hr}$ H₂O for ballast and cooling.

5. Questions & Comments

- K-1024
- IND91-1 ☐ The required ballasting flow volume rate is approximately 1.5 X the maximum usual output of the circulating pump for cooling water to the condenser aboard the ship. The flow rate is more than 2.5 X the usual flow rate for port operations. Northern Star proposes to have the ballast water go through the cooling system prior to entry into the ballast water piping. How will flow be controlled?
 - IND91-2 ☐ Why is a simple piping system filed under CEII?
 - IND91-3 ☐ In the DEIS, Northern Star states that each vessel will need 20 to 50 million gals of ballast water and cooling water. If 50 million gals are needed for any vessel, it will require a flow rate of 10,521 m³/hr.
 - IND91-4 ☐ What are the effects on the river bottom of one or more pumps creating suction lift to supply the required volumes of water?
 - IND91-5 ☐ What are the effects on fish near the intake screens?
 - IND91-6 ☐ This filtered water system for cooling and ballast water should be transparent and available for public comment. This will affect future port operations in the Columbia River so it is imperative that other port users can review it.
 - IND91-7 ☐ The required shipboard modifications are expensive. Will they be certified by the regulatory agencies(ABS, Lloyds, DNV, and others)?
 - IND91-8 ☐ Will each ship be required to provide certification to the USCG prior to entry into the Columbia River?
 - ☐ What will be the penalties for non-compliance? Will the penalties be to both the terminal operator and the shipping company?
 - IND91-9 ☐ Who will have the authority to inspect the operation of the system during discharge? Hopefully that would be a National Marine Fisheries representative.

Individuals

91

- IND91-1 The flow would be controlled by the intake pumps and the screens are designed to minimize fish entrainment and impingement. See also our response to comment PM1-31.
- IND91-2 Engineering views of the pump station have been submitted to the FERC and other appropriate agencies for review; however, these design drawings are considered proprietary information and are not available to the public.
- IND91-3 Note that the intake screens have been redesigned and are larger to meet the slot size and intake velocity requirements of the NMFS. Unloading is expected to occur over a period of 18 hours.
- IND91-4 Due to the low intake velocities of the fish screens, there would be no measurable effects on the riverbed.
- IND91-5 As described in section 4.5.2.1, fish screen designs have been reviewed and approved by the NMFS. Furthermore, we have recommended that NorthernStar conduct post-construction monitoring to assess the effects of impingement and entrainment from use of the screened water supply system on juvenile salmonids during terminal operations and provide annual reports to both the FERC and NMFS regarding the efficacy of the screened water intake system, which would identify any problems and address how such problems would be rectified; therefore, impacts on fish in the vicinity of the intake screens are not expected to be significant.
- IND91-6 Engineering views of the pump station have been submitted to the FERC and other appropriate agencies for review; however, these design drawings are considered proprietary information and are not available to the public. The screened water intake system would apply only to LNG carriers calling at the Bradwood Landing LNG terminal and would not affect other ports.
- IND91-7 We are not aware of any certifications for the retrofit.
- IND91-8 The Coast Guard would not have responsibilities or authority relative to screened water intake system.
- IND91-9 NorthernStar would be responsible for meeting the conditions of the FERC's authorization for operation of the LNG terminal. See also our response to comment PM1-31.

IND91-9
cont'd

- ☐ Will the inspectors have the authority to cease cargo operations if the ship and terminal are in non-compliance?

IND91-10

- ☐ All of the above questions should be addressed by FERC and supplied to regulatory agencies (USACE, NOAA, USFWS, ODEQ, & ODFW) prior to the issuance of any permits?

6. Conclusions

I conclude from material publicly available that the ballast & cooling water system as presented has many engineering hurdles to overcome. The US LNG market is basically a spot market of convenience. Looking at the vessel cargo discharges in the existing operating LNG facilities, cargo deliveries are made available to US import facilities when market conditions make the US the highest bidder. Recently, during the summer and fall, we have been a LNG import destination only because we have been the highest bidder on spot market cargoes. When the US is not in this position, cargoes go to Asian and European facilities. How are we guaranteed that the LNG tankers have been retrofitted in this kind of market? Northern Star claims that they will give financial incentives. What are these incentives? What are the economic impacts to other Columbia River Port Districts regarding the Ballast water requirements on discharging vessels in their docks? Who will bear the costs of these new regulations?

IND91-11

The fish screen aspect of this issue is far from being resolved. Final design information has not been made available to regulatory agencies or the public. How are the adverse affects to endangered species determined without specific data? How can a DEIS be presented to the public for review be so lacking in important data?

IND91-12

IND91-13

If diesel motor driven vessels are to be used in this service, then the cooling water criteria will be totally different as they require less cooling water during normal operation. These situations will require a system that can monitor between the different shipboard propulsion systems and deliver cooling/ballast water systemically.

Who is the regulatory body regarding this? The effects of non-compliance are monumental, FERC is the regulatory body. What are the REGULATIONS.

George Exum has been involved in the maritime industry since 1967. I have a USCG license as Chief Engineer of Steam and Motor Vessels – Any Horsepower. I have sailed in all Engineering capacities on both tankers and freighters. Currently I work as a project engineer on ships performing preventative maintenance analysis and correction. I am also certified by ABS to perform ISM (International Safety Management) audits.

Sincerely,

George Exum

Individuals

91

IND91-10 The FERC's responses to comments are provided in volume 2, Appendix K. The FWS and NMFS will have an opportunity to review this EIS and the FERC's revised BA and our EFH assessment.

IND91-11 See our response to comment PM1-31. The retrofit to allow use of the screened water intake system applies only to LNG carriers calling at the Bradwood Landing LNG terminal and would not affect ship traffic at other ports.

IND91-12 See our response to comment FA1-28. Engineering views of the pump station have been submitted to the FERC and other appropriate agencies for review; however, these design drawings are considered proprietary information and are not available to the public.

IND91-13 It is the responsibility of NorthernStar to determine how they would adapt the screened ballast and cooling water intake system to the different types of LNG carriers that would use the Bradwood Landing LNG terminal. See also our response to comment PM1-31.

Re: docket No. CP06-356-000 et al

To whom it may concern:

There are a multitude of issues that need to be addressed regarding the DEIS submitted by FERC regarding this proposed project. FERC staff will address many of these issues and many will be ignored. Unfortunately for the citizens that live in areas impacted by projects under consideration by FERC, their concerns and issues will only be given minimal consideration in the context of "market forces". FERC is a stellar example of the "best government that money can buy". FERC regulates the corporations and industry that fund its operations. This federal commission seems to operate in a vacuum as to the consequences of its decisions both locally and regionally. With regard to LNG, there is no federal or regional plan to determine the need for the product; only the FERC mandate that rewards the "gold rush" mentality to let the "market" decide.

1. December Storm 2007

IND92-1 Recent headlines from the Daily Astoria include: "Coast digs out of Rubble", "Power on Sometime", "Storm Damage comes to the Surface", and finally "There Will Be a Next Time" by Gov Kulongoski. Where in the DEIS are the recent consequences from recent storm damages effectively addressed? I know that FERC sheltered away in Washington, DC rate the recent storm a non-event. Many aspects of the recent storm have immense impacts on the ability of a large industrial facility at Bradwood to operate. The consequences of the recent storm on the operation of the proposed facility are monumental and they need to be addressed for public consideration. The DEIS gave only minimal coverage of storm impacts on operation. Northern Star and their "for hire" associates will conclude that this is a once in a lifetime event. Locally, citizens want to know why it is a recurring event. "Global warming". Who knows!!! Consequently, it is imperative that FERC address and quantify the effects of these repeated storms have on the operation of an LNG facility in their Environmental Impact Statement,

So what happened recently in Clatsop County? How would these events have impacted the operation of the proposed facility? FERC needs to address the impacts and inform the public before considering approval of this project. The recent storm included winds of 150 mph winds on the coast with high winds inland, massive rain, the Columbia River Bar closed to vessel traffic, loss of power throughout Clatsop County, no phone service, no cell phone service (even satellite phones were affected), Emergency services were

Individuals

92

IND92-1

See our response to comment IND22-20.

K-1026

IND92-1
cont'd

without the ability to communicate, 911 and reverse 911 did not operate, many roads closed including Route 30 that provides access to the site, downed trees on every road and many slides, and massive flooding and that is just the start of the list.

The Clifton area around Bradwood was without electrical power for 6 days. I know that Northern Star has included an emergency generator in their plans. What is the duration of operating capacity for this unit? During and after the storm there was no road access to the proposed site. Major arterials on both side of the Columbia were blocked by flooding, slides, and downed trees. The Wahkiakum County Ferry was not operating. Westport, OR was flooded with no access to Route 30. How would the operator of the facility get employees to the site? The USCG base was worked to the maximum and they were required to bring in back-up personnel from bases out of the Pacific Northwest.

IND92-2

What were the storm impacts on the proposed pipeline route? All streams and rivers were near, at, or above flood stage. Trees were broken off or uprooted and hillsides moved. What are the consequences on a pipeline? How much earth movement can the pipeline withstand during a slide? The damage and devastation was even more pronounced along the linked Palomar Pipeline that exists the proposed terminal.

It is imperative that FERC take the effects of this event into consideration regarding this project. Consult with government agencies that have had to deal with this. Read the press accounts of the storm. Remember what Governor Kulongoski has stated in the press, "There Will Be a Next Time".

Sincerely,

George W. Exum

Individuals

92

IND92-2

Flood and landslide hazards along the proposed pipeline route are addressed in section 4.1.4.3. The Palomar Pipeline is not part of the proposed action.

Re: docket No. CP06-356-000 et al

To whom it may concern:

IND93-1 There are a multitude of issues that need to be addressed regarding the DEIS submitted by FERC regarding this proposed project. It seems as though FERC is rushing the EIS process. The DEIS is supposed to be the summary of all the material that the applicant is required to provide that has environmental consequences. Some of the information required is still being presented by the applicant, how does this haphazard approach relate to the normal NEPA process for energy projects? Many topics are followed by FERC staff recommendations that the applicant supply info or plans prior to construction or operation. Unfortunately the requested information or plans have environmental impacts or consequences to the project, how can the public and governmental agencies analyze and provide comment after the fact? It seems that all information and design criteria should be available for comment prior to the end of the public comment period. FERC relies totally on the information and modeling funded by Northern Star. Has FERC verified and validated the modeling performed in Northern Star's funded studies? Does FERC independently confirm the input and variables of the models used by an applicant? The DEIS for the proposed Bradwood facility is as Governor Kulongowski has stated, "flawed and incomplete".

IND93-2

There are many vague or forward approving topics. Following are a few that I feel should be addressed in the FEIS.

1. Liquefaction and depth of foundation of the tanks.
2. Shoreline Erosion and fish stranding on Puget Island caused by LNG Tanker propeller wash and thruster operation. Also the impacts of three tugboats and military gunboats.
3. Inadequate mitigation
4. Dredge Spoil Disposal
5. Emergency Response Plans
6. Water disposal from SCV operation
7. Property values of residences within the blast zone of vessel transit, the terminal, and the outgoing pipeline.
8. Part 2 of the proposed Palomar Pipeline is linked infrastructure.

On the following pages, I will question how the DEIS addresses these issues

Individuals

93

IND93-1 The FERC has not been rushing through this process, and has been studying this project for almost 3 years. We believe the EIS has been prepared in compliance with NEPA regulations and that it is adequate. See also responses to comments PM5-57 and PM6-94.

IND93-2 See our response to comment IND33-9. Section 4.11 explains how we used modeling to develop exclusion zones.

- IND93-3 1. **Liquefaction**
Potential exists for liquefaction to occur at the proposed LNG terminal. In the DEIS page 4-12, "the upper 85 feet at the site would liquefy during events with large ground motions. The section goes on to state that deep foundations would support the LNG storage tanks. How deep? I assume below the 85 feet of soil that could liquefy. Does that 85-foot figure include the dredge material that Northern Star proposes to put on the existing site? During the last major seismic event in 1700 the land on Puget Island and other areas in the estuary sank approximately 3 feet (see research previously submitted to FERC by K. Takada & B. Atwater). What would the consequences be to the terminal and the send out pipeline if the ground dropped that much? It should be examined and detailed in the FEIS. Most of the staff recommendations in the DEIS include the phrases like in the design phase, prior to construction, or prior to commissioning. Seismic activity has monumental environmental consequences but FERC seems to be rushing to approval prior to the information necessary.
- IND93-4 2. **Shoreline erosion**
In the DEIS page 4-66, FERC states that they do not anticipate propeller wash from LNG ships and tugs would result in significant degradation of water quality even though in the same paragraph they state that ship wakes breaking on the shore could cause increased erosion along the shoreline and re-suspend the eroded material in the water column. FERC generalizes the effects in section 4.1.2.3. Unfortunately nowhere are the effects of the ship's propulsion engines, assist thrusters, 3 tugboats, and multiple USCG gunboats scurrying around on the shoreline of Puget Island. During the turning maneuver all vessel's propeller thrust will be directed towards the island's shoreline. The DEIS does not address the issue of erosion on Puget Island during the maneuvering and turning of multiple vessels. An independent agency should analyze the situation. If the project moves forward, then Northern Star should be financially responsible to ensure the shoreline and property on the west side of Puget Island, It is FERC's responsibility to make this a condition.
- IND93-5 3. **Mitigation**
How can the Hunt Creek area, which is already natural, be considered for mitigation? Maybe Northern Star will destroy it so they can then restore it to the condition that now exists there.
- IND93-6 4. **Dredge Spoil Disposal**
Northern Star proposes to pump approximately 350,000 cubic yards of material to the Wahkiakum County Sand pit and adjacent shoreline on Puget Island. From discussions with Wahkiakum County officials, the USACE also plans to use this same area for the Columbia River Deepening Project and for regular maintenance dredging. Where will Northern Star place dredge material if the closest place is not available? On a similar path, the JARPA submitted by Wahkiakum County

Individuals

93

- IND93-3 The foundation piles would be set into stable soils at depths of at least 140 feet. See also our response to comment PM1-6.
- IND93-4 See our response to comment PM3-18.
- IND93-5 Preservation of the Hunt Creek Mitigation Site as part of the NorthernStar's Compensatory Mitigation Plan is discussed in the response to comment FA3-3. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.
- IND93-6 NorthernStar would place additional dredged material at the LNG terminal site or at another approved dredged material disposal site.

IND93-6 cont'd	for those location only requests a permit for the placement of no more than 205,000 cubic yards of material.
IND93-7	<p>5. Emergency Response Safety and security are paramount for the transportation, storage, and re-gasification of LNG. All aspects of safety and security including local gaps in resources, necessary equipment, evacuation, available medical personnel and resources, police requirements, and funding for all of these services needs to be addressed prior to construction. The applicant should shoulder funding for all of the services that are additional to local communities. If the facility were not there, then the local community would not need the extra services. FERC as the regulatory agency should make a condition of any approval on the applicant to formulate a plan with all affected local communities and contractually agree to the funding prior to the start of construction.</p>
IND93-8	<p>5. Water Disposal Operation of the Submerged Gas Vaporizers will generate approximately 160 gals of wastewater per minute. This water will be chemically treated to neutralize its acidic nature. In all probability it will also need to be treated for dissolved oxygen. Nowhere in the DEIS is the total chemical treatment explained for public comment. Only temperature is listed as a concern. FERC's solution is the old adage, "the solution to pollution is dilution". Industry worldwide has found solutions that eliminate discharging into sensitive waterways. Obviously, we don't want to inconvenience the applicant.</p>
IND93-9	<p>6. Property values The section on property values borders on the ridiculous. To compare property values next to a small peak storage facility, which in all probability is located in an industrial area, to a large noisy illuminated re-gasification facility in a beautiful rural setting is absurd. Also to claim that the most recent studies on this type of situation were 1993 seems to be strange. George Tolley from the University of Chicago has done extensive studies on residential property near numerous types of industrial facilities, including the approximate percentage loss in property value determined by the distance from the industrial facility. FERC requires mitigation for numerous things including plants, animals, fish, and numerous activities but does nothing for economic impacts on people. Another example of absurdity is the statement from FERC/Northern Star that claims "the site would have minimal impact on the view shed from roadways and surrounding communities". How is a facility with two 17 -story tanks with noisy industrial fully illuminated components a "minimal impact" on the surrounding communities?</p>

Individuals

93

IND93-7	See our response to comment IND60-6 and LA3-55.
IND93-8	NorthernStar proposes to discharge the excess SCV water directly to the Columbia River under an NPDES permit following pH adjustment. Sampling and analysis of the SCV discharge would be carried out in accordance with the requirements of the NPDES permit issued by the ODEQ.
IND93-9	See our responses to comments PM1-5 and IND3-16. Visual impacts including the LNG storage tanks are discussed in section 4.7.2.7.

IND93-10

7. **Palomar Pipeline**

By some logic, a pipeline that carries the product from a re-gasification facility to an end user is not linked to the project. What kind of piecemeal approach is being used? Indications from agencies and business state that the capacity of the Williams pipeline is at capacity. Where will the output from the proposed Bradwood facility go?

Sincerely,

George W. Exum

Individuals

93

IND93-10

As described in section 3.1.2.2, we consider the Palomar Project to be a separate undertaking from the Bradwood Landing Project. Neither project is inter-dependent on the other. If Palomar is not authorized or built, the Bradwood Landing Project could still go forward, and vice versa. As discussed in section 1.0, the Williams Northwest pipeline would have capacity for the natural gas from the Bradwood landing pipeline project.

FEDERAL ENERGY
REGULATORY COMMISSION

Re: Docket No CP06-000 et al.

CP06-365-000

To Whom It May Concern:

Thank you for providing this venue for me to voice my opinions.

I have three major concerns

- IND94-1 1. **Distance from the proposed plant to Puget Island.** Using a GPS we measured from shore to shore from our property to the proposed site. This is 0.48 miles. Because we are so close, we will be the direct recipients of pollution (noise, light, carbon dioxide emissions).. And in a worse case scenario, we would be in danger of fire. (Please note the photos which I have provided showing distance.)
- IND94-2 2. **Size of the project.** According to the DEIS there are several pages where this is referred to as a large project. The site where the proposed plant is zoned for a small to medium size plant. The following are pages from the DEIS:
- p. 162 A type of low-profile LNG storage tank, referred to as LNG Smart Horizontal Tank Storage, has been developed by Mustang Engineering, but has not been used on a scale as large as the proposed project.
- P. 165 Because the surface area of the heat exchangers needs to be large for efficient heat transfer, the structures would be large and require significant space for construction and operation.
- P. 266 Potential impacts on water quality, resulting from boring operations would be due to the relatively large work areas.
- p. 328 Due to the very dynamic nature of large-scale construction, Northern Star has not defined specific lighting plans for construction.
- P. 262 Most large energy facilities in Oregon are under the jurisdiction of the Oregon Energy Facility Siting Council.
- P. 565 Motor vehicles are a primary source of air pollution with large industrial facilities accounting for

Individuals

94

- IND94-1 Visual impacts associated with lighting at the proposed LNG terminal are discussed in section 4.7.2.7. In addition, this section has been revised to include additional information regarding NorthernStar's terminal lighting plan. Potential impacts in air quality and noise associated with the proposed project are discussed in section 4.10. Section 4.11.5.4 discloses that there are 22 structures overlapped by Zone 1 on Puget Island. However, with the safety considerations outlined in section 4.11, we believe that this project does not represent a danger to the public or nearby residences.

- IND94-2 See our response to comment IND90-1.

K-1032

Individuals

94

IND94-2 | less than 15% of most types of criteria pollutants

cont'd

Finally there are four pages that contain the same phrase:

p. 276 For any large construction project there is the potential for spills or leaks.

P. 283 For any large construction project there is the potential for spills or leaks

p.329 For any large construction project there is the potential for spills or leaks

p.350 For any large construction project there is the potential for spills or leaks

As you can see, the FERC and Northern Star refer to this project as LARGE. It is not small to medium size.

3. Safety concerns

IND94-3 | There have been concerns raised by elected officials as well as concerned citizens regarding the safety plan as stated in the DEIS. I want to add a further concern. Clatsop County was crippled by the recent rain/wind storm. Highway 30 was closed due to landslides. I have included some newspaper accounts of this storm. Although seldom, this kind of storm happens in this area. With the landslides, there was no way to get to Astoria or Portland. What would happen if there was an emergency with an LNG plant sited in this area?

I would like you to take these three areas of concern-distance, size, and safety.

Thank you again for taking my comments into consideration.

Sincerely,

Carol A. Kriesel

Re: docket No . CP06-356-000 et al

To whom it may concern:

IND95-1

The Society of International Gas Terminal and Tanker Operators (SIGTTO) is an international organization that has formulated the industry standards that have help to create the current safety and operations record of the LNG industry. The society was formed to develop and promote the criteria for best practices.

FERC and Northern Star's selection of Bradwood fails on many levels to adhere to the best practices as detailed by SIGTTO. I will list some of them and will include the SIGTTO publication, "Site Selection and Design for LNG Ports and Jetties."

1. Short approach channels are preferable to long inshore routes which carry more numerous hazards.
2. The width of the channel should be examined throughout its length to confirm that it provides adequate navigable water in all operational contingencies.
3. Ship movements by nearby ships when the LNG carrier is pumping cargo should be disallowed.
4. Locations that already attract other craft, including pleasure craft and fishing vessels, are inherently unsuitable for LNG terminals.
5. Ideally, LNG terminals should be sited away from fairways used by other ships. Even when protected from the threat of approaching ships, the berth ought to be free from wave effects generated by passing traffic.
6. Harbor channels should be of uniform depth and have a **Minimum** width equal to **Five Times** the beam of the largest ship
7. Turning circles should have a minimum diameter of twice the overall length of the largest ship where current effect is minimal. Where turning circles are located in areas of current, diameters should be increased.

There are also many other items that FERC, USCG, & Northern Star have attempted to engineer around to make a unsuitable site acceptable to themselves. The DEIS fails to address what is the worldwide best practices with regard to LNG.

Individuals

95

IND95-1

See our response to comment IND60-11.

IND95-2 Finally, a brief comment about a figure in the DEIS. Figure 4.4.1-2 on page4-93, labels the waterway adjacent to the terminal incorrectly. According to NOAA Chart 18523, the waterway is Clifton Channel not the Columbia River. Obviously NRG staff was to busy on the Palomar Pipeline to verify the information on Bradwood.

The DEIS is "flawed and incomplete"!!!!!!

Sincerely,

George W. Exum

Individuals

95

IND95-2 The Clifton Channel is part of the Columbia River. See our response to comment PM4-20.

Washington, DC 20426

Re: Docket No. CP06-365-000 et al.

ATTN: Gas Branch 3, PJ11.3

To Whom It May Concern:

We're writing to say that we oppose the building of the LNG plant at Bradwood, OR and the building of the pipeline across Cowlitz County in Washington State. We are landowners who will be directly impacted, again, by the construction of a pipeline. To us it means increased trespassing, increased exposure to liability from those trespassers, loss of income-producing forestland and loss of wildlife habitat. Since this pipeline will apparently be placed south of the existing pipeline, we're also very concerned about its effect on our spring, the only water source for our household. No one is sure where the aquifer is that feeds our spring and if it is damaged during construction it is irreplaceable to us. It will be an invasive 100-foot-wide swath out of our forest. The final frustration of this whole process is that no one can tell us exactly where this pipeline is going to be built, and our experience with a previous pipeline that was built is that people tell you one thing and do something completely different. Why can't we get accurate maps and statements to say exactly where it is going to go on our property? In fact, the information provided by the Army Corps of Engineers doesn't even make it clear where the proposed pipeline will cross the Columbia River.

In the Draft Environmental Impact Statement (DEIS), on page ES-3, it was recommended that NorthernStar would allow only ships that can hook up to their screened water filtering system, when they take up their ballast water, "...up to 50 million gallons over a 24-hour period." (DEIS, p. 4-67) Yet on page 2-7, "NorthernStar has stated it will offer contract incentives to the LNG suppliers to retrofit the LNG ships with the piping and equipment necessary to connect with the filtered water supply." The implication here is that if they choose not to retrofit, they'll just suck up unfiltered water with all the accompanying juvenile salmon or other fish that are there. This should not be acceptable.

We have many other concerns about the impact of this project on our river and surrounding environs. It just does NOT, in our opinion, fit our river and the places around it. Specifically, this river, with its relatively narrow channel, serves a huge area upriver clear to the Lewiston, Idaho. If some disaster were to happen, shipping would be shut down. Similarly, if NorthernStar chose to use smaller boats and had to have an extra ship anchored in the river, waiting to offload (with its exclusion zone of 500 yards, DEIS p.4-431), all of the upriver commerce, from Longview's port and beyond, would be impacted. This is not a wide harbor on a busy seacoast where ships can choose to move to another port. Our states stand to lose much valuable commerce due to the opening of this one facility. That does not seem fair.

Many industries along the lower Columbia River are dependent on its pristine habitat. Timberland makes up a major portion of the land base and lumbering and pulp and paper are still major employers. Tourism is growing rapidly. Fishing, both sport and commercial, are major employers, and both occur in the Bradwood area in addition to along the route of the ships. Four species of salmon and steelhead, sturgeon, Dungeness crab, smelt and crayfish are all harvested in the lower river. The seasons are carefully managed and are time-dependent as part of their

- IND96-1 We revised the text of the EIS to address the potential for trespass and unauthorized use of the pipeline right-of-way by ORVs. Impacts on forest and mitigation are discussed in section 4.4.2.3. See our response to comment PM3-6.
- IND96-2 See our response to comment PM6-85. The EIS discusses potential impacts on springs and wells, and we have included a recommendation that the Commission Order contain a condition requiring NorthernStar to develop a plan to mitigate impacts on residences and residential water supplies within 50 feet of the construction right-of-way. Impacts on wildlife and mitigation are discussed in section 4.5.3.3.
- IND96-3 Comment noted. Upland forested communities would be replanted in-kind with trees, with the exception of the portion of the right-of-way within 15 feet of the pipeline. NorthernStar's proposed tree planting exceeds the revegetation requirements of the FERC staff's Procedures.
- IND96-4 See response to comment PM1-38.
- IND96-5 See our response to PM1-31.
- IND96-6 As discussed in section 4.7.1.5, LNG ships would be generally consistent with large tankers that currently use the navigation channel heading to and from upriver ports. Given the measures to be implemented by NorthernStar and the conditions of the Coast Guards WSR, we believe that an accident involving an LNG carrier shutting down commercial traffic on the Columbia River is highly unlikely. See our responses to comments PM1-14, PM1-52, PM3-11, PM5-31, PM5-47, and others.
- IND96-7 The lower Columbia River is not a pristine habitat, and places along the river have been developed for commercial and industrial uses since the early nineteenth century. As explained in sections 4.7 and 4.8 of our EIS, we do not believe that the project would have significant impacts on the timber industry, fishing, commercial shipping, and recreational boating. Impacts on fisheries are discussed in sections 4.5 and 4.6.

IND96-7
cont'd

compliance with Endangered Species regulations. Halting or postponing a fishery could have a devastating impact on the management and success of that fishery and its ability to stay within its EIS guidelines.

We hope you will deny NorthernStar their final permit to build this facility. Thank you for this opportunity to express our concerns. If you would ever like to have a tour of our property, please feel free to contact us. We have a barn that has recently been added to the Washington State Heritage Barn Register. We manage our forestland for a compromise between profit and habitat. We enjoy sharing our sustainable-yield tree farm with interested people.

Sincerely,

Robert and Lisa Sudar

FERC
Reference docket No. CP06-365-000 et al

These comments pertain to the DEIS for the Bradwood Landing LNG Project in Oregon. I am a professional ecologist and writer who resides in Washington not far from the proposed project site. I will confine my remarks to four essential points:

- IND97-1 1) Consideration of the potential impacts to the Julia Butler Hansen National Wildlife Refuge is extremely cursory and inadequate in the document. One would think from the data presented that the only effect would be shore-wash from LNG ship wakes, and that this would be minor. In fact, the proximity of the terminal to the major refuge for the endangered Columbian white-tailed deer places this national resource--and the many years and public funds spent toward its recovery--in jeopardy from accident and fire. This adjacency alone should render the site selection invalid.
- IND97-2 2) Many points in the EIS admit that accidental or intentional release of LNG from the terminal or ships would have the potential for major damage, from immediate lethality to regional forest fire over a long stretch of Columbia shoreline. But in each instance, this concern is met by the summary statement that "the risk of gas release is very low and can be managed." This response is far too glib and dismissive of actual threat. Even if the statistical risk is deemed to be low, the specific consequences should be parsed in the EIS. For example, what would riverside forest fires mean for erosion and its effect on salmon and sturgeon populations in the downslope waters? What would the likely mortality of Columbian white-tailed deer be in the case of a pool fire spreading to island habitats very near the project site? And so on. There are many such potential cases, skirted by the present document, that should certainly be modeled in full in any final EIS.
- IND97-3 3) The narrative of mitigation measures is unbalanced and conveys no compelling reason to accept it at face value. While salmonid mitigation is discussed at length, many other aspects are only suggested in vague lines. For example, control of alien weeds is often mentioned as a goal, with almost no discussion as to how this difficult work would be accomplished. And while the restoration of plant communities is laid out with species lists, there is a paucity of detail as to how such worthwhile but always very challenging goals would be realized on the ground. In other words, some problems are recognized and glossed over with pretty but unrealistic plans, while others are simply ignored. In reality, many plant communities and their attendant fauna would be heavily affected by the project site and the pipeline, and the ideal of mitigation and recovery would likely lose attention as its difficulty became apparent, and ultimately fail. The full EIS would require much more concrete detail about how such a common outcome would be avoided, and how mitigation promises would be guaranteed. In any case, I have serious doubts about several of the mitigation measures proposed as regards their functional equivalency with existing ecological conditions.

Individuals

97

- IND97-1 Potential project impacts on the JBHNR are discussed in sections 4.7.1.4, 4.7.2.6, 4.7.3.6, and 4.8.1.7. Impacts on the Columbian white tailed deer are discussed in sections 4.6.2.1, 4.6.2.2, and 4.6.2.3.
- IND97-2 Even if the probability of an impact is exceedingly low, the FERC's EIS for the Bradwood Landing Project recognizes the catastrophic consequences that could result from an accidental or intentional release of LNG. However, according to the CEQ regulations for implementing the NEPA, we only need to consider impacts that are likely to occur. We believe that a release of LNG is highly unlikely, given the measures that NorthernStar would implement and the conditions required in the Coast Guard's WSR. After mitigation, we conclude such effects would not be significant. Where new information is available and where it is appropriate, the EIS has been updated to include additional information on the potential impacts of an LNG release on wildlife in the project area (see section 4.6.1.4). However, the analysis was done in a manner that was concise, clear, and to the point. Updates were completed provided that the analysis of the impacts was supported by credible scientific evidence, was not based on pure conjecture, and was within the rule of reason (see 40 CFR 1502.22).
- IND97-3 The adequacy of compensatory mitigation proposed for the project is discussed in the response to comment FA2-10. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11. Implementation of the final Compensatory Mitigation Plan would be assured through the FERC's authorization of the project. Noxious weed control is discussed in the response to comment FA3-10. Directions for accessing NorthernStar's Noxious Weeds and Soil-borne Plant Disease Control Plan via the eLibrary can be found in the response to comment PM6-60.

IND97-4

4) Finally, in my area of expertise, I find almost no attention to terrestrial invertebrate populations in the vicinity of the Bradwood Landing project site. The Federally Threatened Oregon silverspot butterfly is considered, which does not occur nearby--yet virtually no other attention is given to insects and other invertebrates, in spite of the fact that they comprise the great majority of the biota in the affected area. As just one example, what impact would the vastly increased ambient night-time light have on native moth populations? A large and diverse lepidopteran fauna occupies the project area, but no attempt has been made to survey it or to ask such questions. Moth depletion through light pollution is well documented and can lead to diminished bat and songbird populations--but where is this recognized, or even asked, in the DEIS? Many other such questions are left hanging about other insect orders, let alone overall invertebrate components of the local ecosystem.

In summary, I find the biological analysis of Bradwood Landing impacts and mitigation measures to be uneven, often shallow, acutely uninformed and unhelpful in some key areas, and altogether inadequate. As a local ecologist familiar with Wahkiakum and Clatsop county flora and fauna, I believe that the impacts of the Bradwood Landing LNG project and pipeline would be far more severe and long-lasting than the DEIS suggests. The document fails to inspire any confidence in the environmental acceptability of this massive industrial project, were it to be imposed in a rural and wildland setting such as ours.

Thank you for your attention to my comments.

Robert Michael Pyle, Ph.D. (Ecology and environmental Studies, Yale University, 1976); Founder, the Xerces Society for Invertebrate Conservation; author, Wintergreen, etc. 369 Loop Road, Gray's River, WA 98621 (360)-465-2539

NOTE: I attempted to submit these comments on-line prior to 5 p.m. on Wednesday, December 26, 2007, with my registration no. F168936, but my on-line comment was met with this message several times: "We apologize, an unexpected error has occurred on the server. FERC support staff have been notified of this problem and will work to resolve it as soon as possible. Please try again later." On account of this problem through no fault of my own, I hope my comments above will be allowed into the record of public response.

Individuals

97

IND97-4

Based on the CEQ's guidelines, inclusion of all additional information and plans is not necessary for an EIS to provide a full and fair discussion of significant environmental impacts in a manner that is concise, clear, and to the point (see 40 CFR 1502.1). The FERC staff believes that the draft EIS provided sufficient detail to allow a review of wildlife occurring within the project site and determine the extent of potential project impacts on that resource.

Re: Docket No. CP06-365-000, Bradwood Landing Project

Attn: Gas Branch 3, PJ11.3

Dear FERC Commission Members:

During this comment and rebuttal period to the DEIS, there are specific concerns regarding wildlife habitat that I would like for you to please formally address and respond to.

IND98-1 | In a pre-DEIS letter, I wrote of my concern for the safety and protection of the greater and lesser scaup of the Clifton Channel in regard to the obvious negative impact to their habitat that tanker transport, storage, and conversion of LNG at Bradwood Landing would entail. In addition, the dredging of the river to accommodate these tankers would adversely impact their habitat. Would you explain how these major impacts would not significantly harm the scaup and other migrating and native birds and waterfowl that use and inhabit the Clifton Channel? The Clifton Channel is within the Pacific Flyway and is important, fragile, unique, and vital to the wildlife of the lower Columbia River. Additionally, the effect of the high structures and lights on night-migrating birds would be negative and profound. [Mitigation in the form of proffered low-light emissions and camouflage are not really satisfactory in this regard].

IND98-2 | I would also like to bring up the concern of the pipeline and its impact on the Columbian white-tailed deer population and other wildlife that inhabit these areas. The proposed pipeline would pass through several miles of prime Columbian white-tailed deer habitat, disturbing and displacing the population. Besides the significant impact to the habitat by constructing the pipeline, there is also potential devastation (should there be an explosion or fire at the plant or at the pipeline sites) to human and wildlife populations in the areas as well as to the nearby protected Columbian white-tailed deer herd and wildlife habitat of the Julia Butler Hansen NWR at Tenasillahe Island.

There are many such serious concerns regarding wildlife habitat that the DEIS did not sufficiently or satisfactorily address. Please re-evaluate and address these concerns further.

Thank you,

Jessie Jones

Santa Barbara, CA 93130

Individuals

98

IND98-1 | The greater and lesser scaup are included in tables 4.5.1-2 and 4.5.3-4, which describe the wildlife species that occur in the vicinity of the project. Potential impacts on wildlife from construction and operation of the proposed LNG terminal are discussed in section 4.5.2.1. In addition, potential impacts on migratory birds due to the LNG terminal are described in section 4.6.2.2.

IND98-2 | See response to FA4-5 for a discussion of potential impacts on Columbian white-tailed deer from the Bradwood Landing Project. Potential impacts on humans and wildlife due to a catastrophic event at the LNG terminal site are discussed in sections 4.11.6 and 4.5.2.3, respectively. Potential impacts on humans and wildlife due to a catastrophic event along the pipeline route are discussed in sections 4.11.9.3 and 4.5.3.3, respectively. See our response to comment IND97-2.

RE: OEP/DG2E/Gas 3
Bradwood Landing LLC Northern Star Energy LLC
Docket Nos. CP06-365-000, CP06-366-00, et al.

IND99-1

This is a comment regarding the treatment of the **California Brown Pelican** (*Pelecanus occidentalis*) in the Threatened and Endangered Species section of the Environmental Analysis for the proposed Bradwood Landing LNG terminal. I am a professional wildlife biologist with a specialty in Brown Pelicans. I have conducted numerous field research projects on Brown Pelicans and other seabirds on the Pacific Coast over the past 20 years, including the Columbia River mouth region. The Draft EIS fails to acknowledge the importance of the Columbia River estuary to the Brown Pelican and underestimates the damages that could be incurred to this species in the event of LNG tanker breach at the mouth of the river.

The Columbia River estuary supports as much as 20% of the U.S. west coast population of Brown Pelicans during the migratory season, and is the location of one of the largest traditional non-breeding communal roosts for the species in the United States. More than 10,000 Brown Pelicans have been recorded at East Sand Island, just inside the river mouth at Baker Bay. Many other smaller pelican roost sites exist adjacent to the projected path of the LNG tankers. Pelicans commonly occur as far as 18 miles up the Columbia River, at Rice Island. Several government agencies, universities, and environmental consultants have documented Brown Pelican use of the estuary; including the U. S. Fish and Wildlife Service, University of California at Davis, Oregon State University, Crescent Coastal Research, and Pacific Eco Logic.

While the DEIS does mention that pelicans roost on dry land, it does not mention the primary roost site inside the river mouth, any of the other roost sites in the study region, or the intensive use of the estuary by foraging brown pelicans.

The assessment that "*Brown pelicans occurring along the waterway would be limited to the area near the mouth of the Columbia River during the summer months*" is faulty on 2 points, 1) the birds may found at least 18 miles up the river, and 2) pelicans commonly occur in the estuary from April through November, not just during the summer months.

Individuals

99

IND99-1

Additional information has been added to section 4.6.1.1 on use of the Columbia River estuary by brown pelicans. In addition, section 4.6.1.4 has been revised to reflect potential impacts on brown pelicans in the event of an accidental or intentional release of LNG along the waterway while brown pelicans are present. However, an analysis of population-level impacts on the brown pelican due to the breach of an LNG ship that is supported by credible scientific evidence is beyond the scope of this EIS (see 40 CFR 1502.22).

IND99-1
cont'd

The DEIS states that *"During operation of the proposed project, impacts on brown pelicans from LNG marine traffic would be limited to an accidental or intentional breach of an LNG ship. If a brown pelican were to be in the vicinity of an LNG ship in the event of an accidental or intentional breach, the pelican would likely be injured, killed, or displaced from the area."* Since there could potentially be thousands of pelicans in the vicinity of an LNG ship in the lower estuary, it would be more accurate to state that thousands of pelicans could likely be injured, killed or displaced in the event of an accidental or intentional breach of an LNG ship. The loss of thousands of pelicans in the Columbia River estuary would represent a significant negative impact to the west coast population of the Brown Pelican.

The document goes on to state that *"the risk of an accidental or intentional release of LNG during transit of the LNG ships is extremely low and can be managed by implementing the recommendations in the Coast Guard's WSR."* It is not realistic to expect that even the best plans can prevent significant damages to habitat and wildlife. I have just returned from conducting Natural Resource Damage Assessment work at the San Francisco, California oil spill, where it was clear that responses to such incidents do not always go as planned.

There is no one published document that covers the use of the Columbia River estuary by Brown Pelicans, however, there are many unpublished reports, data sets, meeting abstracts, professional and agency contacts that can be tapped for a proper assessment in the final EIS. I can provide documents supporting the above statements upon request.

Thank you for the opportunity to comment on this project. I hope that the final EIS will reflect a more thorough and accurate treatment of this federally listed species.

Sincerely,

Deborah Jaques

Re: DEIS Comments on Bradwood Landing LLC – Docket No. CP06-365-000,
Northern Star Energy, LLC – Docket No. CP06-366-000, and FERC/EIS – 0214D, *Draft
Environmental Impact Statement* – Bradwood Landing Project Volume I. August 2007

Dear Secretary Bose:

Bradwood Landing is for Fishing.

I am a lifelong Oregonian/Clatsop County resident with nearly 40 years of personal experience with the Bradwood Landing area of the Lower Columbia River Estuary. To say I am dismayed at the proposed Bradwood Landing LNG terminal project is an understatement. For me and the numerous others who fish this unparalleled salmon fishing area, our fate to continue pursuing our passion here appears to now lie solely in your Commissioners' hands. In reviewing the Bradwood Landing Draft Environmental Impact Statement (DEIS) for the project's impact(s) on fish and fisheries resources, I found many of the conclusions to be based on inadequate science and less than truthful submission of basic biological facts about this reach of the river. On this basis alone, the Commission should not be making a decision to license this facility because the information before them is simply inadequate. For the record, please submit the following comments about salmonid biology and fisheries of the Lower Columbia River estuary that the above referenced DEIS does not adequately address.

Background

The Columbia River Estuary is the culmination point for all of the upriver sub-basins and tributaries. The health and overall long-term survival of all of this river's migratory salmonid species depends, to a significant extent, on a fully natural functioning estuary and a healthy lower Columbia ecosystem. The significance of this phenomenon is paramount to the entire range of salmonid life history types represented by such a vast watershed (the river and its tributaries are the dominant water system in the Pacific Northwest) and is unrivaled by any other river system in the continental United States.

The area comprising the Bradwood Landing site is located at Columbia River Mile (CRM) 38 and is within the head of tidewater in the Lower Columbia River Estuary. The affect of the twice a day Pacific Ocean tide reversal of fresh water river flow occurs even to a greater extent upriver of Bradwood, as far as Oak Point (CRM 53) and the extent of tidally induced changes in water level are observed even further upriver as far as Bonneville Dam (CRM 146).

Individuals

100

K-1043

K-1044

It is common knowledge that juvenile salmonids migrate to the ocean, residing in the head of tidewater areas of estuaries for weeks to months at a time as they grow and adapt to salt water before moving out to sea. It is here in the estuary where they make the critical transformation from a freshwater to a saltwater fish, a process called smoltification. With this transformation come changes in body chemistry, appearance, and behavioral characteristics. When these same fish return from sea as adults, they pause again in the estuary to readapt to freshwater, before heading back upstream to spawn and complete the life cycle. Consequently, because of this behavioral use of the estuary by salmonids, the most highly productive fishing opportunities for recreational and commercial fisheries are resultant.

In light of these facts and considering the unique/critical nature of the Lower Columbia River estuary for fish and fisherman, CRM 38 (Bradwood Landing) is within the worst possible area of the river for sighting a LNG Terminal operation.

Specific Comments to the DEIS missing or found to be problematic for fair evaluation of fish or fisheries resources in addition to other comments I am already aware that have been submitted to FERC:

Section 4.5.1.2 (p.4-125)

Identification of Essential Fish Habitat along the Waterway for LNG Marine Traffic

IND100-1 The statement of "2 species of salmon" is not true. There are 7 species of salmonids found in the Lower Columbia River Estuary immediately around the proposed LNG terminal location, including five species of salmon (Chinook, Coho, Chum, Sockeye, & Pink) and two species of trout (Steelhead and Sea run Cutthroat).

Section 4.5.2.1 Aquatic Resources (p. 4-132)

IND100-2 The extent of saltwater intrusion in the Lower Columbia River is transient, not a static/stationary location at CRM 23 as suggested here. For example, the extent of saltwater intrusion has been measured beyond Pillar Rock (CRM 28) during periods of low river flow. The extent of the upriver estuarine boundary is also much further upriver than stated. Reversal of river flow during high tide is measurable as far upstream as Oak Point (CRM 53) (an area well beyond the proposed Bradwood Landing LNG terminal site at CRM 38).

NOTE: *The extent of saltwater intrusion is subject to extend even further upstream from its current recognized location as a result of any future channel deepening (dredging) efforts within the Lower Columbia River estuary.*

Section 4.5.2.2 (p. 4-154)

Essential Fish Habitat

IND100-3 This section implies that only two species of salmon, Coho and Chinook may be affected negatively by the construction of this project. As stated previously, there are seven species of salmonids that utilize the Lower Columbia River Estuary, including the area surrounding the Bradwood Landing site. Again, these other species include, Chum, Pink, and Sockeye salmon and Steelhead/Sea-run Cutthroat trout.

Individuals

100

- IND100-1 Sections 4.5.1.2, 4.5.2.2, and 4.5.3.2 discuss EFH in the vicinity of the proposed project. As discussed in section 4.5.1.1, six species of salmonids occur within the lower Columbia River and its tributaries (Chinook, coho, chum, and sockeye salmon; steelhead; and coastal cutthroat trout); however, EFH has only been defined for two of these species (Chinook and coho). Pink salmon do not occur in the lower Columbia River system.
- IND100-2 Section 4.5.2.1 has been revised to reflect the extent of saltwater intrusion into Columbia River. The additional dredging that would occur for the terminal area would represent an increase of approximately 0.1 percent to the existing dredged area within the navigation channel that between the mouth of the Columbia River and Portland. Therefore, impacts on saltwater intrusion along the lower Columbia River are not expected to be significant.
- IND100-3 See our response to IND100-1.

Figure 4.7.1-1

IND100-4 This map is incomplete; it should show all the commercial gillnet drift locations and popular recreational fishing areas including where boats anchor along the shorelines and/or in the main channel, tie up to the pile dikes, areas that are targeted for trolling, and the entire popular beach fishing locations.

Section 4.7.1.4 (pp. 4-279 – 4-280) and Section 4.8.1.7 Transportation and River Traffic (pp. 4-328 – 4-330)**Commercial and Recreational Fishing Use of the Columbia River**

IND100-5 The applicant has stipulated in various public meetings that LNG ships will navigate the Lower Columbia River at night during the key fishing seasons to avoid disruption of the highly popular fisheries for both Recreational and Commercial users. This is not true, as anyone who lives along the river or who knows anything about ship traffic operations, know that ship movement in the river is entirely dependent on stage of tide, tide height, river bar conditions, weather, bar/river pilot availability, and competition for the limited space within the navigation channel as it is utilized by other ship traffic. (This is partly brought to light in the 1st paragraph of page 5-9 and the 4th paragraph on page 5-12 of the DEIS). In other words, LNG ships will cross the bar and move up and down the river when conditions permit, regardless of any consideration for fisheries in progress.

IND100-6 Also brought to light in the 1st paragraph of page 5-9 and in the 3rd paragraph of page 5-12 (without coming out and specifically stating it), is the impact security measures surrounding LNG traffic will impose on commercial fishing and recreational users of the Lower Columbia River. This impact must not be taken lightly. It is imperative for all to know who and what stands to be lost in the way of river use(s) if LNG is allowed to proceed. Anything less than full disclosure for all to weigh prior to a decision would be unjust, negligent, and criminal.

Sec 4.7.2.6 Recreation, Public Interest, and Special Use Areas

IND100-7 There is historical (year round) public use of the Bradwood Landing property (up until the current change in property ownership) that provided bank angling opportunity (day use) for dozens of people throughout open periods of salmon/steelhead fisheries. At present there is an extensive boat fishery for Salmon and steelhead in the Clifton and Columbia River channels directly in front of the proposed LNG terminal site. This fishery includes boaters who anchor directly along the shoreline in front of Bradwood landing and fish the outgoing tide as the shoreline at this location is in the direct pathway for migrating adult salmon.

NOTE: A consultation with the Oregon Department of Fish and Wildlife Columbia River Management Program will yield data showing significant (100+) peak boat counts fishing the head of Clifton and the Columbia River channels at Bradwood during the months of late February through May.

Directly across the Clifton Channel from Bradwood Landing is the top of Tennessee Island, this is another highly popular angling location for boaters and bank anglers. A sight also used by many for overnight camping and day use during these fisheries. Also,

Individuals

100

IND100-4 Figure 4.7.1-1 is intended to show potentially sensitive resources that have specific designated locations. Our discussion of general recreation and other river users in section 4.7.1.4 includes other commercial and recreational fishing activities.

IND100-5 The final schedule for LNG vessel deliveries would not be known until operation at the proposed LNG terminal begins. Our EIS does not specify the time of day when LNG vessels would navigate the Columbia River. See our response to comment SA1-62.

IND100-6 See our response to comment IND74-1.

IND100-7 A discussion of recreational users, including fishing, of the Columbia River is included in sections 4.7.1.4, 4.7.2.6, 4.8.1.8, and 4.8.2.8. Section 4.8.1.7 discusses gillnetting and drift rights.

IND100-7 cont'd directly across the Columbia River channel along Puget Island directly across from Bradwood Landing are more highly prized salmon fishing areas.

Commercial gill net "drift rights" persist throughout the Lower Columbia River including the area surrounding Bradwood Landing. These drift rights go back over 100 years and are recognized as valid fishing territories amongst commercial fisherman.

General Recreation and Other River Users

IND100-8 4.8.1 Waterway for LNG Marine Traffic

500 people are a gross understatement for the number of people residing in these towns and counties. Try thousands of people.

IND100-9 4.8.1.8 Recreation and Tourism

Why are/was Fishing/Recreational River Uses not covered or discussed here? How can this be? Was this purposefully left out? This is the most **significant** component of the Recreational uses of the Lower Columbia River Estuary including the area immediately surrounding Bradwood landing.

IND100-10 4.8.2.7 Transportation and Traffic (Ship Traffic)

How can the assertion be made that operation of the LNG terminal itself would not affect commercial or recreational uses of the Columbia River? The DEIS goes on to state that, "None of the structures to be constructed as part of the ship berth would be located within the navigation channel." These structures may not be an impediment for ship traffic but certainly will be an impediment for the current recreational/commercial users of the river area surrounding Bradwood Landing for fishing purposes, that is, if they are allowed to continue to utilize the river should this project come to fruition.

Conclusion

The proposed Bradwood Landing LNG Terminal site and the associated shipping operations it brings with it, stand to dramatically change the dynamics of the Lower Columbia River estuary in a way that may be forever unrecoverable. As mentioned previously, anything less than a full disclosure of all potential losses of our commercial and recreational uses, for all to weigh prior to a decision, would be unjust, negligent, and criminal.

Respectfully,

Troy Laws
37878 Hwy 26
Seaside, OR 97138

Individuals

100

- IND100-8 The referenced paragraph states that "**over** 500 people" reside in the towns adjacent to the waterway. The data on the population of communities in the project area, listed on tables in sections 4.8.1.1, 4.8.2.1, and 4.8.3.1, are derived from the United States Census and other demographic sources.
- IND100-9 The discussion of commercial and recreational fishing is included in section 4.7.1.4.
- IND100-10 The berth at the proposed Bradwood Landing LNG terminal would not be a major impediment for recreational and commercial boaters seeking to fish in the lower Columbia River or in Clifton Channel. Fishing boats would not be barred from using either the lower Columbia River or Clifton Channel outside of the safety and security zone around an LNG carrier at dock.

Docket # CP06-365-000 Bradwood Landing and
Northernstar Docket # CP06-366-000

Sir:

IND101-1 Why is Oregon a dumping ground for high risk ventures that could be toxic to our wetlands, farmlands, streams, landscapes, our environment for LNG gas lines that will be

IND101-2 fossil fuel business in our state when we should be thinking of global warming and cutting back on fossil fuel businesses?

IND101-3 The LNG massive gaslines are so high risk that the high pressure pipelines have a blast zone that would extend 700 feet of either side of the pipeline. Why would Oregon want that? California won't allow it on their land and the gas is for them.

We don't want it — not at Bradwood Landing — not at Coos Bay — not at Warrenton!!!

We don't need these energy speculators in our state. We are not backwood hicks — go away and take your greedy speculators with you. we are not for sale!!

Sincerely

Barbara Pereira
1213 SE Umatilla
Portland, OR 97202

IND101-1 See our response to comment PM1-58. The project would not result in the release of any toxins that could significantly impact wetlands or farmlands.

IND101-2 Oregon's future need for natural gas is discussed in section 1.1. Section 3.1.1.2 of the EIS discusses conservation, and section 3.1.1.3 discusses natural gas compared to other fossil fuels.

IND101-3 Pipeline safety is addressed in section 4.11.9.

K-1047

CP06-365-000

07 Nov 14

FERC Testimony: November 8, 2007
Knappa, OR

Ted Messing
35 year resident of Clatsop County
former commercial fisherman

IND102-1 After following these proposed LNG projects for 3 years, during which we have attended nearly every federal, state, and county meeting, I have my doubts that anything I could say here today will make much difference. I am sure that the main purpose of this meeting is so you can check the box that says you held a public meeting.

However, the consensus outside the bubble is that this project is a bad idea! The Bradwood site and head of Clifton Channel is an incredibly sensitive area for ALL Columbia River Salmonids. It is the gateway to their estuary!

The dredging will completely destroy the natural shallow water entrance to the entire downstream estuary ecosystem. Changing river currents will wash away fragile islands all of which are part of the wildlife refuge.

This disruption of the natural path to their estuary of 13 endangered salmonid species, will be a daily occurrence. Dredging, tugs turning massive tankers, millions of gallons of river water sucked up for ballast, does not seem healthy for salmonids.

The LNG industry says they can "mitigate" for this destruction, but how do you mitigate for a river that has been turned into an industrial ditch? Mitigation is a pathetic attempt to restore what we already have, after it has been damaged or destroyed.

There could not be a worse site on the west coast to put an industrial gas terminal and tank farm than Bradwood.

I am submitting 3 testimonies given at the Clatsop County zone change hearings to support our objection.

Individuals

102

IND102-1 The proposed dredging for the Bradwood Landing LNG terminal turning basin would not destroy the lower Columbia River estuary. Nor would it result in major changes to river flow. See sections 4.2.2.2 and 4.3.2.3. Impacts on salmon and mitigation are discussed in sections 4.5 and 4.6.

K-1048

IND102-1
cont'd

#1 Testimony by Lee Cain – fisheries biologist, about the importance of protecting the estuary.

#2 Testimony by Hobe Kyter of Salmon for All, as to the negative impacts on our commercial river fisheries.

#3 Clatsop County Planning Staff report, recommending denial of the zone change requests for Bradwood.

In spite of the heavily influenced and therefore illegal vote in favor of zone changes by some of the Planning Commissioners, the staff report is good science on the consequences of this project and its non-compliance with zoning laws. I have included the website address at which the report can be read.

Docket No. CP06-365-000 et al.

FERC,
I strongly urge you to deny siting of Northern Star's Bradwood Landing LNG Terminal on the Columbia River and the associated pipeline. The points I want to broach are in your DES.

IND103-1 First, there are many instances in which it sounds as though FERC has already made its decision for granting NorthernStar this LNG facility. Examples: page ES-5 Paragraph 3 ... "We have recommended that NorthernStar defer construction until surveys are completed..."

Paragraph 6... "Several areas of concern were noted with respect to the proposed facility, and we identified specific recommendations to be addressed by NorthernStar prior to initial site preparation, prior to construction after final design..."

IND103-2 Secondly, There are big problems with the cost sharing plan for safety services. On pages ES-4 & 5, paragraph 7 (continued on ES-5) you say: "There may be impacts on public services..." "Besides NorthernStar's proposed safety and security measures, the Coast Guard would enforce additional measures to ensure the safety of the waterway and LNG terminal." We have recommended that NorthernStar develop an Emergency Response Plan, which includes a Cost Sharing Plan to reimburse the local providers of these services."

Doesn't 'cost sharing' mean that NorthernStar and local providers share the cost of emergency services and safety services? Our fire departments, ambulances, hospital, and police are thinly stretched as it is. The nearest hospital is 30 minutes away. Where is this money coming from to support an LNG facility? The Coast Guard will have to cut out some of its rescue of boats, ships, and people to attend to the safety of the LNG tankers, the facility, and the Columbia River. They won't be able to do such a great job catching drug traffickers if they are catering to the LNG franchise. Where will the money come from? Will it be us, the taxpayers?

Please do not site this thing on the Columbia River. Most people, the taxpayers, do not want these terminals and tankers on our river.

Sincerely,

Lori Durham

To: Richard Hoffmann
Subject: LNG new energy for 1900's not 2000's

IND104-1

Please develop new energy for the coming century, fossil fuel drove the industries of the 1900's, it also ruined the environment and made some people very rich. We need to develop some energy source that doesn't decimate the environment. This gas will make the same people richer and keep ruining the atmosphere. New technologies are a much better investment. The Federal Government should help in developing new sources more than help en richen existing energy companies. Please don't develop the LNG terminals in Oregon. Californians didn't want these facilities in their state even though they are the ones that need the energy, lets develop new sources of energy that are safe and we all could benefit from. This LNG is too dangerous to plant on the coast and this earthquake prone area is too dangerous to put over 200 miles of high pressure pipeline through.

IND104-2

Oregon is proud of being ahead of the curve on being environmentally aware , why are you doing this to us, many people here don't want this kind of industry. I learned recently that some laws were changed so we wouldn't have the power to object to such goings on and the federal government could force it upon us. Is this the what America is about?

Re: Docket # CP06-365-000
Bradwood Landing LNG Terminal

IND105-1

My biggest complaint (aside from the horrendous environmental impacts) of this project is that there is absolutely no evidence of need. There is nothing wrong with existing grid & there is no reason to add more. If California needs this gas then they should host their own terminals & lines. The other travesty is the way each of these aspects were divided up in an effort to get approval. This should all be considered ONE Project - not a pipeline and a separate terminal project - These should be combined and subjected to a Programmatic

IND105-2

PREFACE

After a brief scan of the DEIS, two things are clear:

- IND106-1 | 1. The Agencies that were part of the DEIS have not been supplied with sufficient information and much of the information they have been supplied with or have presented is incorrect. Purposefully misleading statements are a significant part of the DEIS.
- IND106-2 | 2. The cooperating Agencies have been arm twisted into issuance of their parts of the DEIS

Individuals

106

- IND106-1 | We disagree. NorthernStar provided sufficient information to allow the cooperating agencies to produce an adequate EIS that complies with the NEPA. The data provided by NorthernStar was independently reviewed by the cooperating agencies. The EIS does not contain misleading statements.
- IND106-2 | The cooperating agencies volunteered to participate in the production of the EIS, and each agency will make an independent decision about whether to issue appropriate permits and approvals. See our responses to comments PM4-20, PM1-26, IND33-9, and IND33-12.

K-1053

K-1054

IND106-2
cont'd

prematurely by pressure on Agency management, who then dictate to staff.

This lap dog Agency situation is completely unacceptable as it is contrary to the Public Interest which the Agencies are supposedly there to ensure.

This is a formal request to:

1. Identify those responsible for causing the DEIS to be sent out prematurely and filled with inaccurate and misleading information.
2. Identify and delineate the process by which this occurred and what steps necessary will be taken to prevent its reoccurrence.
3. Recall the DEIS until adequate information and verification can be obtained for a proper DEIS.

As a member of the taxpaying Public that pays for all this nonsense, I fully resent having to take the time to write this when the DEIS should have never been published or at the very least recalled to address the glaring omissions and revise the errors. It is the Agencies' job to check the facts for accuracy and completeness that it presents, not everyone else's.

One could easily conclude that the level of misinformation in the DEIS as well as using unwarranted Homeland Security designations used to keep pertinent information from the Public, was intentional by Bradwood Landing together with FERC and that FERC is clearly not an Agency that represents the interests of the Public, should admit conflicts of interest and be relieved of duty, and be replaced by a Citizen's Panel until such time that FERC can be reorganized to prevent such blatant disregard for honesty and the Public Interest.

This has Not been intended to be a complete review of the DEIS since time doesn't allow delineation of the huge number of inaccuracies and misinformation. Examples of omissions and errors in the DEIS are sprinkled throughout the following comments to demonstrate the complete lack of credibility of the project proponents and FERC who have not performed due diligence in fact checking and completeness.

The section names herein will have to suffice in relation to the DEIS "evidence" location. There can be no "specific evidence location" for items that should be in the DEIS but aren't. Further, I'm not getting paid to make a full time career out of this review which is what a completely detailed comprehensive review would require. FERC is the lead agency on this DEIS, if it is not familiar enough with the project to understand where these major items relate to then READ the DEIS.

Yes, I am extremely displeased with what has gone on here along with all those I know who have read the DEIS and have experienced FERC attitudes and denial of information.

I. LEGAL IMPACTS AFFECTING THE CoE

Note: Several comments in this section are about the CoE involvement in the CRNC Deepening Project and how it relates to the Bradwood Landing project.

IND106-3

Statements made by CoE officials in support of project sponsor Port of Portland and for work for themselves during CRNC Deepening Project approval process to avoid more reasonable and efficient alternatives than dredging the CRNC deeper for deeper draft ships to travel all the way to Portland:

1. The CoE is not in the port building business.
2. Improvements to navigation allowing deeper draft Grain Export ships and Container ships justify the CRNC Deepening Project.

Statement made by CoE officials in support of work for themselves and planned budgetary expenditures for "environmental work" during CRNC Deepening approval process to avoid more

Individuals

106

IND106-3

The COE channel deepening project is a separate and distinct undertaking, for which an environmental review was already conducted, and it is not inter-connected or dependent on the Bradwood Landing Project being reviewed in this EIS.

K-1055

IND106-3
cont'd

reasonable and efficient alternatives than piling Dredged Channel Material on top of wetlands, requiring costly environmental mitigation paid in part by taxpayers:
1. Beach nourishment is not in our long term plan to reduce the amount of Channel Maintenance Dredging and its associated costs.

Other pertinent statements made by CoE Officials regarding the CRNC Deepening Project:
1. CoE involvement in projects rests with National Economic Benefits. A Benefit to Cost Ratio of greater than 1 is necessary to justify involvement.
2. Mitigation projects are to be implemented prior to the commencement of the CRNC Deepening.

Now in the Bradwood Landing DEIS, of which the CoE was a Cooperating Agency, the CoE plans to:
1. Approve of and Dredge out a large LNG ship turning basin for the LNG terminal.
2. Perform Beach Nourishment in the area.
3. Skip the National Economic Benefit analysis with all ship types on the river.

LNG ships and LNG facilities are recognized terrorist targets otherwise there would be no need for the Coast Guard.

Conclusions based on the above items:
It would seem the whole premise for the CRNC Deepening Project is false when the CoE is now planning to support and perform the Dredging and site filling role in the process of "terminal building".

It would seem the whole premise for the justification for destruction of wetlands by deposit of Dredged Materials as well as the Eminent Domain and/or other Land Acquisition for CRNC Deepening Project Wetland Mitigation is false when the CoE now plans Beach Nourishment.

It would seem that the whole premise of National Economic Benefits is false since no National Economic Benefit study was done by the CoE nor FERC regarding this Foreign Energy LNG Project and compared to viable alternatives such as those outlined in the following section "III. Alternatives". Please provide these comparisons.

IND106-4

It also seems the National Economic Benefits analysis was not performed to avoid the negative result and greatly negative as compared to viable alternatives.

Further it seems the National Economic Benefits analysis for Bradwood Landing was not performed to avoid the negative impact LNG ships on the Columbia River would have on the National Economic Benefits of the CRNC Deepening Project, reducing its already questionable greater than 1 Benefit to Cost Ratio to significantly less than 1, knowing that LNG ships on the CRNC will delay other ship traffic; especially Grain Exports and Container ships which were used to justify the CRNC Deepening Project.

IND106-5

The CoE should be required by law to re-analyze the CRNC Deepening Project Benefit to Cost Ratio knowing full well that LNG ships were being proposed on the river and that they would affect river traffic certainly in time to affect major expenditures of the taxpayers' money.

It seems that the CoE and the Ports are asking for lawsuits regarding the above items from interested parties and parties affected by and to be affected by the CRNC Deepening Project.

Individuals

106

IND106-4 See our responses to comments IND3-4 and IND33-52.

IND106-5 See our response to comment IND106-3.

K-1056

- IND106-5 cont'd Agencies responsible for permitting and allowing recognized terrorist targets to build within the borders of the USA and allowing the recognized terrorist target LNG ships to transit within the CRNC have full culpability for any loss of life. Protections afforded government workers do not apply to willful misconduct.
- IND106-6 If built Bradwood Landing will cause negative National Economic Benefits in three ways:
1. The economic drain caused by energy dollars going to foreign interests.
2. The additional Homeland Security (Coast Guard) and other Public expenditures resulting from the importation of LNG.
3. Indirect military costs and casualties and possible civilian costs and casualties associated with USA purchased LNG dollars going to terrorist supporting countries and Iraq insurgents.
- IND106-7 Does the CoE want to be implicated along with other governmental agencies, administration officials, NW Natural, NorthernStar Energy / Bradwood Landing along with their representation which appear to have conspired to deny due process to intervenors and the Public? Remember that the CoE is a cooperating agency which has failed the Public in its duty in performing due diligence in its DEIS responsibility (and it could be argued purposefully) as well as the significantly premature and erroneous Public Notice for Permit Application.
- IND106-8 Additional
When exactly did the CoE gain autonomy over the Columbia River? CoE Public Notice states CoE will determine appropriate mitigation for the Bradwood Landing project. Possibly written for expediency, if so, again demonstrates the Public Notice was severely premature. All damages to Public resources as well as mitigation requirements are to be provided for review by the Public.

I'm sure others who would like to do projects along the Columbia River will be happy to know that it is fine to fill in wetlands and dredge in the river then point to another environmental habitat restoration project as compensating mitigation as is the case with the Bradwood Landing proposal.
- IND106-9 Although the CoE appears to be fond of "mitigation" since it is a growing part of their job justification, with the amount of Public and private funds spent on salmon restoration and subsequent lack of success, it can be argued that "mitigation" doesn't work, is a farce, and the epitome of man's arrogance, to attempt to relocate important naturally formed habitat.
Further, ignoring the far reaching long term consequences of the turning basin dredging along with maintenance dredging, being the erosion of the downstream salmon rearing grounds which cannot be replaced and are extremely rare, is not in the Public Interest since salmon is a food source.
- IND106-10 The easiest, best, least cost to the Public, method of habitat restoration is not to destroy it in the first place and especially when superior alternatives to a proposed project exist that will not damage the habitat in jeopardy.
- II. NEED and JUSTIFICATION
- IND106-11 The DEIS claims the PNW could face a Gas shortfall ...which flies in the face of plentiful and available existing and New North American energy sources other than the multi-detrimental proposed Bradwood Landing LNG facility along the Lower Columbia River.
The LNG promoters(Bradwood Landing, FERC, et al) CITE NO described market condition other than some magical future Gas shortage, described in the DEIS, as possible "extremely cold

Individuals

106

- IND106-6 NorthernStar would pay for additional resources required by local first-responders for security related to this project, as outlined in its ERP. It is unsupported speculation that money spent to import LNG would go to countries that encourage terrorism. Although NorthernStar is not required to reveal the source of its LNG, exporting nations around the Pacific Basin include the United States (Alaska) and Australia. Trinidad and Tobago is currently the biggest exporter of LNG to the United States.
- IND106-7 There is no evidence that due process was denied during review of this project. The COE's processing of NorthernStar's application is being conducted according to its regulations.
- IND106-8 The COE has regulatory responsibilities under the RHA and CWA.
- IND106-9 The adequacy of mitigation is discussed in the response to comment FA2-10.

Potential impacts on salmonids as a result of dredging of the ship berth and maneuvering area during construction and operation of the project is discussed in section 4.5.2.1. As stated in section 4.6.3, the FERC would not allow construction to proceed until after we have concluded formal consultation with the FWS and NMFS.
- IND106-10 The alternatives section of the EIS compares the proposed Bradwood Landing Project to other alternatives.
- IND106-11 See our response to comment PM1-8.

K-1057

IND106-11 | winter" or "a high growth scenario", without saying just how infinitely cold that would have to be or how ridiculously unlikely high growth that would entail, with NO CITED reasoning or information (a continuing theme with the LNG promoters) to suggest plausibility.

cont'd

The industry self serving NW Gas Association, a major member being NW Natural, whose projections fly in the face of the more rationally expected Energy Information Agency projections which also may be high considering the advance of alternative energy and the decline of industry and manufacturing in the USA in favor of Asia. Note that Industrial use is the major use, by far, of Gas in the PNW.

IND106-12 | The DEIS claims LNG would "contribute to natural gas price stabilization".

However, LNG CANNOT provide price nor supply stability when LNG ships can and have been held off shore waiting for prices to rise -or- supplying countries can cut off supplies at any time. Price manipulation, embargoes, war, political conflicts, worker strikes, internal energy policy changes (which have already occurred in some potential South American Gas sources for LNG), are all part of the foreign LNG equation just as it is with crude oil.

IND106-13 | The DEIS states that "NorthernStar's Project" is specifically designed to:

1. Deliver Gas to Wauna Mill and Beaver Power Plant at Port Westward (both in Oregon along the Columbia River)

However, Wauna Mill already has a supplier of Gas and has alternatives such as liquid fuel (bunker C, I think) and "hog fuel" (black liquor and other products of the pulp and paper process). Supply from Bradwood Landing is unneeded.

Beaver Power Plant already has a supplier of Gas as well since it is an operating Gas fired turbine electrical generating facility. Supply from Bradwood Landing is unneeded.

IND106-14 | 2. Interconnect with NW Natural's pipeline which can also feed their Mist Storage Facility.

This will introduce the regasified LNG into NW Natural's system. The regasified LNG is known to burn hotter and dry out seals and has been linked to home explosions for that reason. The National Gas Manufacturers Association does Not recommend using regasified LNG and consider it damaging to their equipment for those same reasons. Mixing domestic Gas and regasified LNG is supposed to solve the problem but what happens when you get a long slug of mostly the regasified LNG? Are residential and business consumers being notified of this? ...Unlikely and jeopardizing their lives and businesses which is Not in the Public Interest.

IND106-15 | 3. Interconnect with Williams interstate pipeline system.

This is the biggest ruse of all. Bradwood Landing representation stated in Clatsop County testimony and in the DEIS that ONLY the original 36 mile interstate sendout pipeline extending to the Williams pipeline near Kelso, WA was part of the project. They also stated in both, that the extension of the proposed Palomar pipeline (which connects to the TransCanada pipeline to California) to Bradwood Landing's sendout pipeline near Wauna, OR was Not part of the project and not necessary for the project at all.

However, at Pipeline capacity meetings regarding the said Williams pipeline, it was determined No additional capacity was needed.

Further, Williams representatives have stated that no contact has been made by or between NorthernStar Energy [Bradwood Landing].

On Nov. 29, 2007 at WA State Citizens Advisory Committee on Pipeline Safety meeting:

It was stated that the Williams pipeline has no room for the LNG from Bradwood Landing, to which the Williams manager agreed.

No indication that a significant increase in capacity would be required in the future was forthcoming. If so, it would be logical for Williams to gear up for that, which it has not.

Individuals

106

IND106-12 See section 1.1. NorthernStar believes imported LNG can compete with domestic natural gas, and this competition using supplies from other countries with natural gas reserves would help stabilize the price of natural gas in the Pacific Northwest.

IND106-13 The Bradwood Landing Project would provide an alternative source of natural gas for the Wauna Mill and Beaver Power Plant.

IND106-14 See our response to comment IND33-27.

IND106-15 See our response to comment PM3-50.

K-1058

IND106-16 | So, there is the Bradwood Landing proposed 30 inch sendout pipeline connect to Williams which has nowhere to send the Gas ...while the Palomar pipeline isn't needed nor part of the project but has a large market being California. Right. A demonstration of Bradwood Landing and FERC lack of credibility.

It is California's job to take care of California not a Columbia River based LNG facility nor NW Natural nor the Portland CoE nor FERC aiding and abetting same.

Taxation without representation in this matter is unacceptable to the PNW.

Independent analysis:

Oregon Public Utilities Commission analyst stated that three quarters of the Gas from Oregon based LNG facilities would go to California.

The California Lieutenant Gov. stated that the majority of Oregon based LNG would come to California AND ALSO STATED THAT IT IS THE ROLE OF GOVERNMENT TO PROTECT CONSUMERS FROM MARKET MANIPULATION, SUBSTITUTING HIGH PRICED LNG FOR LOW PRICED NORTH AMERICAN GAS.

When reading FERC literature and the DEIS, it seems FERC believes its role is to promote LNG regardless of the damage and risk to the Public and Public Interests.

It is easy to conclude that the whole premise of Bradwood Landing's proposal of Gas for the PNW is false.

The straight fact is, there is NO justifiable need for LNG in the PNW.

LNG proponents should not be allowed to redefine the PNW to include parts of California.

There is NO evidence to suggest in any way that the PNW will have a shortage of Gas if LNG is Not located along the Columbia River or in the PNW, quite the contrary, see section III.

ALTERNATIVES.

The simple fact is that Gas is sold on contract. You pay, you get. That's it, end of story. All the self-serving nonsense about Canadian and Rocky Mountain region Gas going elsewhere would only occur if NW Natural refuses to contract for it.

Further, new Gas field sources are available from the Rockies if needed, see section III.

ALTERNATIVES.

IND106-17 | LNG is all about supplanting domestic supply with foreign and causing the Gas price to rise JUST LIKE CRUDE OIL which has the supply quantities to garner a much lower price as compared to before the run up to the war in Iraq. This isn't rocket science, it is the screwing of the Public just as with crude oil. The reason the other Gas pipeline companies aren't complaining much is they know LNG will cause prices to go UP not down, just as the California Lieutenant Gov. warns.

Apparently as long as "certain entities" are making more money, the consequences don't matter and governmental Agencies charged with industry regulation have been co-opted by the Gas and oil industry.

Obviously foreign LNG WHICH CAN BE CUT OFF AT ANY TIME is not in the Public Interest, especially along the Columbia River with its many risks and detriments, see subsequent sections.

UNTIL AN HONEST INDEPENDENT ANALYSIS OF THE ENTIRE GAS SUPPLY AND DEMAND PICTURE FOR THIS WHOLE REGION INCLUDING THE ROCKY MOUNTAIN STATES REGION AND WESTERN CANADA IS DEVELOPED THERE IS NO BASIS WHATSOEVER TO JUSTIFY ALLOWING ALL THE DETRIMENTS OF BRADWOOD LANDING.

Individuals

106

IND106-16 | See our response to comment PM1-58.

IND106-17 | See our discussion of purpose and need in section 1.1, where we cite several sources which indicate that LNG would have a positive impact on natural gas prices.

K-1059

IND106-18 | What justification is there to allow the TROJAN HORSE LNG into the CRNC with all it's negative risks and impacts? (A Trojan Horse that can bring economic as well as physical destruction.)
A case COULD be made IF we desperately needed Gas to keep the Trojan Horse outside of our gates, being off shore, where it could be prevented from causing massive destruction but under NO CIRCUMSTANCES can it be justified to bring such a Trojan Horse into our borders and into the Columbia River. Statements made by the Mayor of Boston as to the risks and dangers of LNG support this argument. Furthermore, superior alternatives exist to make that proposition unnecessary, see section III. ALTERNATIVES.

IND106-19 | Quite plainly,
Bradwood Landing wants to make money selling regasified LNG. Apparently they don't care who they sell it to nor the consequences to others.
NW Natural wants to expand and make more money sending Gas to California since the market in the PNW has been and is likely to remain relatively flat. Apparently they don't care who they send it to nor the consequences to others.
It seems Bradwood Landing is using FERC, Homeland Security, the CoE, and friends in high places as a crowbar to get in.
It seems NW Natural is using its political connections to assist in this violation of the Public Trust and Interests.
They both seem to be more than willing to misrepresent the facts.
If they are successful, will the PNW be better off? That depends on how you measure it, if you are Bradwood Landing and NW Natural you are better off, if you are almost everyone and everything else you are much worse off, see subsequent sections.

Facilitating NW Natural's foreign imported regasified LNG Transmission business, to get a piece of the pie of Gas to California via Bradwood Landing, on the backs of NW landowners via ruining their land and property value and limiting its use, also on the backs of the Public via Coast Guard Security costs, Emergency Management costs, and Environmental costs not born by Bradwood Landing, as well as facilitating a serious risk to the Public's physical and economic safety while aiding and abetting Foreign energy interests as well as terrorist interests, IS COUNTER to the purpose of government regulation, the role of the Agencies, nor is it in the Public Interest, nor will it provide National Economic Benefit, nor can it provide price and supply stability of Gas.

It seems likely that the mad rush to obtain LNG project permits around the nation, stems from the structure of FERC along with the current Federal Administration and Congress being highly foreign Gas and Oil industry supportive which could change in the next national election.

When the Senate took away State's rights against the intentions of the Constitution to provide FERC siting authority over LNG facilities, this demonstrated the corruptive influence of the foreign and international (Oil and Gas) energy lobby, none of which is in the Public Interest.

If all the proposed LNG facilities were built, the amount of regasified LNG would be more than the nation could use, by several times, SUPPLANTING domestic Gas, and further draining and weakening the USA economy and strengthening our enemies, putting the USA at further risk, again, not in the Public Interest.

Why should private individuals and groups have to provide independent economic and other analysis that Permitting Agencies SHOULD be performing and supplying to the Public for review?

If the LNG project promoters information and analyses are accepted, then the whole process of DEIS Comment is a scam on the Public, the Agencies should admit conflict of interest or

Individuals

106

IND106-18 | See section 3.1.4 for our conclusions regarding offshore alternatives.

IND106-19 | NorthernStar indicated that its project is intended to serve markets mainly in the Pacific Northwest, not California. We briefly summarize the project need and purpose in section 1.1. The Commission will determine public necessity in its project Order. No state rights were taken away. The NGA established that the FERC would authorize onshore LNG import terminals and that was reinforced by the EPAct 2005. The EPAct 2005 has a provision allowing states to provide comments to the FERC on safety and security concerns. Further, it clarifies that states retain permitting powers under federally delegated laws, including the CWA and CZMA.

IND106-19 inability to protect the Public Interest, be relieved of duty, and be replaced by a Citizens Panel to protect the Public Interest.

cont'd

III. ALTERNATIVES

IND106-20 What is the EXACT QUANTITY of people in an area for which an LNG facility would not be allowed to be built near? What is the EXACT DISTANCE that an LNG facility would be required to be built away from such a quantity of people?

Until these questions can be defined to a number, then Portland, OR is the most logical choice for this project IF a new LNG source of Gas were needed for the PNW (which it isn't needed). Portland can accommodate all its requirements of depth, turning basin, terminal space, short distance access to distribution pipelines, sufficient emergency management and security resources, firemen, tugboats, parts for maintenance, technical personnel, and Union Workers who want the project. Who cares if Portlanders may not want it, if it is needed as stated in the DEIS then "railroad it" onto them just as has been attempted at Bradwood. If those in Portland want the Gas from the LNG then it should be provided to them in an efficient short distance manner without long pipelines ruining our wetlands, farmlands, forest lands, and fish rearing grounds as the current proposal does.

The hypocrisy should be clear by now. It is okay to put "those people over there" at risk and screw up their environment and way of life, who have no need for LNG but "not us" in Portland who would more likely have the need if there was a need and less likely to screw up the fish and fish habitat, wetlands, forest lands, farmlands, with the sendout pipeline, but have the ability to say no since sufficient authorities reside there and who want it approved so long as they don't have to suffer any of the consequences.

IND106-21 There are other opportunities for jobs which unions could recruit and promote without all the negatives of bringing LNG into the river. If politicians weren't in the back pocket of large corporations it would be an easy matter to create a significant number of jobs tomorrow, more so than LNG, with no risk to the river and other jobs.

Alaska has a law which does not allow raw logs to be shipped out of the state. So, the Japanese built sawmills to cut the logs into lumber before shipping, employing Alaskans, the whole purpose of the law. The same could easily be done in OR and WA.

If the Unions want jobs, there they are, building and operating sawmills, an industry that is well known and compatible with the Lower Columbia River area. Why Unions are so counterproductive as to want to build the object of their own destruction losing many more Union jobs at the Ports is beyond me. Likely the same reason they don't seem to bother working towards the no raw logs export law.

Other jobs could be had developing the 500 year supply of shale oil in the basin between Colorado, Utah, and Wyoming which studies have shown it to be profitable at about \$30/bbl (which patriotic Union members could promote rather than economy draining foreign energy LNG). So one has to ask why do we need all the foreign energy?

Has our administration and elected representatives sold us out to foreign energy interests again? What have they done in the past 30 years to secure the nation's economy from economic terrorism of foreign oil since the OPEC oil embargo in the 1970s? Worse than nothing. They have sold us out to foreign interests again and again. Worse yet they have caused us to be funding our own terrorism nightmare. We do NOT need more foreign energy. It is NOT in the Public Interest when ABUNDANT supplies exist within our nation.

Individuals

106

IND106-20 There is no exact population numbers, required by regulation, that would prevent the location of an LNG import terminal. However, there would be less environmental impacts on people if an LNG terminal was located in an unpopulated area, in comparison to a densely populated area. The exclusion zones around an LNG carrier at dock and the LNG terminal piping and storage facilities, established by regulations, would represent the distance that an LNG terminal must be built away from people's residences or other occupied structures. As explained in other responses, the project proponent selects the location of its facilities, and the FERC analyzes the environmental impacts associated with the proposed action at that location. Our alternatives analyses did not identify another location in the region that would have significantly less environmental impacts than the proposed project. We did not identify specific sites in the Portland area to consider in our alternatives analysis due to the longer LNG marine waterway that would be required and the much higher population density in the Portland area.

IND106-21 Additional supplies of natural gas from domestic unconventional onshore resources, including coalbed methane, tight sandstones, and gas shale, are discussed in section 1.1 of this EIS.

K-1061

- IND106-22 | The completely sound and logical permit denial alternative is the most appropriate choice for the Bradwood Landing proposal due to Public Safety and Columbia River valley economics and environment safety (includes wetlands, fish and fish habitat, Ports, river commerce, fishing industry, sport fishing, recreation, river related businesses and jobs, forests, farms, and other business and jobs which support all those such as stores, services, schools, government) impacted by LNG ship security zone caused delays and disruption to all others on the river as well as real and perceived danger to the Public.
- IND106-23 | There is a tremendous supply of Gas in the Rockies with new source fields that have been more recently developed. The planned Bronco pipeline coming West proves this. However, Williams already has a pipeline routed West from the Rockies through Idaho, then following I-84 until it connects to their I-5 North/South pipeline. IF (as in "if") the PNW needed more Gas, Williams could supply it. Pipeline capacity meetings show NO NEED to increase capacity. We do NOT need LNG in the Columbia River screwing it up.
- IND106-24 | Another completely sound and viable alternative to the Bradwood Landing proposal would be the Kitimat LNG facility in British Columbia, Canada.
Purely speculative comments in the DEIS about very little of the Kitimat Gas coming to the USA are unfounded, unwarranted, and an obvious attempt to mislead the Public regarding that already authorized LNG facility's markets of Western Canada, PNW, and California. There is nothing to show that sufficient supplies wouldn't be available to the PNW from this and current Canadian Gas suppliers.
- IND106-25 | The 3 authorized gulf states LNG facilities together with the 4 existing LNG facilities in the USA will provide more than sufficient Gas supplies to the USA. Note previous FERC Chairman's comments about the number of LNG facilities needed.
Statements in the DEIS about the gulf states LNG facilities being too distant to be considered an alternative are ridiculous and inconsistent with how Gas is transmitted from pipeline to pipeline.
Further, whatever markets the gulf states LNG proposals would serve, that would free up yet more of the already abundant domestic Gas from the Rockies to come West.

The only thing wrong with the proposed Kitimat and Gulf States alternatives (or any other alternative sourced outside of this region) is that it doesn't give NW Natural a piece of the Gas transmission business to California, so to put money in their pockets they need to screw Williams pipeline company, screw the fish and environment, screw the landowners, screw the grain exporters and other river users, port workers, etc.
- IND106-26 | It is not FERC's, the CoE's, the DOT's, nor Homeland Security's job to permit Bradwood Landing and NW Natural at the detriment of everyone else's business and the environment while putting most everyone and everything in the Lower Columbia River Valley at risk.
It is California's job to take care of California not a Columbia River based LNG facility nor NW Natural nor the Portland CoE nor FERC aiding and abetting same. Taxation without representation in this matter is unacceptable to the PNW.
IF LNG were absolutely needed, the authorized Kitimat LNG facility, or the Baja California LNG facility, or the 3 authorized Gulf States based LNG facilities alternatives eliminates all risks and detriment stated herein to the Columbia River, to the Grain Exports, river commerce, fishing, recreation, environment, people, and so on.
Further, there is no proof that any of these are necessary for sufficient Gas to the PNW.

Individuals

106

- IND106-22 | The no action alternative is discussed in section 3.1.1. Impacts on environmental resources, and mitigation, are addressed throughout section 4.
- IND106-23 | Section 1.1 of the EIS acknowledges projected increases in Rocky Mountain natural gas production. We added text in section 3.1.2.2 to address newly proposed pipelines as system alternatives, including the Ruby Pipeline Project and the Bronco Pipeline Project, which would bring Rocky Mountain gas to Malin, Oregon.
- IND106-24 | The Kitimat LNG terminal could not satisfy all of the objectives of the Bradwood Landing Project. According to the developers of the Kitimat Project, one of their main goals is to provide natural gas for use in the extraction of tar sands oil in Alberta, Canada. The text regarding this project has been updated in section 3.1.3.2.
- IND106-25 | The existing and authorized LNG import terminals on the East and Gulf coasts are intended to serve markets in the southern and eastern portions of the United States. They do not supply natural gas to the Pacific Northwest. The Pacific Northwest is served by only two interstate natural gas pipelines, Williams Northwest and GTN, neither of which is connected to an East or Gulf coast LNG terminal.
- IND106-26 | A study conducted by Wood McKenzie indicated that at full use, more than 80 percent of the natural gas sent out from the proposed Bradwood Landing terminal would go to customers in Washington and Oregon. As explained in section 3.1.3.1, the majority of the natural gas sent out by the Costa Azul LNG terminal would be transported to customers in northern Mexico and southern California.

K-1062

- IND106-27 Not mentioned in the DEIS, the also completely sound and viable domestic (and non foreign LNG) alternative to Bradwood Landing, the Bronco pipeline's 1.0 Bcfd coming to the PNW and California from the Rockies scheduled for 2011, would be more than sufficient.
This alternative recycles our energy dollars in the USA so would be an ECONOMY BOOSTER having positive National Economic Benefits instead of a drain like foreign imported LNG.
- IND106-28 With the Current Canadian suppliers, Williams pipelines, the Kitimat LNG project, and the Bronco pipeline, there certainly won't be a shortage of Gas coming to the PNW, further demonstrating the lack of need for the Bradwood Landing project with all its risks and detrimental physical and economic impacts of polluting and blocking the river, fish degradation, etc.
Bradwood Landing's position in the DEIS of other alternatives not meeting "all their objectives" is irrelevant. Wauna Mill and Beaver Power Plant at Port Westward would be sufficiently supplied will any of the alternatives describe in this document.
- IND106-29 Clearly there are superior, less detrimental alternatives to the Bradwood Landing project.
However, since other viable Alternatives were omitted from the DEIS they may as well be mentioned:
1. Since a stated design goal of Bradwood Landing is to connect regasified LNG to the Williams pipeline in the State of Washington, it is more that preposterous, it is purposeful omission, to ignore the Kalama, WA area as the site for the LNG facility due to its much closer proximity to the Williams pipeline and Goble, OR pipeline interconnect. It would provide for a much more efficient location. The NEGATIVE environmental IMPACTS and geologic risks as well as quantity of landowner impacts would be far less than the Bradwood, OR location.
- IND106-30 2. Locating an LNG FUELED ELECTRICAL GENERATING FACILITY OFF SHORE. No fuel pipelines coming ashore, only underwater electrical lines would lead ashore from the facility. Since a major use of Gas is for electrical generation, this method would eliminate most of the problems associated with the importation of LNG. It eliminates the risk of an LNG ship or facility being targeted within our shores, putting the Public at risk. It would eliminate much of the risk and costs to the Public and private:
Public Costs significantly reduced or eliminated by locating an LNG Fueled Electrical Generator off shore:
1. Safeguarding LNG ship transit up the Columbia River.
2. Additional Emergency Management Systems, personnel, and equipment.
3. Fish, fish habitat, and fishing industry degradation.
4. Lower Columbia River water and air pollution.
5. Delays to other ships, barges, fishing, and recreation and associated job loss and economic deterioration.
6. Road improvements.
7. Facility and pipeline impacts to wetlands, streams, fish, and wildlife.
Private Costs significantly reduced or eliminated by locating an LNG Fueled Electrical Generator off shore:
1. Initial and ongoing Pipeline costs to landowners (drain tiles, pipe floating, pipe leaks, pipeline deaths, inability to change operations to utilize land over pipe = limited use, harder to sell, lowered value, etc.)
2. Ongoing costs of LNG caused delays to all other shippers and users of the river.
Benefits to LNG promoters and the Environment:
1. The multitude of pipeline impacts would be eliminated, one of the cited reasons for the off shore alternative having failed to pass in California.

Individuals

106

- IND106-27 See our response to comment IND106-23.
- IND106-28 See our response to comment IND106-26.
- IND106-29 We did not analyze an alternative at Kalama, Washington because no developer had suggested that an LNG terminal be sited there. We have no data on the suitability of the Port of Kalama to handle LNG carriers, including the amount of dredging that may be necessary at an LNG terminal at that location. A shorter sendout pipeline from Kalama to the existing Williams Northwest system would be offset by other factors such as a longer LNG marine transit route, including a bridge at Longview. Furthermore, an LNG terminal at Kalama would require lateral pipelines to the Beaver Power Plant, Wauna Mill, and the Northwest Natural pipeline to the Mist storage facility.
- IND106-30 We addressed the feasibility of locating an LNG import terminal off the coast of Oregon in section 3.1.4. It is beyond the scope of this EIS to speculate on the environmental impacts of locating an electrical generation plant offshore. The ODE would be the state agency responsible for evaluating the siting of a power plant. Also see our response to comment PM1-58.

K-1063

- IND106-30 cont'd
2. Vaporizing the LNG would be much more efficient, utilizing waste heat from the electrical generator as well as sea water if necessary.
 3. More electricity would be generated more efficiently since no LNG would be needed to vaporized the LNG.
 4. Water and Air pollution would be reduced as no LNG would be needed to vaporize the LNG.
- Since it is known that the majority of the Bradwood Landing regasified LNG would be consumed in California, likely by Electrical Generating Facilities, then to provide efficient transmission of the electrical power to its intended customers, the Off-shore LNG Fueled Electrical Generation Facility would best be located off the California coast.
- If at some point there was evidence of a "high growth scenario" in Oregon bringing with it the increased demand for electricity then an Off-shore LNG Fueled Electrical Generation Facility located near Oregon could be considered at that time and compared to other available alternatives.
- IND106-31
- THE COSTS of various alternatives to Bradwood Landing or NorthernStar Energy should NOT be a consideration whatsoever. If it is, you are then saying the Safety of Public and All Costs to the Public and other businesses and individuals are secondary to the cost savings to an LNG project's first cost and not necessarily the LNG facility operating cost.
- Should the FERC or any other Agency or any of the other LNG project promoters be allowed to dictate the price of a human life, especially mine? Hardly. But for the record, landowners who produce food versus LNG: Can you live without food? Can you live without LNG? Does LNG have the potential for destroying food or fish habitat? Case closed.
- Conclusions based on the above items:
Superior efficiencies, minimized impacts, and minimized risks and costs to the Public and Private occur with the Off Shore LNG Fueled Electrical Generating Facility. It is only the First Costs which may be higher for this off shore alternative with Operating Costs lower due to the superior efficiencies.
- IND106-32
- TO ENSURE THE HONESTY OF ALL PARTIES INVOLVED WITH THE LNG AND SENDOUT PIPELINE, IF THE LNG FACILITY IS SITED ALONG THE COLUMBIA RIVER IT SHOULD BE A CONDITION OF PERMIT APPROVAL THAT ALL REGASIFIED LNG AND ELECTRICAL POWER GENERATED FROM IT BE CONSUMED WITHIN WA, OR, AND ID, SINCE THAT IS THE STATED GOAL "TO PROVIDE A NEW SOURCE OF GAS TO THE PNW". THIS WILL ENSURE THAT WE ARE NOT BEING PUT AT RISK FOR LITTLE OR NO BENEFIT. ENSURING REPRESENTATION FOR OUR TAXATION.
- IND106-33
- Even If the regasified LNG and electrical power generated from the proposed LNG facility remains in OR, WA, and ID, then there is no justification to site the LNG facility at Bradwood, OR when it can much more efficiently, with much less damage to the environment and to landowners, with an order of magnitude lower in length sendout pipeline, be sited near Kalama, WA or Portland, OR.
- On principle, if as all the project proponents claim, that the LNG is safe, has an excellent safety record, can be brought into the Columbia River safely, it should then be REQUIRED for this LNG project to disturb and impact the environment and all others as little as possible.
- IND106-34
- The current plan outlined in the DEIS impacts much more environment than is necessary and much more so than could be had with other viable alternatives.
1. Least Environmental and Economic Impact:
LNG FUELED ELECTRICAL GENERATING FACILITY LOCATED OFF SHORE with only electrical transmission cable coming onshore. Then LNG ships wouldn't affect river commerce at

Individuals

106

- IND106-31
- NorthernStar would bear the burden of paying for additional public safety services necessary as a result of its project, through a cost sharing agreement outlined in its ERP. No major sources of food would be destroyed as a result of this project. Impacts on fishery resources are addressed in section 4.5. See also our response to comment FA2-5.
- IND106-32
- Market conditions would determine where the re-gasified LNG is ultimately used. See our response to comment PM5-43.
- IND106-33
- See our responses to comments IND106-29 and PM5-8.
- IND106-34
- See our responses to comments IND106-29, PM5-8, and IND106-30.

K-1064

IND106-34 | all. LNG promoters still get to make money and have a much broader market.
cont'd | 2. Minimal Environmental and Economic Impact:
Locating LNG terminal in the Portland area, industrial areas and deep water port/terminal locations exist. Sendout pipeline has very short distance to distribution pipelines. LNG facility and pipeline would have a much lower impact on the environment.
3. Minimal to Some Environmental Impact:
Locating LNG terminal in the Kalama area. Deep water port/terminal locations exist. Sendout pipeline has very short distance to the planned distribution pipeline and Goble interconnect river crossing pipeline nearby.
4. Most Environmental Impact:
Locating LNG terminal at Bradwood, OR. Sendout pipeline has long distance through various wetlands, streams, and slide prone hills. LNG facility built on unstable base soil. Major and continual detriment to fish.
The worst environmental impacts, geologic risks, and navigational risks, by far, of any LNG facility location proposed for the nation and should be the outlier eliminated from consideration.

If the DEIS plan is accepted and permitted, it will demonstrate that the Agencies involved are more than willing to allow Foreign and Corporate interests to destroy USA environment and resources in almost any amount they so desire, rather than make as small an impact as possible.
It will also demonstrate the hypocrisy of those in authority, for if LNG is safe enough to travel past Boston, MA, and to bring into the Columbia River, yet deny it from being efficiently located in Portland, OR then those in authority such as the Portland CoE feel it is fine to put others at risk just not themselves. In other words its okay to put Astorians and others at risk just not themselves.
If a terrorist can take an LNG ship with little difficulty to Portland anyway (it seems only a few rifles and rocket propelled grenades would be all that is needed), what is the justification for not siting the LNG facility in Portland?

IV. POLLUTION and OTHER ENVIRONMENTAL IMPACTS
Pollution
IND106-35 | If the FERC, CoE, EPA, Oregon DLCD, Oregon DEQ and/or the Washington State DE allow Bradwood Landing to dump the pollutants stated in and also conveniently LEFT OUT of the DEIS into the Columbia River and Clifton Channel (incoming tides will take the pollutants upstream as well) that will result from the OUTDATED polluting technology described and planned for in the DEIS then the Agencies have completely failed to do their duty and need serious reorganization.
IND106-36 | Any and all building operators and any processes requiring heat, for the sake of energy efficiency and cost savings at the expense of the environment, should then convert to the same outdated polluting technology. If these supposed environmental protection agencies refuse to deny this backward step towards pollution, any business utilizing heat would then have the luxury at laughing in the face of these agencies and sue for equal protection, as they should.
IND106-37 | Directly exposing the LNG vaporizer heating water to flame products of combustion will introduce a number of pollutants into that heating water which may already have impurities from its source. The heating water will then have a portion that will be treated with acid neutralizing agents and dumped into the Columbia River.
Where is the table listing these items, quantities, their known detrimental effects, and cumulative impacts, such as carbonic acid, hexavalent chromium, benzene, PCBs, formaldehyde, and others, as well as the acid neutralizing agents' impact on fish and salmon sensitivity/death as a

Individuals

106

IND106-35 | Table 1.3-1 lists the major federal, state, and local codes, ordinances, statutes, rules, regulations, and permits that would apply to the project. NorthernStar would adhere to conditions of these permits. Each agency designs the permitting process to ensure that projects comply with the regulations set by each agency for the area of concern.
IND106-36 | The project would not pollute the Columbia River. See section 4.3.2.
IND106-37 | A table of the SCV constituents has been added to section 4.3.2.3. Section 4.5.2.1 includes a discussion of potential impacts on aquatic species due to the routine discharge of condensate water from the SCVs.

K-1065

- IND106-37 cont'd | result of exposure to such acid neutralizing agents (which are oftentimes considered "safe" but not to fish)?
- IND106-38 | The long term effects will be that these pollutants will get into the food chain and be detrimental to fish, humans, and other wildlife. Where are these long term costs to the Public and fishing industry and sport fishing industry delineated?
- IND106-39 |
- IND106-40 | It is stated in the DEIS that LNG will not mix with water in a spill, that it will only evaporate. That statement is also false. Previously FERC has mentioned spills at other LNG facilities, they described "a real mess". If as they claim in the DEIS, it only evaporates, then what causes the mess?
The super cold LNG will contact FREEZE the water along with the contaminants, pollutants, and material already in the river water. There will be mixing of LNG, being mostly the hydrocarbon methane, with all these things. There is a large amount of chlorinated fecal matter coming down the river from all the cities and towns upriver as well as pulp and paper effluents. (Following standard scientific procedures of course) get samples of water at different days and times at Bradwood, pour LNG into it, and send it to a lab to tell you how much hydrocarbon remains and what kind of other nasty combinations occur that will be impacting the fish, humans, and other environmental constituents. This information should be listed in the DEIS and other Agency Public Notices. It would seem extremely unlikely that FERC wouldn't be aware of this. It would only be a matter of time before some amount of spill from an overflow, backup, human error, or worse occurs (note various occurrences at other LNG facilities).
- IND106-41 | Where is the information listing the amounts of Methane that will be vented to the atmosphere when systems over pressure or cannot use the evaporated LNG in time and how it may impact the Air and Environment? At the very least an estimated quantitative information should be obtainable from other LNG facilities, by monitoring if need be.
- IND106-42 | Dredging Impacts
Bradwood Landing's analysis of the effects of dredging the turning basin is faulty. This large area deepening will scour out the salmon rearing grounds West of Bradwood over time.
- IND106-43 | In the DEIS Bradwood Landing states that the turning basin will need to have maintenance dredging every 2 to 4 years. This may be underestimating the short period of time generating large quantities of sediment build up.
- IND106-44 | Dredging the turning basin of approximately 50 acres:
The increased depth will also act as a large volume settling and catch basin causing the river to unload sediment there as the relative water speed slows into the area.
- IND106-45 | Water speed picks up sediment downstream:
Following the flow of the water downstream, when the ship turning basin bottom ends and the Clifton Channel bottom rises up to its undredged normal level, the water will have to increase speed to maintain the rate of flow coming into the channel. The increased speed (return to normal speed without dredging) enables the water to carry a larger load of sediment, and it WILL pick up sediment to replace that sediment which it unloaded into the large volume turning (catch) basin.
Results:
- IND106-46 | The downstream fish habitat will suffer scouring out and become deeper over time adding more sediment to the further downstream CRNC at bends in the river COSTING taxpayers more in CRNC maintenance dredging.
- IND106-47 | Bradwood Landing's paid for computer modeling is irrelevant when Actual similar river conditions can be used as evidence. It seems the only reason to use a computer to model the condition is to obtain the desired biased misinformation when actual similar river conditions can be
- IND106-48 |

Individuals

106

- IND106-38 | The long-term bioaccumulative effects of pollutants on fish, humans, and other wildlife resulting from construction and operation of the Bradwood Landing Project can not be characterized with the best available science. Bioaccumulative effects can result from a variety of physical, chemical, and biological processes. However, the concentration of contaminant levels reported in section 4.2.2.2 of the EIS does not indicate a significant biological effect is likely.
- IND106-39 | We have not identified any pollutants that would be produced by the project that could cause harm to humans or fish; see sections 4.2 and 4.10.1. Impacts on aquatic resources are addressed in section 4.5 and 4.6. Potential project impacts on fishing are discussed in sections 4.7 and 4.8.
- IND106-40 | Methane would not mix with water and freezing would be a temporary impact that would not alter existing contaminants in the river.
- IND106-41 | Section 4.10.1 has been updated to include the estimated greenhouse gas emissions resulting from the construction and operation of the project. Emissions resulting from upsets or system malfunctions are unpredictable and not considered reasonably foreseeable. As such, an evaluation of emissions and impacts from these events has not been included in the EIS.
- IND106-42 | While some downstream changes would likely occur as the river adjusts to the changes from dredging of the maneuvering basin, we do not believe the salmon rearing grounds west of Bradwood would be scoured out. See also our response to comment IND82-5.
- IND106-43 | This is NorthernStar's best estimate for maintenance dredging. Our review found it a reasonable estimate.
- IND106-44 | The EIS text has been revised to indicate that about 46 acres would need to be dredged for the turning basin. NorthernStar conducted modeling that indicates that the dredging would not greatly alter the flow or sedimentation of the river.
- IND106-45 | Sediment erosion and deposition is a dynamic and natural process. Changes anticipated to Clifton Channel and the main river channel as a result of the dredging are discussed in section 4.2.2.2.
- IND106-46 | See our response to comment IND106-42.
- IND106-47 | Data provided by NorthernStar, including modeling, were independently reviewed by staff, our third-party environmental contractor, cooperating agencies, and other agencies, such as the FWS and NMFS.
- IND106-48 | There is no evidence that the computer models used by NorthernStar were biased. The results of the modeling were independently reviewed by the FERC staff and appropriate resource agencies.

K-1066

IND106-48 | found.
cont'd

IND106-49 | Where is the disposal plan for the maintenance dredging of the LNG ship turning basin? Maintenance dredging without a disposal plan is not appropriate and should not be allowed. Without knowing the plan, the Public Interest is susceptible to compromise. It is extremely surprising that the CoE didn't require this prior to publication of the DEIS.

Pipeline Impacts

IND106-50 | If you have seen a pipeline installation. Any claims of "temporary impacts" are invalid whether to wetlands, water run off or drainage areas or to private property. The right of way above the pipeline is maintained clear of woody vegetation. The pipeline can have leaks or blowouts and require maintenance which will again disturb the area.

IND106-51 | The pipeline in saturated soils that giggle with tremors, earthquakes, and heavy equipment do not always stay at the level installed and can float upwards becoming exposed in some instances despite claims of precautions of concrete coatings to prevent this or the soil can settle or be forced downward around the pipe. Such conditions can severely affect the drain tiles in agricultural lands.

IND106-52 | The temperature of the Gas in the pipeline can affect the crops and vegetation.

IND106-53 | It is possible in hillsides with creeks and streams or abundant rainfall, pipelines can create abnormal water drainage along the pipeline, backing up water and creating weaknesses and mud slides. Obviously, the larger the pipe the larger the concern.

Additional

IND106-54 | Bradwood Landing will make the subset of "Lower Columbia River Humans" an endangered specie due to the real and/or perceived danger along the route of the LNG ships, in the area of the LNG facility, and along the sendout pipeline and new connecting pipelines. Some of these endangered Humans are in the agriculture industry whose agriculture activity support a wide variety of wildlife including endangered species of Deer, Geese, Birds of Prey, etc. through the increased and prime forage availability in agriculturally maintained lands.

When these Humans leave or are destroyed by LNG or regasified LNG incidents the agricultural lands will go fallow or be replaced by non agricultural industry and/or "mitigation" sites which many don't provide adequate forage or type, the essential ingredient for any specie, and not support the numbers of wildlife. (Note the huge budgets Congress allocates for acquisition of properties along waterways)

IND106-55 | This and follow on projects will further endanger the listed endangered species of "Lower Columbia River White Tailed Deer". Where will the US Fish & Wildlife Dept. get White Tailed Deer to replace those drowned in floods under their protection as has occurred in the past? Or to helicopter to other locations to attempt new group formations?

How will these Deer be able to traverse from group to group to ensure the strength of their gene pool when their pathway is blocked off by the expansive fenced footprint and continuous high levels of artificial light and noise as with the Bradwood Landing project directly across from the Tenas Illihee Island White Tailed Deer Refuge, the Deer, which swim across to traverse the other areas?

IND106-56 | How can the Agencies be said to have performed due diligence when all these items and other items identified by others have Not been addressed nor presented to the Public?

If it is up to the Public to identify many of the detrimental impacts of such a project, what is the purpose of the Agencies that are paid to and are supposed to be doing this work? If the project proponent analyses are accepted, then the whole process of Public review and comment is a scam on the Public, the Agencies should be relieved of duty, and be replaced by a Citizens Panel to

Individuals

106

IND106-49 | Permits for maintenance dredging, including all associated environmental review required under section 404, would be obtained from the COE.

IND106-50 | We agree that pipeline construction does create permanent impacts. These are addressed in various sections, including 4.4 and 4.7. See also our response to comment SA1-113.

IND106-51 | As discussed in section 4.3.1.4, NorthernStar would coat the pipe with a minimum of 4 inches of concrete to maintain negative buoyancy in areas of shallow groundwater (typically wetlands). This is a standard and effective mitigation measure when properly implemented. The proposed pipeline and associated aboveground facilities would be maintained as required by the DOT. Regular inspections would identify areas of pipe exposure or subsidence and corrective actions would be taken.

IND106-52 | See our response to IND33-38.

IND106-53 | FERC staff's Plan and Procedures include BMPs for construction in saturated soils. Section 2.4.2.2 also discusses special construction techniques. The proposed pipeline and associated aboveground facilities would be maintained as required by the DOT. Regular inspections would identify areas of pipe exposure or subsidence and corrective actions would be taken (see section 4.11.9.1).

IND106-54 | The EIS documents that the proposed project including mitigation would not result in significant impacts on humans and their environments.

IND106-55 | Section 4.6.2.2 and 4.6.2.3 have been revised to include additional information on the Columbian white-tailed deer due to construction and operation of the proposed terminal and pipeline facilities. See also our responses to comments PM3-68 and FA4-6.

IND106-56 | No information was withheld. Appropriate information has been included in the EIS to disclose to the public the potential environmental impacts associated with the proposed project, and comply with the NEPA. See our responses to comments IND33-9 and IND33-12.

K-1067

IND106-56 | protect the Public interest.
cont'd | How can the Public make comment on significant information that has been withheld, not included, or misinformed about? If the Agencies responsible do not have the appropriate information then they should not be issuing a DEIS or "Public Notices" until they do. PLEASE RESPOND WITH A LIST OF YOUR SUPERIORS' NAMES AND CONTACT INFORMATION WHICH HAVE REQUIRED YOU TO PUBLISH THE DEIS AND/OR "PUBLIC NOTICES" WITHOUT THE APPROPRIATE INFORMATION NECESSARY TO FULLY INFORM THE PUBLIC OF SIGNIFICANT IMPACTS. ALL I CAN SUGGEST IS THAT IT WOULD BE WISE FOR YOU TO DO SO AT THIS POINT.

V. ECONOMIC IMPACTS

IND106-57 | When dangerous LNG ships, their caused delays to all others utilizing the river, dangerous LNG facilities, and polluted diminishing numbers of salmon cause people to leave and less to visit, what will become of the viability of the Lower Columbia River communities as well as state and federal TAX and licensing REVENUE from them? The few industrial employed will not be able to make up the difference.

Claims of LNG not being dangerous or being safe are irrelevant even if it were safe. The perception of danger is enough to cause the effect. No matter what the advertising campaign, it would be difficult to convince folks that something is safe when it needs gunboat security which would be unlikely to prevent accident or attack.

IND106-58 | No adequate economic impact study was delineated in the DEIS. No delineation of the actual sequence of events which could and would cause economic impact were to be found in the DEIS. Such a delineation should include the path of the LNG ship beginning at the mouth of the Columbia River to its destination, listing all points along the way and associated impacts and potential impacts which would and could occur; Actual long term impacts to tourism, recreation, fishing industry including shellfish, import and export shipping, barge and river commerce, ports, jobs, population, schools, emergency management and services, etc.

IND106-59 | The premise of the Coast Guard's Waterway Suitability Report is faulty in many ways: Foremost is the ridiculous premise that LNG ships and the LNG facility could be successfully prevented from attack along the Columbia River. The city of Astoria, shore vegetation, river channels, canals, sloughs, and islands all provide sufficient cover for a successful attack. Claiming that an attack in this area is unlikely is merely misleading conjecture. There is absolutely no proof or factual basis that this area is less likely to have a terrorist attack.

The case could be made that an attack is More Likely since it would be much easier, with the multitudes of cover than in other locations, especially with any notion that it is "unlikely" causing the Coast Guard and/or other authorities to have lax or more lax security procedures than at other locations.

IND106-60 | What would be the corresponding economic impacts should a terrorist attack occur to an LNG ship at the significant points along the route? What would it be if terrorists took the LNG ship to Longview or Vancouver, WA or Portland, OR? How could this be prevented with terrorists already onboard an LNG ship having rifles and rocket propelled grenades which are easy to hide?

LNG Ship Caused Delays To Others

IND106-61 | 1. LNG ships will have a security zone around them with Coast Guard gunboat escorts and possibly others such as a helicopter with rifle, to enforce the security zone. There will be a lead tugboat which the LNG ship will be tethered to and a tugboat behind. All this will be moving

15

Individuals

106

IND106-57 | The safety of LNG carriers is addressed in section 4.11.5. See response to IND106-39.

IND106-58 | A discussion of potential socioeconomic impacts is included in section 4.8. NorthernStar commissioned a study performed by Dr. Philip Romano, of the University of Oregon, on the impact of LNG on the economy of the Pacific Northwest.

IND106-59 | Credible terrorist attack scenarios were developed in the WSA process including the measures needed to be in place to detect, deter, and respond. This was further analyzed in the WSR. The scenarios developed in the WSA and the WSR analysis are considered SSI and not releasable to the public. Also, a discussion on terrorism is included in section 4.11.8. It is possible that a release from the LNG storage tanks could be caused by an intentional act, such as a terrorist attack. Although an intentional breach scenario could result in greater thermal radiation in the immediate vicinity of the release, such scenarios are typically associated with the desire to inflict damage to major infrastructure and population and commercial centers.

IND106-60 | Section 4.11.8 includes a discussion of terrorism and security requirements that would be included as part of the proposed project.

IND106-61 | The safety aspects of LNG transportation by ship is discussed and summarized in section 4.11.5. The Coast Guard would be responsible for enforcing the conditions of its WSR. Pre-arrival and ongoing communication between the pilots, the LNG carriers, and other vessels that would occur would often assist in avoiding delays. In many instances, if a conflict with another vessel arrival or LNG carrier delay is anticipated by the bar pilots, other vessels may be instructed to increase speed and/or the LNG carrier may be instructed to decrease speed so as to avoid delays at the Bar.

K-1068

IND106-61

cont'd

slower and cause delays since other vessels will not be allowed to overtake the armada.

2. Since LNG ships require additional maneuvering room on CRNC turns, other ships would not be allowed to meet LNG ships on turns. At one time designated LNG Ship Passing Zones were proposed and located on a river map, which shows a great lack of understanding of river flow and ship movement. These LNG Ship Passing Zones are nothing more than a ruse to pacify those who don't know any better.

LNG Ship Passing Zones could not be enforced. How could they? Is the Coast Guard going to tell a ship to stop if it is about to pass through and leave a passing zone before the LNG ship gets there? This cannot happen since the ship, if it slowed enough or stopped, will not be able to maintain position on its side of the CRNC nor would it be able to slow or stop in time anyway.

Will LNG ships stop in LNG Ship Passing Zones waiting for other ships to pass through? And what if the timing is misjudged while the LNG ship attempts to make it to the next LNG Ship Passing Zone? "It would never happen" is yet another ridiculous notion.

What would happen to an LNG ship passing zone when the security alert level is raised?

Dependence on Global Positioning Systems(GPS) for accurate speed which relates to time to reach a passing zone will prove faulty since GPS systems are not always accurate, fluctuate in accuracy, and more so in the rain and other weather conditions. And what will occur when the LNG ship is delayed for some reason, any reason, such as an LNG escort tugboat that develops a performance problem? This could cause an LNG ship to meet another ship on a turn.

No depiction of LNG Ship Passing Zones were found in the DEIS so hopefully the silliness of this idea has been discovered and discarded.

It is unfortunate that the realization of safe transport of LNG on the Columbia River being a gross misjudgment has yet to occur by those same folks. What will that take, a catastrophe? How many ship groundings that have already occurred does it take to realize that an LNG ship which needs "extra room" on turns is an accident waiting to happen?

In general the passing zones are a joke and ships will likely time their outbound transit to coincide with arriving at Longview, WA at the supposed time the LNG ship is to be completely secured at the Bradwood terminal, so they can confirm that before passing the Longview area where sufficient anchorage exists along with available tugboats if needed to straighten themselves to get underway again.

Who will pay these ship operators for their additional expenses and time? Who will pay for the ship operators' waiting at the Columbia River Ports, due to LNG ships, waiting for the timing to be right to depart? How many delays will turn into 12 hour delays waiting for the next tide? A 12 hour delay to a ship can easily cost \$5000 and up.

Time is money in the shipping business and how many shipping lines will be lost due to LNG ship caused delays?

How many jobs will then be lost? How many more when there is more than one LNG facility along the Columbia River?

Why is LNG more important than any one else's business when Gas can be obtained by other superior means than LNG on the Columbia River?

IND106-62

Where in the DEIS are all the scenarios, for the LNG ship caused delays to all others who utilize the river, and time tables for review? If one LNG facility is allowed along the Columbia River, the likelihood of more than one through equal protection could easily result in 250 ships per year on the Columbia and the number could easily expand to 325 ships per year, with only 2 LNG facilities.

How will the Ports survive with all these delays? And the subsequent economic impacts of the domino effect of lost jobs which require less jobs in the service oriented businesses, etc.?

Individuals

106

IND106-62

Our EIS discusses potential delays to other commercial ship traffic in the Columbia River is section 4.8.1.7, and takes into account the potential impacts on ship traffic resulting from more than one LNG terminal operating in the region under the cumulative impacts section 4.12.5. We assume the Coast Guard would require similar mitigation measures for managing the LNG marine traffic associated with the Oregon LNG Project as for the Bradwood Landing Project and, therefore, the cumulative impacts on shipping and the ports would be minor.

K-1069

IND106-63 Channel Deepening Project rightfully revisited
Considering the LNG caused delays to other ships, what then is the economic justification as measured by National Economic Benefits for the CRNC Deepening Project, from the furthest up river LNG facility to Portland? And for the whole length of the CRNC since the LNG shipments provide negative Economic Benefits to the nation draining the economy and increasing the balance of trade deficit?
Bradwood Landing should be paying for CRNC dredging at least from the Mouth of the Columbia up to Bradwood, OR; where is this mentioned in the DEIS?

IND106-64 Property Values
1. A Gas pipeline near or in a property makes those properties undesirable due to the risks of leaks and blowouts and the many deaths that occur due to pipeline incidents, lowering the value, and making it harder to sell. Has FERC verified the accuracy and completeness of the pipeline death statistics? No.
2. A Gas pipeline through a property limits the use of the property, lowering the value, and making it harder to sell.
3. Undesirable pipeline containing properties greatly reduces economic activity in that area. Even areas of scenic interest in WA state but having a pipeline through the property have proven difficult to sell.
I have heard one politician state that over time pipelines don't matter to property values and sales but not how long "over time" takes and whether I would be alive then.
The "don't matter" condition is ridiculous. The ONLY way that would occur is IF buyers were NOT NOTIFIED of the pipeline. This has been the case in some areas of the country where not even developers were notified and built residential property near or on pipeline right of ways, and likely the condition used for the "don't matter" incorrect notion.
Quite simply a property with a pipeline IS harder to sell. The only condition in which a property's "ease of sale" would equal that of the same or similar property without a pipeline is if it also had NO PIPELINE. Almost anyone looking at property for sale would avoid a pipeline unless significant price incentive were to be had, and many would not consider it at any price. This is only logical and makes the property much more difficult to sell and thereby reducing the economy of the area.
Real estate sales are an indicator of economic activity in an area because they are in themselves significant economic activity. Rising prices indicate increasing economic activity, falling prices indicate slowing economic activity and can indicate people leaving an area.
Who would buy property in such a pipeline route zoned agriculture or residential? People that don't want to move from the area or those that can't pass up or can't afford anything but a cheap price.
The pipeline condition doesn't make for a vibrant economy. Note that Cowlitz and WA State Realtors Associations are against the LNG project and pipeline. Note also that the national economy has been floated for quite some time on rising real estate prices and note that the economy is slowing along with falling real estate prices demonstrating the aspect of economic indicator.
Real estate activity is serious business and the LNG impact in reducing property values and making properties harder to sell, in this area which is economically bland as it is, will definitely worsen the situation.

IND106-65 Increased Energy Costs
Since the California Lieutenant Gov. stated that the majority of Oregon based LNG would come to California AND ALSO STATED THAT IT IS THE ROLE OF GOVERNMENT TO PROTECT CONSUMERS FROM MARKET MANIPULATION, SUBSTITUTING HIGH PRICED LNG

Individuals

106

IND106-63 The project would not result in major delays for other commercial ships. See section 4.8.1.7.

IND106-64 A discussion of property values along the proposed pipeline route is included in section 4.8.3.3. Pipeline safety is discussed in section 4.11.9.

IND106-65 Market conditions will determine when LNG gas is price-competitive with other sources of natural gas. See our response to comment IND106-19.

K-1070

- IND106-65 | **FOR LOW PRICED NORTH AMERICAN GAS.**
 cont'd | And since it is a FACT that Foreign LNG arriving by ship will not guarantee lower Gas prices (Reference current price of Foreign Crude Oil arriving by ship which is in sufficient supply to garner a much lower price historically. It is not difficult to check historic API and EIA supply figures with corresponding prices.)
 | And since LNG ships can be held off shore or all the same claims of production or delivery disruptions due to weather, war, worker strikes, etc. as with crude oil.
 | It is highly likely LNG will bring higher energy prices.
 |
 | These conditions are a significantly negative impact to the local, regional, and national economies due to higher energy prices driving up the cost of everything else since it requires energy to make it, including heat and light. This is Not in the best interests of the Public.
 |
 | VI. RISK TO HUMANS AND OTHER
- IND106-66 | This is a formal request to protect from risk, impact, or disturbance by the Bradwood Landing project, all registered and eligible to be registered Cultural Resources, and do so as a former resident of the Clifton Bradwood area.
- IND106-67 | Either LNG is safe or it isn't. If it is safe as claimed then the LNG ship can travel to Portland much more efficiently to connect a short distance to several distribution pipelines than the planned inefficient long distance connect to distribution via expensive, dangerous, likely to fail in slide areas killing humans and starting forest fires which may kill more humans and wildlife, environment damaging sendout pipelines at and near Bradwood.
 |
 | If the LNG ship can't safely travel to Portland, or the Portland area is consider too populous for an LNG facility, then subjecting all of the people along the LNG ship route to the LNG terminal and possibly beyond in a terrorist LNG ship take-over situation, is more than hypocritical, it is an unconscionable breach of morality and ethics. It says you are more than willing to put all those people at risk but not the superior location of those who want the regasified LNG being NW Natural and Unions in Portland, OR having nearby distribution pipelines, large industrial and consumer base, deep water port with turning basins, etc.
 | What makes me wonder is why Portland folks aren't worried that a terrorist could easily take the LNG ship to Portland to explode; who is going to stop them if they have a few rocket propelled grenades on board? Could it be that they haven't been sufficiently informed of the risks by the Agencies that are supposed to inform and protect them but refuse to in favor of corporate and foreign interests?
 |
 | If terrorists exploded an LNG ship near Portland they could incinerate a 150,000 folks or more, start forest fires, and possibly wipe out the fuel supply for the region for a long while, wipe out lots of industry and other important structures that would take a long time to recover from if ever.
 | Ridiculous?
 | Oh no that would never happen, not here. Especially because it would be so easy for them, much easier than 911, and cause approximately 50 times the human toll. So don't even think about it. Give them permits and bend over for them since its the USA for sale to foreign energy interests again.
- IND106-68 | The LNG facility and sendout pipeline is an accident waiting to happen in this part of the river valley consisting of slide prone hills and saturated wiggly and easily displaced soil. Note 1996 and

Individuals

106

- IND106-66 | As discussed in section 4.9.4, we are recommending that NorthernStar defer construction until: 1) cultural resource surveys are completed and evaluation reports, any required treatment or avoidance plans, and a cultural resources management plan are filed with the Secretary; 2) the SHPOs' comments on reports and plans are filed with the Commission; and 3) the Advisory Council on Historic Preservation has been given an opportunity to comment if any historic properties would be adversely affected.
- IND106-67 | NorthernStar selected the proposed location for the Bradwood Landing LNG terminal based on numerous factors. See also our response to PM1-1 and LA3-55.
- IND106-68 | Landslides are addressed in sections 4.1.3.3 and 4.1.4.3. NorthernStar's ERP would address emergency routes.

K-1071

- IND106-68 | 2007 hills sliding and blockage of US Highway 30 in the Clatskanie Oregon area. Note that Clifton Road slid out a few years ago. Note hills sliding and blockage of WA State Route 4 in 2006 and previously.
cont'd | What escape route is planned when these roads are blocked again and occurs in conjunction with an LNG tank failure or sendout pipeline blowout caused by a slide or an earthquake?
- IND106-69 | What escape route, what emergency measures, would prevent a large loss of life, what means of safety would prevent a catastrophe, when a 7/8ths empty GASOLINE ship INTENTIONALLY strikes the LNG ship in front of Astoria, had been set to and is then exploded?
- IND106-70 | Imagine what a broken or ruptured 1300psi 36 inch gas pipeline turned blow torch could do to the forests around here. But who cares about loggers and the timber products industry anyway... not to mention the people, pets, livestock, and wildlife that would be killed. What pipeline in this area hasn't leaked or broken? There isn't any! The big difference is the pressure and volume of gas that will be coming through the proposed sendout pipeline. Its destructive capability far exceeds that of the other pipelines in the area.
- IND106-71 | Since pipelines in the area readily leak or fail due to the geologic and soil conditions it doesn't make any sense to allow this pipeline to go through any area where people reside nor the residential areas Non-odorized.
What good is any taxpayer supported government agency that will not represent the Public's safety interest and require the sendout pipeline to be ODORIZED? The only reason given by NorthernStar Energy[Bradwood Landing] Joe Desmond when questioned was that industry doesn't want it odorized.
HOW CAN THIS BE IN THIS DAY AND AGE THAT THE PUBLIC AT LARGE IS EVEN BEING CONSIDERED TO BE PUT AT RISK WITH NO WAY TO SAVE THEMSELVES FROM GAS PIPELINES WHICH IT IS ONLY A MATTER OF TIME BEFORE THEY LEAK OR BLOW OUT? THIS SHOULD NOT BE ALLOWED AND ODORANT SHOULD BE REQUIRED IN THE PUBLIC INTEREST AS A PERMIT REQUIREMENT.
Why is it that we are to be put at risk to save industrial customers money? This not acceptable. If Bradwood Landing gets to claim PUBLIC use and necessity "utility status" for eminent domain to plow through everyone's place then the PUBLIC should be able to request and receive Public protections.
On behalf of the Public, I request those protections and request Odorant be put into the sendout pipeline at Bradwood, OR.
If industrial customers don't want to have to remove the Odorant then they don't have to buy the Gas. They can chose to find or develop a less costly method of odorization and removal or odorant that doesn't require removal for their processes or use the standard methods when economic conditions warrant.

It is and has been the position of Bradwood Landing to NOT introduce Odorant into the sendout pipeline so it should be clear that the PROJECT CANNOT MOVE FORWARD DUE TO PUBLIC SAFETY AND PERMITS SHOULD BE DENIED.
It also should be clear that Bradwood Landing is not in the Public Interest.
- IND106-72 | The sendout pipeline has the ability to blow out levees which it passes under causing flooding of entire diking districts and wiping out the farms and businesses within them. It is the duty of the CoE who have authority over such levees to protect them. Again, how is LNG, which is unnecessary for the PNW, more important than anyone else's business, especially the food

Individuals

106

- IND106-69 | Security measures would be in place to mitigate risk from terrorist attacks on LNG vessels. Also, a discussion on terrorism is included in section 4.11.8. It is possible that a release from the LNG storage tanks could be caused by an intentional act, such as a terrorist attack. Although an intentional breach scenario could result in greater thermal radiation in the immediate vicinity of the release, such scenarios are typically associated with the desire to inflict damage to major infrastructure and population and commercial centers. See also our response to PM1-1 and LA3-55 on emergency response plan.
- IND106-70 | Pipeline safety is addressed in section 4.11.9.
- IND106-71 | See our response to comment PM5-81.
- IND106-72 | The pipeline would not blow out levees. The proposed pipeline would be constructed in accordance with the regulations included in the DOT's Minimum Federal Safety Standards in 49 CFR Part 192. The COE would ensure, through its permit process, protection of all areas under its jurisdiction. The project would not impact food production; see our responses to comments IND33-59 and IND33-71.

IND106-72
cont'd

production business? Can you live without food?

IND106-73

There is information available which links a home being totally destroyed in a Gas explosion from regasified LNG which dried out connection seals. Regasified LNG is known to be typically hotter and to dry out seals.

The Gas [equipment] Manufacturers Association has stated that they have concerns about LNG, consider it damaging and don't recommend it for their equipment.

IND106-74

There is no law that states that this permitting must be approved. There are several laws that must be fractured to allow its approval, such as Coastal Zone Management Act regarding Clatsop County and State planning goals 11, 12, and 16.

However, the permit should be denied on any number of reasons, the foremost being Public Safety since it truly is impossible to protect the Public from a geologic or terrorist or human error caused incident or catastrophe nor Gas price manipulation without permit denial.

VII. VERIFICATION, ADDITIONAL COMMENTS & QUESTIONS

IND106-75

Just because Bradwood Landing and/or their contractors or other entities in support of their project have supplied FERC and other Agencies with studies and/or data, it certainly doesn't mean that it is accurate or addresses the situation, condition, item, or question adequately or appropriately. Quite the opposite, the Bradwood Landing DEIS demonstrates inaccuracy and incompleteness to the level of which relegates it to fiction. It is the duty of the Agencies to independently verify DEIS information in the Public Interest. The FERC consultants used to produce the DEIS are fully inadequate to the task and FERC reputation suffers as a result.

IND106-76

Note that the DEIS does not adequately describe ALL the discharges, their impacts, and cumulative long term effects, especially the discharges into the river. The DEIS is premature at best since this information should be readily available.

IND106-77

Further, of the information that State and Federal Agencies have requested regarding the LNG project but never received, the Agencies must stand firm against pressure, which they failed to do with the DEIS, and withhold publishing any approvals, permits, or Final Environmental Impact Statements until the information is supplied and have had independent analysis to confirm or deny that information. Failure to do so would be a failure of duty, a breach of the Public Trust.

In many instances Bradwood Landing et al has supplied outdated information and data, or removed sections of data from data available that are inconvenient for their purposes. Note the dates of several of the data/information in the DEIS.

No mention of the LNG ship which caught fire in the Middle East, I believe off the coast of Jordan or in that region. No mention of LNG coming from Iran, the source for the proposed LNG facility at Port Westward as stated by the project proponent. That project proponent has stated the project is not dead. Likely waiting for Bradwood Landing approval so that it can get approval through equal protection ruling as will Oregon LNG.

IND106-78

I've heard representatives of organizations supposedly representing the interests of shippers and longshoremen claim to Clatsop County officials that they "have looked at the issue and support LNG coming into the Columbia" yet they cite nothing about how they came to this conclusion excepting the honesty of NorthernStar representatives, which is one of the biggest jokes of all. Note all the misinformation, misuse of risk analysis techniques, omission of inconvenient information, and misleading statements contained in the DEIS.

One can only wonder what all those in support of LNG were promised and what will happen

Individuals

106

IND106-73

See our response to comment IND67-13.

IND106-74

Public safety is addressed in section 4.11. Clatsop County made a land use decision about the project on March 20, 2008, as discussed in section 4.7. The ODLCD will determine if the project is consistent with the CZMA, as indicated in sections 1.3.9 and 4.7.2.4.

IND106-75

We agree it is the duty of the cooperating agencies to independently review and analyze data provided by NorthernStar.

IND106-76

Water appropriations and discharges associated with construction and operation of the proposed project are described in table 4.3.1-1. In addition, discharges to surface waters and their associated impacts are described in sections 4.3.2.3, 4.3.2.4, and 4.5.2.1. Water discharges to the Columbia River would be carried out in accordance with the requirements of the NPDES permits issued by the ODEQ and WDE.

IND106-77

See our response to comment PM6-94. While NorthernStar does not have to disclose the source of its LNG, it is more likely to come from exporting nations around the Pacific Basin than from Iran. LNG carrier accidents are discussed in section 4.11.5.

IND106-78

Section 4.8 discusses socioeconomic impacts and potential economic benefits for local communities. We assume people support the project because they want to see new supplies of natural gas made available to the Pacific Northwest through the importation of LNG, and they appreciate the potential economic benefits the project may have.

IND106-78
cont'd

to them when the investigation begins.

IND106-79

A prime example of misleading, is stating that the Gas is for the PNW. Independent analysis by the Oregon PUC, by the California Lieutenant Governor, and analysis by Columbia Riverkeeper shows this to be false. Even the DEIS description of the LNG project connection to the Palomar pipeline project proves this to be false, fortified by the fact that Williams pipeline cannot take the Bradwood Landing sendout pipeline capacity, is at capacity now and has no demand for more. On this basis alone there is no justification for the Public safety risk, pollution, habitat and economic damage along the Columbia River.

IND106-80

Bradwood Landing's claim of about 65 jobs is ridiculous. Their own prospectus states about half that which is also likely high. It is a for profit business so employees will be minimized. Why would they have any more than the following?:
1 manager/system operator
1 system operator
1 boom operator
1 millwright
1 electrician
3 security/firemen/tie up tenders
125 ships/yr X 24hr turn around = 60hrs/week
At two 12 shifts but only 30hrs/week each.
16 full time facility staff
Plus 6 tugboat employees, only 1 shift needed.
So 22 - 25 full time employees.
Their purpose is to sell Gas not hire people. This number of employees doesn't warrant all the jobs lost due to decline in recreation, import/exports shipping lines moving to elsewhere due to LNG caused delays on the river as well as to other river commerce and river users.

IND106-81

An Agency needs to step forward and halt this insanity and abuse of eminent domain of a sendout pipeline that connects to an already full pipeline. The FERC is best positioned and equipped to step forward and serve the Public Interest in denial of this PROJECT APPARENTLY BUILT ON DECEPTION.
Even if Bradwood Landing convinced Williams pipeline's suppliers to shut off supply to Williams so that Bradwood Landing could have the capacity, Williams pipeline could only handle part of the Bradwood Landing capacity. Yet Bradwood Landing states emphatically that the Palomar pipeline is separate and not part of the situation and unneeded ...more dishonesty from Bradwood Landing. It would take an inordinate amount of time to list it all and is not my job.
It is the job of Agencies to verify. Is there no penalty for lying the way through the permit process to get a project in?
What conflict of interest does FERC have regarding LNG and with Bradwood Landing?
Former FERC employees who are still friends with FERC management is a conflict of interest.
FERC literature PROMOTES foreign LNG, foreign energy being something that as a nation we should be and the President has stated that we should be weaning ourselves off of, yet their is a mad rush to get numerous LNG facilities authorized before the President's term is up, why is that?
This situation should be investigated for a blatant breach of the Public Trust.

IND106-82

The DEIS also states that the other gulf states authorized LNG sites are not considered suitable due to the distance from the proposed market area. This is an insult to anyone's intelligence who has any idea how far Gas already travels from pipeline to pipeline and is being proposed to travel in

Individuals

106

IND106-79

See our responses to comments PM1-58 and PM3-50.

IND106-80

The number of employees that NorthernStar has indicated would be required during operation of the proposed project is in line with those required at similar facilities. There is no evidence that the project would result in a loss of jobs in other sectors. No declines in recreation or tourism are expected. There would not be major delays for commercial ships or other river users. The project would probably have a beneficial impact on the local economy; see section 4.8.

IND106-81

See section 1.0 for a discussion that although the existing Williams Northwest system is fully subscribed, it is still possible to find capacity for new entrants through a variety of programs, including interruptible transportation, capacity releases and turnbacks, and reverse open seasons. There is no conflict of interest for this project, see our response to comment PM3-65.

IND106-82

See our response to comment IND106-25.

K-1074

- IND106-82
cont'd | pipelines to "proposed market areas". Note the "Rocky Mountain Express" pipeline heading East.
- IND106-83 | Where is the independent unbiased Gas needs analysis for the Nation and the PNW? There can be no reason to warrant such risks and detrimental impacts in the Lower Columbia River Valley without a profound need. Obviously "independent" does Not include FERC nor the NW Gas Association whose major member is NW Natural a driving force behind LNG here so it can get a piece of the pie of Gas transmission to California.
- IND106-84 | The DEIS states, regarding the British Columbia, Canada authorized Kitimat LNG facility Gas that "only a portion would end up in the United States as most would probably go to Canadian markets". However NO EVIDENCE was given at all, nor regarding "most". No analysis of the British Columbia and Alberta Canada Gas equation. It is just as "probable" that more than sufficient supplies will be heading for the PNW and California from this facility.
Nonetheless, the Kitimat facility output, claimed to be about half that of Bradwood Landing, could be increased since it has storage capacity and pipeline size similar to the Bradwood Landing proposal.
It is just as likely that the Kitimat facility proponents have done their market analyses and don't foresee any more required supply to their Canadian, PNW, and California markets or they would have proposed increased supply capability or will do so WHEN a market for it develops.

FERC SHOULD DENY ANY PERMITS UNTIL FULL AND HONEST DISCLOSURE OCCURS.
- IND106-85 | THE EASIEST WAY TO VERIFY THAT THE GAS FROM THE LNG IS FOR THE PNW IS TO REQUIRE THAT AS A CONDITION OF PERMIT APPROVAL, THAT IT CAN ONLY BE SOLD WITHIN WA, OR, AND ID, AND THAT ALL ELECTRICAL GENERATION FROM THE GAS IS SOLD IN WA, OR, AND ID.
IF NOT THEN ALL PROPOSALS OF ANY TYPE CAN BE AFFORDED THE SAME LACK OF SCRUTINY OF DISHONEST STATEMENTS OR MISLEADING STATEMENTS, INFORMATION, AND DATA AND/OR LACK OF PERTINENT DATA AND INFORMATION.
- IND106-86 | The map of geologic fault lines included in the DEIS is incomplete at best. Note State of Oregon geologic comments. A true assessment of the geology of the area should require a permit denial to protect the Public unless Authorities purposefully intend to endanger the lives of those within 7plus miles of the LNG facility and within a half mile of the sendout pipeline, according to Sandia Labs modeling of a storage tank failure and ACTUAL pipeline incidents of similar size and pressure. If a major leak occurs Gas can accumulate into a wide area before reaching an ignition source or asphyxiate animals including humans before it reaches an ignitions source.
- IND106-87 | How is it that the US Coast Guard does NOT approve of LNG ships in other locations which are less difficult to safeguard than the route to Bradwood? Note US Coast Guard ruling at another proposed location. In truth it only shows the political and other pressure which has been applied to the Coast Guard in this district, with no regard for the safety or livelihoods of the many affected in this area and beyond. This situation is not in the Public Interest.

If one LNG facility is permitted here, the likelihood of more than one LNG facility along the Columbia River is high via equal protection. To provide for the Public interest, delays to all other ships, barges, and users of the river, should be determined for all scenarios. Many imports and exports come and go on a high tide as will the LNG ship. Timing conflicts and delays to other ships

Individuals

106

- IND106-83 | See our response to comment PM1-8.
- IND106-84 | Our information was derived from the proponent of the Kitimat project, who indicated their target market was the tar sand oil production region of Alberta.
- IND106-85 | See our response to comment IND106-32.
- IND106-86 | Methane from a pipeline leak would not accumulate in a wide area at concentrations such that animals and human would be asphyxiated.
- IND106-87 | As discussed in section 4.8.1.7, the project would have minor impacts on other ship traffic. The delay scenarios for multiple non-existent LNG terminals are beyond the scope of the EIS. The majority of this comment is not relevant to the EIS

K-1075

IND106-87 cont'd | will occur. Even if only one LNG facility the delay scenarios for one and two and three should be outlined, why has this important issue been avoided? Because it is so damaging to Bradwood Landing, yet FERC is supposed to be an Agency of the government not of Bradwood Landing. Will FERC cause this information to be developed in the Public interest?

Why has the Port of Portland director told his staff that he is satisfied with LNG ships on the Columbia River without doing an actual in depth analysis? Why does he consider it a hands off issue? Who is he subordinate to on this issue? Why is he willing to screw all the port waterborne clients, those port workers, all the economy they affect and to benefit FOREIGN ENERGY INTERESTS which funds may go to kill our troops? Who is really calling the shots on this deal? Why is LNG so important? In truth it isn't at all. LNG is only important to those who plan to make money from it, otherwise it wouldn't even be considered here as their is absolutely no credible proof that LNG is needed in the Columbia River, and wasn't until LNG facility proposals met roadblocks in California. Why did the Stoel Rives attorney, the firm that also represents the Port of Portland, move to NW Natural VP slot in 2005 who also happens to be the wife of Congressman Blumenaur? Why does Blumenaur support LNG in the face of the lack of need? Please delineate all the other conflicts of interest such as all the Senators who have gained benefits from the energy lobbies that voted to give FERC powers that it should not have under the Constitution.

Where is the table of CONFLICTS OF INTEREST regarding this project so that the Public can be fully informed?

IND106-88 | Why should landowners along the proposed sendout pipeline route to the Williams pipeline connection be required to put up with a dangerous pipeline, loss in property value, hard to sell property, limited use property, when the Williams pipeline HAS NO ROOM FOR THE GAS?

IND106-89 | At the very least since the LNG sendout pipeline gets "public utility" status to plow through anyone's property and we all in the region have to live with the risk. We should get to VOTE on it like we did the Trojan nuclear plant. Interestingly the vote passed to keep Trojan since the Public was misled into thinking we needed the energy. The promoters of Trojan claimed that the area was solid and no reason to worry, however, later it was found to be on a fault line.

Statements in the DEIS about Trojan Nuclear plant are also false. Note that its vote passed. Misleading the decision makers regarding Alternatives to Bradwood Landing, such as nuclear not being acceptable to the Public, as well as the Kitimat conjecture, and gulf states LNG facilities inaccurate "opinions" should not be allowed.

WHERE IN THE USA IS A WORSE PLACE FOR LIKELIHOOD OF AN LNG FACILITY TANK BUCKLING, WORSE FOR FISH, WORSE RISK OF FOREST FIRES, WORSE PROBABILITY OF PIPELINE FAILURE? EASE OF TERRORIST ATTACK TO LNG SHIPS OR FACILITY?

Maybe next to a volcano? Oops! Mt. St. Helens anyone?

IND106-90 | Where is the EPA Public Notice regarding the unnecessary pollutants going into this interstate waterway? Tides will take the pollutants upstream into the main river channel and over to WA areas as well throughout the salmon rearing grounds West of Bradwood. Has FERC and/or Bradwood Landing notified the EPA of the "stuff" it is going to be dumping into the Columbia River continually while the facility is in operation for the life of the facility?

IND106-91 | It is worth noting that the Mayor of Boston, MA is completely against the LNG ships passing in front of Boston and has stated that the LNG facility should be located where the LNG ships would

Individuals

106

IND106-88 | See our response to comment PM3-50.

IND106-89 | The Commission will determine if the project is a utility in the public necessity. The U.S. Congress gave certificated companies the power of eminent domain through section 7h of the NGA. Our discussion of nuclear power in section 3.1.1.3 indicated that it would not be a viable alternative for several reasons, including costs, problems associated with the remediation of nuclear waste, regulatory hurdles, long project planning time, and public opposition, based on a variety of cited sources. Likewise, our descriptions of the Kitimat and Gulf Coast LNG terminals are accurate, and based on cited sources.

IND106-90 | Although the EPA is involved in the review of the project's permit under section 404 of the CWA, this permit is actually issued by the COE. The COE issued a public notice on October 18, 2007. However, if the COE issues a section 404 permit, the EPA can veto the COE permit (see table 1.3-1). Section 401 of the federal CWA requires applicants for federal permits or licenses to provide the federal agency a water quality certification from the state agency if the proposed activity may result in a discharge to surface waters. The EPA delegated the project's section 401 certification to the ODEQ; the state issued a public notice on October 18, 2007.

IND106-91 | Each project and project location has unique characteristics and must be considered on its own merits.

K-1076

IND106-91
cont'd
be away from the city. Obviously he has the best interests and safety of the people of Boston at heart. Why don't the Agencies have the best interests and safety of the people in Astoria, OR at heart?

IND106-92
At a FERC hearing in the area, FERC representative Mr. Freidman stated that they cannot do anything outside of their current directives unless Congress asks them to.
Ron Wyden stated publicly in Astoria in 2006 that he had requested FERC to do a rating of proposed LNG facility locations around the country and make a table of merits and demerits so that poor locations would be omitted.
Where is this rating? If it hasn't been completed, then it should be required to be completed before a decision is rendered on permitting of Bradwood Landing.

IND106-93
The Coast Guard didn't call for the WSA to be kept from the Public, NorthernStar Energy did and got their friends at Homeland Security to implement that scam.
When a terrorist will be able to observe everything they would need to know, after the LNG facility is built, there can only be damaging information to Bradwood Landing's project in the WSA for them to want it kept from the Public. Allowing such is subverting the Public interest. The appropriate individuals with Homeland Security and NorthernStar Energy should be investigated for conspiracy against the Public interest and preventing due process.
Why would the avid fence sitter Congressman Baird come out against LNG on the Columbia but only after reading the WSA as he was able to do with his security clearance? What does he know that the rest of us should know?
Why would an Emergency Response Plan be kept secret? The only way people can follow "the plan" is if it is known! It seems that it is held secret because there IS NO CREDIBLE PLAN. They don't want to jeopardize their project when the people realize they will be dead in any number of scenarios. Another breach of the Public trust and due process.
No Action until the full WSA and ERP is made public seems the only route to take in safeguarding the Public.

IND106-94
VIII. ENDING COMMENT
Regarding the Agencies' permit decisions being based on the "probable impact on the Public Interest", "reflecting national concern for protection and utilization of resources", and "balancing expected benefits against foreseeable detriments":
The large number of omissions and misinformation demonstrate the DEIS should be recalled and revised.
There is enough information in this document to show how the negative impacts to the Public greatly outweigh the positive impacts of LNG ...since the LNG isn't needed here, that LNG positive appears to just be a low number of jobs which can be had by other less destructive means. It would seem concern for protection of the heart healthy food source of salmon and the fishing industry including sport fishing would be much higher than destroying it for unneeded LNG. It would also seem that delays making our grain exports less competitive would not be desirous either. It would be good to see this decision matrix in a revised DEIS.
Although it may take some creative thinking to straighten the bent Agency knees to corporate-political greed of those above you, I urge you to make this effort on behalf of the Public, multitudinous costs to the Public of this LNG Trojan Horse, and costs to our brave soldiers, who will benefit greatly from less foreign energy, when we truly have all the energy we need for 500

Individuals

106

IND106-92 The FERC's regulatory responsibilities have been established in legislation passed by Congress and signed into law by the President. With regard to Senator Wyden's letter, see our response to comment PM2-32.

IND106-93 WSAs for all LNG projects are filed as SSI. See also our response to comment PM6-23.

IND106-94 The analyses in the EIS indicate that the project would not destroy salmon or fishing in the lower Columbia River, project-related impacts on salmon can be mitigated, and it may cause only inconsequential delays for grain cargo ships using the river. The EIS does not contain misinformation or omissions and is adequate to comply with the NEPA. The Commission will ultimately decide if the project is in the public interest and is necessary.

years to come. And with 4 existing and 3 already authorized LNG facilities in the USA along with those in Canada and Mexico, there is more than enough LNG coming to the USA (Note previous FERC Chairman comments).

One can never forget who owns the large media, Wallstreet corporations do, and energy company profits are riding high the more they claim energy is in short supply. And it is very difficult to justify high prices without a plausible method why energy could be cut off at any time.

Thank you for all the efforts, to the Patriots of the USA!

Sincerely,

Vance Fraser

2007

Re: Docket No. CP06-365-000 et. Al

Dear Ms. Bose,

Thank you for the opportunity to comment on the FERC DEIS for the Bradwood Landing Project.

IND107-1 | A major concern to me seems the amount of river water intakes at up to 35,000gpm¹ and the secrecy of the applicants intake strainer design. The applicant should be able to show a percentage of fish kill due to impingement or other causes just as our hydro projects on the river.

IND107-2 | Footnote d, page 4-53 States the applicant to offer incentives to retrofit LNG carriers with a water intake system. **Should not the FERC in good judgement DEMAND that all LNG carriers on the Columbia River be equipped with such a system.**

2.8.1.3. Hazard Control System.

IND107-3 | The applicant seems to omit a High Expansion Foam system (HEFS) as this would be one of the only systems to extinguish a fire of this source.

3.1.6.3 Alternative Vaporization Technologies.

IND107-4 | Page 3-42, 3-43 The applicant should be limited to the highest environmental standards in regards to air and water quality, therefore only the STV system should be allowed in this environmental sensitive area. This system will not discharge water into the river and the exhaust can be treated by means of a Selective Catalytic Reduction (SCR) and Oxidation Catalysts system.

Page 2.

¹ Page 4-53, table4.3.1-1

Individuals

107

IND107-1 | Potential impacts on aquatic resources due to water intake are discussed in section 4.5.2.1. See also our response to comment PM1-131.

Engineering views of the pump station have been submitted to the FERC for review; however, these design drawings are considered proprietary information and are not available to the public.

IND107-2 | See our response to comment PM1-31.

IND107-3 | High expansion foam is discussed under Safety and Security Systems at the LNG terminal in section 2.1.3.6.

IND107-4 | SCV systems are commonly considered in the design of LNG import terminals throughout the world. Their proven operational history, low capital cost, simplicity in design and operational flexibility combine to make this an attractive option to LNG terminal developers. While it may be technically feasible to use a vaporization system with reduced emissions and/or water discharges, the use of the SCV system would be required to operate within acceptable air and water quality standards.

K-1078

4.1.3.3 Geologic Hazards.

Shoreline Erosion, page 4-15, 4-16

IND107-5 | This subject is totally to the advantage of the applicant with statements such as “The results indicate that the potential for bank erosion due to the high velocity created by a tugboat would be low for the shoreline along Puget and Tenasillahe Islands”. Regardless what the circumstances of high or low velocity fields, the applicant needs to assume responsibility of additional erosion due to their operation, and I request this to added to the FEIS.

Site Suitability

IND107-6 | The applicant controls 411 acres, with a facility footprint of 40 acres and a permit application for 13.71 acres of tidal and non-tidal wetland fill, wouldn't the FERC ask the question “Is this a suitable site”.

1.1 Purpose and Need.

IND107-7 | Page 1-3, This whole chapter is a case of salesmanship as the need is not realistic nor the ability to subscribe to some of the pipelines. The FERC should DEMAND from the applicant to be truefull.

2.1.5 Wetland and Habitat Mitigation.

IND107-8 | The FERC and other agencies should not allow or accept Svendsen Island's² mitigation to offset the lost of habitat, due to this was in process of being returned to its natural state. Hunt Creek³ is currently a beautiful fish rearing creek in a natural setting, why mitigate this site, unless the applicant destroys it during construction. FERC and other agencies should DEMAND robust and significant mitigation sites.

4.8.1.3 Property Values.

IND107-9 | The applicant is unaware of any studies that have been done relative to the effects on property values, etc.⁴. I disagree with the applicant and will be able to proof the opposite⁵, the applicant should accept responsibility for their effects on the disruption of life on the river and the residents. Page 3.

4.12.7 Air quality and Noise.

² Page 2-29, fig. 2.1.5-1.

³ Page 2-29, fig. 2.1.5-1

⁴ Page 4-323

⁵ Preliminary Assessments of Economic Impacts from the proposed Bradwood LNG Terminal, Julie Ann Gustanski, Phd.

Individuals

107

IND107-5 | See our response to comment PM3-18.

IND107-6 | The site was formerly occupied by lumber mills and has been used for disposal of almost 1 million cubic yards of dredge spoils. It is zoned for industrial use. The purpose of the EIS is to look at a myriad of factors to determine whether the site would be suitable for the proposed use.

IND107-7 | See our response to comment PM1-8.

IND107-8 | See our response to comment FA3-3.

IND107-9 | The referenced study has not been filed with the FERC as part of this proceeding, so we are unable to address this comment. We do not believe that the proposed project would cause major disruptions to regional residents and river users. There are already existing industrial facilities operating along the lower Columbia River.

I totally disagree with the statement made in this paragraph⁶, such as “These effects could add to the ongoing air and noise impacts in the project area”.

At this time there are no other effects on the local area, unless the applicant is granted a permit. If granted a permit, this will indeed add a significant air quality problem to the upriver areas of Longview/Vancouver and Portland with a known airshed problem during the summer.

Conclusion.

The applicant and the FERC DEIS have been less than truefull about their representation of the facts and/or minimized the negative impacts to the river, estuary, cumulative impacts of water and air quality, socioeconomic impacts on the river communities.

Very truly yours,

Frans Eykel

Docket CP06-365-000
OFFICE OF THE SECRETARY

December 20, 2007

2007 DEC 27 P 3:37

Federal Energy Regulatory Commission
Comment on the draft EIS for the proposed Bradwood Landing LNG Project

We urge you to stop the Bradwood Landing LNG project.

IND108-1 | Objection #1: There is an unacceptable level of risk to the community. There is not a sufficient guarantee of public safety. From the information buried in the Oregon Department of Energy's Appendix K, the Safety Advisory Report, there is an assumption that local jurisdictions will be able to upgrade their capability to handle a LNG emergency situation. Where is an assessment of their current capability? Who will pay for upgrades if they are found lacking? Should the cost of the upgrades, no doubt in the millions, be born by the community for the benefit of a private corporation? Is this the best use of limited public funds?

IND108-2 | Objection #2: There was very brief mention in 5-8 of the "impact of marine release of LNG with ignition." This needs to be explored further and analyzed. How will Columbia County be able to respond? How can the firm assure us that there will not be such a "significant event?" As we know from Three Mile Island and the Valdez spill, just because the odds are "remote" does not mean they do not happen. I do not believe that the very limited benefits to our community outweigh these huge risks.

And, if an incident occurs, who cleans it up? The state? The county? The firm? Would a several billion dollar bond be appropriate?

IND108-3 | Objection #3: The report in section 5.1.7 refers to the population of our area as less than 500 people, as though damage to our family and property counts less because we're fewer in number. Our area seems to be especially vulnerable to economic justice issues because it's difficult for a county of our size to respond to the complexities of such a project.

IND108-4 | Objection #4: I was surprised at the public meeting in Longview to see no educational material available for the dozens of people who cared to show up, not even a map. The draft EIS was written in such a way that makes it difficult for a non-professional to understand it. There are no maps, it's full of acronyms, and important information to the community is buried in its depths. Something as basic as having the address and/or email printed on a meeting notice so that people can send in their comments is missing. This strikes me as an economic justice issue when notices are poorly written, inadequately distributed, and little true information is made available.

Individuals

108

IND108-1 | See our response to comments PM1-1, PM6-24, and LA3-55.

IND108-2 | See our response to comment FA2-35.

IND108-3 | The EIS states that other communities along the waterway, outside of Warrenton, Astoria, Cathlamet, and Puget Island, each individually have populations of less than 500 people. It is an established fact that the project area is mainly rural, and the proposed LNG terminal would not be located in a densely populated urban center. The reference to population is not meant to imply a lesser importance regarding risk. Economic justice issues are addressed in sections 4.8.1.9, 4.8.2.9, and 4.8.3.9.

IND108-4 | The Notice of Availability for the draft EIS, which requested public comments on the document, contained the name (Secretary of the Commission) and the address of the FERC to which comments could be sent. It also indicated how comments could be filed electronically by computer via the internet. These instructions for submitting comments were reiterated at the public meetings, the transcripts of which have been placed into the record of this proceeding. Copies of the draft EIS were available at the public meetings, such as the two held in Longview, Washington on November 7, 2007. The EIS contains many maps and drawings.

K-1081

IND108-5 | Objection #5: How is the public compensated for this significant benefit to a private company? What should the cost of such a permit be? According to 4.8 there is very limited benefit to the residents of Oregon

IND108-6 | Objection #6: Why does a private company get to have pre-emptive use, a 500-yard zone, of the river? Why should all other traffic defer to them? The Columbia River is a major source of food, transportation, and recreation for the Pacific Northwest and why should any of those interests take a back seat or be damaged in any way? We will need more food and more transportation in the future, not less.

IND108-7 | Let us invest our community's resources into developing renewable sources of energy instead of damaging our ecosystem to perpetuate a system of imported energy.

Thank you for your attention to these issues. I urge you to stop the LNG project.

Sincerely,

Steven Miller and Erika L. Miller
7915 NW Skyline Blvd
Portland, Oregon 97229
503 283 8626

Individuals

108

IND108-5 | We disagree. We think section 4.8 demonstrates that the project may have a strong economic benefit for the region. The general question of public need and benefit from this project would be addressed in the Commission's Order.

IND108-6 | The LNG carriers would not pre-empt other river users. NorthernStar and the Coast Guard, together with the river pilots and other commercial ships, will coordinate safe passage for LNG carriers with other river traffic. The project would not result in significant negative impacts on river transportation, recreational use of the river, or food production. See our responses to comments IND33-59 and IND33-71.

IND108-7 | The EIS discusses renewable energy resources in section 3.1.1.3.

Docket No. CP06-365-000 et al.

ORIGINAL

To: Federal Energy Regulatory Commission

Delivered at Tues, Sept 18 meeting, Warrenton High School

From: Lee & Judy Talbot - PO Box 925, Astoria, Or
Property owners/ Residents in Clatsop County

FILED
OFFICE OF THE
SECRETARY

2007 DEC 27 P 3:34

IND109-1

Based on facts and setting aside unknowns and unenforceable promises and sales pitches, my wife and I see LNG as a source of irreversible damage to our beautiful area, as well as raising a safety issue. We spent a day listening to LNG promoters dodging pointed questions and making vague promises. Clatsop Co. Commissioners have approved some things that should have involved other responsible agencies such as Coast Guard, law enforcement, Emergency response, Fire depts, ect. Who, what agency is going to make the LNG people accountable?

Our concern and reason for involvement is the safety issue. I retired from Lawrence Livermore National Lab. after 36 years in Nuclear Test Eng. I'm no stranger to sources of destruction. When I was a youngster I was active in a water ski club in the Calif. Delta. The club had an island that was 1/2 mile long and 1/4 mile wide. One evening we were called to the island by the local fire dept. Apparently the 500 gal. propane tank which had just been filled, leaked its contents. The low lying gas cloud was concentrated on the island because of the heavy growth of tules surrounding it. Gas must have permeated some of the structures before it reached an ignition source. What wasn't blown up was burn to a crisp. The volunteer firemen's comment was "This was no regular fire like we're used to." This episode is still clear in my mind. Relating the destructive potential of that 500 gals to what the volume of gas in an LNG tanker would be capable of, is beyond comprehension.

IND109-2

To get the perspective of a qualified authority, I contacted Dr. Ron Koopman who is a Hazard Analysis Consultant involved in California's proposed off shore LNG terminal. I interacted with Dr. Koopman while at LLNL when he was directing a series of Liquefied Gaseous fuel test at the lab's Nevada test site. Since our proposed LNG sites are located on a geographical fault, I asked Dr. Koopman what he could visualize, if during the transfer of LNG, we experienced an earthquake which broke the transfer line, creating an uncontrolled flow of LNG into the river and surrounding area. The following is a quote from Dr. Koopman's response. "The biggest and unique hazard associated with an LNG ship (should there be an uncontrolled release of LNG) would be spilling LNG on the water, but not igniting it. Since LNG is so cold, it vaporizes very rapidly when spilled on water, forming a dense low lying vapor cloud that can travel long distances down wind. It will travel down wind (indefinitely as long as there is a source) until it disperses to concentrations below the lower flammability limit (5%), or runs into an ignition source and ignites. It will not explode unless it infiltrates a confined space and is then ignited. But it (the gas cloud) will burn back to its source. If the spill rate is large, the flammable cloud could travel several miles down wind."

In summary, I understand FERC has the final responsibility for the LNG terminal approval. I would hope that FERC's #1 priority would be the safety of our citizens, the emergency response, fire fighters, and law enforcement. Films of field test conducted by LLNL and Sandia Labs are available. I believe FERC has responsibility to show these films to the public and afford 1 on 1 awareness sessions for our emergency response people.

Respectfully

Lee Talbot

December 17 2007

Federal Energy Regulatory Commission
Office of the Secretary, Washington DC 20426

Re: Docket Numbers CP06-365-000 and PF07-10-000

I have been extremely disappointed in the Federal Energy Regulatory Commission (FERC) process in permitting Liquefied Natural Gas (LNG) terminals and pipeline proposals for the state of Oregon.

The federal Energy Act of 2005 needs to be revised if a federal regulatory agency continues to "promote private speculation in their quest for profit. Very little information about the Oregon LNG proposal was provided to the property owners affected by the pipeline. As recently as last week the pipeline route has been revised. FERC's website is cumbersome and has had numerous technical problems. Why are there three separate competing proposals being considered at the same time in one state? How many similar overlapping proposals are being considered in other states? Should there not be an overall national plan for natural gas terminals and pipelines instead of tagging along behind each individual proposal to license and permit? I question if this is good use of taxpayer dollars. Northern Star, Palomar and Oregon LNG have little regard for the health, safety, environment or even the long-term economic conditions in Oregon. They are here for the short-term, will sell their interests in the docking facilities and pipelines as soon as they are built and leave state and local agencies with any problems that arise once the projects are built.

State agencies have voiced serious reservations about the draft of the LNG environmental impact statement. FERC has not provided an independent assessment to justify the need for terminals or pipelines. The Oregon Department of Geology and Mineral Industries found the Bradwood Landing site to have "severe natural hazard potential". Even the US Coast Guard said the Bradwood site is "unsuitable without extensive measures to improve safety and security". Representative David Wu has asked Admiral Thad Allen to make public the Waterways Suitability Assessment report for the proposed Bradwood Landing site. The Columbia Bar is one of the most dangerous areas on the Pacific coast. Do we really want ships loaded with LNG navigating this area? Do we really need a LNG pipeline under the Columbia River? Does this not conflict with state and federal efforts to restore and promote fish habitat on the Columbia River? How will dredging for terminal and pipeline affect water quality?

The proposed terminals and pipelines are a move toward continued dependence on foreign energy sources. Sources, I might add, that are potentially unstable and unreliable. It does not make sense to spend billions on creating these facilities. Oregon's own energy policy encourages renewable and conservation measures. Transporting LNG from long distances offsets any benefit there is to "clean" natural gas. The liquefaction process requires massive amounts of energy. We need to support sustainable energy policies for the state and on a national level. Invest in tidal energy research, initiate strong campaigns to conserve energy, promote solar, biomass, geothermal and wind projects.

I own a 14-acre parcel in the foothills of the Coast Range. I have 12 acres in timber that I have managed and cut in a sustainable manner for over thirty years. I have witnessed numerous landslides when timber is removed from steep slopes. What happens to a pipeline that is buried in unstable soils? Fire and emergency services are stretched very thin in our rural areas. Who will respond to an emergency in the forest? Is it right to use eminent domain to support these speculative for-profit short-sighted LNG proposals? Most of these questions have not been answered. These LNG proposals for Oregon are seriously flawed. I hope you will consider rejecting the LNG docking terminals and pipelines proposed for the state.

Sincerely,
Chris Michel and Linda Kaiser

IND110-1

Only Congress can revise the EPAct 2005. See our response to comment FA4-1.

IND110-2

Any operator of a FERC-authorized facility would have to adhere to the conditions of the project Order.

IND110-3

The purpose and need for the project is described in section 1.1.

IND110-4

The Coast Guard has identified the measures necessary to make the waterway suitable for LNG marine traffic (see WSR in Appendix H). The WSA is SSI and can not be made public.

IND110-5

The pipeline would transport re-gasified natural gas, as opposed to LNG. The pipeline would be installed beneath the Columbia River using the HDD method. The HDD method avoids disturbance of waterbody bed and banks and therefore is the most effective means of avoiding impacts on fish habitat. The effects of dredging on water quality are discussed in sections 4.2.2.2 and 4.3.2.3.

IND110-6

The EIS discusses conservation under section 3.1.1.2 and renewable energy resources in section 3.1.1.3.

IND110-7

Areas of unstable soils would either be avoided or mitigated as described in section 4.1.4.3.

IND110-8

Emergencies would be responded to by the emergency response unit(s) having local jurisdiction.

IND110-9

A discussion of landowner rights, the easement negotiation process, and eminent domain is included in section 4.7.3.1. See our response to comment PM1-15.

ORIGINAL

Comment in Opposition to Proposed Bradwood Landing LNG Project

2007 DEC 27 12:52

- IND111-1 | Whereas, all industrial development in Clatsop County is subject to State of Oregon, Planning Goals and Guidelines, the Clatsop County Comprehensive Plan, and local land use laws;
- IND111-2 | Whereas, LNG tankers traversing the narrow Columbia River channel will adversely affect commercial shipping, commercial fishing, treaty rights, and the tourism industry of the entire Columbia River basin;
- IND111-3 | Whereas, LNG tankers, three proposed Bradwood Landing storage tanks 17 stories high, off-loading facilities, and all pipeline segments will constitute prime terrorist targets that endanger the people, property, ecology and beauty of the Columbia River Estuary;
- IND111-4 | Whereas, LNG tanker security escort requires the same designation as Search and Rescue, the United States Coast Guard will be constrained in its emergency response to other vessels and other duty assignments on the sea and in the Columbia River ;
- IND111-5 | Whereas, the Bradwood Landing Project's reliance on foreign fossil fuels will not contribute to Oregon's goal of 25% renewable energy by 2012;
- IND111-6 | Whereas, the Bradwood Landing Project terminal, storage tanks, and pipelines are proposed in areas subject to earthquakes, slides, and tsunamis;
- IND111-7 | Whereas, a spill at any location involved in this project (tankers, terminal site, storage tanks, and/or pipelines) could result in a vapor cloud fire endangering the lives of people for over one mile;
- IND111-8 | Whereas, the Bradwood Landing Project, as a result of its effect on federally protected salmon and countless other endangered species in the Columbia River Estuary , will be in direct violation of Oregon Planning Goal 16, Estuarine Resources;
- Whereas, Northern Star Natural Gas, Inc is demanding twenty-seven changes to Clatsop County's Comprehensive Plan in order to fit a large terminal/storage landing and pipeline project into a site that does not allow large development;
- Therefore, We call upon Governor Ted Kulongoski, U.S. Senators Ron Wyden and Gordon Smith, U.S. Representative David Wu, State Senator Betty Johnson, and State Representative Debbie Boone, and the Clatsop County Commissioners to take any and all means necessary , to stop this inappropriate and dangerous Bradwood Landing project.

Individuals

111

- IND111-1 | Clatsop County approved NorthernStar's requested land use zoning changes in a final decision of the Board of Supervisors on March 20, 2008.
- IND111-2 | The EIS indicates that LNG carriers in the waterway transiting to the proposed Bradwood Landing LNG terminal would probably not have significant adverse impacts on commercial ship, fishing, treaty rights, and tourism on the lower Columbia River. See sections 4.7.1.4 and 4.8.1.7
- IND111-3 | See our response to comment IND60-17. Pipeline safety is addressed in section 4.11.9.
- IND111-4 | Most Coast Guard units are multi-mission assets, capable of performing Search and Rescue or Ports, Waterways, and Coastal Security, as well as Law Enforcement (e.g. drug or migrant interdiction, fisheries enforcement).

The Coast Guard balances and prioritizes various mission requirements to best allocate resources to meet public needs.

The Coast Guard is fully aware of the potential LNG escort requirements and would balance mission needs and resources accordingly to mitigate risks throughout the port.
- IND111-5 | The EIS discusses renewable energy resources in section 3.1.1.3.
- IND111-6 | Geologic hazards and mitigation measures are discussed in sections 4.1.3.3 and 4.1.4.3.
- IND111-7 | LNG spill hazards are described in section 4.11.
- IND111-8 | The project would not be in violation of Oregon Planning Goal 16. Clatsop County made land use zoning changes so that the project is now compatible with Oregon Planning Goals. See section 4.7.

Bradwood Landing, LLC

NorthernStar Energy, LLC

Docket Nos. CP06-365-000,

CP06-366-00, et al.

Dear Ms. Bose:

IND112-1 The Draft Environmental Impact Statement for the Bradwood Landing, LLC does not meet National Environmental Protection Act criteria. It is woefully deficient in process and procedure. I see no other alternative but for you to issue a new DEIS in order for the public to comment on the total impact of the project once all the information has been gathered and evaluated in a like manner. The DEIS needs to be analytical. It can't be without all the

Individuals

112

IND112-1 See our response to comment PM4-20.

K-1086

K-1087

- IND112-1 cont'd pertinent resource information. For example, as of October 23, 2007 NMFS, National Marine Fisheries Service, still had 25 unresolved major adverse impact questions that Northern Star had not answered to their satisfaction. To issue a FEIS without it will result in a "homerun" for an appellant. This is obviously a "rush to press" document. Section 1502.2 (Implementation) of NEPA states agencies shall not commit resources prejudicing selection of alternatives before making a final decision and should not justify decisions already made. The DEIS reads like a justification statement.
- In reviewing NEPA and instructions for preparing an environmental impact statement, I found the DEIS deficient in the following areas.
- IND112-2 1.. The impact statement is supposed to be driven by the process of scoping. The scoping process, in part, includes public comments, as well as agency, to determine issues, concerns, and opportunities. Although you mention (1-24, 1-25) pre-filing public scoping process and meetings, you have excluded, in part, comments from the public meetings that dealt with unsuitable soils and socioeconomic effects of landowners. All issues, concerns, or opportunities identified by the public need to be addressed in the DEIS.
- IND112-3 2.. Criteria to evaluate alternatives are not adequately addressed. There is no systematic way for the reader to evaluate alternatives against each other. This applies to all alternatives for various planned project activities and is especially important for terminal site and pipeline location. The criteria again should reflect data developed from the scoping process. How can you select an alternative if you haven't evaluated alternatives in a systematic manner against issues, concerns and opportunities; identified a preferred, and documented such? The DEIS only tells you the agency looked at other alternatives and discarded them! You can't even tell if you considered a "broad range of alternatives" as required by NEPA. The document does not follow NEPA 1502.14 that states in part that alternative development and evaluation is the "heart" of the EIS and that "(a) Rigorously explore and objectively evaluate all reasonable alternatives.". The evaluation of the alternatives was subjective rather than objective.
- IND112-4 3.. The cover letter indicates that: "The draft DEIS addresses the potential environmental effects associated with the construction and operation of the following facilities located at the proposed Bradwood Landing LNG terminal..". The letter states that the DEIS also "evaluates alternatives to the proposal". If the alternatives were equally evaluated, including the "No Action", against each other, why weren't other alternatives addressed with equal weight as the preferred Bradwood Landing and the pipeline alternative?
- IND112-5 4.. The definition section of the document does not include the definition of "Pacific Northwest". It is imperative to know if other states besides Oregon and Washington are included in the purpose or objective of the project. This is especially true when considering demand for natural gas. For example, California's demand is much more than Oregon or Washington. Should this facility and pipeline be built to serve California? The evaluation of alternatives against economics might suggest the demand, now or in the future, isn't here in Oregon or Washington for a LNG facility.
- IND112-6 5.. The DEIS is a draft decision document. There should not be any

Individuals

112

- IND112-2 The FERC considers issues raised during public scoping that are relevant to the project.
- IND112-3 The criteria we used to evaluate alternatives are explained at the beginning of section 3.1 and in section 3.1.5.3. Our alternatives analysis meets the standards outlined by the CEQ at 40 CFR 152.14. We evaluated a broad range of alternatives including no action or postponed action, LNG terminal system alternatives, site alternatives, LNG terminal design alternatives, vaporization technology and tank design alternatives, power line and pipeline route alternatives, and dredged material placement alternatives. See also our responses to comments FA3-14, SA1-78, SA1-180, and IND86-8.
- IND112-4 The no action alternative is discussed in section 3.1.1. The information on different alternatives differs because the availability of data on certain alternatives was limited. See also our response to comment IND112-3.
- IND112-5 California is not included as a target market of the project. See our response to comment PM1-58.
- IND112-6 See our response to comment PM6-94.

K-1088

IND112-6

cont'd

questions left unanswered, especially ones involving environmental consequences. Several places it leaves it up to Northern Star to do what they want rather than telling them what they must do. I realize the Commission makes the decision on the FEIS but the statement that you recommend to them for consideration should contain the words necessary to meet NEPA. This document should not leave any subjectivity to NS, FERC, COE, USCG, DOT, or the commission, especially to the discretion of Northern Star. The public must have a chance to evaluate all project activities that effect environment, property, economics, and health and safety. This document does not do that. Some examples are:

1. Section 106 of the National Historic Preservation Act has not been met. A completed survey of proposed pipeline location hasn't been done. (ES-5)

2. FERC identified safety concerns with both the proposed facilities and the related LNG vessel transit through the Columbia River yet NorthernStar doesn't have to address these concerns prior to this DEIS or final EIS. (ES-8)

3. FERC recommends that NorthernStar develop The Emergency Response Plan with local emergency agencies which includes cost sharing. How do we, the public, know what economic effect or human impact this has on us? This should be part of the DEIS decision

4. The discharge temperature does not meet 303(d) requirement of the Clean Water Act. What are the effects?

There are many more.

IND112-7

6.. The mitigation Plan for T&E species does not adequately compensate for loss of habitat and taking of species. No reference has been found to requiring a "Taking Permit". There is no question that the dredging, terminal construction and subsequent ballast water intake will "take" T&E fish species. A recovery Plan for T&E species addresses the enhancement needs...not mitigation. An enhancement plan satisfying NMFS is needed prior to approval of EIS. There is no mention of an approved Enhancement Plan.

IND112-8

7.. Trenching across many of the streams reviewed on the maps provided is not compatible with requirements of Washington Department of Natural resources Forest Practices permitting process concerning stream crossings and vegetation removal. Also nothing is mentioned about requirements of wildland fire season. WDNR requirements must be met.

IND112-9

IND112-10

8.. I can't believe that the proposed pipeline couldn't have an effect on BPA transmission facilities in areas of unstable soils. Especially when BPA has had to work on a tower in the past because of unstable soil. There is no reference to proximity to BPA lines and the potential hazards. Have you requested pertinent information from them? In addition, the K-B natural gas pipeline (now owned by Northwest Natural Gas) has several hundred feet of natural gas line above ground because of mass movement. The last noted movement was in April/May 2007. This line is approximately ¼ to ½ mile from proposed location of the proposed Bradwood pipeline. Cowlitz County mapping, Critical Areas Ordinance, identifies the entire area as unstable soils. I found nothing in the DEIS so noting.

IND112-11

9.. NEPA states that a "systematic interdisciplinary approach" needs to be

Individuals

112

IND112-7 See our response to comment PM4-18.

IND112-8 See our response to comment PM4-11.

IND112-9 Meeting the applicable WDNR requirements related to forest fires would be an obligation of NorthernStar. Also, see our response to comment IND22-10.

IND112-10 The pipeline would not affect the stability of the BPA transmission line towers. The pipeline would be collocated with the KB pipeline as much as possible along the route through Cowlitz County but not in areas of landslide potential.

IND112-11 As the lead federal agency responsible for compliance with NEPA, the FERC coordinates input, analysis, and review from professionals in industry, regulatory agencies, and the public with a broad range and depth of expertise relevant to the environmental impact analysis embodied in the EIS. Comment periods and other aspects of the FERC's Pre-filing NEPA Process are essential to gathering that input.

K-1089

- IND112-11 cont'd utilized to insure integrated use of the natural sciences and the environmental design arts in planning and in making decisions. Although the document references several participants of various arts and sciences, no mention of an interdisciplinary approach to decision making is mentioned. How can a graduate wildlife biologist expertly evaluate impacts to T&E fish?
- IND112-12 10. This document states on page ES6 that to make the Columbia River suitable for LNG marine traffic, specific risk mitigation measures would be necessary. The measures would include a 500 yard moving safety zone around LNG ships in transit and a 200 yard fixed security zone around LNG ships moored at Bradwood terminal. Even though the Captain of the Port may make an exception to this, he still can enforce the above restrictions. There are no guarantees. This will drastically effect other commerce on the river and recreational boating including fishing. Very little data is available in this document concerning recreational fishing. On page 4-328 it states that there were 1500 recreation fishing boats using the effected portion of the river between February and October 2004. This number has to be in error. I would estimate there are at least that many in August alone. The disruption in and around buoy ten, if the above restrictions are enforced, would be tremendous. let alone in the river proper. The impacts to fishing and other marine traffic are not adequately evaluated.
- IND112-13 11. On page 4-330 is the following statement: "In fact, implementation of NorthernStar's SEI is expected to result in a net benefit to fishery resources on the lower Columbia." This is based on NorthernStar avoiding, minimizing, reducing, rectifying and compensating for impacts during construction and operation of project. I strongly disagree. The mitigation plan doesn't compensate for the lost and there is no enhancement plan in place. The final location of the pipeline has not been determined so how can you adequately evaluate environmental impacts? Also, if the oversight is anything like what was provided during the K-B pipeline construction, there will be a considerable net loss. The document does state (page 2) that federal DOT is responsible for "ensuring the safe, reliable and environmentally sound operation of the nation's transportation system.". No reference is made to pipeline installation. NorthernStar is required to hire an independent contractor to monitor construction but this is like letting the fox, coyote in our case, guard the chicken house. Who from FERC or state agencies will be monitoring the daily on the ground construction activities so the EIS isn't a moot point? The landowners need to know in advance what federal or State public official to contact with the authority to immediately stop work when environmental problems arise. This needs to be in writing. NorthernStar's environmental inspector responsibilities (page 2-56,57,58) means nothing to the landowner. Again, how can you possibly allow NorthernStar to develop a third-party environmental plan. That's your job. Are you going to let them select the contractor also?
- IND112-15 12. The landowners in the path of the pipeline route are left hanging. They are on their own to protect their interests, resources, and any improvements. Enforcement of the right-of-way agreement with NorthernStar can only be accomplished through the court unless you can get contractors to stop work until resolved, which is highly unlikely. This includes such things as topsoil segregation, property monument protection, drilling mud disposal, and road and culvert protection to mention a few. This should be addressed as part of the social-economic write-up of the DEIS.
- IND112-16 13. Page ES-4 First paragraph. You state NMFS and FWS has requested

Individuals

112

- IND112-12 We do not believe that the safety and security zones around LNG carriers would have significant adverse impacts on other commercial river uses, including recreational boating and fishing; see sections 4.7.1.4 and 4.8.1.7. Section 4.8.1.7 has been revised to correct the number of recreational fishing boats.
- IND112-13 See our response to comment FA4-12.
- IND112-14 The project will be monitored by a variety of independent agencies. The EPAct 2005 provided a role for the states to monitor construction and operation for safety concerns. DOT would conduct inspections to make certain the facilities meet their standards and regulations; typically delegated to the states through the OPUC and WUTC. In addition, FERC staff and our third-party contractors would conduct inspections. Our environmental compliance inspection and mitigation monitoring program is explained in section 2.6.
- IND112-15 As discussed in section 4.8.3.3, NorthernStar would compensate the landowner for use of the land through the easement negotiation process. The easement agreement between NorthernStar and the landowner would specify compensation for damage to property during construction, loss of use during construction, and loss of renewable and nonrenewable or other resources. See our responses to comments PM4-4 and IND48-3.
- IND112-16 See our response to comment PM5-27.

K-1090

IND112-16
cont'd

additional information and that you will be revising your EHA Assessment and BA. Your revision again needs to be part of the DEIS so that the public can respond intelligently to the impacts to T&E species.

14.. Page ES-5. You state that the technical review identified: "Several areas of concerns with respect to the proposed facility, and we identified specific recommendations to be addressed by NorthernStar prior to site preparation.". Again these concerns should be part of the DEIS and EIS, not left up to the discretion of NorthernStar. They shouldn't be recommendations, but mandatory. A portion of the terminal site, including mill pond, is below MHWL. Oregon State lands, Marine Board, etc need to be involved in permit issuing.

15.. Page ES-7. You stated that US Coast Guard will issue an LOR finding including recommendations that "may" include (6) conditions. Here again it leaves it up to NorthernStar discretion to implement all of the USCG identified safety conditions. It should be a requirement of the DEIS. Otherwise, how can you adequately evaluate navigational and community safety?

16.. Page ES-8. How can you conclude that construction and operation of the Bradwood Landing Project has the potential for limited significant environmental impacts when NMFS and FWS are still requesting additional information and haven't identified the impact on federally listed species? They need the answers before they can issue a BA and give you the BO. How can you possibly even issue a DEIS without this pertinent information?

IND112-17

17.. Page 1-25. I specifically mentioned at a scoping meeting, along with others, the unstable soils along the proposed pipeline route. Nothing mentioned.

IND112-18

18.. Page 1-3 Purpose and Need. How can NS deliver natural gas to the Williams Northwest interstate pipeline system when it is fully subscribed?

IND112-19

19.. Page 1-6 Permits, Approvals, and Regulatory Requirements. FERC is also required to follow the NEPA process. NEPA is excluded from statement regarding regulatory requirements of FERC.

IND112-20

20.. Page 2-12 2.1.2.5 The discussion concerning 1500 recreational fishing boats using the Lower Columbia River in a year is a very poor way of determining use. Besides the number being very low, the use needs to be expressed in user days to determine and accurate description of total use. Charter boats, for example, can be on the Columbia for 8 hours a day. It is not uncommon for a recreational fishing boat to spend 5 hours a day on the river. In addition, a person who fishes the Columbia usually takes more than one trip per year. For example, I took seventeen. On November 9, 2007 I went crabbing out of Warrenton, OR. There were 18 other boats doing likewise within 500 yards of a incoming cargo and oil tanker vessels. This was over a two hour period of time at or near high tide. Your description and evaluation of potential effects of LNG tankers on recreation boating on the Columbia is very poor and needs to be re-evaluated. One paragraph and five lines are insufficient to describe the current situation. The impact is much greater than described.

IND112-21

21.. Page 2-46 Survey and staking. It is unclear if survey and staking occurs before felling and clearing operation begins or before "construction" of trench. Property survey and witness monuments need to be marked and protected throughout all phases of construction. All phases of construction must operate within the ROW or with approval of landowner. This should include all equipment including egress and ingress over approved access

Individuals

112

- IND112-17 Soils prone to liquefaction and landslide areas along the pipeline route are discussed in section 4.1.4.3.
- IND112-18 See our response to comment PM6-94.
- IND112-19 The EIS text states explicitly on page 1-1 that the document was produced to comply with the NEPA. Also, see table 1.3-1.
- IND112-20 Section 4.8.1.7 has been revised to correct the number of recreational fishing boats.
- IND112-21 Figure 2.4.2.1 outlines the sequence of construction activities. Survey and staking requirements are discussed in section 2.4.2.1. Access roads that would be used are described in table 4.7.3-3.

K-1091

IND112-21 cont'd	roads. All access roads must be indicated in DEIS otherwise how can impacts of use be evaluated.
IND112-22	22.. Page 2-46 Clearing and Grubbing. This paragraph is entirely inadequate. There is nothing stating that the felling, bucking and yarding of merchantable timber should maximize utilization. The trees still belong to the landowner and should be handled accordingly. The appropriate way to determine value of commercial trees is to cruise, appraise, and pay for standing trees prior to harvest. Nothing is mentioned about felling trees within the right-of-way to avoid damage to other trees or property improvements. Nothing is mentioned about Washington State DNR fire protection needs during fire season. Construction equipment needs to be washed periodically to avoid distributing noxious plant distribution.
IND112-23	23.. Page 2-48 Trenching. In many instances, drainage structures, water pipelines, and other underground improvements could, and probably would be, severed by trenching. These structures need to be repaired or replaced. Statement regarding "Foreign Pipelines and Utilities" page 2-53 is insufficient.
IND112-24	24.. Page 2-48 Cleanup/ Revegetation. Access roads need to be restored to original condition. When will temporary erosion control fencing be removed? Access roads needed for rehabilitation work needs to be identified in advance of start of work, not after the pipe is laid.
IND112-25	25.. Page 4-24 Subsidence. The statement "there are no significant aquifers beneath the proposed pipeline". What is "significant"? There are several wells drawing from aquifers that landowners are concerned about. What are the potential economic and environmental impacts?
IND112-26	26.. Page 4-24,25 Cowlitz County CAO Considerations. Between milepost 32.5 and 34 is considered a potential landslide area. This area is designated by NorthernStar to trench across streams. Paragraph 4 page4-25 states that HDD installations can serve to avoid or minimize impacts to landslide areas. The HDD method needs to be implemented.
IND112-27	27.. The acronym ESC is used throughout DEIS. It is not listed on page xvi.
IND112-28	28.. Page 4-59,60 Groundwater Uses/ Impacts Mitigation. There is no reference to potential impact of identified wells within 200 ft. of drill sites under Cowlitz or Columbia Rivers. Deeper drilling has more potential of damaging domestic or public wells. References should be made.
IND112-29	29.. Page 4-64,65 Critical Areas Ordinance/ The work area and the Cowlitz River drill site is within the 100 year flood plain. A flood plain permit will be required.
IND112-30	30.. Page 4-81 Table 4.3.2-3 Waterbodies crossed by Bradwood Landing Project. All six Leckler Creek tributary crossings are stream class Np or Ms. Leckler Creek is a salmon/steelhead bearing stream. Open trenching should not be allowed. Ditch and trenching would not be permitted under WNDNR Forest Practices Rules.
IND112-31	31.. Page 4-96 Mitigation. NorthernStar's final Mitigation Plan, as well as the Enhancement Plan should have been part of this DEIS to properly evaluate compensation for project impacts, not prior to construction.
IND112-32	32.. Page 4-115 Paragraph 4. If the ownership of commercial timber remains with the landowner until sold at the mill, How can NorthernStar make an agreement with WDFW for large logs to be used for woody debris habitat improvement bank? Unmerchantable trees and debris needs to be hauled off site to reduce fire hazard not chipped on site. This would not meet WDNR

Individuals

112

IND112-22	Details regarding handling of merchantable timber would be negotiated between NorthernStar and individual property owners. See also our response to PM4-6. Topics included in section 2.4.2.1 are limited to general construction techniques. A detailed discussion of measures proposed to prevent the spread of noxious weeds is provided in section 4.4.2.3 and in the response to comment FA3-10.
IND112-23	The FERC staff's Plan discusses restoration of drain tiles. NorthernStar has indicated that it would ensure the existing pipelines and utilities are not damaged during construction of its pipeline. Locations of these other utility lines would be identified during preconstruction shallow hazards surveys.
IND112-24	Section 4.3.8.7 addresses restoration of access roads once construction is completed. Temporary erosion control measures would be removed when permanent erosion control measures have been put in place.
IND112-25	The statement refers to the fact that there are no major water supply aquifers beneath the pipeline route which are being extensively pumped to the degree that land surface subsidence could result.
IND112-26	HDD or other mitigation measures would be used in potential landslide areas. See also our response to PM3-60.
IND112-27	ESC is an acronym for Erosion and Sediment Control.
IND112-28	See our response to comment PM1-40.
IND112-29	We discuss the Cowlitz County Critical Area Ordinance in sections 1.3.11 and section 4.7.3.2, together with the Cowlitz County Floodplain Management Ordinance. See our response to comment PM4-12.
IND112-30	As described in NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan, Tributaries 2-7 to Leckler Creek would be crossed using the dam and pump method. Table 4.3.2-3 has been updated to reflect these changes. The Lower Columbia River Chinook, Lower Columbia River coho, and Columbia River chum ESUs have been documented within these tributaries. However, these waterbodies are all intermittent headwater streams that would be crossed during the in-water work window (July 15 – September 15), thus it is likely that the streams would be dry at the time of crossing. Therefore, direct impacts on federally listed salmonids would not be anticipated. It is important to note that potential impacts on federally listed species due to waterbodies crossings (including Tributaries 2-7 to Leckler Creek) will be analyzed in further detail in the revised BA and EFH Assessment. Waterbody crossings using open-cut methods as they relate to the WDNR's Forest Practice Rules are discussed in the response to comment PM4-11.

Individuals

112

- IND112-31 NorthernStar's compensatory mitigation is discussed in the response to comment FA2-16.
- NorthernStar's SEI is not a part of the compensatory mitigation for unavoidable impacts associated with the project. The SEI is described in section 4.6.2.2 of the EIS. In addition, NorthernStar filed detailed information on the SEI in a supplement to the draft applicant-prepared BA on November 22, 2006 and is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e. CP06-365), and putting in the proper date range.
- IND112-32 The option of using certain trees cut down during pipeline construction in Washington for the establishment of a LWD bank was suggested by the former WDFW Area Habitat Biologist for Cowlitz County. Because portions of the pipeline cross land owned by the State of Washington, we believe that this agreement is reasonable. The option for use of wood off of any given landowners property would be part of the negotiations for the pipeline easement across that property and would be compliant with both WDNR and WDFW rules and regulations and individual landowner needs.
- Table 1.3-1 lists the major federal, state, and local codes, ordinances, statutes, rules, regulations, and permits that would apply to the project. NorthernStar would adhere to conditions of these permits. Each agency designs the permitting process to ensure that projects comply with the regulations set by each agency for the area of concern.

K-1093

IND112-32

cont'd

IND112-33

hazard reduction requirements with some vegetation classes.

33.. Page 4-115 Paragraph 5. Any grass seed used for revegetation needs to be certified seed to verify viability and noxious weed free. Page 4-117 Paragraph 6. "When available" should be stricken from sentence. The treatment of noxious weeds needs to be more specific as to application of chemicals, including kind and strength of each, time of year, or mechanical control.

IND112-34

34.. Page 4-116 First paragraph. The riparian strip (25 ft) should be planted with indigenous trees when trenching across stream courses. "In kind" replanting of trees need to be defined.

IND112-35

35.. Page 4-121 Paragraph 6. The discussion of present situation for recreation fishing is terrible. NorthernStar's description of use and impact on recreation fishing is embarrassing. The potential economic impact on recreational fishing on the Columbia is tremendous.

IND112-36

36.. Page 4-165 Paragraph 3 In-stream construction would also raise stream temperature.

IND112-37

37.. Page 4-180 No information on Western Snowy Plover.

IND112-38

38.. Page 4-260 Lower Columbia River Coho are also found in Leckler Creek.

IND112-39

39.. Page 4-261 Lower Columbia River Steelhead also found in Leckler Creek

IND112-40

40.. Page 4-265 The Northern Spotted Owl needs to be surveyed along the pipeline where habitat exists.

IND112-41

41.. Page 4-280 Willow Grove boat launch omitted table 4.7.1-1.

IND112-42

42.. Page 4-321 Socioeconomics. This section does not speak to the project impact costs. Dollar values need to be identified when both temporary and permanent loss of resources occur. Such items as loss of timber production, loss of building sites, transfer of livestock while under construction, loss of crops, plus many others. If you are going to identify the amenities by dollars its only right to do the same with impacts. For example, I will permanently lose 3 ½ acres of forest land, a building site, and 20 years of Douglas-fir tree growth. Economic impacts as well as environmental need to be given equal treatment in this DEIS. Property taxes will still have to be paid on land that is not available for use of the landowner. This should be included in the impact cost.

IND112-43

43.. Page 4-453 Paragraph 3. The recreation fishing boat information is inconsistent with other sections in this document. (1,500 boats) Need to use "user days" to evaluate impacts. ODFW and WDFW would have best information. When there is a 500 yard moving exclusion zone around the tankers this is a great impact.

IND112-44

44.. Page 4-454 Paragraph 4. "750 workers" is inconsistent with other tables.

IND112-45

45.. Page 5-19 5.2 FERC STAFF RECOMMENDED MITIGATION.

IND112-46

1.. FERC should require, prior to start of construction, a substantial performance bond to cover all aspects of construction.
2.. Page 5-23 (19) Both the mitigation plan and enhancement plan should be filed with FERC before the end of DEIS comment period, not prior to construction. Otherwise how would you know if mitigation and enhancement satisfies project resource impacts.

IND112-47

3.. Page 5-29 (62) The final ERP should be agreed to by appropriate agencies, including shared cost, prior to DEIS comment period to determine socioeconomic effects.
In summary, there is a lot of information provided by Northern Star that supports the project; little to nothing that can be evaluated to determine

Individuals

112

IND112-33 See our response to comment FA3-10.

IND112-34 Our Procedures require that a riparian strip at least 25 feet wide be allowed to permanently revegetate with native woody plant species. The term "in-kind" as it relates to revegetation along the right-of-way has been defined in section 4.4.1.3.

IND112-35 We do not believe that the proposed project would have significant adverse impacts on recreational fishing; see section 4.7.1.4.

IND112-36 Section 4.5.3.1 addresses in-water impacts on aquatic resources. Specifically, potential impacts on water temperature due to in-stream construction are discussed in section 4.5.3.1, *In-water Construction Activities, Vegetation and Habitat Removal*.

IND112-37 The federal and state status as well as occurrence within the project area for the Pacific Coast DPS of the western snowy plover is included in table 4.6.1-1.

IND112-38 Waterbodies not crossed by the proposed route are not included in section 4.6.2.3, *Occurrence Along the Pipeline Route*. Although the Lower Columbia River coho ESU has been documented within Leckler Creek, the creek is not crossed by the proposed pipeline route. Potential impacts on aquatic resources, including downstream impacts, due to waterbody crossings are described in section 4.5.3.1 and will be described in detail in the revised BA and EFH Assessment.

IND112-39 Waterbodies not crossed by the proposed route are not included in section 4.6.2.3, *Occurrence Along the Pipeline Route*. Although the Lower Columbia River steelhead DPS has been documented within Leckler Creek, the creek is not crossed by the proposed pipeline route. Potential impacts on aquatic resources, including downstream impacts, due to waterbody crossings are described in section 4.5.3.1 and will be described in detail in the revised BA and EFH Assessment.

IND112-40 As described in section 4.6.2.3, forests in the vicinity of the proposed pipeline route are relatively young and generally lack characteristics that contribute to nesting habitats, foraging, and roosting areas for spotted owls. Therefore, we do not believe that requiring surveys for northern spotted owls is warranted.

IND112-41 Table 4.7.1-1 has been revised to include the Willow Grove boat launch.

IND112-42 Landowners would be compensated by NorthernStar for loss of use of the easement, timber, crops, and other negotiated items. See our response to comment PM2-4.

Individuals

112

- IND112-43 Section 4.8.1.7 has been revised to correct the number of recreational fishing boats.
- IND112-44 The number of 750 workers referenced in section 4.12.5 refers to the peak number of construction workers that would occur at any one time.
- IND112-45 See our response to comment IND3-22.
- IND112-46 See our response to comment IND112-31.
- IND112-47 See our response to comments PM1-1 PM6-24, and LA3-55.

adverse consequences. Thus, it doesn't meet NEPA policies and goals. The DEIS is purely a justification of the project.

Sincerely,

Robert L. Kiser

Federal Energy Regulatory Commission
Comment on the draft EIS for the proposed Bradwood Landing LNG Project

- IND113-1 Objection #1: There is an unacceptable level of risk to the community. There is not a sufficient guarantee of public safety. From the information buried in the Oregon Department of Energy's Appendix K, the Safety Advisory Report, there is an assumption that local jurisdictions will be able to upgrade their capability to handle a LNG emergency situation. Where is an assessment of their current capability? Who will pay for upgrades if they are found lacking? Should the cost of the upgrades, no doubt in the millions, be born by the community for the benefit of a private corporation? Is this the best use of limited public funds?
- IND113-2 Objection #2: There was very brief mention in 5-8 of the "impact of marine release of LNG with ignition." This needs to be explored further and analyzed. How will Columbia County be able to respond? How can the firm assure us that there will not be such a "significant event?" As we know from Three Mile Island and the Valdez spill, just because the odds are "remote" does not mean they do not happen. I do not believe that the very limited benefits to our community outweigh these huge risks.
- And, if an incident occurs, who cleans it up? The state? The county? The firm? Would a several billion dollar bond be appropriate?
- IND113-3 Objection #3: The report in section 5.1.7 refers to the population of our area as less than 500 people, as though damage to our family and property counts less because we're fewer in number. Our area seems to be especially vulnerable to economic justice issues because it's difficult for a county of our size to respond to the complexities of such a project.
- IND113-4 Objection #4: This strikes me as an economic justice issue when notices are poorly written, inadequately distributed, and little true information is made available. I was surprised at the public meeting in Longview to see no educational material available for the dozens of people who cared to show up, not even a map. I was hoping to discover just what the impact would be to farmland if a pipeline went through it. After reading the draft EIS I'm still wondering what the answer is to this very basic question. The draft EIS was written in such a way that makes it difficult for a non-professional to understand it. There are no maps, it's full of acronyms, and important information to the community is buried in its depths. Something as basic as having the address and/or email printed on a meeting notice so that people can send in their comments is missing.

IND113-2 See our response to comment FA2-35.

IND113-3 See our response to comment IND108-3.

IND113-4 See our response to comment IND108-4.

K-1096

IND113-5 | Objection #5: Do property owners have to sell or lease their land for the pipeline? Who has the right of eminent domain in this case? Should a private corporation have the right of eminent domain? I don't think so.

IND113-6 | Objection #6: How is the public compensated for this significant benefit to a private company? What should the cost of such a permit be? According to 4.8 there is very limited benefit to the residents of Columbia County

IND113-7 | Objection #7: Why does a private company get to have pre-emptive use, a 500-yard zone, of the river? Why should all other traffic defer to them? The Columbia River is a major source of food, transportation, and recreation for the Pacific Northwest and why should any of those interests take a back seat or be damaged in any way? We will need more food and more transportation in the future, not less. Let us invest our community's resources into developing renewable sources of energy instead of damaging our ecosystem to perpetuate a system of imported energy.

Thank you for your attention to these issues. I urge you to stop the LNG project.

Sincerely,

Steven R. Miller
7915 NW Skyline Blvd
Portland, OR 97229

Individuals

113

IND113-5 NorthernStar would negotiate an easement agreement with landowners. In an agreement cannot be reached, and the company has a Certificate issued by the FERC, it may use eminent domain under section 7h of the NGA. See our response to comment IND108-9.

IND113-6 See our response to comment IND108-5.

IND113-7 The 500-yard security zone is an area that would be under control of the Coast Guard. It is not an exclusion zone. Recreation, transportation, and shipping would not be damaged by the project. See also our response to comment IND33-16.

Individuals

114

IND114-1

Safety issues are addressed in section 4.11. NorthernStar is responsible for paying for additional resources needed by local first-responders to protect communities in the unlikely event of a project-related incident, according to the cost-sharing plan outlined in its ERP. Environmental justice is addressed in section 4.8. See our response to comment IND108-4. Congress conveyed the power of eminent domain to jurisdictional pipelines under section 7h of the NGA. Section 4.8 discusses potential economic benefits from the project. The project would not have pre-emptive use of the Columbia River, and would result in less than significant impacts on other river users as discussed in sections 4.7 and 4.8. The project would not impact the production of food. See our response to comment IND106-31.

Washington, DC 20426

RE: Bradwood Landing Draft Environment Impact Statement Review, Docket
No. CP06-365-000; CP06-366-000

Dear Secretary Rose,

We are Astoria home owners and work immediately adjacent to the West mooring basin and the Columbia River channel. While we appreciate the need for natural gas and we are not so naive to think that change in and of itself cannot represent a positive force for community growth and development, we have grave concerns about the Bradwood Landing LNG project. The Columbia River waterway represents the very lifeblood of our community, providing commercial and sports fishing, tourism, hunting, recreational activities and, plain and simple, what it is to live here. Astoria is unique and has a long and proud history. Every effort must therefore be expended to protect it.

IND115-1

We understand that a serious accident, whether intentional or accidental, or as a result of post 9-11 terrorism, carries with it the danger of an LNG vapor cloud, which would at the very least entirely wipe out the commercial district of Astoria. If we were at work, that would mean we would be vaporized. Although on some level reference to this danger may sound somewhat melodramatic to those who don't face it, it is certainly on the minds of people who actually live and work in Clatsop County. These incineration zone dangers are described, somewhat chillingly, in the Sandia Report, "Guidance on Risk Analysis and Safety Implications of a Large Liquefied Natural Gas (LNG) Spill Over Water," authored by Mike Hightower, et al. It is for these and other reasons that the community has expressed again and again that it does not support the project. At the very least each and every consideration raised by community members, as for example are summarized in the Columbia River Estuary Study Taskforce's 12-21-07 report, which was prepared at the request of the Clatsop Board of Commissioners, should be carefully examined.

IND115-2

While one of our primary concerns about this project is safety, we are also mystified as to why an off-loading facility has to be placed inland, such as at Bradwood Landing, and not be placed 20 miles or so off shore. We understand that the proponents of the project contend that rough sea and weather conditions prevented any consideration

Individuals

115

IND115-1 Comment noted.

IND115-2 The placement of offshore facilities off the Oregon coast was considered and was eliminated because it did not meet the project objectives (see section 1.1), was not technically and economically feasible, and presented additional potential environmental impacts (see section 3.1). In terms of a comparison with conditions in other locations, weather conditions in Oregon were compared with conditions for an existing location that has developed LNG infrastructure offshore (in the Gulf of Mexico) and one proposed location (offshore Massachusetts) (see section 3.1.4.1). Based on this analysis, the FERC does not believe that an offshore alternative is a reasonable alternative to the proposed project.

K-1100

Individuals

115

IND115-2
cont'd of an LNG terminal off the coast of Oregon. It is salient that this was not even considered, much less looked into or examined. This should not be countenanced. It also strains credulity that concerns about storms would prevent such an off shore project. This has not prevented natural gas pipeline terminals from being constructed off shore of Mexico, which certainly experiences strong storms and hurricane winds (i.e. www.cprod.com/bs_op_ongp.html). California has determined that it will not even allow such systems off its shores. Are we then being asked to withstand the inherent dangers of such a project more than residents of Mexico?

IND115-3 Given the opportunity for alternative natural gas supply systems and seemingly casual, or at least short sighted, refusal to even consider it as a viable option, we are concerned about the nature of motivation behind the Bradwood Landing LNG project and its potential to abuse Astoria and the Columbia River estuary. It appears that most of the newer natural gas ships are much larger. These ships could easily navigate to and from off shore systems, but the Columbia River channel is not sufficiently large to accommodate them. The ships which would therefore be used within the Columbia River waterway are older ships, which have a tendency to be owned and operated by companies which own a very few ships, possibly only one ship. The incentives to keep these smaller, less profitable, ships as safe as the larger ships are considerably less. Should an accident or spill occur, the ship owner's assets would most probably not be anywhere sufficient to ameliorate, much less deal with, such a disaster, and we would be left with the bulk of the financial sequelae. At the very least, then, Bradwood Landing - NorthernStar Gas LNG should be absolutely required to have ample insurance or bond assurances to cover all expenses, direct and indirect, of an accident, which is likely to be disastrous if it occurs.

We are very apprehensive that issues relating to the safety of the Bradwood Landing LNG project have not been adequately addressed. In this regard the uniqueness of Astoria, and surrounding areas, cannot be underestimated. We will discuss some specific areas of concern below, but our recent (December 3 and 4, 2007) experience with a storm carrying 50+ mile per hour sustained and 120+ mile per hour wind gusts is telling. The problem we refer to is not the damage to trees and homes, difficult though that was, nor even the lack of electricity for the entire city for a week, but for at least 2 or 3 days, depending upon where one was, Astorians were completely and utterly isolated from the outside world. We know that it is difficult to imagine that such a circumstance could happen in this day and age, but it did. Transportation via Highway 30, 101 and 26 was totally blocked by numerous fallen trees and electrical lines, landslides and sink holes, and these routes were closed to all transportation. This meant that all avenues of road transportation in and out of Astoria were completely unavailable for use. Adding significantly to the reality of our isolation, we could not communicate by phone at all, not at all. Cell phones did not work, nor of course, cordless phones which rely upon electricity, but even the land lines did not work. We were not only unable to place a telephone call to Portland or any nearby Oregon towns or beyond, but we could not even call from one end of Astoria to the other. Critically, emergency 911 service failed. We understand that our telephone service initiates here but goes all the way to Portland and then back in order for even a local call to be completed. For only the second time in its

IND115-3 See our response to comment FA2-35.

K-1101

K-1102

history our local newspaper, The Daily Astorian, did not publish a daily edition. People as near as Portland had absolutely no idea what was happening here. Only days later when communication was possible did the news of what had happened in Astoria appear in the Daily Oregonian, the Portland newspaper. It was quite an unnerving experience.

IND115-4 The point of raising this experience with our winter storm in this letter is that, hopefully, it highlights significant issues of safety and the capability of this region to effectively respond to large scale emergencies. The Bradwood Landing site is even more remote than the town of Astoria. When other alternatives, such as off shores platforms are available, it seems injudicious not to at least seriously consider this option and/or conclude that the risks to the project outweigh any benefits. As can be seen, these issues take on particular and unique importance given the nature of Clatsop County and Astoria.

IND115-5 We are also worried about the potential for damage to our area from earthquakes or tsunamis. We are told by experts that the potential for such disasters is not "if" but "when." If that is so, then the highest level of scrutiny must be given to such projects as Bradwood Landing.

IND115-6 The potential for natural and man-made disasters raises the potential for severe, indeed devastating, long term consequences of not only a liquefied natural gas explosion, but natural gas and ship fuel oil spills. We have but to look to the recent heavy-duty bunker fuel oil spill which took place when a ship hit the San Francisco Bay Bridge. Not only did this spill cause immediate problems by fouling water and beaches and the death of seabirds and other wildlife, but the long term consequences are grave. We read in the San Francisco Chronicle that this oil is "nasty," toxic, breaks down slowly and can persist in sediment for decades, if not more. No one can apparently predict how long the deleterious effects that this damaging pollution will continue.

IND115-7 It is, of course, impossible to predict accident or disasters, but it is not impossible to be aware of and protect ourselves against them. The likelihood of a fuel oil spill such as occurred in California is much higher here as not only the channel but the waterway itself is quite narrow and there are frequent limitations of visibility due to fog and rain. The topography is complicated (see, for example, Dept of Commerce, NOAA, CHART #18253). These aspects of the Columbia River waterway would mean that should an accident such as occurred at the Bay Bridge occur here, the damage here would, if such can be imagined, be much worse. Resting aside the narrow Columbia River waterway are homes, neighborhoods and businesses, even the popular tourist destination, the Columbia River Maritime Museum, which border the waterfront. These are not "merely" uninhabited shorelines.

IND115-8 We can also hardly emphasize enough that the Columbia River estuary is an environmentally complex and sensitive area. One has but to look at the time, money and resources which have been expended in our multi-layered, citizen-local-county-state-federal struggles, spanning decades, to protect salmon habitat. To put this at risk seems to require the highest level of scrutiny. We understand Northern Star has indicated it

Individuals

115

IND115-4 See our response to comment IND22-20.

IND115-5 As discussed in section 4.1.3.3, the LNG terminal location would not be affected by a tsunami and the terminal facilities would be designed to safely withstand the design earthquakes.

IND115-6 See our response to comment PM1-22.

IND115-7 See our response to comment PM1-22.

IND115-8 See our response to comment FA4-12.

IND115-8 | will spend millions in salmon enhancement, but this does not represent a commitment but
cont'd | only a voluntary assertion.

IND115-9 | Commercial shipping and fishing are important sources of revenue for Clatsop
County. While we are not experts on this point, it is our understanding that there will
have to be a 500 foot exclusion zone for 15 minutes or more as the natural gas ships head
to and from Bradwood Landing. Frankly, just mentioning such a thing as an "exclusion
zone" raises concerns about the danger of the project which Bradwood Landing
represents. In any event, we are very aware of the difficulties of crossing the Columbia
River bar and the necessity of timing such crossings with an exceeding degree of care.
Limiting access would narrow, if not totally eliminate, the opportunities for safe
crossings. This is particularly true at peak fishing seasons. Being able to cross the bar at
a particular time is not merely a matter of inconvenience but a life-or-death matter,
particularly for commercial fishermen who face time constraints as to when they can fish
or not. We also understand that the wake which the liquefied natural gas vessels will pull
has the potential to erode our shorelines and related diking systems.

The Bradwood Landing LNG plant raises serious and substantial questions which
must be scrutinized with the highest degree of thoroughness and care. We urge you to
not only look to the considerations we have identified, but those of other groups seeking
to question the viability of this project.

Sincerely,

Bennett and Patricia

Individuals

115

IND115-9 We do not believe that the safety and security zones around LNG carriers
in transit in the waterway to the proposed Bradwood Landing terminal
would have significant impacts on commercial shipping and fishing on the
lower Columbia River. Section 4.8.1.7 has been revised to include
additional discussion regarding potential for navigational conflicts LNG
carrier traffic may have with other commercial ships traversing the
Columbia River bar. The potential for shoreline erosion resulting from
LNG marine traffic in the waterway is addressed in section 4.1.2.3 of the
EIS.

REGULATORY COMMISSION

December 24, 2007

Dear Ms. Bose,

Yes, here it is Christmas eve, and I am having trouble sending via e-mail my comments on the Bradwood DEIS. I went through the registration process and am waiting for my e-mail confirmation from FERC, but it looks like Santa's elf forgot me, or hasn't gotten around to it, so I am sending it via the old fashioned way, the Post Office. It will be postmarked on the 26th, so I am hoping that it will be considered timely. Thanks for your help, and believe me if I didn't think this was so important (it's the biggest cause of concern in our lives) I wouldn't be doing this on this wonderful night. I thank you.

Re: DEIS Bradwood Landing LNG Project (Docket#CP06-365-000, etal.)

I would like to submit the following comments on the DEIS:

- IND116-1 The current information on the geological hazards and seismic and landslide hazards has not been addressed adequately. This area is subject to slides and earth movements. Recently there was a major landslide that blocked the main highway, demolished homes, and destroyed thousands of trees in its wake. This occurred just a few miles from the Bradwood site. It and the major storms that recently hit the north coast of Oregon shut down this major portion of the state. It was so bad that a bar pilot (these are the people who will be piloting the LNG ships) was the only one that had a working cell phone which he had to keep recharging in his car. The events that unfolded from these recent storms and slides alone also tell one that emergency services are lacking as well in the DEIS. The human and safety issues have not been addressed adequately to the extent that there are not enough personnel to respond to an accident or an act of nature of what was witnessed recently. The size of an emergency of an LNG accident with current staff at Knappa, Astoria, and Cathlamet would be tragic. Based on models of impact of an accident within a 2 mile radius it would destroy Puget Island and all of its population. This is not acceptable. Puget Island which has a population of over 1000 people has only one way out, and that is the bridge to Cathlamet. There is only a volunteer fire station on the island. Even if there were adequate personnel if an accident occurred, it would forever destroy this entire area of its livability. Human health, and safety impacts as well as emergency response need to be in the final EIS. The vapor cloud exclusion zone is incorrect and needs to be reexamined and recalculated.
- IND116-2
- IND116-3 I have a huge concern that FERC is not assessing the need for LNG and Natural Gas (and I know they have continually said that need is not there concern as market will determine it), but they need to review this project and it's pipeline as well as other LNG projects in the works in Oregon. FERC should look at these projects comprehensively and review all proposals that are related and interdependent on each other, particularly the Palomar pipeline. It is clear that the footprint for a 3rd storage tank signifies the future need for the Palomar. Therefore, the Palomar project needs to be analyzed in conjunction with the Bradwood site. With regards to the pipeline included in this permit, a Williams NW Pipeline company spokesman said they don't have room for all the gas that Bradwood is proposing and that there also is not enough demand for it. All information points to the fact that the Palomar is crucial to this project and a Supplemental DEIS should be issued incorporating Palomar. FERC needs to solicit comments from all entities prior to the final EIS in this regard.

Individuals

116

IND116-1 See our responses to comments PM1-1, LA3-55, and IND22-20.

IND116-2 See our responses to comments PM1-1, LA3-55, and IND22-20.

IND116-3 This EIS is based on the proposed action, which includes two LNG storage tanks. If expansion of the LNG terminal is proposed in the future, FERC authorization, with the associated environmental review process, would be required. The Palomar pipeline is a separate project and its environmental impacts are being evaluated under a separate EIS. As discussed in section 1.0, the Williams Northwest pipeline would have capacity for the natural gas from the Bradwood landing pipeline project.

K-1105

Individuals

116

IND116-4

Potential conflicts need to be addressed between LNG tankers and the normal activity that occurs on the Columbia. With the current 125 ships per year at the least, with an approximate 36 hour turnaround time (given nothing goes wrong in delays, tanker problems, the Coast Guard, etc.) you are looking at 4500 hours that the river will be at the mercy of LNG and it's militarized maneuvers. And that is at a minimum. When the Palomar is in operation, there will not be a time when there is not activity regarding LNG tankers. This is not acceptable. This will be a huge threat to our fishing, tourism, and general livability and any potential growth in this direction. This is a significant commercial and recreational fishing region and provides millions of dollars in revenue for this area. The impacts on fish habitat are numerous. All phases of the project would greatly impact the salmonids in this area. You can never recover from this destruction no matter the mitigation or stabilization practices. Long term multi-billion dollar efforts over the past 30 years in restoring critical habitat for all salmon species in the Columbia River should not be risked for an LNG facility. Northern Star's mitigation is lame at best. The plan in place could never replace the loss and continued loss of this incredible estuary.

IND116-5

"Contract incentives" to LNG carriers for appropriate screening of fish and other aquatic organisms when taking on ballast water is not an option. Every carrier should have the proper screens as well as the facility. It appears there is no requirement of these ships to do so. This should be mandatory, as well as the system on site. The aesthetic, visual, noise, and light pollution needs to be addressed, particularly to the surrounding communities that will be negatively impacted on a daily basis from this project. The pollution and noise from the LNG tanker and its accompanying tugs keeping it in place at the plant will be continuous. With the prevailing winds from the west this will pollute this whole area particularly Puget Island, Cathlamet, and everyone in that general area. This will be a major health hazard. The general lack of consideration of the welfare of residents all along the Lower Columbia is criminal. This project is flawed in so many ways and should be denied in its entirety

IND116-6

Kristin Lee
5803 SW Garden Home Road
Portland, OR 97219 503-293-5997

IND116-4 As described in sections 4.7.1.4 and 4.8.1.7, the LNG marine traffic would not have a significant impact on commercial and recreational fishing and boating. Potential impacts to salmonids are discussed in 4.5.2.1. See also our responses to comments FA2-10 and PM3-68.

IND116-5 See our response to comment PM1-31.

IND116-6 We have revised section 4.5 with regard to our analysis of impacts on aquatic resources due to the proposed water intake requirements of LNG carriers at berth at the terminal, and have changed condition 24 accordingly.

OFFICE OF THE SECRETARY

2007 DEC 28 P 3:39

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE, Room 2A
Washington, DC 20426

Reference: Bradwood Landing, LLC Docket No. CP06-365-000

Dear Ms Bose:

The follow comments are submitted in regards to the Draft Environmental Impact Statement for the Bradwood Landing LNG and associated pipeline.

Chapter 3 Alternatives:

- IND117-1 General comment regarding geology and geotechnical issues: This chapter provides a discussion of alternative sites and in summary rules out most of the sites on various grounds and leaves others as open possibilities. The proposed Bradwood Landing LNG site DEIS discussion of alternative sites does not provide a comparison of geologic issues at these other sites. There are very significant geotechnical and geology issues at the Bradwood site that may make this site much less attractive relative to other northwest sites. Some discussion and comment should be made in regards to these concerns, particularly for those sites not ruled out.
- Chapter 3 Alternatives, 3.1.8 Pipeline Route Alternatives
- IND117-2 3.1.8.1 Major Pipeline Route Alternatives: In the first paragraph the DEIS states three of the project objectives. The first objective is to supply gas to PGE power plant and the GP mill. Is not gas already readily available to these sites via the existing Kelso-Beaver pipeline? Hence is this really a critical objective warranting FERC oversight or should this be a state issue under Oregon EFSEC?
- IND117-3 3.1.8.1 Major Pipeline Route Alternatives: Second paragraph dismisses the possibility of a direct crossing of the Columbia at Bradwood with a simple declaration that the crossing would not be possible. No analyses or discussion is provided backing up this statement.
- IND117-4 3.1.8.1 Railroad Route Alternative: NorthStar notes that this route to interstate markets would be shorter and hence potentially much less impact. The route is not considered as an alternative because it fails to meet the objective of providing gas to PGE and GP because of the need for a lateral line. A lateral line could readily be constructed under Oregon EFSEC and as noted above gas is readily available to these sites via FERC approved Kelso-Beaver pipeline. This criteria should not dominate the pipeline route decision.
- IND117-5 3.1.8.1 Railroad Route Alternative: NorthStar notes that this route would require potential blasting along the section between Bradwood to Wauna GP. This same issue is readily addressed with the preferred alternative route going west of this section. Hence the Railroad Alternative is viable with this slight variation on the route.

Individuals

117

- IND117-1 The alternatives analysis was conducted based on information that could be readily obtained from published sources. Although site-specific geologic and geotechnical data are available for the proposed LNG terminal site and the pipeline route (i.e., from project-specific geotechnical and seismic reports), the same level of detail is not readily available for all the alternatives.
- IND117-2 The Bradwood Landing pipeline would provide an alternative source of natural gas to the Beaver Power Plant and Wauna Mill. All interstate pipelines require certification by the FERC under section 7c of the NGA.
- IND117-3 NorthernStar indicated that it could not use HDD methods to cross the Columbia River directly north of its proposed Bradwood Landing LNG terminal because of the width of the river at that location. A crossing north from Bradwood Landing would place the pipeline at the town of Cathlamet, and a pipeline route east from there to an interconnection with the existing Williams Northwest system near Kelso, Washington would have to traverse over rough topography.
- IND117-4 As described in section 3.1.8.1, the lateral to serve the Beaver Power Plant would significantly increase the overall length of the pipeline system and subsequently increase the number of landowners and environmental resources impacted by the project. In addition, blasting would be required for pipeline installation which could result in instability issues for the railroad bed.
- IND117-5 Blasting would not be required adjacent to the railroad bed along the proposed pipeline route.

K-1107

K-1108

- IND117-6** Table 3.1.8-1: The table provides a comparison of impacts to various environmental factors between the alternative routes. Three environmental factors are not on the table: landslides, steep slopes that potentially could erode and soils subject or be degraded by pipeline excavation/installation. The proposed route crosses a significant number of landslides and steep slopes and encounters areas of very deeply weathered and in some areas highly leached soils. The landslides on the proposed route are well documented in the URS geology report. Based on the route descriptions, it would appear that there will be many more acres of steep slopes on the proposed route relative to the Railroad route. In regards to deeply weathered soils with areas of leached soils the proposed route encounters soils that have been deeply weathered and are much older than most of the soils that will be encountered on the Railroad route (the Railroad route follows areas underlain by recently alluvium and areas impacted by the Bretz floods). These deeply weathered soils caused revegetation problems on The Kelso-Beaver pipeline route.
- IND117-7** Table 3.1.8-1: The table indicates that 228.9 acres of forest would be cleared on the proposed route. This is significantly more than the Railroad route. In addition the table does not take into account potential blowdown of trees along the proposed route and I was unable to find any reference to this very real issue. Significant stretches of blowdown impacted the Kelso-Beaver pipeline route shortly after construction due to the predominant slope aspects of the southwest and south facing slopes of the proposed route. Hence the loss of forest may be somewhat larger than projected in the table.
- Chapter 4
- IND117-8** Page 4-12 and 4-13 Recommendations: A list of recommendations for work to be completed at the early stages of project design is provided. This list is in response to significant challenges posed by development at the site by settlement sensitive soils, seismically induced soil liquefaction and seismically induced lateral spreading. The URS geotechnical report recommends very significant soil augmentation and deep pile foundations. Of particular concern will be the need to support the LNG tanks on piles and at the same time augment soil conditions beneath the site in a manner that will prevent lateral spreading from impacting the pile supports. I concur with the detailed analyses recommended and suggest that this analysis be verified by an independent qualified geotechnical engineering firm.
- IND117-9** Section 4.1.3.2 and 4.1.4.2 Mineral Resources: The proposed pipeline route and development of the site will impact the potential future use of the quarry at Bradwood. It is my understanding that the quarry is located in a designated mineral resource area of Clatsop County. The pipeline should be routed and the site should be developed in a manner that will not preclude mining of this resource. Pipeline setbacks preclude mining of significant mineral resources. Given the proximity of this deposit to water access, this resource should be adequately protected as a high value source of aggregate crushed rock.
- IND117-10** Page 4-20 Recommendations: The DEIS recommends further site specific analyses of the pipeline route. This is consistent with the URS pipeline geology report. That said, a more robust analyses of the Railroad route should be provided in order to adequately compare the two alternatives. I would strongly encourage the second review to lean towards rerouting the pipeline away from steep hazardous slopes unless completely infeasible. Generally the areas crossed by the proposed pipeline consist of a mix of deeply weathered soils and basalt and unstable slopes are common. Preference should be given to rerouting or boring under landslides over wiring and monitoring for strain on the pipeline.

Individuals

117

- IND117-6** See our response to comment IND117-1.
- IND117-7** Although the term "blowdown" is not used in the EIS, section 4.4.2.3 states that edge trees that were located within a dense stand of trees before construction may lack stability following removal of adjacent supporting trees, which may result in increased tree failures.
- IND117-8** The detailed analysis would be reviewed by qualified FERC engineers and its consultants. Also see our response to comment SA1-4.
- IND117-9** Basalt is very common in the region of the project and the on-site quarry is not a unique mineral deposit that warrants special provisions to allow use during the lifetime of the project.
- IND117-10** The additional facilities and greater number of affected landowners does not support a conclusion that the Railroad Alternative would be significantly superior to the proposed route.

Table 4.1.4-3

IND117-11 Strong justification criteria should be applied to not rerouting the pipeline around confirmed landslides. Otherwise the proposed mitigations with options left open are impossible to fully evaluate. It may be appropriate to defer this more in depth analyses to a more detailed geology and geotechnical analyses, but the criteria for making a choice between mitigation alternatives should be established.

Page 4-42

IND117-12 Soil: Most of the erosion concerns use fairly standard language referring to typical best practices. Some of the soils encountered on the pipe line route are very deeply weathered. Lands in the area were purchased years ago by Reynolds Aluminum as potential bauxite sources. These soils proved to be very difficult to get vegetation established after disturbance at the Kelso Beaver pipeline. Extreme care will need to be applied to save top soil from these areas.

IND117-13 Elk are present in this area and used the pipeline route as a trail as well as resting area. This activity prevented timely establishment of vegetation along portions of the pipeline route and may require temporary fencing.

IND117-14 Noxious weeds: FERC staff should require that NorthStar develop locally specific Noxious Weed Control Plans. FERC should assist the local Noxious Weed Control boards to enforce the plans. The native local ecology of the area is predominantly forest. Areas where the forest canopy is opened and left open will become incubator areas for invasive noxious weed infestations unless ongoing aggressive maintenance is applied. This will be particularly true in areas where NorthStar is asking for wider corridors. Pipeline and electric transmission corridors in western Washington and Oregon are often areas of significant noxious weed infestations.

Thank you for consideration of these comments and I hope they provide some small assistance in your evaluation of this project.

Best regards

Dan McShane, L.E.G., M.Sc.
Licensed Engineering Geologist

K-1109

Individuals

117

IND117-11 The appropriateness of the mitigation measures would be assessed when the final pipeline design geotechnical report has been completed.

IND117-12 Comment noted.

IND117-13 Comment noted. It is anticipated NorthernStar would consider temporary fencing or other measures necessary to re-establish stable vegetation along the pipeline corridor. Follow-up inspections of all disturbed areas would occur after the first and second growing seasons to determine the success of revegetation. If revegetation has not been successful after 2 years, revegetation efforts would continue until it is successful.

IND117-14 Noxious weed control is discussed in the response to comment FA3-10. Directions for accessing NorthernStar's Noxious Weeds and Soil-borne Plant Disease Control Plan via the eLibrary can be found in the response to comment PM6-60. The FERC's role in enforcement of the Commission's environmental conditions is discussed in the response to comment IND60-54.

FEDERAL ENERGY
REGULATORY COMMISSION

CP66-366-0000 ET AL

IND119-1

I am writing to you to express my opposition to the development of the Bradwood Landing Liquefied Natural (LNG) Gas Terminal near Astoria, Oregon. My belief is even stronger after reviewing the Draft Environmental Impact Statement (DEIS) on the proposal. Changing words, and even presenting further clarity will not suffice in making this a viable and sustainable proposal.

Many individuals and interests have conversed with your office about concerns such as safety, disruption of other river commerce, long term ability and guarantees of mitigation, impacts on private landowners, and the pressing question of where the LNG will actually end up. I will not repeat these concerns. My primary concern continues to be the health and sustainability of the Columbia River and its many resources, coupled with the never ending stresses we consciously add to the River.

The Bradwood landing LNG terminal proposal suggests that adverse impacts from the development can be easily mitigated by design and off-site habitat improvements over time. I disagree.

I am a long term upstream resident from Northeast Oregon. I have spent a career in natural resource management and have seen the continued pressures on our systems. I am not affiliated with any group or interest; my interest is in the health and sustainability of the River and its resources. Currently, significant work is going on to develop steelhead and salmon recovery plans with the ultimate goal being to recover and de-list these species under the Endangered Species Act. These species are more than just political or biological anomalies. They are part of our culture, communities, and economies. We identify with them as who we are in the Northwest. Currently, Native American Tribes, private landowners, and public agencies have made significant sacrifices and adjustments in their activities and economies to mitigate adverse impacts to aquatic resources. Literally, billions of dollars have been spent for habitat improvement, yet populations still remain tenuous. We continue to pressure aquatic resources, and as in the LNG proposal, propose mitigating these stresses through habitat improvement. This can only go so far. The recovery planning process for the Columbia River Basin has demonstrated one clear message: Habitat improvements alone are not enough for recovery and de-listing of these species. Non-tributary influences, such as main stem hydro power operations, hatcheries, harvest schedules, predation, and estuarine management will all have to play a significant role.

All this being said, the listed fish are but a symptom of the stresses we are now seeing on Columbia River resources. It just does not make sense to continue to stress and adversely impact the Columbia River through shakey proposals such as the Bradwood Landing LNG terminal when so much is at risk in the river system and we have not yet resolved long standing issues such as salmon and steelhead recovery.

The Bradwood Landing LNG Terminal proposal should not move forward to development.

Sincerely yours,

Jeff Blackwood

Comment of Houman Sabahi M.D. in Docket(s)/Project(s) PF05-10-000
Submission Date: 3/16/2008

IND120-1 Re: LNG proposals in the state of Oregon, (as well as the Pacific Northwest), I just wanted you to know my position on this matter. I am vehemently opposed to companies such as Northstar waltzing into our region with your approval, placing our citizens at risk with minimal short term gain to our communities with great profits for themselves and to benefit remote end-users. In fact, research shows that given the high risk and security necessary for such an operation, this will have a negative impact on other developments and businesses and even tourism in our area, which will ultimately hurt the community. This will not only increase our dependence on fossil fuels, but also, as we have learned from history, these companies exploit the local people and their communities as well as the local environment which do not receive adequate protections. Potential for a fire or toxic gas cloud or explosion is low but these things happen. Given the fact that each LNG tanker carries the energy equivalent of 50 Hiroshima nuclear bombs, the so called exclusion zones are clearly inadequate. People want security in their lives and do not appreciate living under the daily specter of the possibility a truly catastrophic event in their community. Everyone I have talked to shares these views once they are aware of the facts. You have too easily granted Northstar's requests without regard to our communities oppositions, who are directly affected by these proposals.

Why should we support LNG and the Bradwood Landing?

IND122-1 Why do we need to ship natural gas into the USA from foreign countries, bring in huge ships full of natural gas up the Columbia River to Bradwood just as a so called bridge to carry us over to the future with renewable energy? Solar, wind and thermal energies are all here just waiting to be developed. We donâ€™t need this bridge just so large companies can make more money.

IND122-2 Yes, for three years several union workers will be employed putting the landing and pipeline in, but what of the landowners who will be asked to sacrifice their property and property values? That wonâ€™t be for just three years. Then there are all of the public lands that will be used for the pipeline and the rivers and streams that will need to be crossed. They say it can be done safely, but from our experiences with pipelines in the ground we doubt it. There are many fault lines that will be crossed, land slides that occur. Even the earth beneath our feet moves ever so slightly over time. Weâ€™ve had rocks that werenâ€™t there when the pipe was placed in the ground make their way up and eventually put a hole in the pipe.

IND122-4 Do you think they will decommission the pipeline once the renewable energy is in place? Not likely when there is so much money to be made. Making us dependent on another energy source from other countries around the world doesnâ€™t seem like a very good idea.

Will this ensure that we move on more quickly to renewable energy and conservation measures? More likely the progress will slow down as these companies have lots of natural gas to sell and with a patch in place whatâ€™s the hurry?

IND122-5 So Clatsop County will receive approximately \$7.8 million per year. What about the property owners with the easements crossing their properties? They keep paying taxes on these easements and are restricted to the uses of their properties.

IND122-6 The Columbia River which moves the largest amount of fresh water in the USA will be put at risk when the huge ships move all of that natural gas up the river to Bradwood. Even human errors occur in the shipping industry. All of the money being spent to preserve the Columbiaâ€™s natural beauty and fishing industry could be for naught.

Now ask yourself this, do we want a better future now or will we accept the patch-bridge and wait longer?

Looking for a brighter
future,
Tom & Marian Sawtell

Individuals

122

- IND122-1 As explained in section 1.1, bringing in new sources of natural gas by importing LNG would diversity the energy portfolio of the Pacific Northwest, meet future demands, and may work to stabilize natural gas and electric prices. It would not necessarily reduce the incentive to conserve or develop additional renewable resources. Increased efficiency and conservation is discussed in section 3.1.1.2. Renewable energy resources are discussed in section 3.1.1.3.
- IND122-2 NorthernStar would compensate the landowner for use of the land needed for the pipeline right-of-way, including damage to property during construction, loss of use during construction, and loss of renewable and nonrenewable or other resources (see section 4.8.3.3).
- IND122-3 Geologic hazards and associated mitigation for the pipeline are discussed in section 4.1.4.3. Proper pipeline construction techniques would prevent damage to the pipe from rocks, as described in section 2.4.2.1.
- IND122-4 See our response to comment IND122-1.
- IND122-5 See our response to IND122-2.
- IND122-6 The Coast Guard has determined in its WSR that the Columbia River navigation channel would be suitable for LNG marine traffic if measures were implemented to responsibly manage navigation, safety, and security risks. These measures are discussed in detail in section 4.11.5.4.

*Bradwood Landing LLC and NorthernStar Energy LLC
FERC Docket Nos. CP06-365-000, et al.*

**Response of Bradwood Landing LLC and NorthernStar Energy LLC
to the Information Request in the DEIS of the
Federal Energy Regulatory Commission**

A1-1

40, 94 and 95. NorthernStar shall provide, in its comments on the draft EIS or in a separate report, calculations showing how the troughs feeding the impoundment sumps would adequately handle the unloading line spill of 529,091 gallons. [Note: Same condition in 40, 94 and 95]

RESPONSE: The question contains the value of 529,091 gallons. If the duration over which this volume drains is one hour, then the 2037 m³/hour is equivalent to 538,000 gallons per hour and satisfies the question. However, we presume the question refers to a spill that would result from a 10 minute spill at 12,000 m³/hour- we disagree that this is the proper design basis for sizing the trough. The attached letters provided by FERC to Bradwood Landing in June 2005 formed the basis for the sizing of the troughs serving the LNG unloading line. See Attachment A hereto: Letters from Richard R. Hoffmann (FERC) and Stacey L. Gerard (USDOT). The Applicants discussed the appropriate line size break with FERC staff for a 10-minute design spill and were told to use a 6" line break as the sizing criterion. The Applicants used the 6" line break as instructed by FERC staff. For the sizing calculation for the 6" line break ten minute spill, and the calculation for the other spill flowrates and preliminary trough sizing, see Attachment B hereto: Spill Rate Calculation and Trough Sizing Calculation.

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, D.C. 20426

ORIGINAL

OFFICE OF ENERGY PROJECTS

April 19, 2005

Theodore L. Wilke
Deputy Associate Administrator for Pipeline Safety
U.S. Department of Transportation
400 Seventh Street, SW
Washington, DC 20590

Dear Mr. Wilke:

In accordance with the February 2004 Interagency Agreement for the review of LNG import/export facilities, we are requesting your concurrence that we are following appropriate procedures on a technical issue related to evaluating exclusion zones around LNG import terminals. The technical issue is about our selection of the single accidental leakage source used to calculate spills from piping at a terminal.

The incorporation of NFPA 59A into 49 CFR Part 193 in March 2000, has resulted in some discussion within the regulatory community on how design spills should be determined for marine transfer lines. Under NFPA Section 2.2.3.5, the design spill used in thermal and flammable vapor exclusion zone calculations for vaporization, process, or LNG transfer areas must equal the greatest volume from any "single accidental leakage source." Prior to March 2000, the design spill required the rupture of a single transfer pipe with the greatest overall flow capacity, for not less than 10 minutes (old Part 193.2059(d)).

The FERC staff presently uses the greatest overall flow volume for sizing impoundments at vaporization, process and transfer areas. This approach ensures that impoundments are sized for a catastrophic failure that could result from an external event or intentional act, while recognizing that a more likely rupture of a connection to the transfer line is more appropriate as the design spill used to calculate flammable vapor exclusion zones.

Our review of marine transfer systems finds that the design construction, operation and historical integrity of all-welded large diameter marine transfer piping does not support a full pipe rupture without ignition as a credible accident scenario. Marine transfer systems are constructed of relatively thick-walled seamless pipe, fully x-ray inspected during construction, and operated at moderate pressures (50 to 80 psi). Maximum flow rates are limited to the 10- to 12-hour cargo unloading period, a time when extra staff is on hand to monitor operations and detect abnormal events and quickly

K-1119

Unofficial FERC-Generated PDF of 20050615-0176 Issued by FERC OSEC 06/15/2005 in Docket#: -

- 2 -

activate emergency shutdown systems. As a result, our determination of a single accidental leakage source for a marine transfer system is based on a facility-specific review of piping and instrumentation diagrams to identify all small diameter attachments to the transfer piping for instrumentation, pressure relief, recirculation, etc, and any flanges that may be used at valves or other equipment, in order to determine the largest spill rate.

As an additional measure of conservatism in evaluating hazards from a terminal's operations, we have also decided to evaluate the marine unloading arms connected to the dock-side end of marine transfer system since the typical 16-inch diameter arms have the potential for a larger spill volume. However, we find that a shorter spill duration is appropriate since the powered emergency release coupling (PERC) valves equipped on all modern arms and the integrated ship to shore emergency shutdown systems should limit spills to less than 30 seconds.

We solicit your concurrence on this approach in determining the accidental leakage source for marine transfer systems. If you have any questions about this request, please call Chris Zerby at 202-502-6111. Thank you for your continued cooperation.

Sincerely,

Richard R. Hoffmann, Director
Division of Gas - Environment
and Engineering

Richard R. Hoffmann
Director
Division of Gas - Environment and Engineering
Federal Energy Regulatory Commission
838 First Street, N.E.
Washington, DC 20426

Dear Mr. Hoffmann:

This is in response to your letter of April 19, requesting the Office of Pipeline Safety's (OPS) advice on the procedures you are following in evaluating exclusion zones for marine cargo transfer lines in LNG import terminals. We are pleased to respond in the spirit of the February 2004 Interagency Agreement on coordination of Federal safety efforts and because our regulations, 49 CFR Part 193, are used to assess the safety and hazard impacts from proposed siting of LNG facilities, including marine transfer lines.

Our regulations provide that impounding areas for marine cargo transfer systems be based on a design spill defined as flow from any single accidental leakage source for 10 minutes or for a shorter time. The shorter time is based upon demonstrable surveillance and shutdown provisions acceptable to the authority having jurisdiction. Therefore, these spills are the basis upon which hazard exclusion modeling could be performed.

The OPS agrees that the design and construction of marine cargo transfer systems is very robust and that failure is unlikely under operational constraints. Moreover, the extensive security and safety oversight provided by the USCG before, during, and after transfer operations further reduces the risk that a spill could threaten life and property. There is no documented evidence of a catastrophic failure ever having occurred in either LNG operational experience or research. The OPS intends to explore a more comprehensive approach that accounts for risk and probability instead of a spill based only on a worst case scenario. This may include incentives that encourage operators to utilize more mitigating measures in controlling potential spills to reduce the impact on people and property close to LNG facilities.

The OPS concurs with the two credible scenarios you propose for potential single accidental leakage sources, including your justification for smaller spill durations. The first scenario focuses on facility-specific small diameter attachments to the transfer piping to determine the largest spill rate. The OPS agrees with using this scenario for the design spill.

K-1121

Unofficial FERC-Generated PDF of 20050615-0177 Received by FERC OSEC 06/15/2005 in Docket#: -

2

The second and more conservative scenario requires the review of the marine unloading arms based on the fact that these components are reconnected to the ship each time a ship docks. We agree that the integrated ship to shore shutdown systems make large spills here very unlikely. Therefore, spill duration of 30 seconds or less from leaking flanges instead of guillotine breaks may be used for the spill rate criteria.

We appreciate the opportunity to provide the above input on your approach in determining the accidental leakage source for marine transfer systems. If you have any questions or require any additional information on our position, please feel free to contact me or Theodore Wilkie, Deputy Associate Administrator for Pipeline Safety, at (202)366-4595.

Sincerely yours,

Stacey E. Gerard
Associate Administrator for Pipeline Safety

Dear Madam Secretary,

A2-1

I am writing in support of the NorthernStar Natural Gas LNG receiving terminal and associated pipeline at Bradwood Landing in Clatsop County, Oregon. Demand for clean burning natural gas is increasing, while North American supplies are stable to decreasing. This is a significant problem in the Pacific Northwest as more and more of the natural gas supply is moving to the Eastern United States. Exploration and drilling in the U.S. and Canada has only managed to maintain current production. Bradwood Landing will assure natural gas supplies needed to maintain a strong economy here in the Northwest. There is no question that the U.S. needs to import liquefied natural gas for the Northwest's energy needs.

The United States continues to lose jobs to overseas manufacturing and I believe we will lose more jobs offshore if we do not compete in the world energy market by importing natural gas. The United States and Pacific Northwest need to import natural gas to maintain "Family Wage" jobs.

I am a Union Carpenter, a member of the Pacific Northwest Regional Council of Carpenters. The PNWRCC represents over 18,000 Union Carpenters in Washington, Oregon, Idaho, Montana and Wyoming. I believe that Northern Star's commitment to a Project Labor Agreement will be a key component to the success of Bradwood Landing. Highly skilled and professional workers will ensure a safe and high quality construction project.

NorthernStar has done an outstanding job of communicating with the Lower Columbia community. They have been open and transparent, hosting open houses at Bradwood Landing, information meetings on both sides of the Columbia River, and public presentations showing a strong commitment to the community. This effort proves that NorthernStar is an exceptional developer and should get your YES vote for issuing the permit to construct Bradwood Landing.

Bradwood Landing was an industrial site for decades, where citizens of the Lower Columbia lived and worked. I believe it is beneficial to use existing industrial land for development, rather than "Greenfield" locations. This also shows NorthernStar's commitment to the environment. In addition, Bradwood Landing is an excellent location for the importation of LNG and the necessary pipeline to Kelso. Bradwood Landing is over two miles north of Highway 30 at mile marker 38 on the Columbia River. It is close to both the Pacific Ocean and the interstate pipeline.

Bradwood Landing should get your approval, a "Yes" vote from the Federal Energy Regulatory Commission. Please approve Bradwood Landing.

Sincerely, *W. H. Ewing Jr.* Local 2154

June 28, 2007

Dear Magalie Salas:

I am writing to voice my support for NorthernStar Natural Gas's proposed LNG terminal at Bradwood Landing in Clatsop County, Oregon.

A2-1
cont'd

I am a resident of the Northwest and believe that this new facility is great for our community by providing much-needed family wage jobs and clean energy for the Pacific Northwest.

The proposed Bradwood Landing terminal site is located on the Columbia River, between Washington and Oregon, which has a long history as a working river. The Columbia is essential to the region's logging and fishing industries, and Bradwood Landing would be a welcome addition to the area's economy. NorthernStar is a responsible company who has pledged to mitigate any environmental effects and even leave the ecosystem in better shape than they found it.

I urge you and the commissioners to support this project.

Sincerely,

Reference Docket No. CP06-365

Dear Magalie Salas:

I support Bradwood Landing, the proposed LNG terminal on the Columbia River. I support Bradwood for Environmental reasons and I have listed them below:

- Methane, otherwise known as Natural Gas produces a much lower amount of CO2 than coal or coal gasification. We are going to need reliable energy supplies and Natural Gas produces less CO2.
- Many of the world's gas reserves are historic "stranded" reserves. These reserves were discovered during oil explorations and capped. So much of the drilling and discovery has been completed. That alone lessens the environmental impact
- Until recently oil wells burned their excess Natural Gas, flared it off. They looked at methane as a useless byproduct in the exploration and development of oil wells. Now, that methane is being captured and sent to market. This again is a very positive environmental gain. The conservation of energy!
- Bradwood will have minimal impact along its pipeline route with directional drilling of the pipeline under rivers and sensitive wetlands. Only 36 miles of pipeline to get Bradwood Landings Natural Gas to the Northwest energy markets.
- Northern Star, Bradwood Landings developer has committed to restoring the Hunt Creek Estuary and Hunt Creek. A small project but we all know how positive Salmon enhancement on multiple projects adds up to Salmon restoration.

Northern Star is a responsible company developing a responsible project. Please join me in supporting Bradwood Landing.

Thank you

Magalie R. Salas, Secretary
Federal Energy Regulatory Commission
888 First St. N.E., Room 1A
Washington DC, 20426
Reference Docket No. CP06-365

Dear Magalie Salas:

I support Bradwood Landing, the proposed LNG terminal on the Columbia River. I support Bradwood for Environmental reasons and I have listed them below:

- Methane, otherwise known as Natural Gas produces a much lower amount of CO2 than coal or coal gasification. We are going to need reliable energy supplies and Natural Gas produces less CO2.
- Many of the world's gas reserves are historic "stranded" reserves. These reserves were discovered during oil explorations and capped. So much of the drilling and discovery has been completed. That alone lessens the environmental impact
- Until recently oil wells burned their excess Natural Gas, flared it off. They looked at methane as a useless byproduct in the exploration and development of oil wells. Now, that methane is being captured and sent to market. This again is a very positive environmental gain. The conservation of energy!
- Bradwood will have minimal impact along its pipeline route with directional drilling of the pipeline under rivers and sensitive wetlands. Only 36 miles of pipeline to get Bradwood Landings Natural Gas to the Northwest energy markets.
- Northern Star, Bradwood Landings developer has committed to restoring the Hunt Creek Estuary and Hunt Creek. A small project but we all know how positive Salmon enhancement on multiple projects adds up to Salmon restoration.

Northern Star is a responsible company developing a responsible project. Please join me in supporting Bradwood Landing.
Thank you

A5-1 Information in this comment regarding rail traffic and associated Safety/ Security procedures, which was submitted by NorthernStar in response to a recommendation in the draft EIS, has been incorporated into section 4.8.2.7.

K-1143

*Bradwood Landing LLC and NorthernStar Energy LLC
FERC Docket Nos. CP06-365-000, et al*

**Response of Bradwood Landing LLC and NorthernStar Energy LLC
to the Information Request in the DEIS of the
Federal Energy Regulatory Commission**

41(a) and 96(a). NorthernStar shall provide in its comments on the draft EIS a description of historical, current, and anticipated rail traffic which includes the type of rail traffic (cargo, passenger, etc.), type of cargo, and frequency of all rail traffic which may utilize the railroad tracks adjacent to the facility. [Note: Same condition in 41 and 96]

RESPONSE: There is one set of railroad rails that runs through the Bradwood Landing terminal site. The tracks end approximately 25 miles west of the site.

Passenger train service through the Bradwood Landing terminal site, running between Portland and Astoria, was abandoned in 1952 due to low ridership.¹ Anecdotal information collected by Bradwood Landing indicates that, with the exception of the brief period described below, a train has not run through the terminal site since at least 1987. In fact, soil covered the railroad tracks for at least 12 years prior to the clearing of the tracks to allow the Lewis & Clark Explorer Train (LCE) to temporarily operate from 2003 to 2005. From 2003 to 2005, during the bicentennial celebration of Lewis and Clark's exploration, the LCE provided summer-only passenger train service between Portland and Astoria. The LCE was heavily subsidized, and the service was terminated in 2005 when the subsidy ended.

Since the termination of the LCE service, a train has not run through the Bradwood Landing terminal site. There is currently no traffic on the tracks and the P&W railroad has no plans to run trains west of Wauna (Wauna is east of Bradwood). The tracks were washed out west of the Bradwood Landing terminal site two years ago, approximately half-way to Astoria, and are currently impassable. The tracks have not been repaired, and there is no justification for trains to run between Bradwood and the washed out tracks, although the P&W railroad is in discussions with the local diking districts to repair the dikes and restore the tracks.

During the construction of Bradwood Landing, materials that can be cost effectively delivered by rail will be.

K-1144

*Bradwood Landing LLC and NorthernStar Energy LLC
FERC Docket Nos. CP06-365-000, et al*

41(b) and 96(b). NorthernStar shall also provide detailed procedures for coordinating with the railroad company to ensure safe rail transit through the Bradwood Landing LNG facility property.

RESPONSE: If there is an upset event at the Bradwood Landing Terminal (the "Terminal"). Terminal security will call the railroad dispatch operator who will call the train engineer and tell him to stop short of the Bradwood Landing facility property until the all clear is given. Such procedures are not foreign to the railroad and are in place for other locations, conditions, and circumstances. The following is the detailed procedure for coordinating with the railroad company to ensure safe rail transit through the Bradwood Landing LNG facility property.

General Operations of the LNG Terminal

Routine Terminal operations are broadly comprised of three separate categories:

1. LNG Carrier Offloading
2. LNG Vaporization
3. General Support Operations

LNG Carrier Offloading operations involve the arrival of a LNG Carrier, the transfer of LNG from the Carrier to the terminal storage tanks, and the departure of the Carrier.

LNG Vaporization activities are carried out based on market demand and are unrelated to LNG Carrier activities. The Terminal is expected to carry out this activity as an around-the-clock routine and under normal operations, no phase of this activity presents any risk to the safety of railroad operations, nor do vaporization operations influence railroad operations.

General Support Operations include routine and nonscheduled maintenance and repairs, administrative support, and all other miscellaneous activities required at the Terminal. Under normal operations, no phase of this activity presents any risk to the safety of railroad operations, nor do LNG Carrier operations influence railroad operations. Under operational upset or emergency response conditions, railroad operations may potentially be affected depending on the nature and severity of the event.

General Operations of the Railroad

There is only one set of railroad rails that runs through the Bradwood Landing Terminal. The railroad may schedule future trains so that there is either an east bound train or a west bound train running at any one time. The logistical possibilities for rail traffic are very limited, thus if service ever did commence, keeping track of train traffic would be simple.

Railroads run trains on a routine schedule where service is provided. If trains begin running through the Terminal, Bradwood Landing management/security would coordinate with the railroad to obtain the schedule for the trains passing through the Terminal.

Applicant

5

K-1145

*Bradwood Landing LLC and NorthernStar Energy LLC
FERC Docket Nos. CP06-365-000, et al.*

Upset Conditions

An upset condition could be an act of nature, such as an earthquake or severe storm; a fire at the terminal or surrounding site; or a hydrocarbon leak. Events that require an Emergency Response are very rare (with the exception of severe storms, which are still infrequent, but less so than the other upset conditions). It is more likely than not that no Emergency Response event will occur during the life of the Terminal. Regardless of the unlikelihood of an upset condition at the facility, it is still necessary for Bradwood Landing to have current and executable procedures in place for the notification of the railroad in the event of an upset condition at the Terminal. In the event that the railroad commences service, the notification procedures would be used to tell the train to stop short of Terminal. Such procedures are not foreign to the railroad and are in place for other locations, conditions, and circumstances.

Notification Procedures

The railroad has a dispatch operator that is reachable by direct phone line 24 hours a day, 7 days a week. If there is an upset event at the Terminal, plant security will call the railroad dispatch operator, who will call the train engineer, and tell him or her to stop short of the Terminal until the all clear is given.

Non-Emergency Operational Upsets

In the event of non-emergency operational upsets, a notification shall be made to the railroad providing the following information:

1. Description of upset/activity: *Scheduled or unscheduled maintenance, equipment failure, etc.*
2. Location on facility of upset: *Jetty, Control Room Building, etc.*
3. Anticipated duration: *When will upset condition be remedied; When will routine operations commence?*
4. Any safety issues: *Description of any issues that may result in an increase, or otherwise influence safety or railroad passage or track use.*
5. Change of status: *Any change to operational upset conditions or other information previously reported.*

An initial notification to the railroad shall be made as part of the initial action to any facility emergency response.

Emergency Response Conditions

There are a number of emergency response events which have specific response plans.

These include:

- Spill or Release
- Severe Weather
- Fire
- Bomb Threat
- Earthquake

Applicant

5

K-1146

*Bradwood Landing LLC and NorthernStar Energy LLC
FERC Docket Nos. CP06-363-000, et al.*

- Terrorist Incident
- LNG Carrier Response

In the event of an emergency response, an initial notification shall be made to the railroad consisting of the following information:

1. Description of upset/activity: *LNG spill, fire, etc.*
2. Recommendation of immediate action by railroad: *Whether conditions and/or risks are such that a train should be stopped outside the Terminal until the situation improves.*

A follow-on notification shall be made providing the following clarifying information as it becomes available:

3. Location on facility of emergency: *Jetty, Control Room Building, etc.*
4. Anticipated duration of emergency: *When will the emergency be remedied; When will Terminal and/or Emergency Responders stand down from response operations?*
5. Any intermediate safety issues: *Description of any issues which may result in an increase, or otherwise influence safety, railroad passage, or track use; Safety related information in addition to that provided in the initial notification.*

Normalization of Conditions

For non-emergency operational upset situations, Bradwood Landing shall appraise the railroad dispatcher when conditions at the Terminal return to normal and shall include a final recommendation regarding the use of the railroad. The dispatcher will communicate the all clear to the train engineer.

Recovery actions from an Emergency Response condition depend on the nature, severity, and in some cases the duration of the event. Emergency responses may be handled completely by Bradwood Landing Terminal personnel or, for responses to events of significant magnitude, it may be appropriate to establish a Unified Command. In the case of a Unified Command structure for the response, the all clear communication to the railroad dispatcher shall be made jointly by the Unified Command and Bradwood Landing. The dispatcher will communicate the all clear to the train engineer.

CP06-376-000
CP06-377-000

Bradwood Landing LLC Docket No. CP06-365-000

**Applicants' Response to FERC Staff's Recommended Mitigation Measures
in the Draft Environmental Impact Statement; Request for Confidential
Treatment**

Dear Ms. Bose:

Pursuant to the Federal Energy Regulatory Commission's ("FERC" or "Commission") "Notice of Availability of the Draft Environmental Impact Statement for the Bradwood Landing Project" issued August 17, 2007, Bradwood Landing LLC and NorthernStar Energy LLC (the "Applicants") hereby submit the following materials in response to and as requested by FERC Staff's Recommended Mitigation Measures in the Draft Environmental Impact Statement ("DEIS") issued in the above-referenced dockets.

The following materials comprise this filing:

1. **Public Version:** Applicants are submitting for filing an original and 7 copies of a public version of the Applicants' Response to FERC Staff's Recommended Mitigation Measures in the Draft Environmental Impact Statement. The public version has certain privileged and confidential information redacted.

Applicant

6

2. **Confidential Version:** Applicants are also submitting for filing one copy of confidential version of the Applicants' Response to FERC Staff's Recommended Mitigation Measures in the Draft Environmental Impact Statement, and request that the Commission treat this material as privileged and confidential pursuant to Commission Rule 385.1112 (18 C.F.R. § 385.1112). Applicants hereby request confidential treatment of the enclosed information based on the concerns expressed by certain landowners over the personal nature of the information contained therein. This information is marked "Contains Privileged Information – Do Not Release."

The conditions and responses are summarized below. For certain responses, Applicants have enclosed additional responsive information, as noted below.

- A6-1 1. *DEIS Condition 16: Conduct a comparative analysis of the FERC's Plan and its pipeline ESC Plan and SWPPP to demonstrate that NorthernStar's plans provide equal or greater protections to the environment. If the analysis determines that specific aspects of NorthernStar's plans do not provide equal or greater protections, NorthernStar shall revise its plans to include the measures from the FERC's Plan or shall provide proposed alternative measures that would provide equal or greater protections*
Applicants' Response to Condition 16: Applicants' comparative analysis is included as "Applicants' Condition 16 Response" in the enclosed materials.
- A6-2 2. *DEIS Condition 20: NorthernStar shall revise the locations of the 10 unapproved additional temporary workspaces listed in table 4.4 1-7 of this EIS that are within 50 feet of wetlands per our Procedures (see section VI.B.1.a), or provide a better site-specific justification for situating those temporary workspaces within 50 feet of wetlands for the review and written approval of the Director of OEP.*
Applicants' Response to Condition 20: Applicants' revised locations for Additional Temporary Workspaces are included as "Applicants' Condition 20 Response" in the enclosed materials.
- A6-3 3. *DEIS Condition 21: NorthernStar shall consult with the appropriate federal and state agencies to develop a Bubble Curtain Contingency Plan that establishes a performance standard to assess whether or not bubble curtains are adequately working. The plan shall describe specific noise attenuation methods to be implemented if monitoring indicates poor noise attenuation performance*
Applicants' Response to Condition 21: Applicants' revised Bubble Curtain Contingency Plan is included as "Applicants' Condition 21 Response" in the enclosed materials.

Applicant

6

- A6-1 NorthernStar's response did not provide adequate detail and, therefore, we have modified our recommendation in section 4.2.3.2 that NorthernStar should revise its pipeline ESC Plan and SWPPP to include the measures from the FERC's Plan that provide greater protections.
- A6-2 NorthernStar's response to our recommendation regarding unapproved temporary workspaces within 50 feet of wetlands has been incorporated into section 4.4.1.3.
- A6-3 Section 4.5.2.1 has been revised to include the information from NorthernStar's Bubble Curtain Contingency Plan. However, the Bubble Curtain Contingency Plan provided does not contain the information requested in the recommendation. Therefore, the recommendation has not been removed from section 4.5.2.1.

- A6-4 4. DEIS Condition 26: NorthernStar shall continue to consult with the appropriate federal and state agencies to **develop a Waterbody Mitigation Plan** that describes the specific methods of in-water habitat mitigation to be conducted
- Applicants' Response to Condition 26: The Applicants have continued to consult with federal and state agencies in the development of a Waterbody Mitigation Plan. The result of these continued consultations, Applicants' Waterbody and Wetland Construction and Mitigation Plan, is included as "Applicants' Condition 26 Response" in the enclosed materials.
- A6-5 5. DEIS Condition 30: NorthernStar shall expand the protective measures that would be used to **avoid or minimize impacts** on Steller sea lions during construction of the LNG terminal (e.g., safety, buffer, and noise impact zones) to include all pinnipeds
- Applicants' Response to Condition 30: Applicants' proposed protective measures to avoid or minimize impacts on Steller sea lions and other pinnipeds is included as "Applicants' Condition 30 Response" in the enclosed materials.
- A6-6 6. DEIS Condition 33: NorthernStar shall develop its **site-specific residential construction mitigation plans** in consultation with the affected landowners. These plans shall show the pipeline centerline; the limits of the construction work area, each residence and other structures; existing pipelines and power lines; water bodies, roads, driveways, fences, trees or other landscaping, and private wells; and the location of safety fencing that would be installed during construction
- Applicants' Response to Condition 33: Applicants' Residential Construction Conceptual Mitigation Plan is included as "Applicants' Condition 33 Response" in the enclosed materials.
- A6-7 7. DEIS Condition 38: Prior to the end of the draft EIS comment period, NorthernStar shall file with the Secretary a statement identifying the **noise mitigation measures to be implemented during HDD** activities to reduce noise levels at nearby NSAs. In addition, NorthernStar shall monitor noise during HDD activities and make all reasonable efforts to restrict noise increases from HDD operations to no more than 10 dBA above ambient noise levels if the resulting impact is above 55 dBA Ldn
- Applicants' Response to Condition 38: Applicants' HDD Noise Mitigation Measures are included as "Applicants' Condition 38 Response" in the enclosed materials.

Applicant

6

- A6-4 NorthernStar has filed its Waterbody and Wetland Construction and Mitigation Procedures Plan with the FERC. Directions for accessing NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan via the eLibrary can be found in the response to comment FA2-17. However, agency comments on the plan have not yet been filed. Therefore, condition 26 has not been revised.
- A6-5 NorthernStar's response to our recommendation regarding protective measures to avoid or minimize impacts on pinnipeds was reviewed. However, the response does not provide the protections for pinnipeds requested in the recommendation. Therefore, the recommendation has not been removed from section 4.6.2.2.
- A6-6 Section 4.7.3.3 has been revised to include a discussion of NorthernStar's Residential Construction Conceptual Mitigation Plan.
- A6-7 Section 4.10.2.3 has been updated to include this information.

8. DEIS Condition 39: Prior to the end of the draft EIS comment period, NorthernStar shall file with the Secretary, a statement identifying the **noise mitigation** that would be implemented for the Wauna Mill, Northwest Natural, and Williams Northwest pipeline valve sites to reduce noise at the NSAs to meet 55 dBA Ldn

Applicants' Response to Condition 39: Applicants' Valve Site Noise Mitigation Measures are included as "Applicants' Condition 39 Response" in the enclosed materials.

Applicants' Table of Corrections to
FERC Draft Environmental Impact Statement

Other Documentation Source	DEIS Language or Figure	DEIS Section and Page Number	Reason	Discrepancy to be corrected in FEIS
<p>A7-1 1. In Applicant-prepared BA filed in October 2006, dredging volume is stated at 700,000 cy for dredging on page 9. A cutter suction dredge would be used to remove approximately 700,000 cubic yards of material from about a 46-acre area of the 58-acre turning basin in the river (page 107)</p> <p>2. In March 2007 Conceptual Design Mitigation Plan, NSNG states "Dredging of 45.78 acres below the jurisdictional boundary of the Columbia River" is a permanent impact (page 4). On page 21 the Plan states "Turning basin dredging would affect about 58 acres of bottom habitat in 20 to 40 feet deep water."</p> <p>3. August 2007 Preliminary Design Mitigation Plan, Table 1-2, states "46 acres of bottom habitat ranges in depth from 21 to 42 feet." On page 15, we state: "Dredging of 45.78 acres for the 58-acre turning basin below the jurisdictional boundary of the Columbia River."</p> <p>4. Corps Public Notice October 2007 which is in part based on the April 2007 JPA says: "Dredging of approximately 46 acres"</p>	An additional 58 acres in the Columbia River would be dredged to create a ship maneuvering area	Executive Summary, Page ES-1	While dredging activities are typically quantified in terms of 3-dimensional units, by volume (calculated by estimating the length, width and depth of an area, and the proposed volume of 700,000 cubic yards has remained unchanged), an accompanying 2-dimensional description of the physical limits is typically provided in terms of length and width of the proposed area for dredging. Acres is an atypical way to describe dredging impacts because it's limited to 2 dimensions and doesn't account for surface variations that affect the actual estimated volume	Put construction dredging estimated footprint in the context of the larger "turning basin", "dredging of approximately 46 acres for the 58 acre turning basin is proposed associated with the terminal".

Applicant

A7-1

The text of the EIS has been modified to reflect the correct acreage to be dredged.

Bradwood Landing LLC and NorthernStar Energy LLC
FERC Docket Nos. CP06-365-000 et al

A7-2	In Oregon, temporary impacts to wetlands and waterways include up to 1.5 acres at the terminal and 75.64 acres along the pipeline	Construction of the LNG terminal facilities would result in temporary impacts on about 15 acres of wetland Construction of the pipeline facilities temporarily affect about 98 acres of wetlands	Executive Summary, ES-3	Decimal point dropped, overestimates impacts by factor of 10	August 07 Mitigation Plan, 3rd draft indicates in Oregon, temporary impacts to wetlands and waterways include up to 1.5 acres at the terminal and 75.64 acres along the pipeline.
A7-3	N/A	Bradwood Landing Project Dredge Area Figure 2.1.3-2	Description of the Proposed Action Page 2-15	Drawing shows old and outdated footprint of terminal footprint, turning basin and wharf configuration	Replace with updated terminal operational layout (correct layout is shown in Figure 2.1.3-1 of DEIS) and attached dredge layout

Applicant

7

A7-2 As described in table 4.4.1-2, construction of the LNG terminal would have temporary impacts on about 14.8 acres of wetlands. Of these, 12.9 acres would be permanently impacted by operation of the LNG terminal. Therefore, we have not revised the wetland acreages impacted by the LNG terminal facilities in the Executive Summary.

A7-3 Figure 2.1.3-1 has been updated.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Bradwood Landing LLC)	Docket No.	CP06-365-000

RESPONSE OF NORTHERNSTAR ENERGY LLC AND
BRADWOOD LANDING LLC TO THE FEDERAL ENERGY REGULATORY
COMMISSION STAFF'S RECOMMENDED MITIGATION MEASURE 24 IN
THE DRAFT ENVIRONMENTAL IMPACT STATEMENT

NorthernStar Energy LLC and Bradwood Landing LLC, Applicants in the above captioned proceedings, hereby submit to the Federal Energy Regulatory Commission ("FERC" or "Commission") Applicants' supplemental comments on "Mitigation Measure 24" proposed by FERC Staff in the Draft Environmental Impact Statement ("DEIS"), issued on August 17, 2007.¹ In the DEIS, FERC Staff recommended certain mitigation measures to be included in the authorization if the Commission authorizes the proposed Bradwood Landing liquefied natural gas ("LNG") import terminal and associated sendout pipeline (the "Project"). Recommended Mitigation Measure 24 in the DEIS states:

Prior to beginning initial site preparation at the LNG terminal, NorthernStar² shall prepare a plan, for review and written approval of the Director of OEP, which outlines how NorthernStar would ensure that only LNG ships that are retrofitted to use the screened water supply system at the berth are allowed to unload cargo at the Bradwood Landing LNG terminal. The plan shall include a method for

¹ Draft Environmental Impact Statement regarding the Bradwood Landing Project under CP06-365 et al., Accession Number: 20070817-4000 (filed Aug. 17, 2007).

² The DEIS refers to Applicants collectively as "NorthernStar."

Applicant

8

notifying FERC in advance of an LNG ship's initial call to the terminal and verify that it has been retrofitted to utilize NorthernStar's screened water intake system for taking on water from the Columbia River for ballast and engine cooling.³

Applicants respectfully request that FERC revise recommended Mitigation Measure 24 for the reasons set forth herein.

I. RECOMMENDED MITIGATION MEASURE 24 REFLECTS A MISUNDERSTANDING OF APPLICANTS' PROJECT AND PROPOSED MITIGATION MEASURES.

A8-1

Applicants propose to construct and operate an LNG import facility and sendout pipeline located at approximately river mile 38 on the Columbia River at Bradwood Landing in Clatsop County, Oregon. The Project will include a state of the art terminal design, including a screened intake shore-based ballast water system ("on-site water system") to avoid and minimize, to the maximum extent practical, any harm to species listed as threatened or endangered ("Listed Species"). Applicants cannot guarantee that the Project as proposed by Applicants, including the on-site water system, will be 100% effective at mitigating all impacts on Listed Species.

In contrast, FERC Staff's Recommended Mitigation Measure 24 would require Applicants to *only* accept LNG carriers that have been retrofitted to utilize the on-site water system. For the reasons discussed below, by requiring *all* LNG carriers to be able to accept the on-site water system, Mitigation Measure 24 establishes a standard that is impossible for Applicants to guarantee.

Applicants' proposal has been, and continues to be, to construct the on-site water system and to negotiate with LNG carriers to fit the LNG carriers with the equipment necessary to allow LNG carriers use of the on-site water system. The goal of Applicants'

³ Draft Environmental Impact Statement, *supra* note 1, at p. 4-145 and 5-24.

Applicant

8

A8-1

Information in this comment regarding use of the on-site water system by LNG carriers, which was submitted by NorthernStar in response to a recommendation in the draft EIS, has been incorporated into sections 4.3.2.3 and 4.5.2.1. Additional analysis of the potential impacts on water quality and federally listed species associated with LNG carrier water intakes and discharges will be included in the revised BA and EFH Assessment.

A8-1
cont'd

on-site water system program is to ensure that as many LNG carriers as practicable have the ability to use the on-site water system. Over time, Applicants expect that the LNG carriers that regularly visit the Bradwood Landing terminal will routinely use the on-site water system. However, to date, there are no LNG carriers configured to accept filtered ballast and cooling water from the on-site water system. Equipping LNG carriers with this system is best done during construction. If equipping is undertaken after construction, *i.e.*, through retrofitting, such retrofitting can only be done during the dry-docking of the LNG carriers that happens only twice every five years. Applicants expect that the LNG carriers that routinely visit the Bradwood Landing terminal will be constructed or retrofitted to be compatible with the on-site water system, however, this process will take time.

Applicants have proposed, as part of the Project, to provide reasonable contract incentives to encourage equipping or retrofitting LNG carriers for compatibility, but it is not in Applicants' control to require *all* LNG carriers to retrofit. Despite these reasonable contract incentives proposed by Applicants, it is not likely that all LNG carriers making deliveries to the Bradwood Landing terminal under spot market contracts, short term contracts, or as replacement carriers to long term contracts will be equipped for the on-site water system. This is because it is likely that these spot cargoes will be diverted to the Bradwood Landing terminal from previously planned destinations at other terminals. It was never the Applicants' proposal to guarantee 100% use of the on-site water system as Mitigation Measure 24 appears to require, nor is such a guarantee possible.

Applicant

A8-1
cont'd

II. RECOMMENDED MITIGATION MEASURE 24 DOES NOT BEAR A RATIONAL RELATIONSHIP TO THE PROJECT

Mitigation Measure 24, as proposed in the DEIS, reflects a misunderstanding of Applicants' Project proposal, and establishes (or at a minimum implies) a requirement of usage of the on-site water system by 100% of the LNG carriers arriving at the Bradwood Landing terminal. For the reasons stated above, this mitigation condition would be impractical because it could never be satisfied, and as such it was not nor rationally could have been proposed by Applicants. Indeed, Applicants believe that the lack of a logical relationship between recommended Mitigation Measure 24 and the Applicants' Project proposal could place such a condition at risk of being deemed arbitrary and capricious under the Administrative Procedure Act.⁴ In addition, there is a question as to whether the Commission could ultimately require such modifications in light of international treaties.⁵ Recommended Mitigation Measure 24, therefore, is neither desirable from an agency perspective, nor is it necessary to ensure mitigation of Project impacts on Listed

⁴ See *Missouri Pub. Serv. Comm'n v. FERC*, 337 F.3d 1066 (D.C. Cir. 2003) (rejecting the Commission's approval of initial rates as both arbitrary and unsupported by substantial evidence); *Great Lakes Transmission Ltd. P'ship v. FERC*, 984 F.2d 426, 432–34 (D.C. Cir. 1993) (finding a condition included in a certificate authorizing expansion of a pipeline unreasonable because the Commission did not provide a full and rational explanation supporting the condition); *Ozark Gas Transmission Sys. v. FERC*, 897 F.2d 548, 551–53 (D.C. Cir. 1990) (rejecting a condition attached to a blanket certificate authorization because the condition was patently unreasonable). The Court found that the condition made it impossible for Ozark to compete in the market and that the Commission "had used a sledgehammer to accomplish [its objective], instead of an instrument suitable to the purpose." *Id.* at 552.

⁵ Federal agencies, in this instance FERC, do not have the authority to mandate that foreign-flagged vessels be retrofitted, and similarly, the agency's authority to condition Applicant's project on this basis may also be in question. International treaties governing the design, equipment, and construction of vessels specifically require the signatory state to honor certificates of compliance issued by foreign states. U.S. courts have recognized the need for consistency and reciprocity regarding international agreements, particularly in regard to foreign-flag vessels. See, e.g., *Ray v. Atlantic Richfield Co.*, 435 U.S. 151 (1978); *U.S. v. Locke*, 529 U.S. 89, 110–12 (2000).

Species. As discussed below, Applicants have proposed an innovative and sound approach to the protection of listed salmon.

III. APPLICANTS' PROPOSED ON-SITE WATER SYSTEM COUPLED WITH THE PERFORMANCE STANDARDS ARE PROTECTIVE OF LISTED SALMON.

In order to bolster the mitigation potential of Applicants' on-site water system and corresponding LNG carrier fit-out program, Applicants have proposed that two performance standards would be applicable to the Project. Applicants' performance standard proposals would be an innovation in LNG terminal operations and habitat protection, but they derive from the performance-based approach to salmon habitat protection followed by NOAA Fisheries in the Federal Columbia River Power System remand proceedings.⁶ The performance standards will specify: (i) that all cooling water discharges from LNG carriers at the wharf will meet the proposed temperature performance standard; and (ii) a performance standard for entrainment of Listed Species. Both performance standards will have a monitoring component. Applicants will include these performance standards in their Applicant-Prepared Biological Assessment to be submitted to the Commission at the end of May 2008.

As noted above, Applicants have designed this performance standard approach following the NOAA Fisheries' approach in the Federal Columbia River Power System remand process. Applicants agree with NOAA Fisheries that performance standards can provide the necessary certainty to ensure protection of the species and to address the

⁶ NOAA's National Marine Fisheries Service, Endangered Species Act - Section 7 Consultation Biological Opinion - Remand Draft, Consultation on Remand for Operation of the Federal Columbia River Power System, F/NWR/2005/05883 (Oct. 30, 2007) (revised and reissued pursuant to court order, *Nat'l Wildlife Fed'n v. NMFS*, Civ. No. CV 01-640-RE (D. Or. 2001)), <http://www.nwr.noaa.gov/Salmon-Hydropower/Columbia-Snake-Basin/Draft-BOs.cfm>.

A8-1
cont'd

recent holding by the U.S. Court of Appeals for the Ninth Circuit that an applicant's proposal must be reasonably certain to occur and must therefore be within the applicant's control.⁷ Applicants' on-site water system coupled with performance standards will provide protection for the listed salmon and satisfy the "reasonably certain to occur" standard as interpreted by the courts.

IV. RECOMMENDED MITIGATION MEASURE 24 IS PREMATURE

Applicants recognize that the Commission has a responsibility to fulfill under the National Environmental Policy Act ("NEPA") and are not suggesting that the Commission in any way abdicate this responsibility. However, the issue of listed salmon protection and the benefits of the on-site water system are being addressed as part of the consultation process with NOAA Fisheries pursuant to Section 7 of the Endangered Species Act.⁸ NOAA Fisheries consultation with FERC will conclude with the issuance of a Biological Opinion by NOAA Fisheries describing the effects of the proposed action on Listed Species or their critical habitat and determining whether the proposed action would cause jeopardy to the species or harm to their critical habitat.⁹ NOAA Fisheries may conclude no jeopardy and include reasonable and prudent measures. If the Biological Opinion finds that the proposed project may jeopardize the species or

⁷ *National Wildlife Federation v. NMFS*, 481 F.3d 1224 (9th Cir. 2007)(The Ninth Circuit upheld the invalidation of NMFS' 2004 Biological Opinion for the Federal Columbia River Power System, stating that NMFS' failure to ensure that certain proposed mitigation measures, including promises to implement removable spillway weirs, were conditioned on availability of Congressional appropriations).

⁸ 16 U.S.C. § 1536 (2007).

⁹ 16 U.S.C. § 1536(b)(3)(A).

Applicant

8

A8-1
cont'd

adversely modify their habitat, NOAA Fisheries must work with the Applicant and FERC to develop a “reasonable and prudent alternative” to avoid jeopardy.¹⁰

NOAA Fisheries has not yet issued its Biological Opinion containing its analysis of the potential threat to Listed Species and any necessary “reasonable and prudent alternatives,” thus it is premature for FERC to establish a requirement that 100% of the LNG carriers servicing the Bradwood Landing terminal be equipped for use with the on-site water system. NOAA Fisheries’ Biological Opinion may recognize different risks to species resulting from the Project than those identified by FERC and/or may identify reasonable and prudent measures and/or reasonable and prudent alternatives necessary to avoid these risks entirely different than or incompatible with those identified by FERC.

While Applicants acknowledge that it is generally true that FERC is not bound to follow the recommendations of a Biological Opinion,¹¹ in the context of threatened or endangered species and an incidental take statement, both Commission and U.S. Supreme Court precedent recognize that it is prudent for FERC to defer to the conclusions of the agency principally charged with administering the ESA—NOAA Fisheries in the present case.¹²

For example, in *Pacific Gas and Electric Co.* (Potter Valley Project), the Commission in the Final Environmental Impact Statement (“FEIS”) disagreed with

¹⁰ *Id.*

¹¹ *Pacific Gas and Electric Co.*, 107 FERC ¶ 61,232, at P 16 (“PG&E is correct that the law does not require the Commission to adopt a reasonable and prudent alternative or the RPMs [reasonable and prudent measures] which implement the incidental take statement.”).

¹² See *Bennett v. Spear*, 520 U.S. 154, 169 (1997) (“[W]hile the Service’s Biological Opinion theoretically serves an ‘advisory function,’ in reality it has a powerful coercive effect on the action agency.”); *City of Tacoma, Wash.*, 110 FERC ¶ 61,239, P 7, n.4 (2005); *Pacific Gas and Electric Co.*, 106 FERC ¶ 61,065, order on reh’g, 107 FERC ¶ 61,232 (2004).

Applicant

A8-1
cont'd

NOAA Fisheries' Biological Opinion with respect to what operational and physical modifications to the project were required to benefit federally-threatened salmonids, "but concluded that in light of NOAA Fisheries' status as the agency principally charged with administering the ESA with respect to anadromous fishes, and the essentially mandatory nature of an incidental take statement, the Commission has no real choice but to amend the license consistent with the Biological Opinion."¹³ Similarly, because NOAA Fisheries is the agency principally charged with administering the ESA with respect to the Listed Species in the Columbia River, the Commission should not make any final decisions about appropriate mitigation requirements until NOAA Fisheries, the agency that has the relevant expertise, has the opportunity to fully evaluate the Project and advise what measures it feels are necessary to protect listed salmon. Mitigation Measure 24, as proposed in the DEIS, is premature because it proposes a standard that cannot be met, before any input from the resource agencies with relevant expertise is even presented.

In addition to being appropriate,¹⁴ reasoned deference to the Biological Opinion is prudent from an administrative perspective because an agency that deviates from a Biological Opinion bears a dual burden of "articulating in its administrative record its reasons for disagreeing with the conclusions of a biological opinion"¹⁵ and establishing that its actions will not result in jeopardy and will adequately protect Listed Species.¹⁶

The Commission and the U.S. Supreme Court both recognize that an action agency (FERC, in the instant case) that disregards an incidental take statement does so at

¹³ 107 FERC ¶ 61,223 at P 9.

¹⁴ *Id.* at P 21 ("It is appropriate for an agency to show reasoned deference to the ESA agencies with regard to the interpretation of their Joint Regulations and documents associated therewith.").

¹⁵ *Bennett*, 520 U.S. at 169 (citing 51 Fed. Reg. 19,956 (1986)).

¹⁶ 107 FERC ¶ 61,223 at P 16.

A8-1
cont'd

its own peril because any person who knowingly takes an endangered or threatened species is subject to substantial civil and criminal penalties, including imprisonment.¹⁷ Therefore, rather than setting the stage for an inconsistent result with NOAA Fisheries, the prudent course of action is to defer establishment of any FERC mitigation condition until NOAA Fisheries proposes the measures it believes are required to ensure that sufficient protections for listed salmon are implemented by Applicants.

V. RECOMMENDED MITIGATION MEASURE 24 SHOULD BE MODIFIED BEFORE ISSUANCE OF THE FINAL ENVIRONMENTAL IMPACT STATEMENT OR INCORPORATION INTO THE COMMISSION'S AUTHORIZATION

For the reasons stated above, Applicants respectfully request that FERC modify Mitigation Measure 24, as proposed in the DEIS, before issuance of the FEIS and incorporation thereof in any authorization by the Commission for the Project. Applicants propose the following substitute for recommended Mitigation Measure 24:

24. Prior to the issuance of a Biological Opinion by NOAA Fisheries, NorthernStar shall consult informally with NOAA Fisheries, as appropriate, in the development of proposed measures for mitigation of impacts on federally listed endangered species. After issuance of a Biological Opinion and prior to operation of the LNG terminal, NorthernStar shall prepare a plan, for review and written approval of the Director of OEP, setting forth the mitigation measures it intends to take with respect to the Biological Opinion. At the same time, copies of the plan shall be served upon the agencies consulted. NorthernStar shall allow a minimum of 30 days for the consulted agencies to comment on the plan.

After issuance of a Biological Opinion and prior to operation of the LNG terminal, NorthernStar shall file for the review and written approval of the Director of OEP a copy of a monitoring plan. At the same time, copies of the monitoring plan and schedule shall be served upon the agencies consulted. NorthernStar shall allow a minimum of 30 days for the consulted agencies to comment on the plan. Any written comments on the

¹⁷ 107 FERC ¶ 61,223 at P 16; *Bennett*, 520 U.S. 154, 170.

Applicant

8

A8-1
cont'd

monitoring plan received by NorthernStar from the consulted agencies shall be filed with the Commission.

If based on the results of the monitoring, NorthernStar determines that changes in project structures are necessary to protect the relevant federally listed endangered species covered by the consultation, then NorthernStar shall submit a schedule to the Commission for approval for implementing the specific changes in project structures. At the same time, copies of the schedule shall be served upon the agencies consulted.

The Commission reserves the right to require modification of any plans or schedules.

Applicants' proposed Mitigation Measure, above, allows for NOAA Fisheries substantive input on protective measures for listed salmon, reasonable evaluation of Applicants' proposed performance standard proposal, and full FERC oversight of all applicant-proposed mitigation measures. It also avoids the administrative and procedural deficiencies that may result from Mitigation Measure 24 as proposed in the DEIS.

[THIS SPACE IS INTENTIONALLY LEFT BLANK]

Applicant

The Northeastern Pacific Ocean has been further defined in section 4.6.1.3 as the area off the coasts of Oregon and Washington. The complete list of marine mammals with potential to be found off the coasts of Oregon and Washington has been added to section 4.6.1.3. The list was determined using the most recent versions of both the U.S. Pacific Marine Mammal Stock Report and the Alaska Marine Mammal Stock Report (NOAA Technical Memo.). State and federally listed species, and those which are most likely to be impacted by the proposed project, based on correspondence with the NMFS, have been further discussed in section 4.6.

Lighting Plan for the Bradwood Landing LNG Terminal (Lighting Plan)	4-165
liquefaction	ES-2, 1-4, 2-43, 3-10, 3-18, 4-8, 4-9, 4-13, 4-15, 4-18, 4-28, 4-447, 4-505, 5-2, 5-36
liquefied natural gas (LNG)	ES-1, ES-2, ES-3, ES-4, ES-5, ES-6, ES-7, ES-8, ES-9, ES-10, 1-1, 1-2, 1-3, 1-4, 1-7, 1-8, 1-9, 1-10, 1-11, 1-12, 1-15, 1-19, 1-20, 1-22, 1-28, 1-29, 1-32, 1-33, 1-34, 2-1, 2-3, 2-4, 2-5, 2-6, 2-7, 2-8, 2-9, 2-10, 2-11, 2-12, 2-13, 2-14, 2-15, 2-19, 2-20, 2-21, 2-22, 2-23, 2-24, 2-25, 2-26, 2-27, 2-28, 2-29, 2-31, 2-33, 2-34, 2-35, 2-39, 2-40, 2-41, 2-42, 2-43, 2-44, 2-45, 2-49, 2-57, 2-59, 2-60, 2-61, 2-62, 2-63, 2-64, 3-1, 3-2, 3-3, 3-4, 3-9, 3-10, 3-12, 3-13, 3-14, 3-15, 3-16, 3-17, 3-18, 3-20, 3-21, 3-22, 3-23, 3-24, 3-25, 3-26, 3-27, 3-29, 3-31, 3-32, 3-35, 3-39, 3-40, 3-41, 3-42, 3-45, 3-46, 3-47, 3-48, 3-49, 3-50, 3-51, 3-52, 3-53, 3-54, 3-55, 3-56, 3-57, 3-58, 3-59, 3-60, 3-62, 3-64, 3-65, 3-68, 3-69, 3-71, 3-73, 3-74, 3-75, 4-1, 4-2, 4-3, 4-5, 4-6, 4-7, 4-8, 4-9, 4-11, 4-12, 4-13, 4-14, 4-15, 4-16, 4-17, 4-18, 4-19, 4-20, 4-21, 4-22, 4-23, 4-24, 4-25, 4-28, 4-29, 4-31, 4-32, 4-33, 4-34, 4-44, 4-46, 4-55, 4-56, 4-57, 4-58, 4-59, 4-60, 4-61, 4-66, 4-70, 4-71, 4-72, 4-73, 4-75, 4-76, 4-77, 4-78, 4-81, 4-83, 4-84, 4-85, 4-86, 4-87, 4-89, 4-100, 4-101, 4-103, 4-104, 4-105, 4-106, 4-108, 4-109, 4-116, 4-121, 4-122, 4-123, 4-124, 4-125, 4-127, 4-132, 4-134, 4-135, 4-136, 4-137, 4-138, 4-139, 4-140, 4-143, 4-144, 4-145, 4-146, 4-147, 4-148, 4-149, 4-150, 4-151, 4-152, 4-153, 4-154, 4-156, 4-157, 4-158, 4-159, 4-160, 4-161, 4-162, 4-163, 4-164, 4-165, 4-166, 4-167, 4-168, 4-169, 4-171, 4-172, 4-173, 4-174, 4-175, 4-176, 4-178, 4-179, 4-180, 4-191, 4-198, 4-199, 4-200, 4-201, 4-202, 4-209, 4-226, 4-227, 4-228, 4-229, 4-230, 4-231, 4-232, 4-233, 4-234, 4-235, 4-237, 4-239, 4-240, 4-241, 4-242, 4-243, 4-244, 4-245, 4-246, 4-247, 4-248, 4-249, 4-250, 4-251, 4-252, 4-253, 4-254, 4-255, 4-256, 4-257, 4-258, 4-259, 4-260, 4-261, 4-262, 4-263, 4-264, 4-265, 4-266, 4-268, 4-269, 4-270, 4-271, 4-272, 4-274, 4-275, 4-276, 4-277, 4-278, 4-279, 4-280, 4-281, 4-282, 4-283, 4-284, 4-285, 4-287, 4-290, 4-292, 4-295, 4-298, 4-299, 4-300, 4-303, 4-304, 4-305, 4-307, 4-310, 4-311, 4-313, 4-314, 4-315, 4-316, 4-317, 4-318, 4-319, 4-320, 4-321, 4-322, 4-324, 4-325, 4-326, 4-327, 4-328, 4-330, 4-331, 4-333, 4-334, 4-335, 4-338, 4-342, 4-345, 4-346, 4-355, 4-358, 4-359, 4-360, 4-361, 4-362, 4-364, 4-365, 4-366, 4-367, 4-368, 4-369, 4-370, 4-371, 4-372, 4-373, 4-374, 4-375, 4-376, 4-377, 4-378, 4-379, 4-380, 4-381, 4-382, 4-383, 4-384, 4-385, 4-386, 4-387, 4-388, 4-389, 4-390, 4-393, 4-394, 4-395, 4-399, 4-400, 4-401, 4-402, 4-403, 4-404, 4-405, 4-406, 4-410, 4-412, 4-414, 4-415, 4-416, 4-417, 4-419, 4-420, 4-421, 4-422, 4-423, 4-424, 4-425, 4-426, 4-427, 4-428, 4-429, 4-430, 4-431, 4-434, 4-435, 4-436, 4-437, 4-439, 4-440, 4-441, 4-442, 4-443, 4-445, 4-447, 4-448, 4-449, 4-450, 4-451, 4-452, 4-453, 4-454, 4-455, 4-456, 4-458, 4-461,

SUBJECT INDEX

4-462, 4-463, 4-464, 4-465, 4-466, 4-468, 4-470, 4-471, 4-472, 4-473, 4-474, 4-475, 4-476, 4-477, 4-478, 4-479, 4-480, 4-481, 4-482, 4-483, 4-484, 4-485, 4-486, 4-487, 4-488, 4-489, 4-491, 4-494, 4-500, 4-501, 4-504, 4-505, 4-506, 4-508, 4-509, 4-510, 4-511, 4-512, 4-513, 4-514, 4-515, 5-1, 5-2, 5-3, 5-4, 5-5, 5-6, 5-7, 5-8, 5-9, 5-11, 5-12, 5-13, 5-14, 5-15, 5-16, 5-17, 5-18, 5-19, 5-20, 5-21, 5-22, 5-23, 5-24, 5-25, 5-26, 5-27, 5-28, 5-29, 5-30, 5-31, 5-32, 5-33, 5-34, 5-35, 5-36, 5-37, 5-38, 5-39, 5-40, 5-41, 5-42	
liquid petroleum gas (LPG)	4-472
LNG Vessel Transit Management Plan	ES-8, 3-74, 3-75, 4-483, 4-484, 5-1, 5-20, 5-22
log pond	2-41, 3-56, 4-13, 4-21, 4-58, 4-75, 4-76, 4-149, 4-156, 4-157, 4-171, 4-172, 4-173, 4-235, 4-258, 4-259, 4-260, 4-261, 4-262, 4-263, 4-264, 4-265, 4-287, 4-300, 5-8, 5-30
Long Beach LNG Import Project.....	3-59, 5-21
Longview	ES-9, 1-19, 1-30, 1-31, 2-9, 2-13, 2-36, 3-35, 3-62, 3-64, 3-66, 4-24, 4-53, 4-114, 4-163, 4-272, 4-311, 4-313, 4-338, 4-353, 4-354, 4-355, 4-363, 4-393, 4-395, 4-404, 4-407, 4-415, 4-416, 4-430, 4-479, 4-501, 4-502, 4-504, 4-508, 4-510, 4-512
Lower Columbia Fish Recovery Board (LCFRB)	4-101, 4-149, 4-212, 4-248, 4-266, 4-267, 4-268, 4-270
Lower Columbia River Estuary Program Comprehensive Conservation and Management Plan.....	4-268, 4-506
Lower Columbia River Salmon Recovery and Fish & Wildlife Plan.....	4-268, 4-506
Lower Columbia Salmon Recovery and Fish & Wildlife Subbasin Plan	4-269
lower flammability limit (LFL).....	ES-6, 4-468, 4-470, 4-475, 4-477, 4-478, 5-19
Magnuson-Stevens Fishery Conservation and Management Act (MSA)	1-10, 1-13, 1-22, 4-135, 4-139, 4-144, 4-149, 4-183, 4-196, 4-230, 4-300, 4-358, 4-360, 4-375, 4-376, 4-377, 4-389, 4-511, 5-14
mainline block valve (MLV).....	1-3, 2-25, 2-27, 2-28, 2-57, 3-15, 4-342, 5-20
Major Land Resource Area (MLRA).....	4-32, 4-47
marbled murrelet.....	3-17, 3-27, 3-31, 4-214, 4-233, 4-251, 4-252, 4-276, 4-277, 4-291, 4-292, 4-509, 5-10, 5-11
marine mammal	1-14, 1-21, 3-31, 3-48, 3-54, 4-133, 4-135, 4-139, 4-148, 4-149, 4-152, 4-154, 4-156, 4-157, 4-159, 4-209, 4-224, 4-247, 4-256, 4-257, 4-273, 4-274, 4-509, 5-7

SUBJECT INDEX

Marine Mammals Protection Act of 1972 (MMPA).....	1-14, 1-21, 4-133, 4-135, 4-196, 4-208, 4-212, 4-224, 4-257, 4-273, 4-300, 4-303, 5-7, 5-11, 5-32
Marine Protection, Research, and Sanctuaries Act (MPRSA)	3-70, 3-71
Maritime Security (MARSEC)	1-11, 2-13, 4-482, 4-483, 4-484, 4-485, 4-490, 5-20
Maximum Achievable Control Technology (MACT)	4-421
maximum allowable operating pressure	2-26, 4-455, 4-493, 5-41
McGowan.....	4-304
Megler	2-8, 2-12, 3-31, 3-32, 4-3, 4-304, 4-364, 4-479
Memorandum of Understanding on Natural Gas Transportation Facilities (Memorandum).....	4-492
meter station.....	1-2, 2-25, 2-26, 2-27, 2-28, 2-33, 2-39, 2-57, 3-27, 4-119, 4-338, 4-342, 4-357
Method Reporting Limit (MRL)	4-39, 4-40, 4-41, 4-42
Migratory Bird Nest Avoidance Plan.....	4-285, 4-298, 4-300, 5-9, 5-32
Migratory Bird Treaty Act.....	1-21, 4-179, 4-196, 4-217, 4-225, 4-257, 4-283, 4-284, 4-298
migratory birds.....	1-21, 4-174, 4-177, 4-179, 4-196, 4-217, 4-225, 4-257, 4-283, 4-284, 4-285, 4-298, 4-300, 5-9, 5-32
Moss-Maritime LNG Project	3-20
National Ambient Air Quality Standards (NAAQS)	4-412, 4-413, 4-414, 4-416, 4-417, 4-423, 4-424, 4-428, 4-431, 4-432, 5-18
National Emission Standards for Hazardous Air Pollutants (NESHAP)	4-418, 4-421
National Environmental Policy Act (NEPA).....	ES-1, ES-9, 1-1, 1-9, 1-13, 1-20, 1-26, 1-28, 1-29, 2-3, 2-13, 2-64, 3-1, 3-14, 4-107, 4-115, 4-139, 4-196, 4-273, 4-348, 4-372, 4-447
National Fire Protection Association (NFPA)	2-21, 2-24, 2-39, 2-60, 2-61, 2-62, 3-51, 4-11, 4-12, 4-451, 4-458, 4-461, 4-462, 4-463, 4-464, 4-465, 4-466, 4-468, 5-38
National Fish and Wildlife Foundation (NFWF)	2-33, 4-266, 4-267, 4-268, 4-269
National Historic Preservation Act (NHPA).....	ES-5, 1-10, 1-14, 1-20, 1-23, 1-24, 4-399, 4-410, 4-411, 4-514, 5-17
National Pollutant Discharge Elimination System (NPDES)	1-12, 1-22, 1-25, 2-39, 2-47, 3-39, 4-8, 4-60, 4-87, 4-88, 4-168, 4-242, 5-5

SUBJECT INDEX

National Priorities List (NPL).....	4-352
National Register of Historic Places (NRHP).....	ES-5, 1-14, 1-23, 1-24, 3-31, 4-399, 4-400, 4-, 01, 4-402, 4-403, 4-404, 4-405, 4-411, 4-514, 5-16, 5-17
National Weather Service (NWS).....	3-8, 4-416, 4-430
National Wetlands Inventory (NWI).....	3-32, 3-39, 3-40, 3-66, 3-67, 4-109, 4-113
Native American	ES-5, ES-9, 1-19, 1-28, 1-32, 4-134, 4-182, 4-372, 4-389, 4-401, 4-406, 4-407, 4-408, 4-409, 4-410, 5-14, 5-17
Natural Gas Act (NGA)	ES-1, 1-1, 1-16, 1-20, 1-21, 1-29, 2-3, 3-52, 4-343, 4-347, 4-390, 4-399, 4-487, 5-13, 5-20
Natural Resource Group, LLC (NRG).....	4-409
Navigation and Vessel Inspection Circular – Guidance on Assessing the Suitability of a Waterway for Liquefied Natural Gas (LNG) Marine Traffic (NVIC 05-05).....	1-11, 1-20, 2-1, 2-13, 4-1, 4-482, 5-20
New Source Performance Standards (NSPS).....	4-418, 4-419, 4-426, 4-433
Nez Perce Tribe.....	1-30, 1-31, 1-34, 4-406, 4-408, 4-409
Nisqually Tribe	4-406, 4-407, 4-409
NMFS National Marine Mammal Laboratory’s Platform of Opportunity Program (POP).....	4-209, 4-211, 4-246
noise-sensitive area (NSA)	ES-6, 4-321, 4-437, 4-441, 4-442, 4-443, 4-444, 4-445, 4-446, 5-18
North American Industry Classification System (NAICS).....	4-379
North American Vertical Datum (NAVD).....	2-41, 2-42, 2-44, 3-59, 4-19, 4-60, 4-75, 4-76, 4-78, 4-234, 4-328, 5-3
northern goshawk.....	4-223, 4-256, 4-283
Northwest Gas Association (NWGA).....	1-5, 1-6, 1-8, 1-9, 3-2, 3-18
Northwest Indian Fisheries Commission	4-406, 4-407, 4-409
Northwest Natural Gas Company (Northwest Natural)	ES-2, 1-3, 1-4, 1-34, 2-1, 2-27, 2-28, 2-32, 2-39, 3-1, 3-10, 3-12, 3-13, 3-14, 3-18, 3-26, 3-29, 3-40, 3-62, 4-335, 4-337, 4-338, 4-342, 4-362, 4-443, 4-446, 4-447, 4-501, 5-19, 5-35
Northwest Natural Gas Company’s Mist storage facility .	2-39, 4-338

SUBJECT INDEX

Northwest Power and Conservation Council Fish and Wildlife Program Subbasin Plan for the Lower Columbia Mainstem and Estuary	4-268, 4-506
Notice of Intent to Prepare an Environmental Impact Statement for the Proposed Bradwood Landing LNG Project, Request for Comments on Environmental Issues, and Notice of Joint Public Meeting, and Site Visit (NOI).....	1-28, 3-13, 4-406, 4-407, 4-408, 4-410, 5-17
noxious weeds	ES-4, 2-59, 4-125, 4-127, 4-129, 4-130, 4-131, 4-158, 4-172, 4-180, 4-194, 4-347, 4-508, 5-7
Occupational Safety & Health Administration (OSHA)...	4-29
Ocean Way LNG Terminal	3-24, 3-46
ODF's Forest Management Plan for Northwest Oregon...	4-326
off-highway vehicle	4-309, 4-326
Office of Coast and Resource Management (OCRM)	1-15, 4-322
Office of Energy Projects (OEP)	ES-2, ES-3, 1-3, 1-19, 2-59, 4-15, 4-16, 4-17, 4-22, 4-34, 4-46, 4-54, 4-96, 4-97, 4-114, 4-156, 4-161, 4-163, 4-166, 4-178, 4-279, 4-281, 4-303, 4-350, 4-351, 4-352, 4-364, 4-395, 4-411, 4-440, 4-444, 4-450, 4-455, 4-464, 4-488, 4-493, 5-2, 5-4, 5-7, 5-8, 5-17, 5-20, 5-23, 5-24, 5-26, 5-27, 5-28, 5-29, 5-30, 5-31, 5-32, 5-33, 5-34, 5-35, 5-36, 5-38, 5-42
open rack vaporizer (ORV).....	3-22, 4-354, 4-355
Operating Basis Earthquake (OBE)	4-11, 4-12, 4-13, 4-14, 4-18, 5-36
operation and maintenance (O&M)	ES-6, 2-36, 2-60, 4-94, 4-98, 4-177, 4-338, 4-447, 5-18
Oregon Administrative Rule (OAR).....	1-13, 1-17, 1-23, 1-24, 2-54, 4-60, 4-66, 4-67, 4-181, 4-418, 4-420, 4-422, 4-423, 4-425, 4-426, 4-427, 4-431, 4-432, 4-435, 4-436
Oregon Ambient Air Quality Standards (OAAQS)	4-412, 4-424
Oregon Biennial Energy Plan	3-3
Oregon Coastal Management Program (OCMP)	1-15, 4-322, 4-323
Oregon Department of Energy (ODE)	1-4, 1-5, 1-6, 1-8, 1-9, 1-16, 1-22, 1-28, 1-30, 1-31, 1-34, 3-2, 3-3, 3-4, 3-5, 3-6, 3-7, 3-8, 3-9, 3-10, 4-358, 4-364, 4-382, 4-406, 4-427, 4-428, 4-434, 4-435, 4-487, 4-488
Oregon Department of Environmental Quality (ODEQ) ..	ES-10, 1-12, 1-13, 1-22, 1-30, 2-39, 3-39, 4-35, 4-5, 4-57, 4-60, 4-61, 4-63, 4-66, 4-67, 4-73, 4-74, 4-79, 4-80, 4-81, 4-87, 4-89, 4-94, 4-157, 4-164, 4-168, 4-188, 4-319, 4-352, 4-412, 4-416, 4-419, 4-420, 4-422, 4-423, 4-424,

SUBJECT INDEX

4-425, 4-426, 4-427, 4-428, 4-429, 4-430, 4-432, 4-433, 4-435, 4-436, 4-507, 4-514, 4-515, 5-5, 5-17	
Oregon Department of Fish and Wildlife (ODFW)	ES-3, ES-10, 1-17, 1-23, 1-30, 1-31, 2-13, 2-25, 2-29, 3-31, 4-52, 4-73, 4-103, 4-109, 4-120, 4-122, 4-129, 4-134, 4-137, 4-150, 4-154, 4-156, 4-158, 4-160, 4-161, 4-163, 4-166, 4-175, 4-176, 4-178, 4-179, 4-181, 4-182, 4-183, 4-193, 4-194, 4-197, 4-200, 4-202, 4-207, 4-217, 4-219, 4-220, 4-221, 4-222, 4-237, 4-239, 4-240, 4-243, 4-254, 4-255, 4-258, 4-260, 4-262, 4-267, 4-269, 4-280, 4-281, 4-282, 4-284, 4-285, 4-286, 4-287, 4-295, 4-296, 4-299, 4-311, 4-371, 4-508, 4-509, 5-4, 5-7, 5-26, 5-30, 5-31, 5-32
Oregon Department of Forestry (ODF)	1-23, 4-309, 4-326, 4-357, 4-382, 4-393
Oregon Department of Geology and Mineral Industries (DOGAMI).....	1-30, 4-7, 4-8, 4-19, 4-22, 4-25, 4-29
Oregon Department of Human Services (ODHS).....	4-56, 4-63
Oregon Department of Land Conservation and Development (ODLCD)	ES-10, 1-15, 1-23, 1-30, 1-31 4-147, 4-322, 4-323, 4-324, 5-14, 5-32
Oregon Department of State Lands (ODSL).....	ES-10, 1-16, 1-23, 1-30, 2-29, 3-29, 3-69, 4-81, 4-101, 4-103, 4-106, 4-107, 4-109, 4-115, 4-120, 4-182, 4-319, 4-323, 4-354, 4-402, 4-507, 4-508, 4-509, 5-6, 5-26
Oregon Department of Transportation (ODOT)	1-24, 1-30, 2-26, 4-213, 4-383, 4-384, 4-385, 4-386, 4-395, 4-513, 5-15, 5-33
Oregon Department of Water Resources (ODWR)	1-24, 4-20, 4-57, 4-63, 4-76, 4-98, 4-160, 5-3, 5-4
Oregon Energy Facility Siting Council (Council)	1-1, 1-5, 1-8, 1-30, 3-3, 3-5, 3-6, 3-7, 3-8, 3-9, 3-54, 3-55, 4-143, 4-173, 4-190, 4-268, 4-361, 4-362, 4-375, 4-376, 4-378, 4-391, 4-406, 4-407, 4-408, 4-427, 4-428, 5-17
Oregon Legislative Commission on Indian Services	4-407, 4-409
Oregon LNG Project	3-26, 3-27, 3-28, 3-29, 3-30, 3-31, 3-55, 4-500, 4-501, 4-504, 4-505, 4-506, 4-507, 4-508, 4-509, 4-510, 4-511, 4-512, 4-513, 4-514, 4-515, 5-21
Oregon Natural Heritage Information Center (ORNHIC)	3-66, 4-197, 4-200, 4-217, 4-254, 4-274, 4-276, 4-277, 4-278, 4-280, 4-283, 4-291, 4-292, 4-293, 4-294, 4-295, 4-297, 4-298
Oregon Revised Statute (ORS)	1-16, 1-22, 1-23, 1-24, 4-196, 4-435
Oregon Timber and Lumber Company (OTLC).....	4-402, 4-403
Outstanding Resource Water (ORW)	4-67
Pacific Coast Salmon Plan	4-142

SUBJECT INDEX

Pacific Connector Gas Pipeline, L.P. (PCGP)	3-26, 3-27, 5-21
Pacific Gas and Electric (PG&E).....	3-12, 3-13, 3-14, 3-15, 3-17, 3-27
Palomar Gas Transmission pipeline project (Palomar).....	1-7, 1-35, 3-12, 3-13, 3-14, 3-16, 3-17, 3-29, 4-500, 4-501, 4-504, 4-506, 4-507, 4-508, 4-509, 4-510, 4-511, 4-514, 4-515, 5-21
peakshaving.....	3-20
peregrine falcon	4-145, 4-179, 4-192, 4-219, 4-222, 4-255, 4-256, 4-281, 4-283, 4-296, 4-298
pig launcher/receiver facilities	ES-2, 1-3, 2-25, 2-26, 2-27, 2-28, 2-39, 2-57, 4-338
Pigeon Bluff.....	4-304, 4-480
Pillar Rock	2-11, 4-252, 4-304, 4-322, 4-401, 4-480
pipe storage and contractor yards.....	2-33, 2-34, 2-36, 2-47, 4-53, 4-54, 4-338, 4-342, 4-394
Pipeline and Hazardous Materials Safety Administration (PHMSA).....	ES-1, 1-1, 1-22, 4-463, 4-491
Piping & Instrument Diagrams (P&ID)	4-452, 5-39
Plan and Procedures for the Unanticipated Discovery of Cultural Resources and Human Remains (Discovery Plan)	4-406
Plan for the Discovery and Management of Contaminated Soils and Groundwater.....	4-325, 4-352
planned development	4-351
polychlorinated biphenyls (PCBs)	4-33, 4-41, 4-44, 4-66, 4-67, 4-70, 4-74, 4-324, 4-325, 5-5
polycyclic aromatic hydrocarbon (PAH)	4-40
Port Westward Power Plant	4-502, 4-504, 4-506
Portland & Western Railroad, Inc. (PWRR).....	2-26, 2-42, 3-62, 4-159, 4-238, 4-315, 4-324, 4-385, 4-386, 4-387, 4-403, 4-405, 4-466, 5-15, 5-16
Portland General Electric Company (PGE)	ES-2, 1-3, 1-4, 1-34, 2-27, 2-28, 2-32, 2-39, 3-1, 3-39, 3-62, 3-64, 4-94, 4-335, 4-337, 4-338, 4-342, 4-351, 4-442, 4-443, 4-446, 4-447, 4-502, 5-35
Portland General Electric Company's Beaver Power Plant.....	ES-2, 1-4, 2-27, 2-28, 2-32, 2-39, 3-1, 3-62, 3-64, 4-94, 4-335, 4-338, 4-342, 4-442, 4-443, 4-446, 4-447, 5-35

SUBJECT INDEX

Portland.....	ES-2, 1-3, 1-30, 1-31, 2-9, 2-26, 2-33, 3-8, 3-13, 3-14, 3-16, 3-18, 3-20, 3-23, 3-69, 4-9, 4-71, 4-81, 4-83, 4-133, 4-140, 4-162, 4-266, 4-272, 4-353, 4-354, 4-358, 4-365, 4-371, 4-374, 4-375, 4-376, 4-377, 4-378, 4-383, 4-385, 4-388, 4-389, 4-391, 4-392, 4-407, 4-414, 4-431, 4-478, 4-479, 4-484, 4-501, 4-511, 4-512, 5-1, 5-14, 5-21, 5-40
Portland-Vancouver-Beaverton, Oregon-Washington, Metropolitan Statistical Area (Portland MSA).....	4-358, 4-374, 4-375, 4-376, 4-377, 4-378, 4-389, 4-391, 4-392, 4-511, 4-512, 5-14
potential impact circle.....	4-493, 4-494
potential impact radius.....	4-493
potentially highly erodible land (PHEL).....	4-34, 4-49, 4-53
Primary Agriculture (PA)	1-12, 2-24, 4-346, 5-13
prime farmland.....	1-20, 3-29, 3-32, 3-35, 4-34, 4-47, 4-50, 4-53, 4-505, 5-2
Priority Habitats and Species (PHS).....	3-66, 4-276, 4-277, 4-278, 4-291, 4-292, 4-294
